CAUTION: A unique transmission fluid has been developed for this transmission. This

fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid see VEHICLE QUICK REFERENCE .

The transmission case is a single-piece unit. The starter pocket, cooler line fittings, and manual park release lever are located on the driver's side of the case. The electrical connector and oil fill plug are located on the passenger side of the case. The transmission uses a flanged output shaft connection.

OPERATION

OPERATION

CAUTION: A unique transmission fluid has been developed for this transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid see VEHICLE QUICK REFERENCE .

The 8HP70 is an electronic eight-speed automatic transmission. The Transmission Control Module Assembly (TCMA), which is integrated into the valve body, provides fully synchronized clutch-to-clutch shifting through four planetary gear sets. The TCMA includes a mounting plate that holds the Transmission Control Module (TCM) and a molded wiring harness for connection to various transmission sensors and solenoids. The valve body assembly contains all the sensors and solenoids required for operation, completely inside the transmission. Eight speeds allow the engine to maintain its optimal rpm range, increasing fuel economy and performance.

Transmission control is performed by the TCM based on hard-wired and CAN bus signals from sensors and modules. The TCM receives driveability data from the Powertrain Control Module (PCM) and other modules over the CAN-C bus. It also receives shift lever position information from the electronic shifter over a dedicated transmission CAN bus. The TCM processes this input data and controls operation of the torque converter clutch, park lock system, solenoid valves, and pressure regulating valve.

The input and output speed sensors are Hall-effect sensors that measure shaft rotational speed. The input speed sensor is located at the top, near the center, of the of the TCMA and reads input shaft speed from the magnetic ring on the P2 carrier. The output speed sensor is located at the back of the TCMA and reads output shaft speed from the P4 carrier

FILTER SERVICE The 8HP70 has a conventional fluid sump design, however, the filter is integrated into the oil pan resulting in a lower profile for improved vehicle packaging. The oil pan gasket is reusable providing it is not damaged during removal.

FLUID CHECK AND FILL A fluid fill tube and indicator are not provided. All work is performed under the vehicle while raised on a hoist. In the event of a transmission shift quality concern, a fluid leak, or in conjunction with a transmission repair, the transmission fluid level must be validated and topped off as necessary. The procedure involves the use of a scan tool to monitor transmission fluid temperature. Specific service procedures are necessary to check and fill the transmission with fluid. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

CLUTCHES

The 8HP70 transmission uses two multi-plate holding clutches (A and B) and three multi-plate driving (rotating) clutches (C, D, and E). Gear shifts from one - eight and eight - one are synchronous shifts, meaning one of the clutches must continue to transmit torque at lower pressure until the other clutch is able to accept the

input torque.

Clutches A and B are holding clutches. Clutch A is applied by hydraulic pressure and released by a return spring, similar to the driving clutches. Clutch B operation is unique because it has fluid chambers on both sides of the apply piston, and therefore it is applied and released hydraulically. Regulation of fluid pressure on each side of the piston allows precise positioning of clutch B for apply, release, and controlled slip conditions.

Clutches C, D, and E operate in a similar manner. Regulated pressure is available at the clutch C shift solenoid and the clutch valve. When the shift solenoid is de-energized, fluid flows through the shift solenoid and applies pressure to the clutch valve. During the shift, pressure moves the clutch valve, which begins to apply the clutch. Pressure from the holding valve regulates the opening of the clutch valve, softening the shift. Above a set threshold, the holding valve seats and allows the clutch valve to open completely.

EMERGENCY RUNNING FUNCTION - LIMP IN MODE

In the event of a complete transmission electrical failure (loss of power to the TCM), the transmission enters default limp-in mode. When the TCM loses power, all solenoids are de-energized. Maximum pressure locks the transmission in 6th gear, and a diagnostic trouble code (DTC) is stored in memory. If the vehicle is in a forward gear range when the fault occurs, the transmission defaults to 6th gear.

If the vehicle is in park, reverse, or neutral, or if the engine is turned off when the fault occurs, the transmission will remain in park because the park lock release system cannot release the parking pawl. No hydraulic pressure is supplied to the driving clutches. In this situation, the manual park release lever must be used to disengage the park pawl.

The limp-in function remains active until the DTC is rectified or the stored DTC is erased with the appropriate scan tool.

OIL PUMP OPERATION

The oil pump is located just behind the torque converter, between the pump housing and cover assemblies. The torque converter drives the pump assembly using a chain and sprockets. The oil pump is a double-stroke vane pump. The pump has dual chambers, two inlet and two outlet ports, allowing it to produce the fluid volume necessary for all operating conditions. The pump draws fluid through a filter and pressurizes the fluid as the pump rotates. After the fluid is pressurized, it exits the pump through two exhaust ports that feed the system pressure valve. The system pressure valve maintains fluid pressure and allows excess pressure to be returned to the pump. This reduces cavitation and noise. A slipping clutch can often be determined by comparing which internal units are applied in the various gear ranges. The Clutch Application chart provides a basis for analyzing road test results.

Ā	

Use this POWER FLOW COMPONENTS graphic and chart to identify the individual components of the specific gear powerflow explanations below:

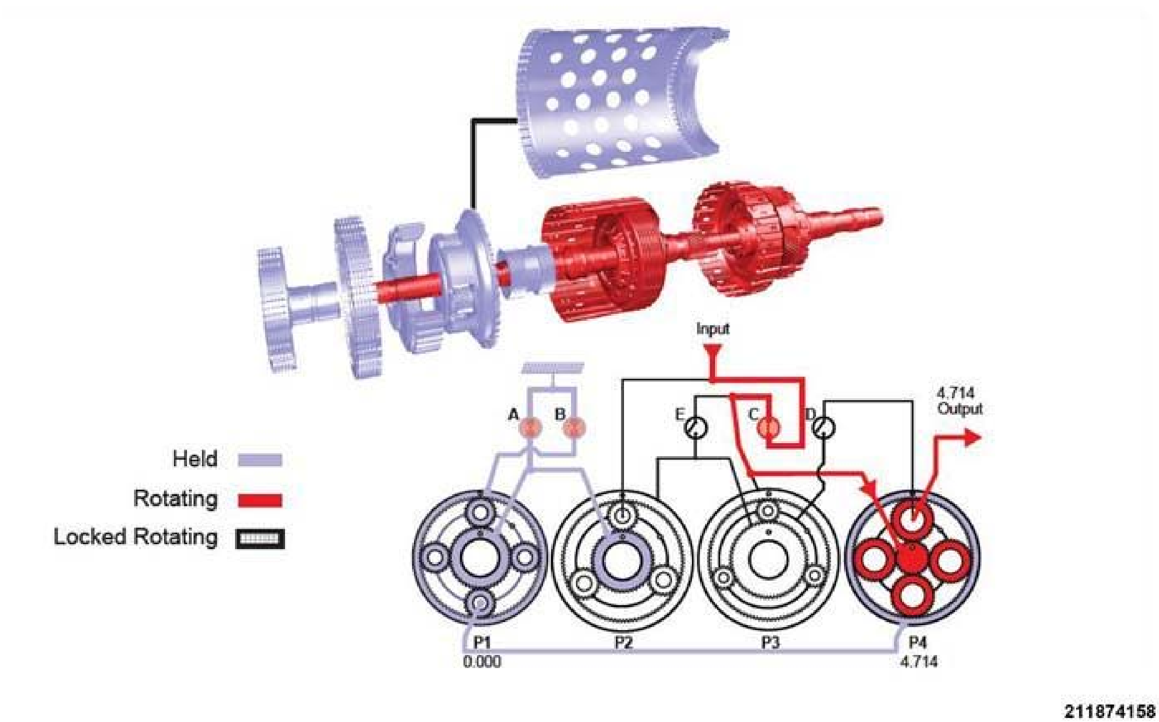

Fig. 3: Powerflow In First Gear
Courtesy of CHRYSLER GROUP, LLC

FIRST GEAR POWERFLOW

Clutch A (1) holds the P1/P2 sun gear (17) and clutch B (2) holds the P1 annulus (3). Because two members of the same gear set are held, the entire P1 gear set is stationary. The stationary P1 carrier (18) is connected to the P4 annulus (9), locking the annulus. The input shaft (19) drives the C clutch (13), and the C clutch (13) drives the P4 sun gear (10). The P4 sun gear (10) drives the P4 carrier (11), whose pinions walk around the held P4 annulus (9).

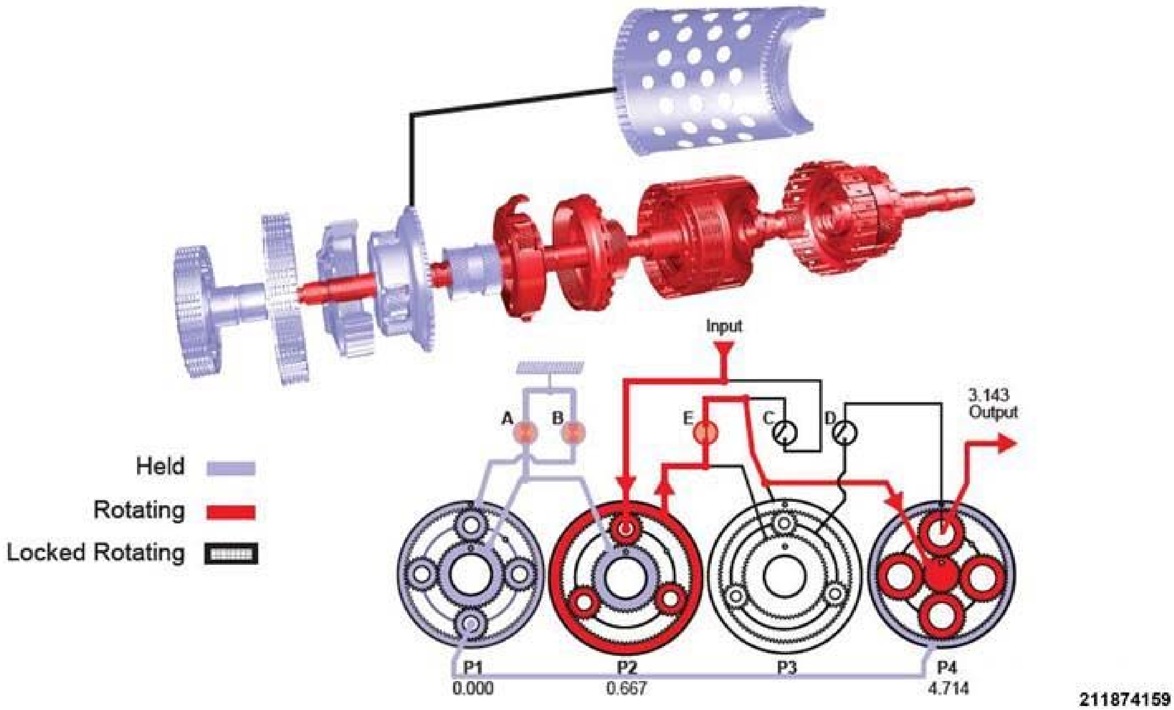

Fig. 4: Powerflow In Second Gear
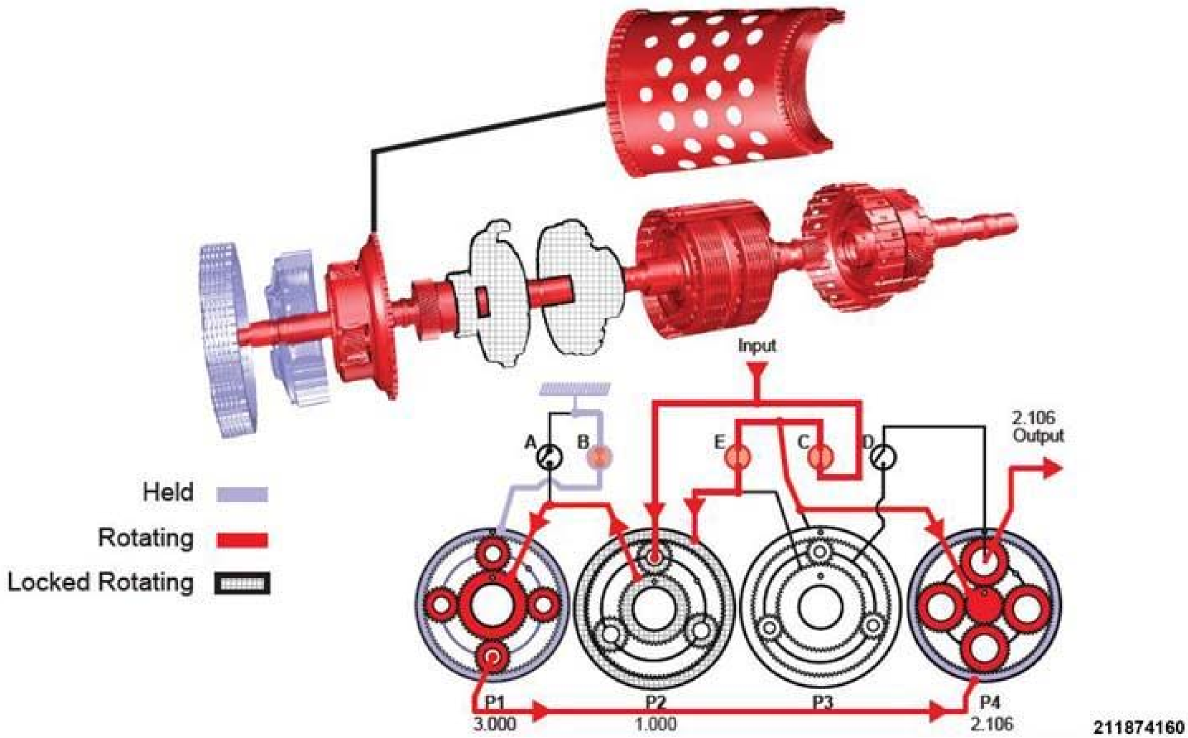
Courtesy of CHRYSLER GROUP, LLC

SECOND GEAR POWERFLOW

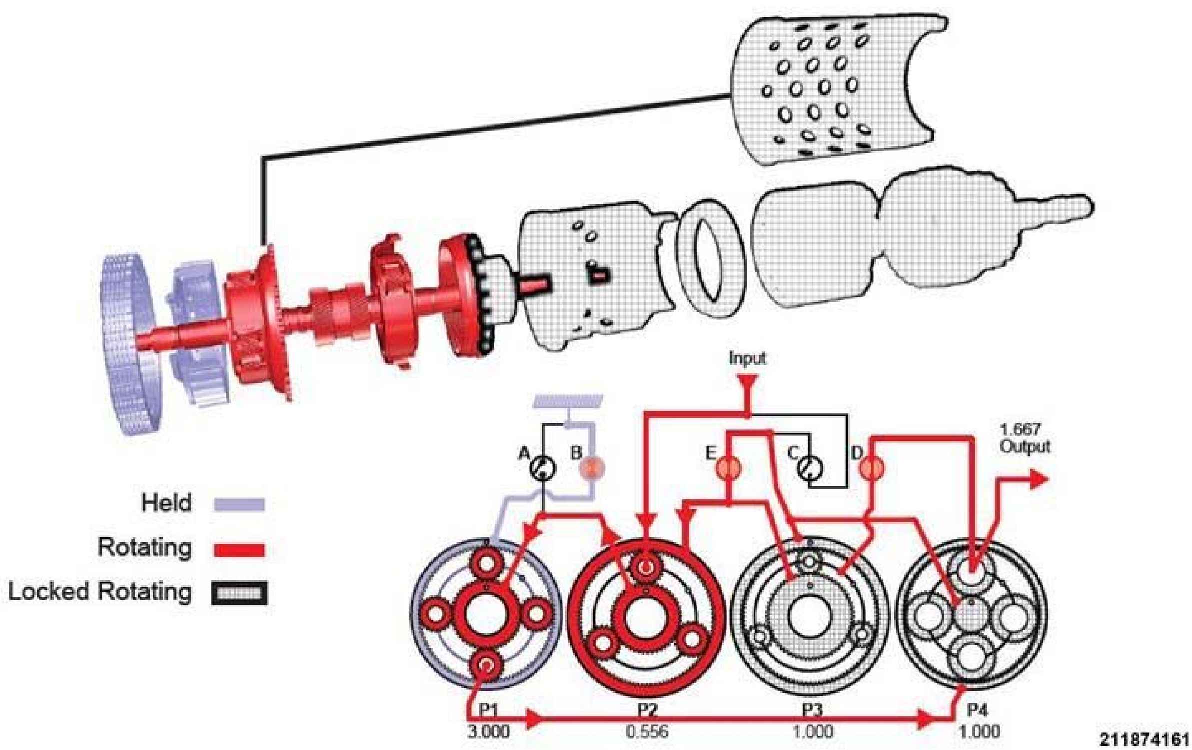
Clutch A (1) holds the P1/P2 sun gear (17) and clutch B (2) holds the P1 annulus (3). As with 1st gear, the entire P1 gear set is stationary. The stationary P1 carrier (18) is connected to the P4 annulus (9), locking the annulus. The input shaft (19) drives the P2 carrier (16). The P2 carrier (16) drives the P2 annulus (4). The P2 annulus (4) drives the E clutch (14) through the P3 sun gear (5) connection. The E clutch (14) then drives the P4 sun gear (10). The P4 sun gear (10) drives the P4 carrier (11), whose pinions walk around the held P4 annulus (9).



[Fig. 5: Powerflow In Third Gear](#)
Courtesy of CHRYSLER GROUP, LLC

THIRD GEAR POWERFLOW

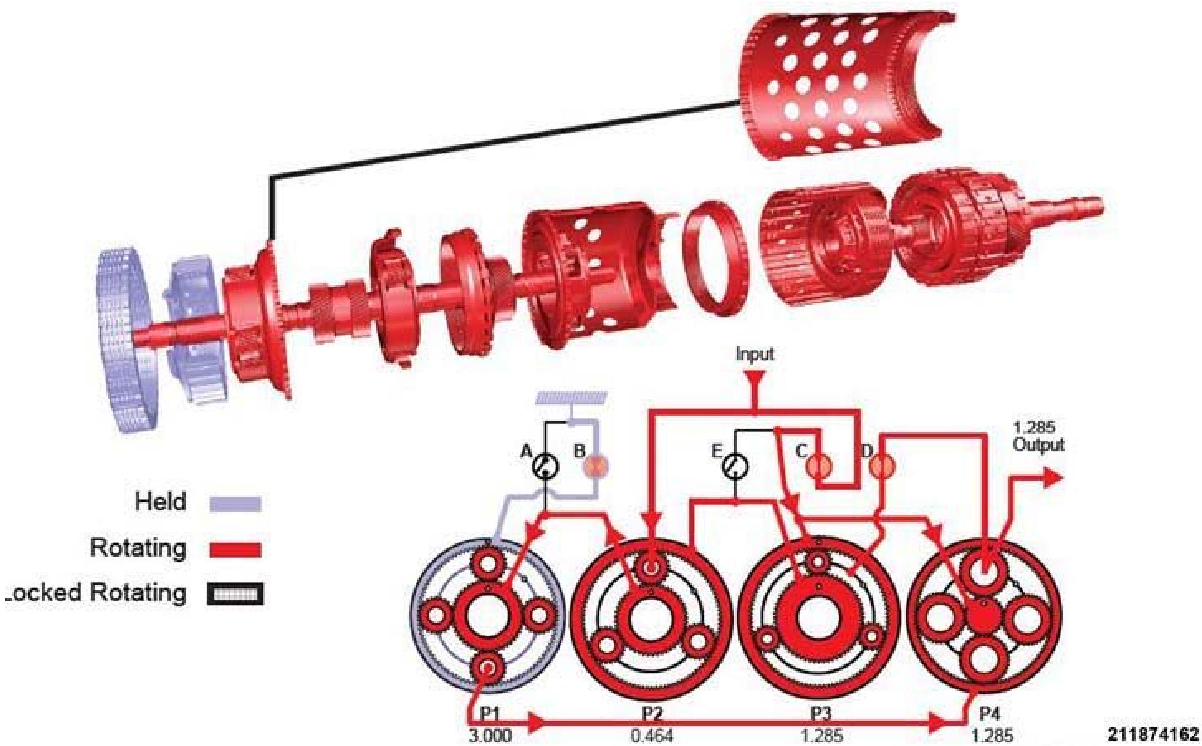
Clutch B (2) holds the P1 (3) annulus. The input shaft (19) drives the C clutch (12), which drives the P4 annulus (9). The C clutch (12) also drives the E clutch (14), which drives the P2 annulus (4). Because the P2 carrier (16) and the P2 annulus (4) are both driven at input shaft speed, the P2 gear set is locked at input shaft speed. The P1/P2 sun gear (17) drives the P1 carrier (18), and the P1 carrier drives the P4 annulus (9).



[Fig. 6: Powerflow In Fourth Gear](#)
Courtesy of CHRYSLER GROUP, LLC

FOURTH GEAR POWERFLOW

Clutch B (2) holds the P1 annulus (3). With the E (14) and D (12) clutches applied, all components of the P3 and P4 gear sets are locked together to rotate at the same speed. The input shaft (19) drives the P2 carrier (16) which drives the P1/P2 sun gear (17). The P1/P2 sun gear drives the P1 carrier (18). The P1 carrier drives the P4 gear set through the P4 annulus (9).



[Fig. 7: Powerflow In Fifth Gear](#)
Courtesy of CHRYSLER GROUP, LLC

FIFTH GEAR POWERFLOW

Clutch B (2) holds the P1 annulus (3). The input shaft (19) always drives the P2 carrier (16). Because the C clutch (13) is applied, the P3 annulus (15) and P4 sun gear (10) are also driven at input shaft speed. The D clutch (12) is applied to connect the P3 carrier (6) with the P4 carrier (11). The P2 carrier (16) drives the P1/P2 sun gear (17), which drives the P1 carrier (18). The P1 carrier walks around the held P1 annulus (3) and drives the P4 annulus (9). Gear reduction is achieved between the P4 sun gear (10) rotating at input shaft speed and the P4 annulus (9) rotating at a reduced speed.

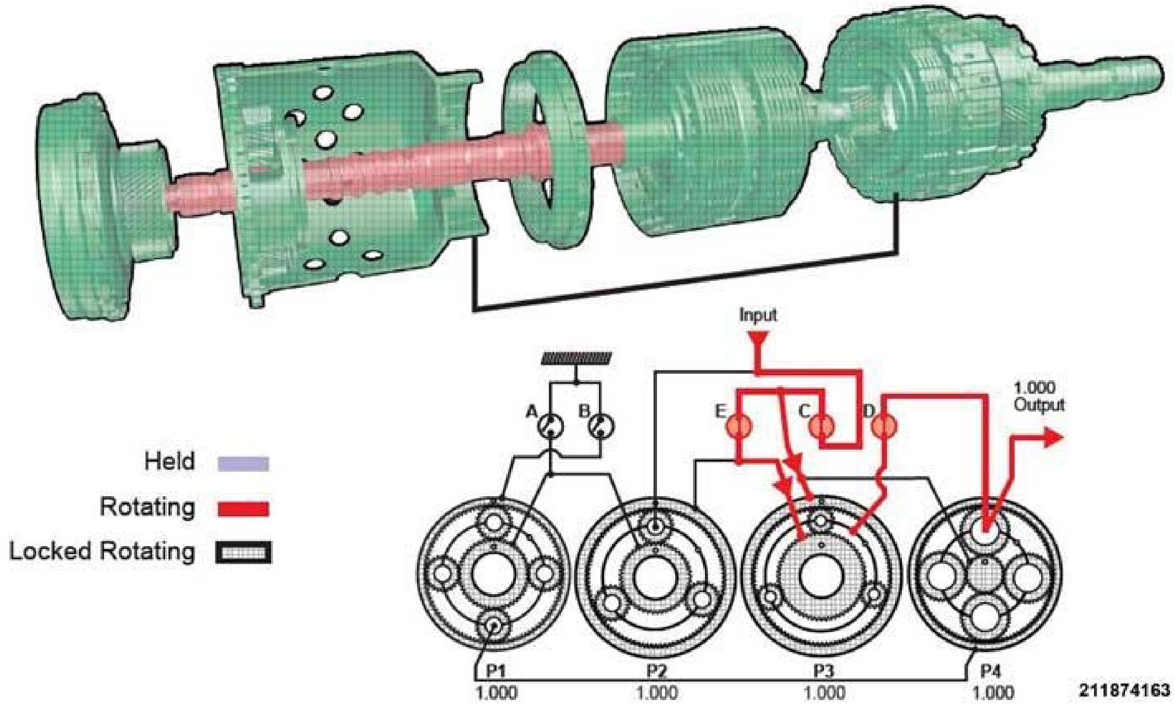


Fig. 8: Powerflow In Sixth Gear
Courtesy of CHRYSLER GROUP, LLC

SIXTH GEAR POWERFLOW

Clutch C (13) drives the P3 annulus (15) at input shaft speed and E clutch (14) drives the P3 sun gear (5) at input shaft speed. Because two components of the same gear set are driven at the same speed, the entire gear set is locked in rotation. The D clutch (12) connects the P3 carrier (6) to the P4 carrier (11) and the output shaft.

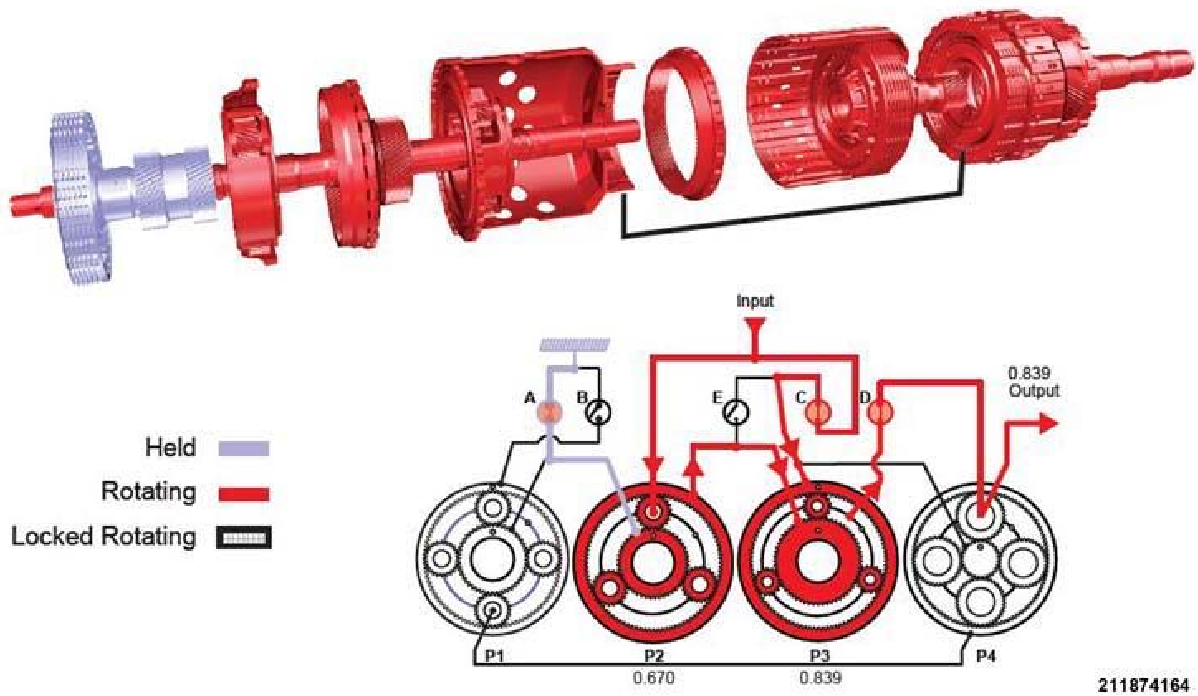

Fig. 9: Powerflow In Seventh Gear
Courtesy of CHRYSLER GROUP, LLC

SEVENTH GEAR POWERFLOW

Clutch A (1) holds the P1/P2 sun gear (17) stationary. The input shaft drives the P2 carrier which drives the P2 annulus, increasing the speed of the P3 sun gear (5) and creating overdrive. The C clutch (13) drives the P3 annulus (15) at input shaft speed. The P3 sun gear (5) spins at a faster speed than the P3 annulus (15) and the P3 carrier (6) is the output of the gear set. This results in a reduction that offsets the overdrive of the P2 gear set. The D clutch (12) connects the P3 carrier (6) to the P4 carrier (11) and the output shaft.

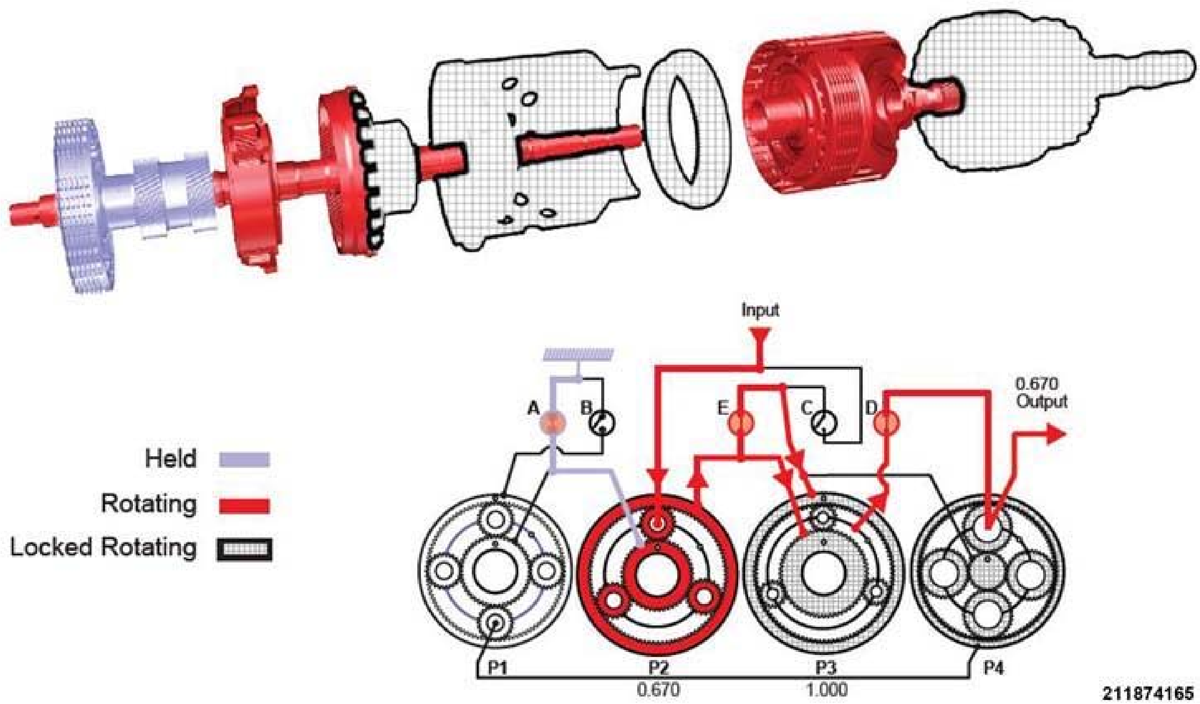

Fig. 10: Powerflow In Eighth Gear
Courtesy of CHRYSLER GROUP, LLC

EIGHTH GEAR POWERFLOW

Clutch A (1) holds the P1/P2 sun gear (17) stationary. As with 7th gear, the P2 gear set creates an overdrive ratio. However, the E clutch (14) is now applied, which locks together the P3 gear set and eliminates any torque multiplication from the P3 gear set. The overdrive created by P2 is transferred by the D clutch (7) to the output shaft.

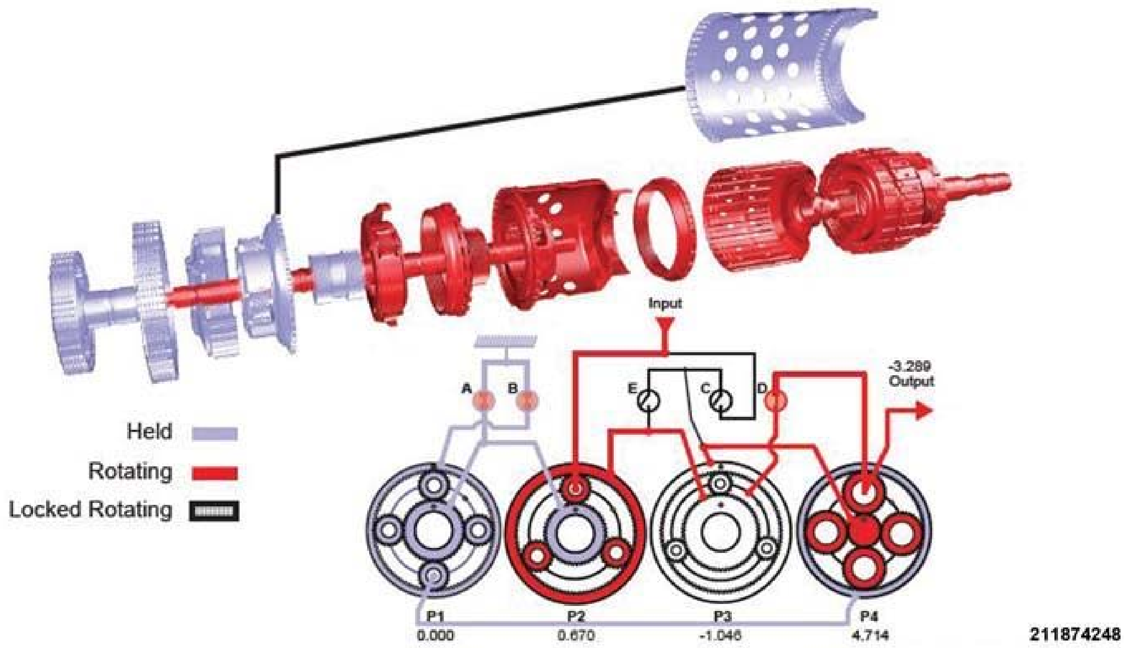

Fig. 11: Powerflow In Reverse Gear
Courtesy of CHRYSLER GROUP, LLC

REVERSE GEAR POWERFLOW

Clutches A (1) and B (2) hold the P1 gear set to hold the P1/P2 sun gear (17). The input shaft drives the P2 carrier, which produces an overdrive ratio from the P2 gear set, driving the P3 sun gear (5) in engine direction. The P3 carrier (6) is connected to the output shaft by the D clutch (12). This holds the carrier, reversing the direction and multiplying torque. The P3 annulus (15) is connected to the P4 sun gear (10), which drives the P4 gear set opposite of engine direction and multiplies torque again.

DIAGNOSIS AND TESTING

CLUTCH AIR PRESSURE TESTS

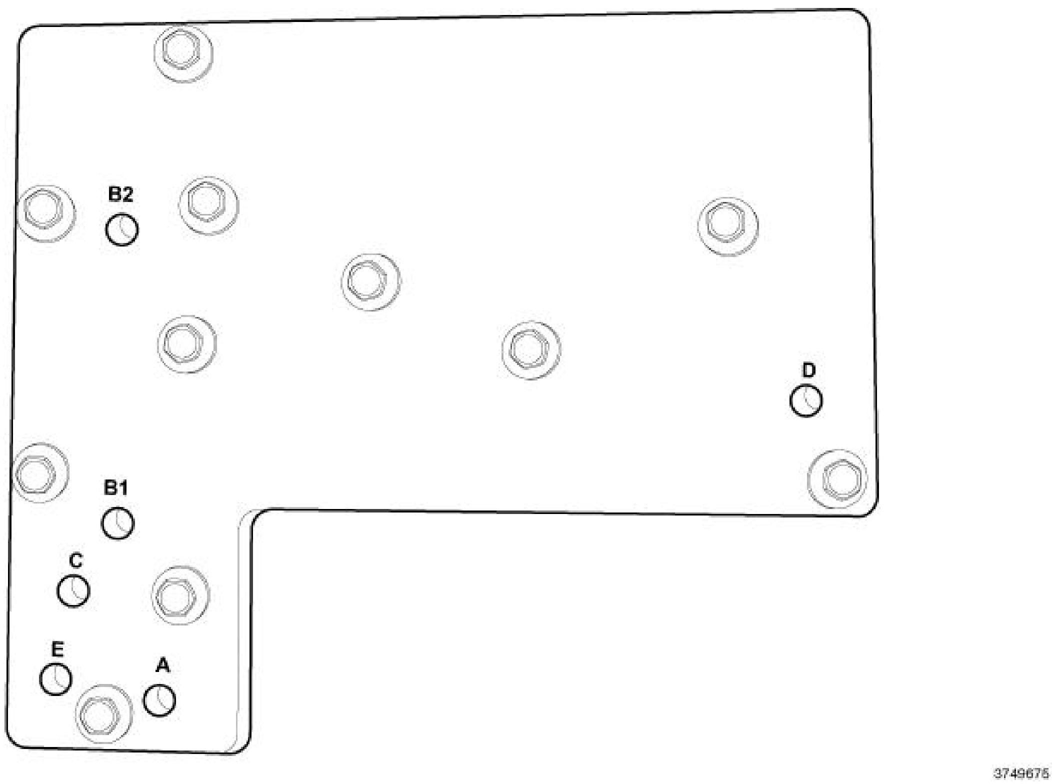

Fig. 12: Clutch Pressure Test Passages
Courtesy of CHRYSLER GROUP, LLC

Inoperative clutches can be located using a series of tests by substituting air pressure for fluid pressure using (special tool #10383, Plate, Clutch Pressure Test).

The clutches may be tested by applying air pressure to their respective passages. The valve body must be removed. To make air pressure tests, proceed as follows:

NOTE: **The compressed air supply must be free of all dirt and moisture. Use a pressure of 5-8 bar (73-116 psi).**

Remove the valve body. Refer to **VALVE BODY, REMOVAL** for 8HP45/845RE. Refer to **VALVE BODY, REMOVAL** if equipped with an 8HP70. Install (special tool #10383, Plate, Clutch Pressure Test) and tighten bolts to 6 N.m (50 in. lbs.). When testing is finished, install valve body. Refer to **VALVE BODY, INSTALLATION** for 8HP45/845RE or, refer to **VALVE BODY, INSTALLATION** if equipped with an 8HP70. Fill the transmission. Refer to **FLUID AND FILTER, STANDARD PROCEDURE** for 8HP45/845RE or refer to **FLUID AND FILTER, STANDARD PROCEDURE** if equipped with an 8HP70.

NOTE: **If any clutch does not appear to be functioning with the air, add some 8HP transmission fluid and try the test again. Some circuits will not operate without fluid.**

A CLUTCH

Apply air pressure to the feed hole located on the test plate marked **A** , listen for an audible thud. The piston should return to its starting position when the air pressure is removed.

B CLUTCH FUNCTION

Apply air pressure to the feed hole located on the test plate marked **B1** , listen for an audible thud. The piston should not return to its starting position when the air pressure is removed. If air pressure is applied to the B2 circuit, the B1 should return. An audible hiss may be heard when testing this clutch as the seal is designed to allow fluid/air to pass.

C CLUTCH

Apply air pressure to the feed hole located on the test plate marked **C** , listen for an audible thud. The piston should return to its starting position when the air pressure is removed.

D CLUTCH

Apply air pressure to the feed hole located on the test plate marked **D** , listen for an audible thud. The piston should return to its starting position when the air pressure is removed.

E CLUTCH

Apply air pressure to the feed hole located on the test plate marked **E** , listen for an audible thud. The piston should return to its starting position when the air pressure is removed.

DIAGNOSIS AND TESTING - AUTOMATIC TRANSMISSION - GENERAL CONDITIONS

CAUTION: Before attempting any repair on an automatic transmission, check for Diagnostic Trouble Codes with the appropriate scan tool.

CAUTION: A unique transmission fluid has been developed for this transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid see **VEHICLE QUICK REFERENCE** **.**

Transmission malfunctions may be caused by these general conditions:

- Poor engine performance.
- Improper adjustments.
- Hydraulic malfunctions.
- Mechanical malfunctions.
- Electronic malfunctions.

Diagnosis of these problems should always begin by checking the easily accessible variables: fluid level, fluid condition, and transmission fault codes using the appropriate scan tool. Then perform a road test to determine if the problem has been corrected or if more diagnosis is necessary.

DIAGNOSIS AND TESTING - PRELIMINARY

CAUTION: A unique transmission fluid has been developed for this transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid see **VEHICLE QUICK REFERENCE** **.**

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for

disabled vehicles (will not back up or move forward).

VEHICLE IS DRIVABLE

1. Check for transmission fault codes using the appropriate scan tool.
2. Road test and note how transmission upshifts, downshifts, and engages.
3. Check fluid level and condition.

VEHICLE IS DISABLED

1. Check for transmission fault codes using the appropriate scan tool.
2. Check for cracked, leaking cooler lines.
3. Check fluid level and condition.
4. With the transmission in the Park position, attempt to rotate drive shaft(s) to ensure transmission output shaft coupler/flange is secure.
5. Raise and support vehicle on safety stands, start engine with transmission in the Park position and allow to idle for several minutes, shift transmission into gear, and note following:
    a. If propeller shaft turns but wheels do not, problem is with differential or axle shafts.
    b. If propeller shaft does not turn and transmission is noisy, stop engine. Remove oil pan, and check for debris. If pan is clear, remove transmission and check for damaged driveplate, converter, oil pump, or input shaft.
6. Check the TCMA, Wiring, Valve body, and Solenoids (Utilize fault codes to diagnose if available).

DIAGNOSIS AND TESTING - ROAD TESTING

CAUTION: A unique transmission fluid has been developed for this transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid see VEHICLE QUICK REFERENCE .

Before road testing, be sure the fluid level has been checked and adjusted if necessary. Verify that all diagnostic trouble codes have been resolved.

Observe engine performance during the road test. A poorly tuned engine will not allow accurate analysis of transmission operation.

Operate the transmission in all gear ranges. Check for shift variations and engine flare which indicates slippage. Note if shifts are harsh, spongy, delayed, early, or if part throttle downshifts are sensitive.

Slippage indicated by engine flare, usually means clutch, overrunning clutch, or line pressure problems.

A slipping clutch can often be determined by comparing which internal units are applied in the various gear ranges. The Clutch Application chart provides a basis for analyzing road test results.

STANDARD PROCEDURE

A-CLUTCH MEASUREMENT

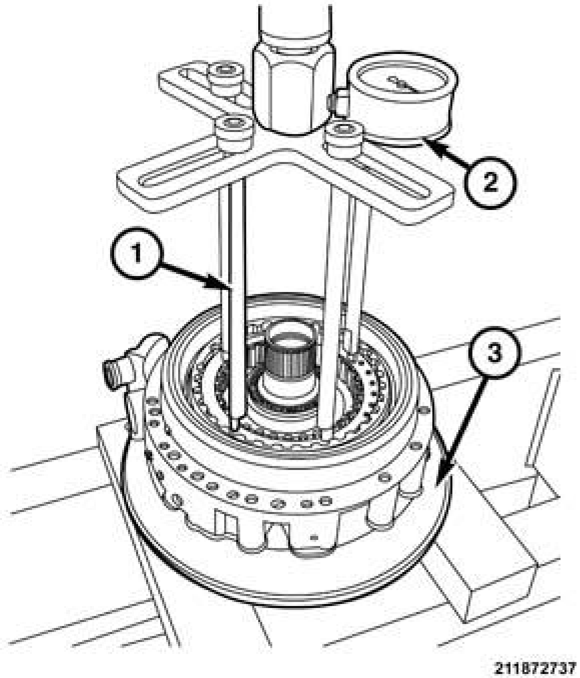

Fig. 13: Adapter & Pressing Tool
Courtesy of CHRYSLER GROUP, LLC

1. Using (special tool #10428, Adapter, Pressing Tool) (1) and (special tool #10429, Gauge, Force) (2) Place the A-clutch/oil pump assembly in a suitable arbor press.
2. Apply 200 N (45 lbs.) of force to the A-clutch backing plate to compress the wave plate.

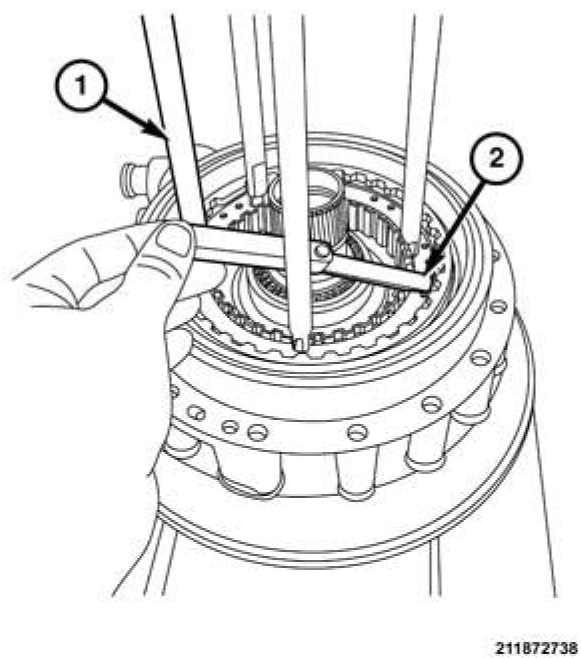

Fig. 14: Measuring Gap Between A-Clutch Backing Plate & Snap Ring
Courtesy of CHRYSLER GROUP, LLC

3. With a suitable feeler gauge (2) measure the gap between the A-clutch backing plate and the snap ring.

4. Refer to CLUTCH A SELECTABLE SNAP RINGS for specs. If clearance is not within specification, a thinner or thicker selectable snap ring can be installed for proper clearance.

B-CLUTCH MEASUREMENT

When the B-clutch is replaced, the proper selectable shim must be installed to achieve specified clearance.

Measurement (special tool #8901A, Pressing Tool), (special tool #10429, Gauge, Force).

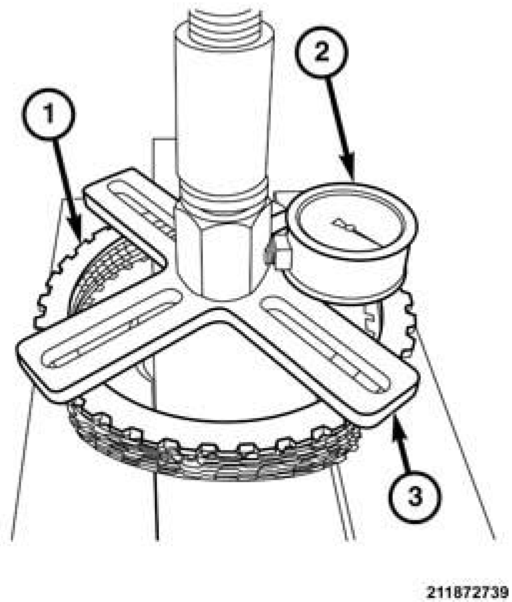

Fig. 15: Pressing Tool
Courtesy of CHRYSLER GROUP, LLC

1. Place the B-clutch, with the wave plate on top, on a suitable arbor press.
2. Position tools (special tool #8901A, Pressing Tool) (3) (using just the cross bar) (3) and (special tool #10429, Gauge, Force) (2) on top of the B-clutch wave plate (1) and under the press ram.

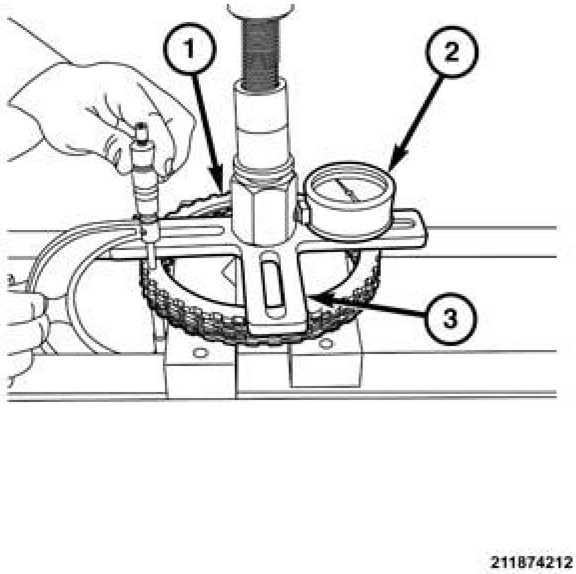

Fig. 16: Gauge, Pressing Tool & B-Clutch
Courtesy of CHRYSLER GROUP, LLC

3. Apply 500 N (112 lbs.) of downward force on the B-clutch to compress the wave plate.
4. Using a suitable micrometer, measure the thickness of the compressed B-clutch (3). **Record the measurement as (A)** to calculate the B-clutch clearance in order to determine the correct selectable shim thickness.

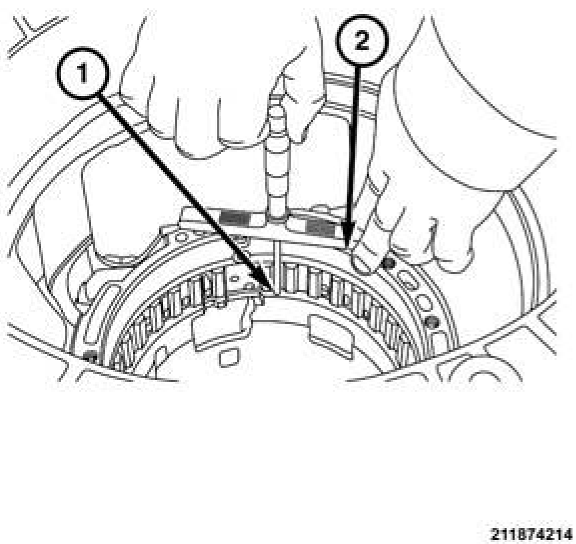

Fig. 17: Transmission Oil Pump & B-Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

5. With a suitable depth micrometer, place it at the mounting surface of the transmission oil pump (2) and measure to the base of the B-clutch retainer on the case (1). This measurement should be 61.05 mm. **Record the measurement as (B)** to calculate the B-clutch clearance in order to determine the correct selectable shim thickness.

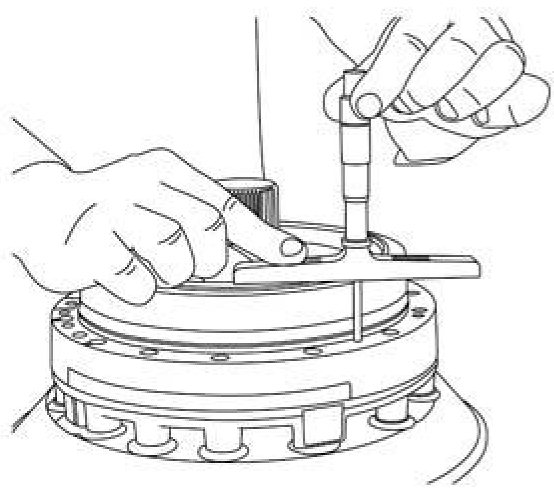

Fig. 18: Measuring B-Clutch Piston Using Depth Micrometer
Courtesy of CHRYSLER GROUP, LLC

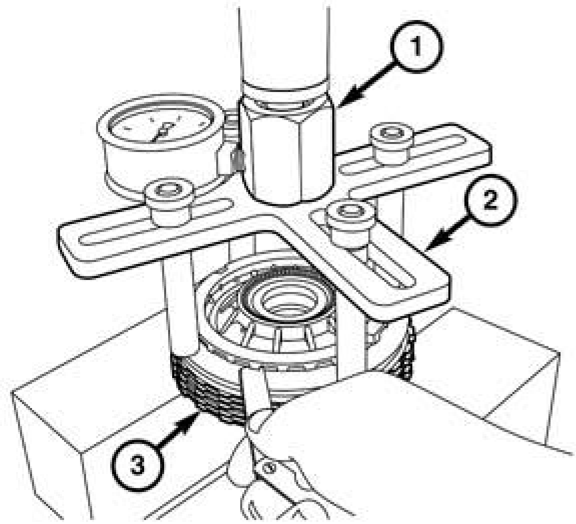
6. Using a suitable depth micrometer, measure the B-clutch piston.
7. Measure between the fluid pump sealing surface and the bottom of the straight edge. **Record the measurement as (C)** to calculate the B-clutch clearance in order to determine the correct selectable shim thickness.

Calculation

Take the case depth (B) subtract (C) subtract (A) remainder is the clearance of the B-clutch. If the clearance is not within specification a thinner or thicker reaction plate can be installed to achieve proper clearance.

C-CLUTCH MEASUREMENT

1. Using (special tool #8901A, Pressing Tool) (2) and (special tool #10429, Gauge, Force) (1) place the C-clutch (3) in a suitable arbor press (with the backing plate facing up).
2. Apply 200 N (45 lbs.) of force to the C-clutch to compress the wave plate.
3. With a suitable feeler gauge, measure the gap between the C-clutch backing plate and the C-clutch retainer.
4. Refer to **CLUTCH C AND E SELECTABLE BACKING PLATES** for specs. If clearance is not within specification a thinner or thicker selectable backing plate can be installed to achieve proper clearance.



211872743

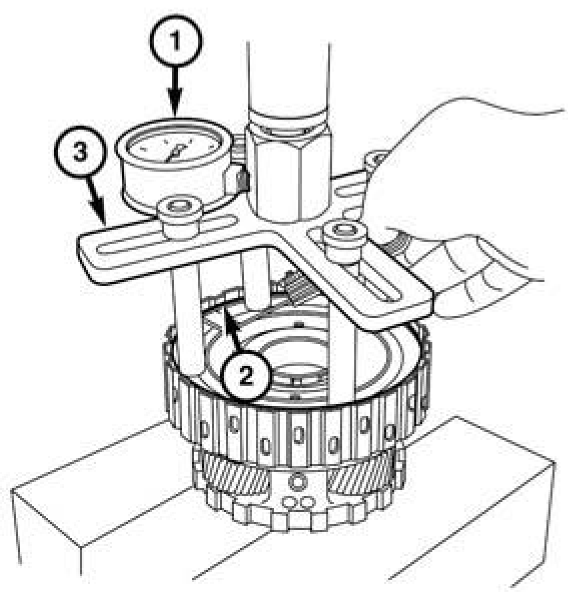
Courtesy of CHRYSLER GROUP, LLC

D-CLUTCH MEASUREMENT



211872744

[Fig. 20: Measuring Gap Between D-Clutch Backing Plate & D-Clutch Retainer](#)
Courtesy of CHRYSLER GROUP, LLC

1. Using (special tool #8901A, Pressing Tool) (3) and (special tool #10429, Gauge, Force) (1) place the D-clutch in a suitable arbor press.
2. Apply 200 N (45 lbs.) of force to the D-clutch backing plate to compress the wave plate.

3. With a suitable feeler gauge (2), measure the gap between the C-clutch backing plate and the C-clutch retainer.
4. Refer to **CLUTCH D SELECTABLE SNAP RINGS** for specs. If clearance is not within specification a thinner or thicker selectable snap ring can be Installed to achieve proper clearance.

E-CLUTCH MEASUREMENT

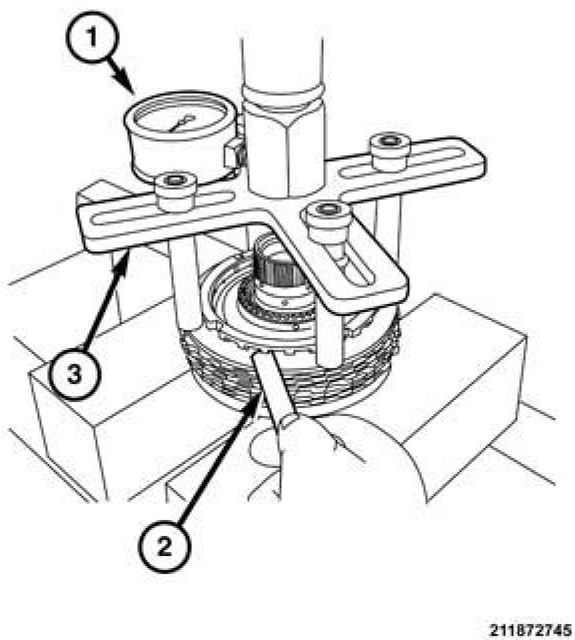


Fig. 21: Measuring Gap Between Backing Plate & Retainer Of E-Clutch
Courtesy of CHRYSLER GROUP, LLC

1. Place the E-clutch in a suitable arbor press.
2. Using (special tool #10429, Gauge, Force) (1) and (special tool #8901A, Pressing Tool) (3) apply 200 N (45 lbs.) to the backing plate of the E-clutch.
3. Using a set of feeler gauges (2), measure the gap between the backing plate and the retainer of the E-clutch.
4. Refer to **CLUTCH C AND E SELECTABLE BACKING PLATES** for specifications. If clearance is not within specifications, a thinner or thicker selectable backing plate can be installed to achieve proper clearance.

REMOVAL

REMOVAL

1. Put transmission in neutral.
2. Disconnect and isolate the negative battery cable.
3. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
4. Disconnect the right and left bank up stream oxygen sensors.
5. Remove the drive shaft. Refer to **REMOVAL** .

6. Remove the starter. Refer to **STARTER, REMOVAL** .

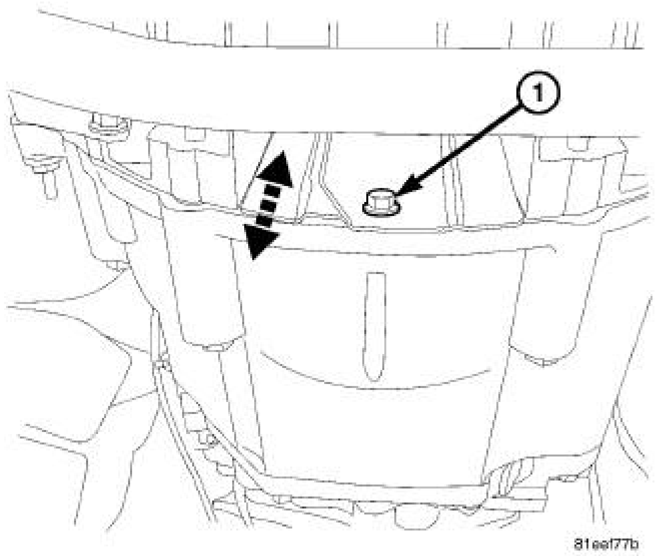

Fig. 22: Inspection Cover
Courtesy of CHRYSLER GROUP, LLC

7. Remove the inspection cover bolt and the inspection cover.

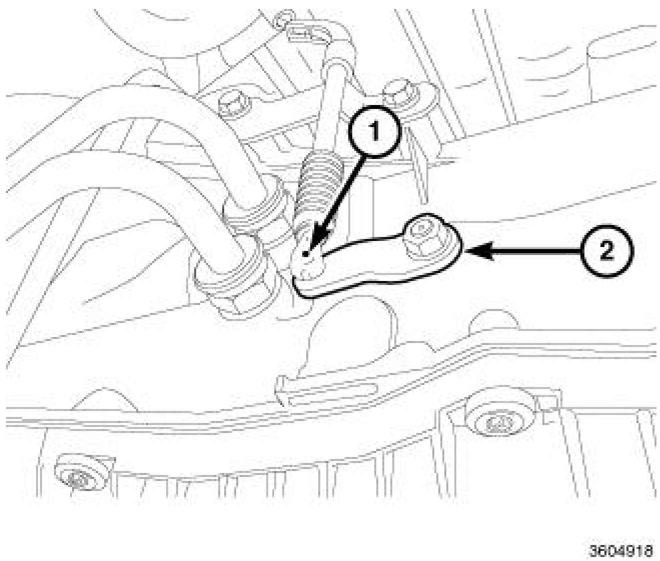

Fig. 23: Manual Park Release Cable & Lever
Courtesy of CHRYSLER GROUP, LLC

8. Disconnect the Manual Park Release (MPR) cable (1) from the MPR lever (2).

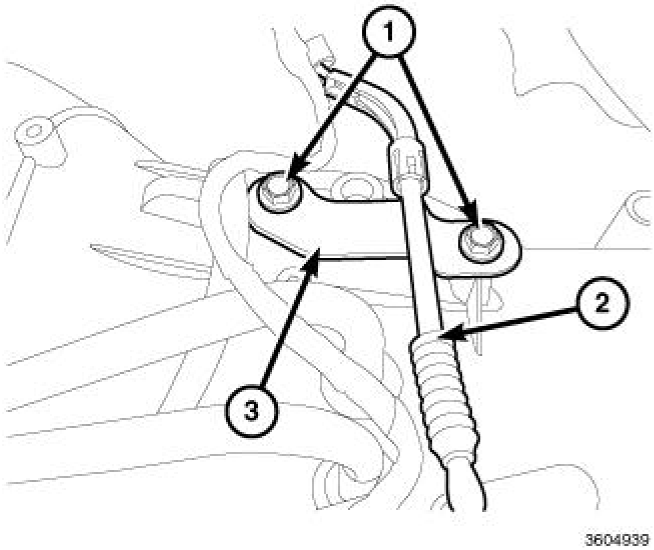

Fig. 24: Bolts, Manual Park Release Cable Bracket & Bracket/Cable
Courtesy of CHRYSLER GROUP, LLC

9. Remove the bolts (1) from the MPR cable bracket (3) and position the MPR bracket/cable (2, 3) aside.

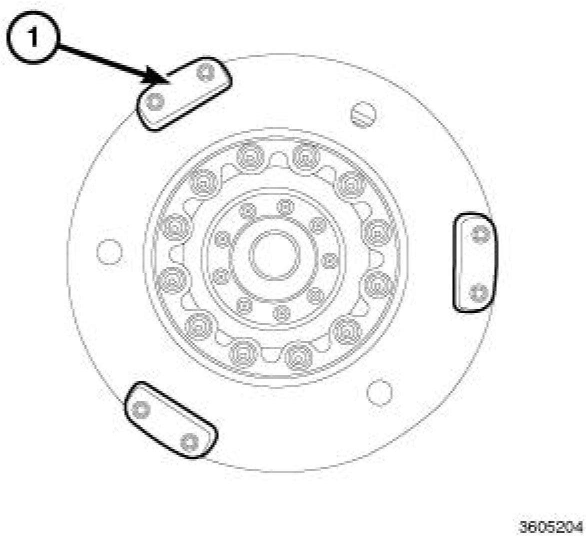

Fig. 25: Two Bolts
Courtesy of CHRYSLER GROUP, LLC

10. The torque converter is attached with three sets of two bolts (1) 120Ā° apart as shown.

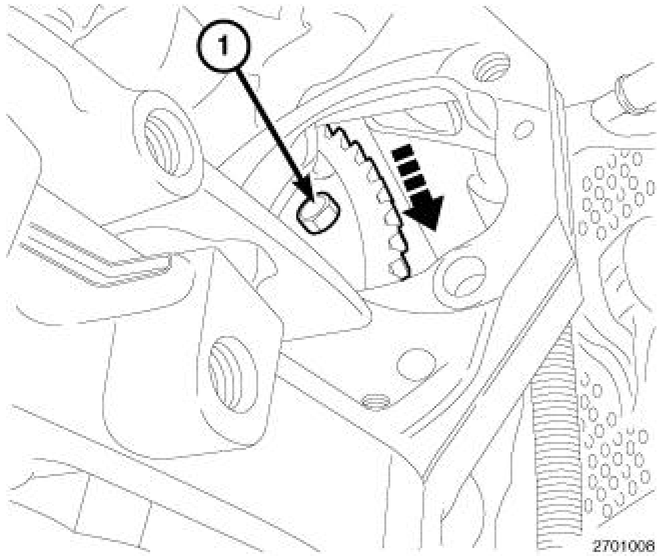

Fig. 26: Torque Converter Bolt
Courtesy of CHRYSLER GROUP, LLC

11. Rotate the crankshaft in a clockwise direction for access, and through the starter opening, remove the six torque converter bolts (1).

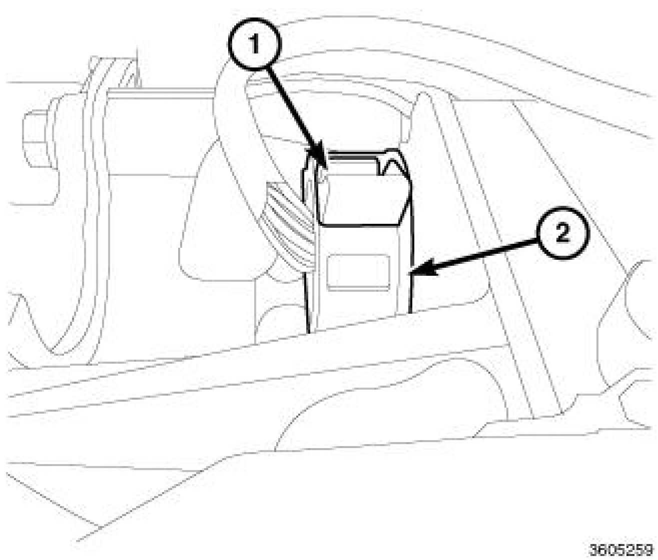

Fig. 27: Locking Mechanism Lock & Adapter Plug Connector
Courtesy of CHRYSLER GROUP, LLC

12. Turn the locking mechanism lock (1) of the adapter plug connector (2) counter-clockwise to release the lock.

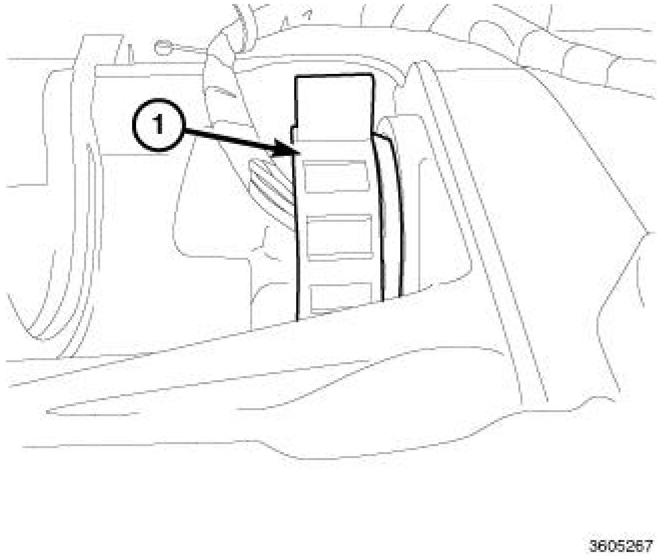

Fig. 28: Adapter Plug Connector
Courtesy of CHRYSLER GROUP, LLC

13. Remove the adapter plug connector (1) from the transmission.

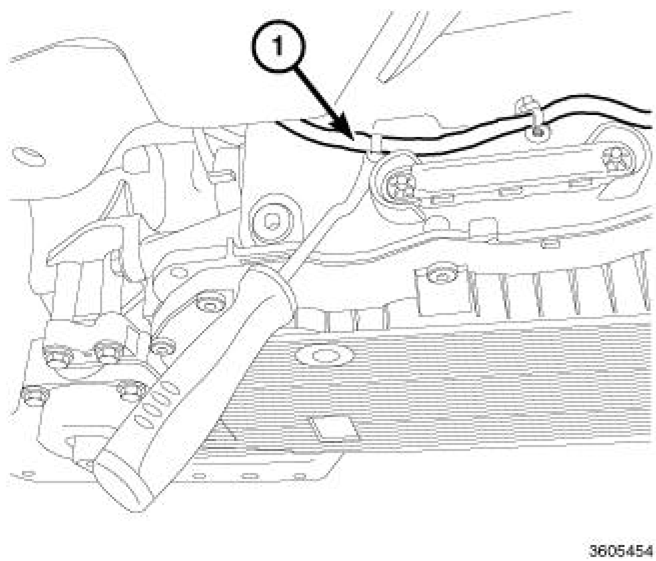

Fig. 29: Wiring Harness
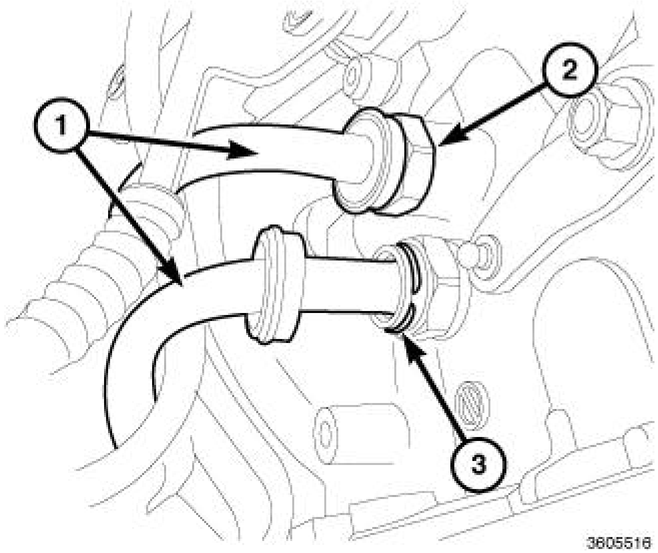
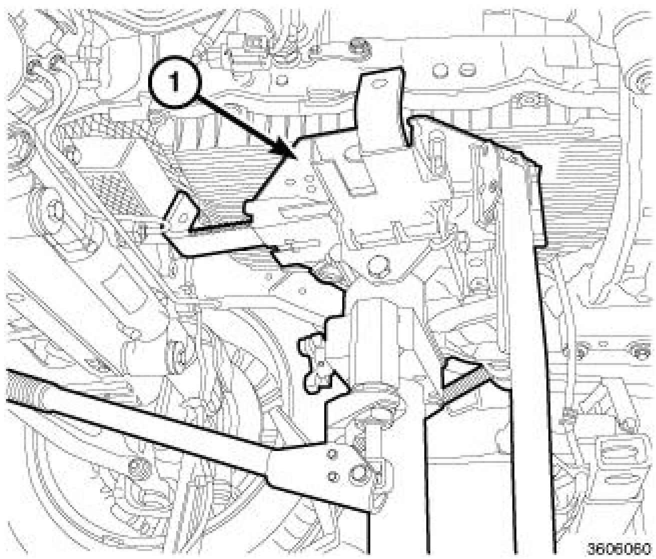
Courtesy of CHRYSLER GROUP, LLC

14. Disconnect the wiring harness (1) from the transmission.



[Fig. 30: Transmission Fluid Cooler Lines, Clips & Fittings]
Courtesy of CHRYSLER GROUP, LLC

15. Disconnect the transmission fluid cooler lines (1) at the fittings (2) by removing the clips (3).



[Fig. 31: Service Jack]
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When supporting or lifting the transmission at the oil pan the weight of the transmission must be distributed evenly on the lifting fixture. Failure to do so could damage the oil pan and transmission.

16. Raise the transmission slightly with a transmission jack (1) to relieve load on the crossmember.

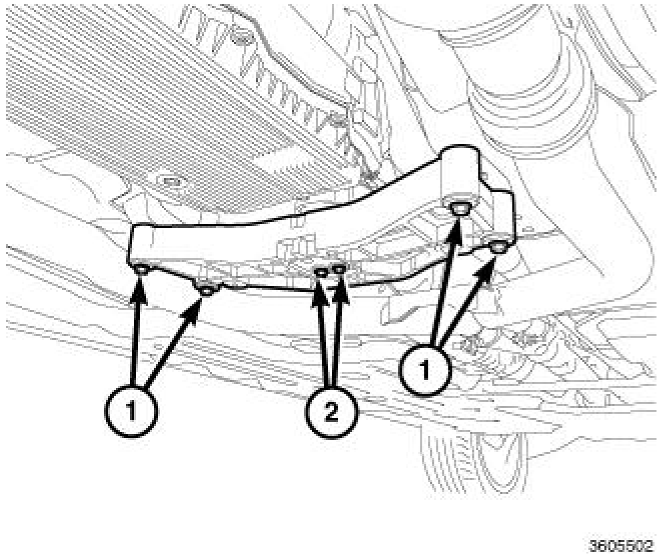


Fig. 32: Crossmember & Bolts
Courtesy of CHRYSLER GROUP, LLC

17. Remove the crossmember bolts (1) and remove the crossmember.
18. Remove the rear support and isolator bolts (2) and remove the rear support and isolator.

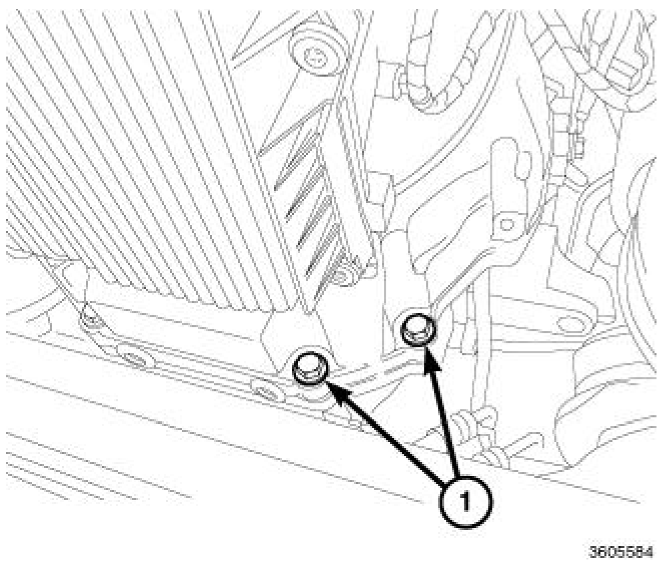

Fig. 33: Bell Housing Bolts (RH)
Courtesy of CHRYSLER GROUP, LLC

19. Remove the transmission to engine bolts (1) on the Right Hand (RH) side.

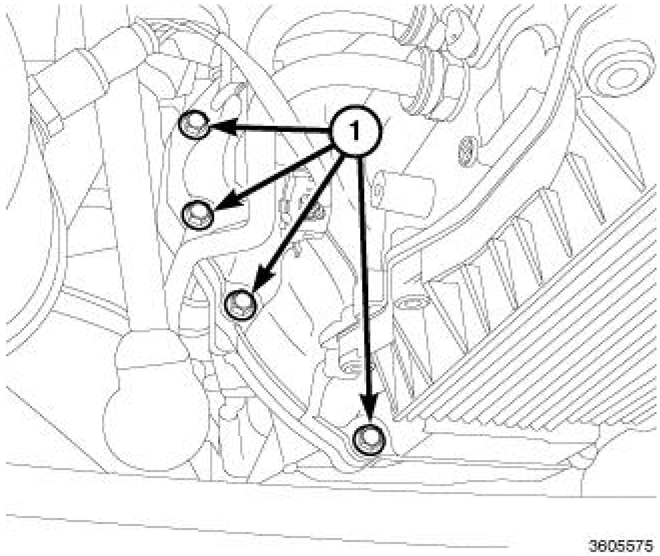

Fig. 34: Bell Housing Bolts (LH)
Courtesy of CHRYSLER GROUP, LLC

20. Remove the transmission to engine bolts (1) on the Left Hand (LH) side.

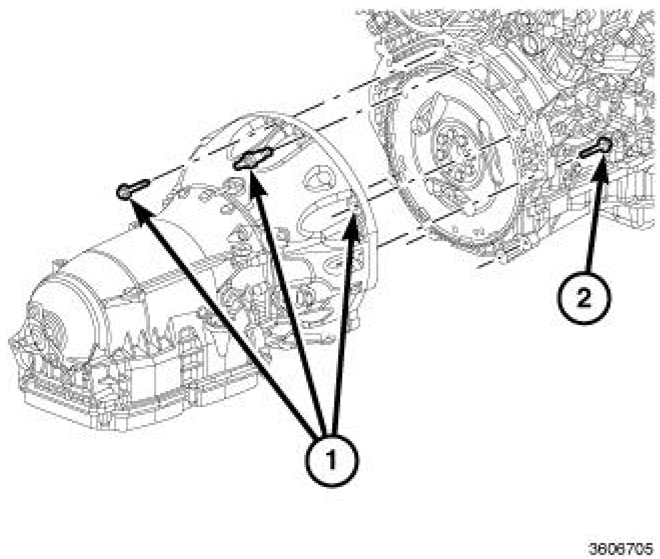

Fig. 35: Remaining Bell Housing Bolts (RWD Shown: AWD Similar)
Courtesy of CHRYSLER GROUP, LLC

21. Remove the remaining transmission to engine bolts (1, 2).
22. Hold the torque converter in place during transmission removal.
23. Lower the transmission and remove the assembly from the vehicle.

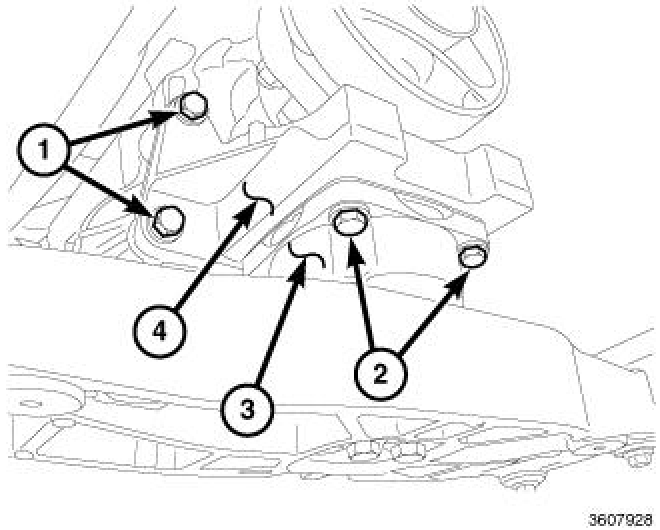

Fig. 36: Transmission Mount Bolts & Transmission Mount
Courtesy of CHRYSLER GROUP, LLC

24. Remove the transmission mount bolts (2) and the transmission mount (3).
25. Remove the four adapter bracket bolts (1) and the adapter bracket (4).

DISASSEMBLY

DISASSEMBLY

CAUTION: **The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Failure to follow these instructions may result in damage to the TCM/TCMA.**

NOTE: **If the transmission is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the TCM Adaptation Procedure. Refer to MODULE, TRANSMISSION CONTROL, MODULE PROGRAMMING .**

NOTE: **Tag all clutch pack assemblies, as they are removed, for reassembly identification.**

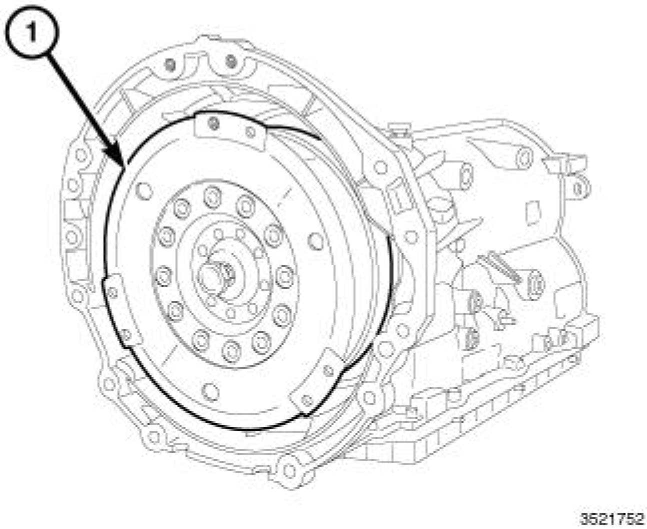

Fig. 37: Torque Converter
Courtesy of CHRYSLER GROUP, LLC

1. Remove the torque converter (1).

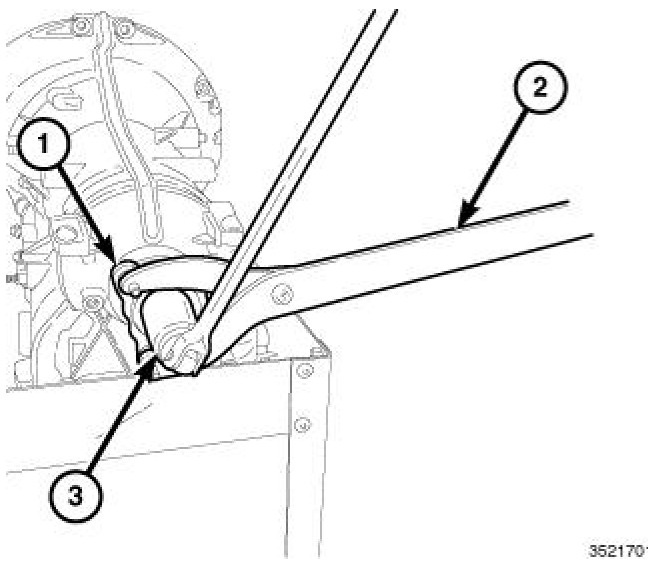

Fig. 38: Flange, Flange Holder & Socket
Courtesy of CHRYSLER GROUP, LLC

2. Using a suitable punch, remove the staking from the propeller shaft flange nut, and loosen the nut about 1 thread using a 34 mm 12 point socket (3) and (special tool #C-3281, Holder, Flange) (2) to hold the flange (1).

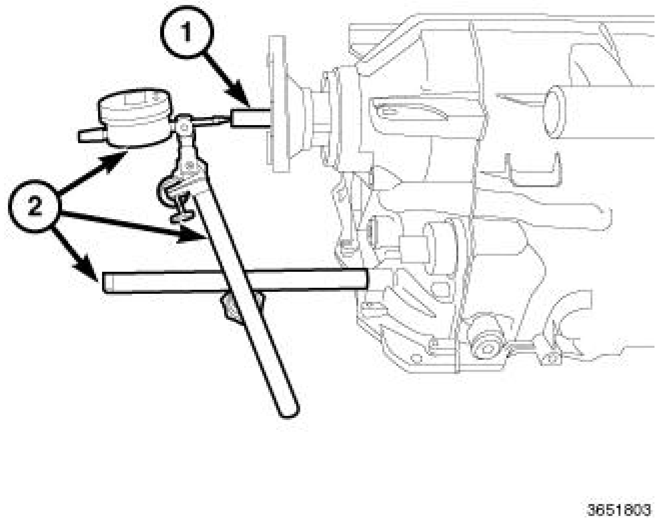

Fig. 39: Measuring End Play
Courtesy of CHRYSLER GROUP, LLC

NOTE: **End play specification is between 0.11 - 0.42 mm (0.0043 - 0.0165 in.). If end play is outside this range, a different selectable end play shim must be used during assembly.**

3. Measure the output shaft (1) end play as follows:
   a. Attach a dial indicator (2) and position the plunger against the end of the output shaft (1).
   b. Zero the dial indicator (2).
   c. Move the output shaft (1) in and out, and record the maximum travel for assembly reference.

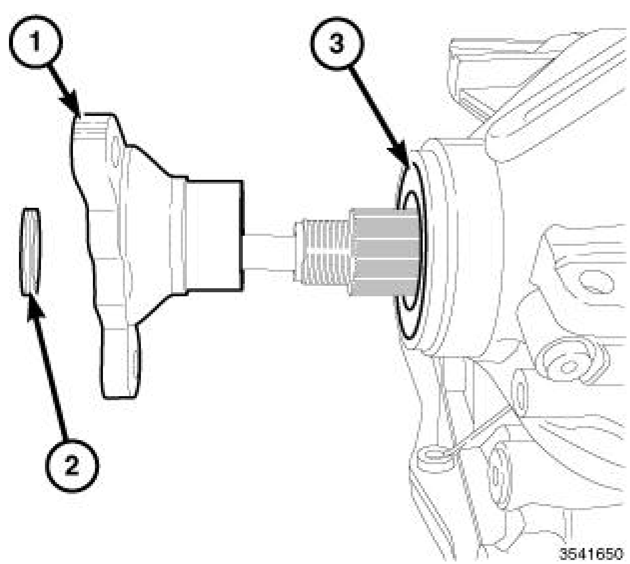

Fig. 40: Propeller Shaft Flange, Rear Dust Seal & Rear Oil Seal
Courtesy of CHRYSLER GROUP, LLC

4. Finish removing the propeller shaft flange nut.
5. Remove the propeller shaft flange (1).
6. Remove the transmission rear dust seal (2).

7. Remove the transmission rear oil seal (3) with a suitable slide hammer and screw.
8. Remove the transmission output shaft washer.

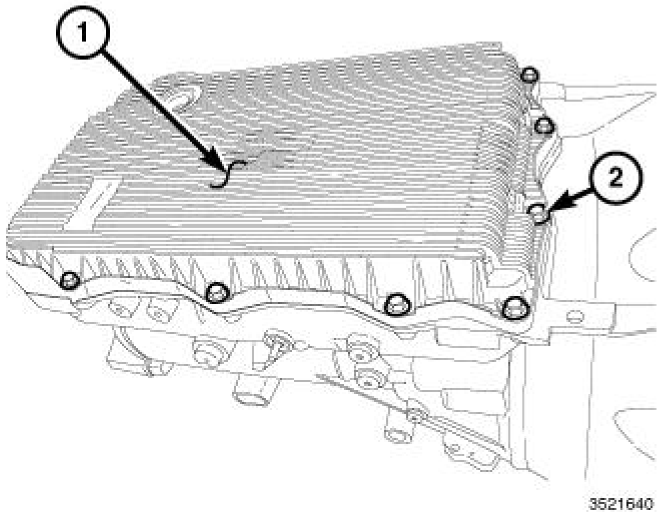

Fig. 41: Thirteen Oil Pan Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

9. Remove the thirteen oil pan retaining bolts (2).

NOTE: **Inspect the gasket for reuse. If the seal is cut or torn, replace the gasket.**

10. Carefully detach the oil pan (1) and gasket.

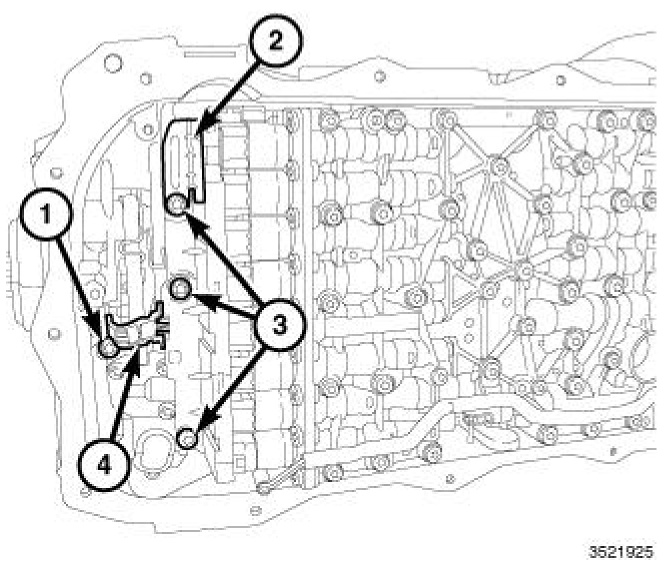

Fig. 42: Valve Body Assembly End Retainer Bolts
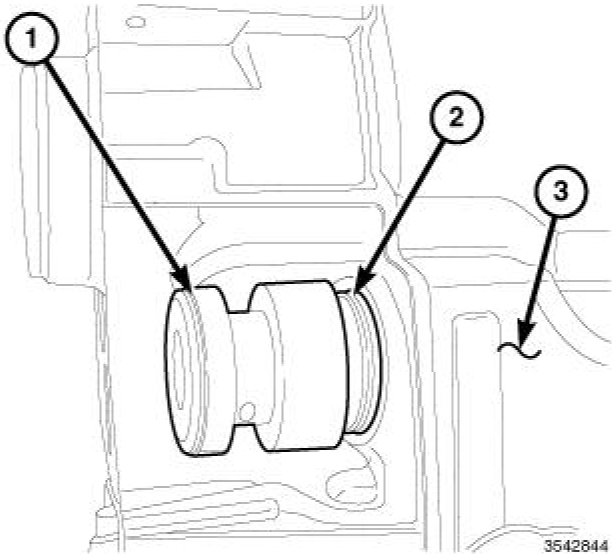
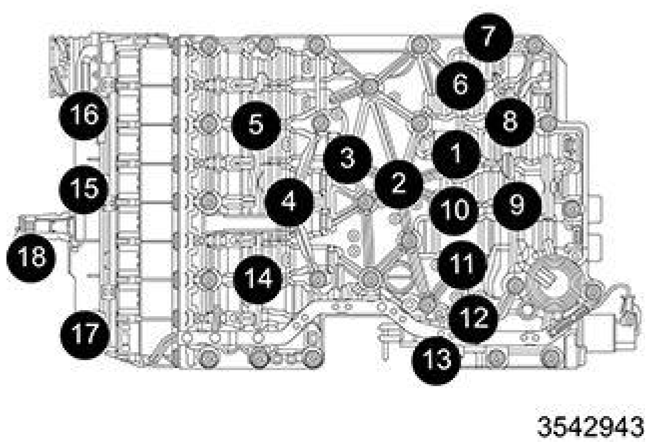
Courtesy of CHRYSLER GROUP, LLC

11. Remove the valve body assembly end retainer bolts (3).
12. Lift the electrical connector lock (2) to release the internal harness end from inside the transmission for valve body assembly removal.
13. Remove the sensor retaining bolt (1) and pull the sensor (4) loose from the case.



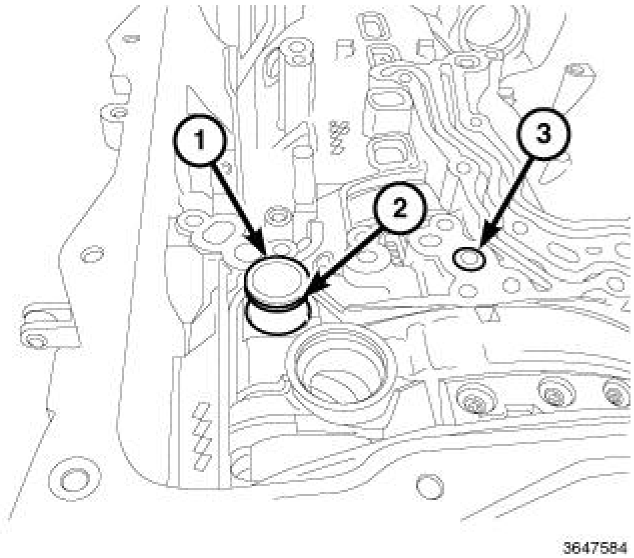
[Fig. 43: Remover/Installer, Guide Sleeve, Electrical Harness Insulator & Transmission Case]
Courtesy of CHRYSLER GROUP, LLC

14. Using (special tool #10377, Remover/Installer, Guide Sleeve) (1) carefully pull the electrical harness insulator (2) straight out from the transmission case (3).



[Fig. 44: Valve Body Bolts Loosening And Tightening Sequence]
Courtesy of CHRYSLER GROUP, LLC

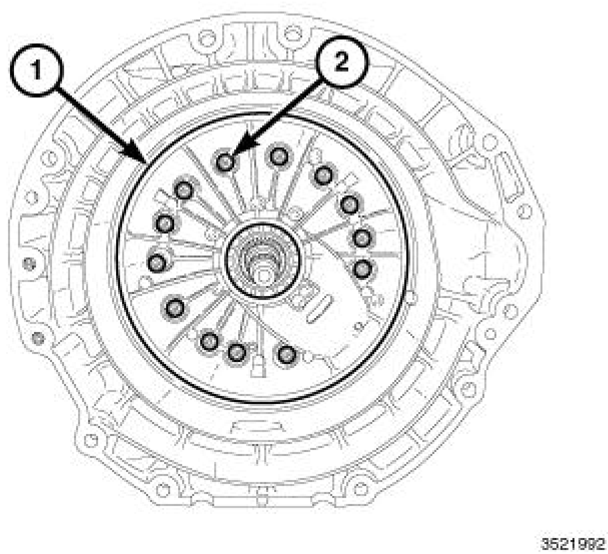
15. Remove valve body assembly retaining bolts 1-14 (15-18 are already removed).
16. Carefully lift the valve body assembly from the transmission.



[Fig. 45: Fluid Port, Two O-Rings, Compression Seal](#)
Courtesy of CHRYSLER GROUP, LLC

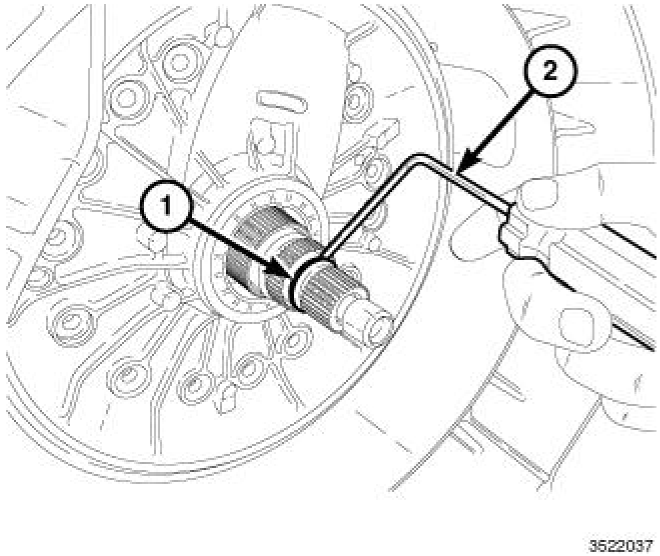
NOTE: **The fluid port (1) may be in the transmission or the valve body assembly.**

17. Pull the fluid port (1) from the transmission or valve body assembly.
18. Remove the two O-rings (2).
19. Remove the compression seal (3) from the transmission.



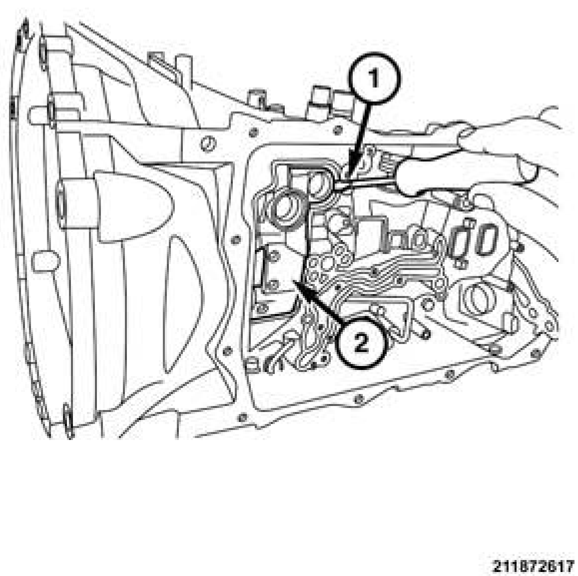
[Fig. 46: Thirteen Oil Pump Housing Retaining Bolts](#)
Courtesy of CHRYSLER GROUP, LLC

20. Remove the thirteen oil pump housing retaining bolts (2).



[Fig. 47: Input Shaft O-Ring & Small Pick](#)
Courtesy of CHRYSLER GROUP, LLC

21. Remove the input shaft O-ring (1) using a small pick (2) or equivalent.



[Fig. 48: Prying Oil Pump Housing Away From Case](#)
Courtesy of CHRYSLER GROUP, LLC

22. Carefully pry the oil pump housing (1) away from the case (2) with a small flat blade screwdriver or equivalent through the case opening.
23. From the front of the transmission, remove the oil pump housing.

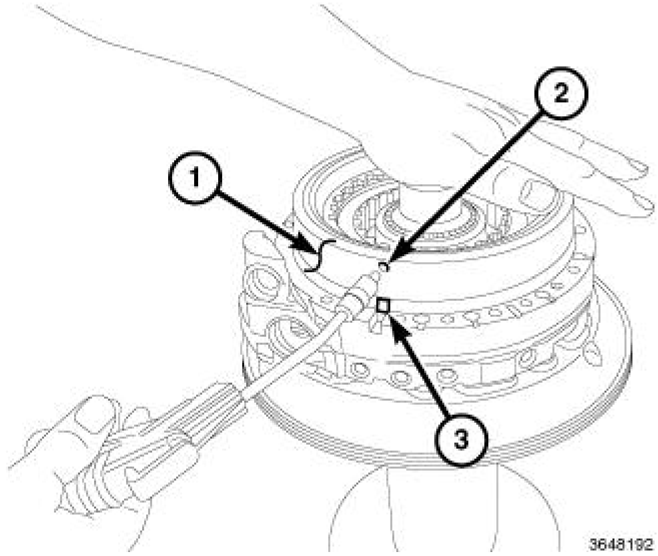


Fig. 49: B-Piston, Hole & B-Piston Alignment Tab
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Apply air pressure slowly because oil may spray when B-piston releases from the assembly.**

24. With one hand above B-piston (1), carefully apply air pressure into the hole (2) directly above the B-piston alignment tab (3) to remove B-piston (1) from the assembly.

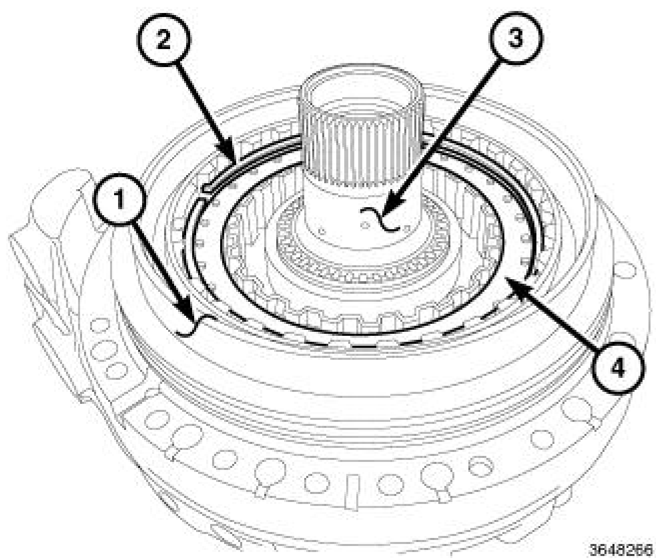

Fig. 50: Outer Ring, Snap Ring, Hub & Spacers
Courtesy of CHRYSLER GROUP, LLC

25. Remove the outer ring (1) (under B-piston).
26. Remove the snap ring (2).
27. Remove the clutches and spacers (4).
28. Remove the hub (3).

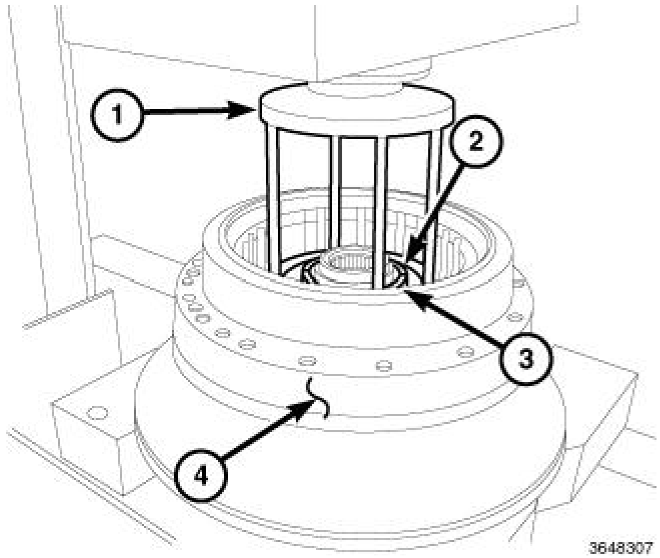

Fig. 51: Oil Pump Housing Assembly
Courtesy of CHRYSLER GROUP, LLC

29. Position the oil pump housing assembly (4) in a suitable arbor press.
30. Using (special tool #8285, Compressor, Spring) (1), press on the fingers of the piston retaining ring to remove tension, and remove the two halves of the split retainer ring (2, 3).

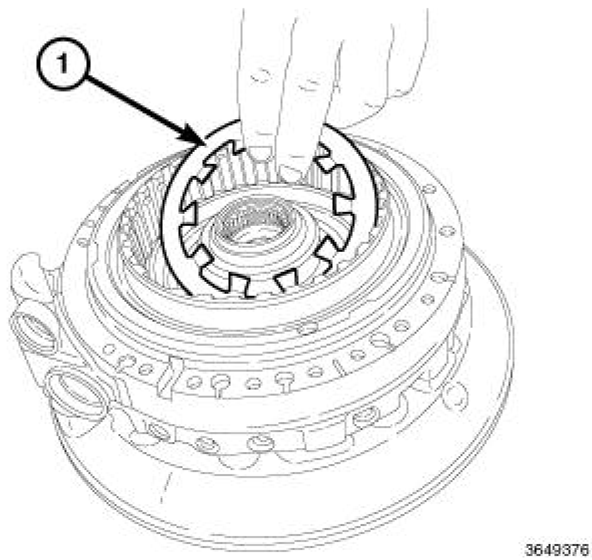

Fig. 52: Piston Retaining Ring And Piston
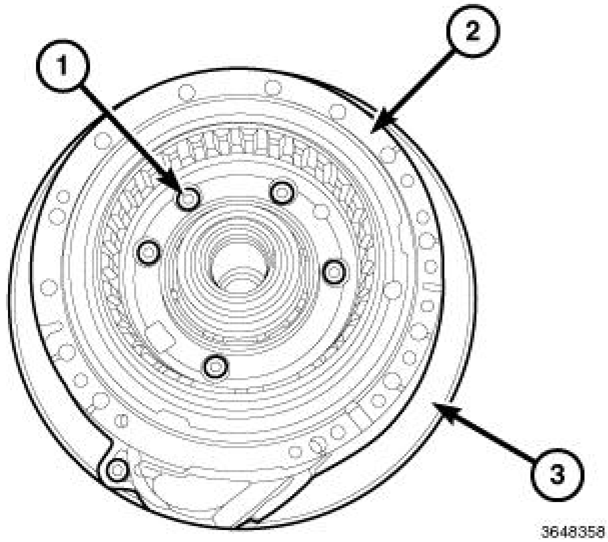
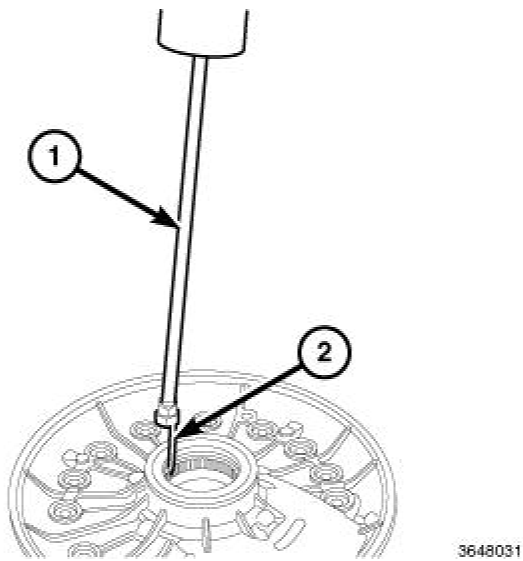
Courtesy of CHRYSLER GROUP, LLC

31. Remove the piston retaining ring and piston below it.



[Fig. 53: Six Bolts, Oil Pump Housing & Oil Pump Cover]
Courtesy of CHRYSLER GROUP, LLC

32. Remove the six bolts (1) and separate the oil pump housing (2) from the oil pump cover (3).



[Fig. 54: Seal Remover & Slide Hammer]
Courtesy of CHRYSLER GROUP, LLC

33. Using (special tool #9667, Remover, Seal) (2) and (special tool #C-3752, Slide Hammers) (1), remove the oil seal from the front pump cover.
34. Remove the outer lip seal from the front pump cover.

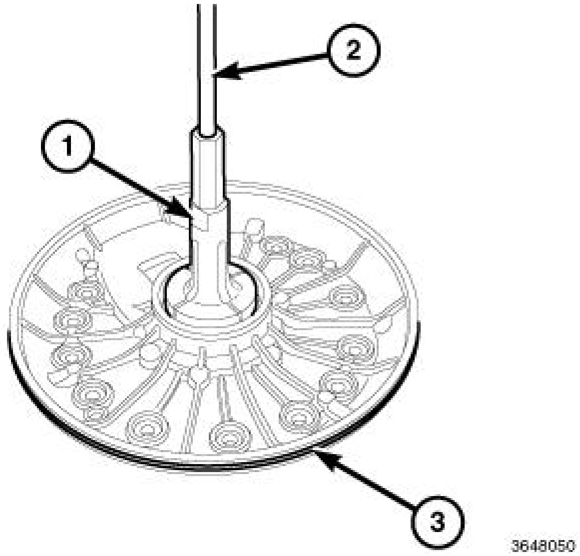


Fig. 55: Remover, Bearing Cup & Slide Hammers
Courtesy of CHRYSLER GROUP, LLC

35. Remove the snap ring.
36. Using (special tool #6787A, Remover, Bearing Cup) (1) and (special tool #C-3752, Slide Hammers) (2) remove the needle bearing from the front cover (3).
37. Remove the snap ring.
38. Using (special tool #9585, Remover, Bearing Cup) and (special tool #C-637, Slide Hammer, Universal) remove the needle bearing.

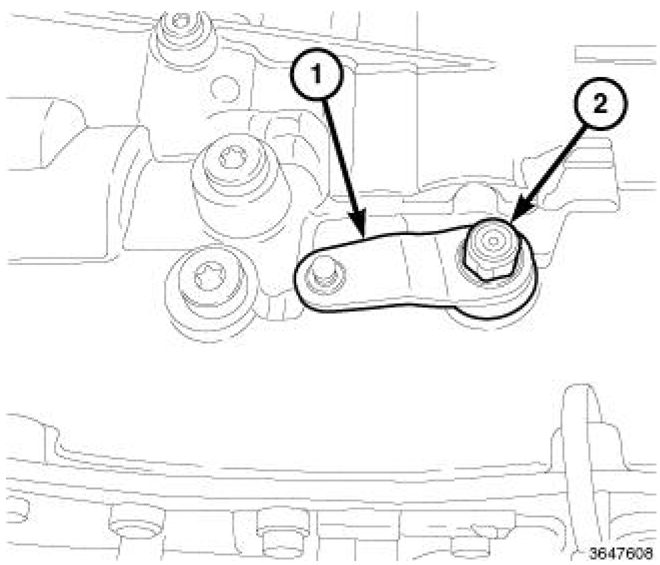

Fig. 56: Manual Park Release Lever Retaining Nut & Lever
Courtesy of CHRYSLER GROUP, LLC

39. Remove the Manual Park Release (MPR) lever retaining nut (2) and remove the lever (1).

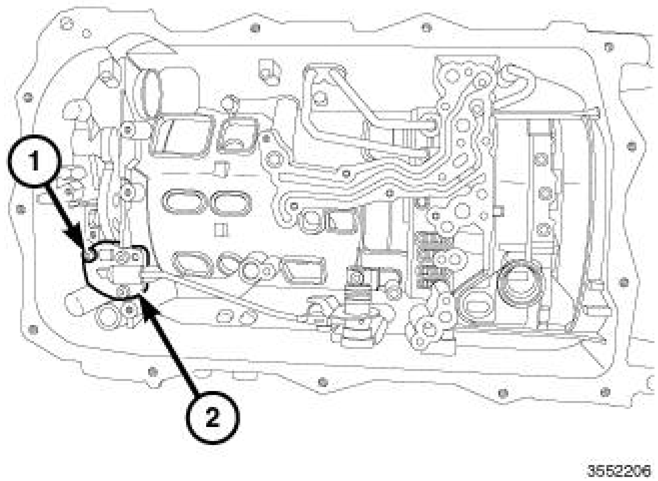

Fig. 57: Three Park Pawl Lock Rod Guide Plate Retaining Screws & Plate
Courtesy of CHRYSLER GROUP, LLC

40. Remove the three park pawl lock rod guide plate retaining screws (1) and remove the plate (2).

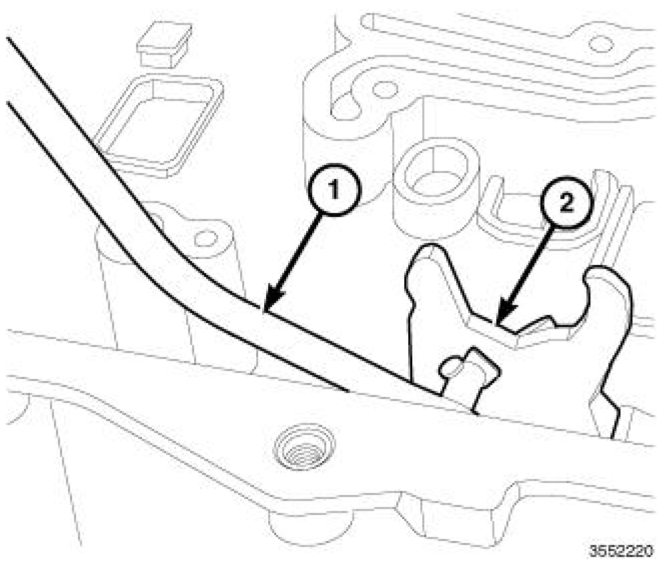

Fig. 58: Park Pawl Lock Rod & Fork
Courtesy of CHRYSLER GROUP, LLC

41. Remove the park pawl lock rod (1) from the fork (2).

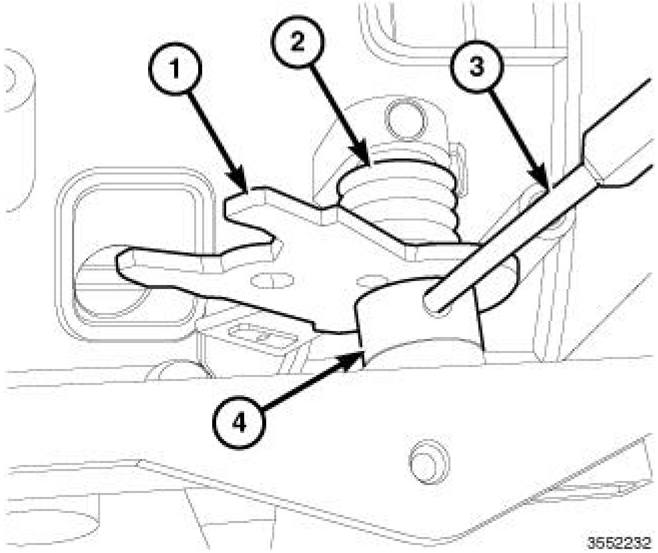

Fig. 59: Selector Shaft, Suitable Pin Punch, Spring & Fork
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Pay attention to the spring position for installation.**

42. Remove the roll pin from the MPR shaft (4) using a suitable pin punch (3).
43. Remove the shaft (4), spring (2) and fork (1) from the case.
44. Remove the MPR shaft seal using a small screwdriver or equivalent.

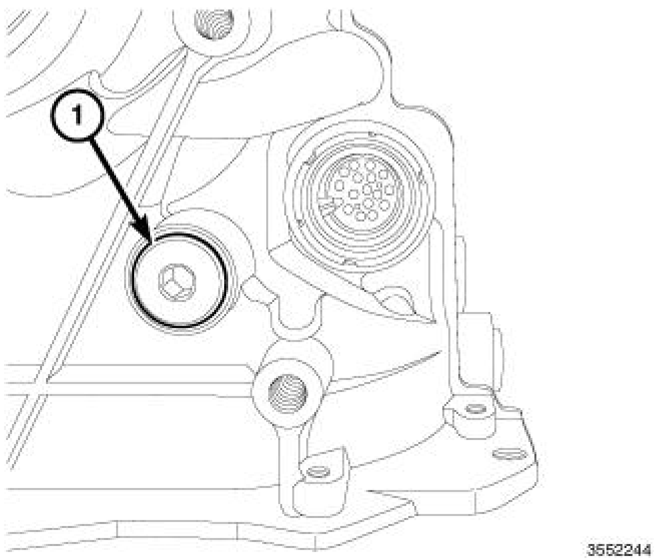

Fig. 60: Park Pawl Shaft Plug
Courtesy of CHRYSLER GROUP, LLC

45. Remove the park pawl shaft plug (1) from the rear of the case.

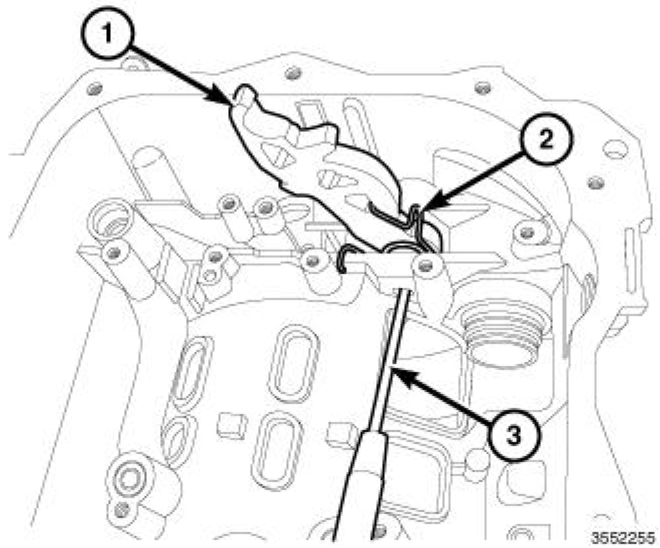

Fig. 61: Removing/Installing Park Pawl Shaft Using A Suitable Pin Punch, Park Pawl And Spring
Courtesy of CHRYSLER GROUP, LLC

NOTE:	**Pay attention to the spring position for installation.**

46. Remove the park pawl shaft using a suitable pin punch (3), remove the park pawl (1) and spring (2).

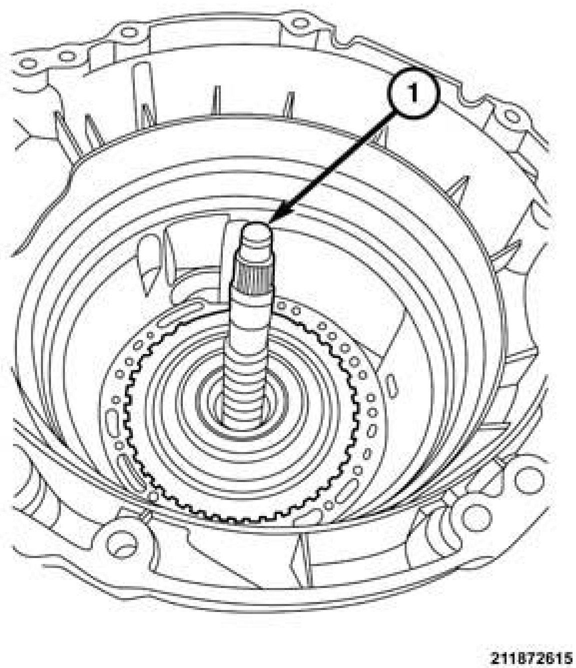

Fig. 62: Park Pawl
Courtesy of CHRYSLER GROUP, LLC

NOTE:	**The transmission must be in the upright position to remove the assembly to avoid damage to the drums.**

47. Remove the input/output shaft and P4 annulus drum assembly (1) from the case.

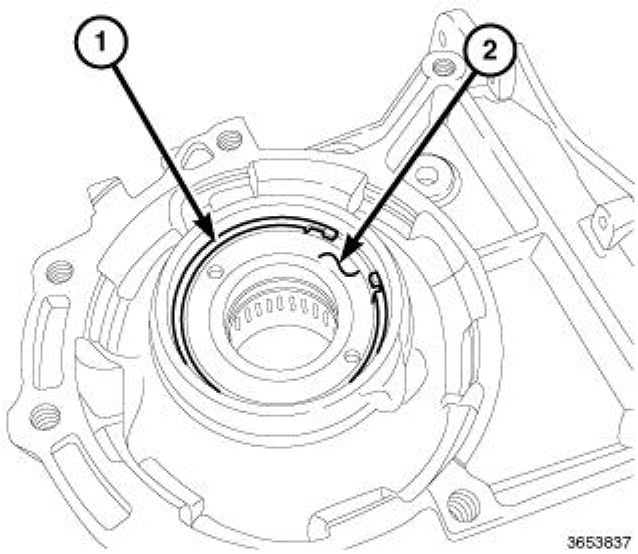

Fig. 63: Outer Bearing Snap Ring & Outer Needle Bearing
Courtesy of CHRYSLER GROUP, LLC

48. Remove the outer bearing snap ring (1), and the outer ball bearing.

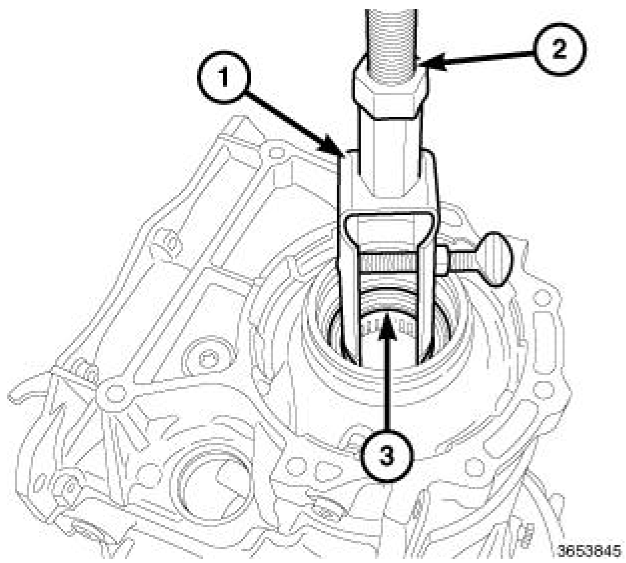

Fig. 64: Bearing Cup, Slide Hammer, Universal & Oil Dam
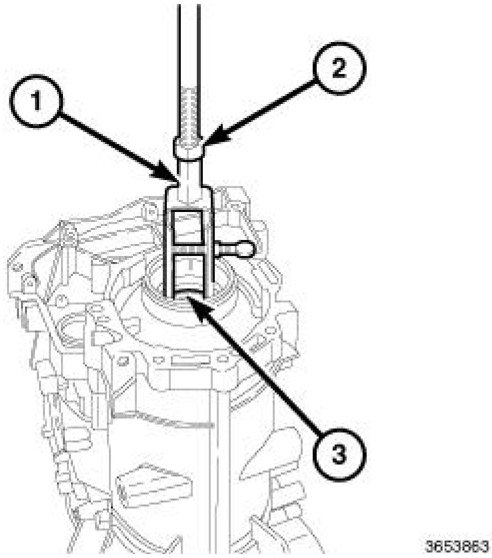
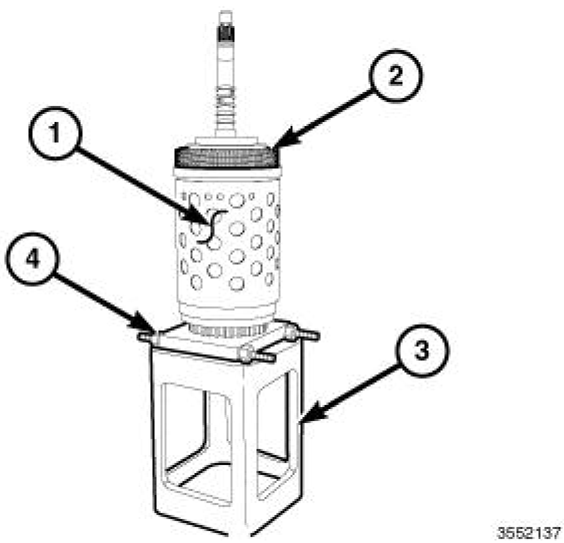
Courtesy of CHRYSLER GROUP, LLC

49. Remove the oil dam snap ring.
50. Using (special tool #9664, Remover, Bearing Cup) (1) and (special tool #C-637, Slide Hammer, Universal) (2), remove the oil dam (3).



[Fig. 65: Bearing Cup, Slide Hammer & Inner Needle Bearing]
Courtesy of CHRYSLER GROUP, LLC

51. Remove the output shaft inner needle bearing snap ring.
52. Using (special tool #9664, Remover, Bearing Cup) (1) and (special tool #C-637, Slide Hammer, Universal) (2), remove the inner needle bearing (3).



[Fig. 66: P4 Annulus Drum Assembly, Press Fixture Assembly & Bearing/Gear Splitter]
Courtesy of CHRYSLER GROUP, LLC

53. Position the input/output shaft and P4 annulus drum assembly (1) on (special tool #8925-3, Assembly, Press Fixture) (3) and (special tool #1130, Splitter, Bearing/Gear) (4).
54. Remove the clutch pack (2).

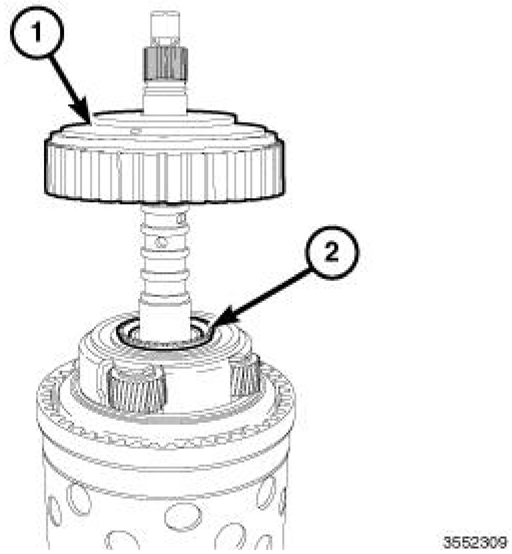


Fig. 67: P1 Annulus/B-Clutch Hub Assembly, Needle Bearing And Holding Plate
Courtesy of CHRYSLER GROUP, LLC

55. Remove the O-ring and 5 squared O-rings.
56. Remove the P1 annulus/B clutch hub assembly (1) from the P4 annulus drum.

NOTE: **The washer may stick to the bottom of the P1 annulus/B clutch hub assembly (1).**

57. Remove the selectable shim from the P1 annulus/B clutch hub.
58. Remove the needle bearing and holding plate (2) from the P1 planetary carrier.

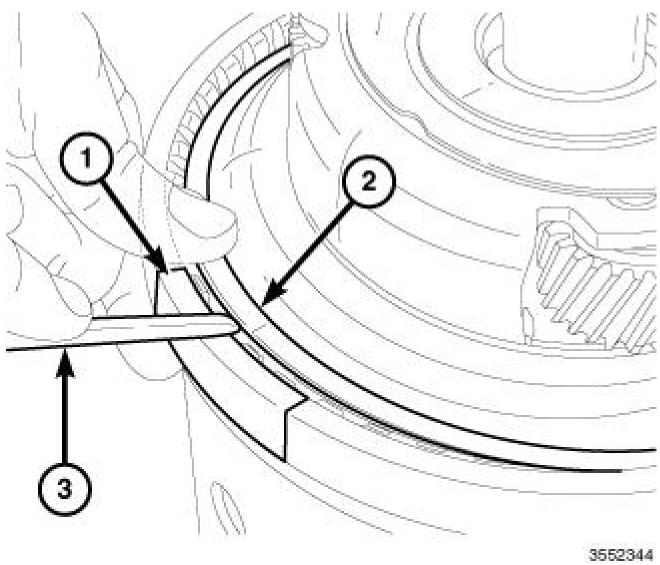

Fig. 68: Tool & Snap Ring
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The (special tool #10378, Rings, Support) are three pieces intended to be used in multiple locations around the drum.**

59. Position the (special tool #10378, Rings, Support) (1) on the P4 annulus drum assembly to protect the

drum.

NOTE: **Pry the snap ring from the opposite side of the snap ring openings to release.**

NOTE: **When the snap ring is removed the internal clutch drum may drop slightly.**

60. Using a suitable tool (3), release the snap ring (2) by prying in and up from the opposite side of the snap ring openings.

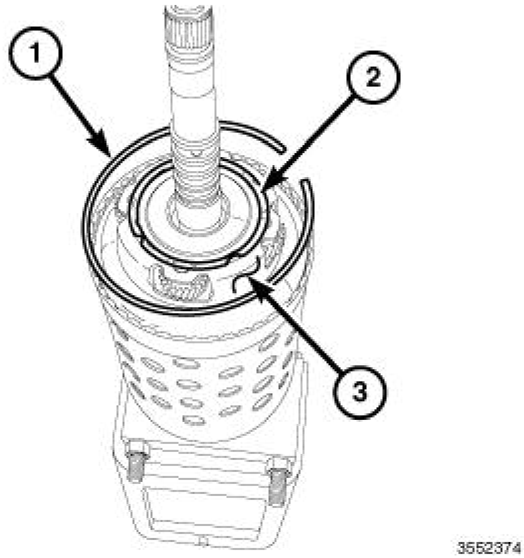

Fig. 69: Snap Ring & P1 Planetary Carrier
Courtesy of CHRYSLER GROUP, LLC

61. Remove the P1 planetary carrier (3).

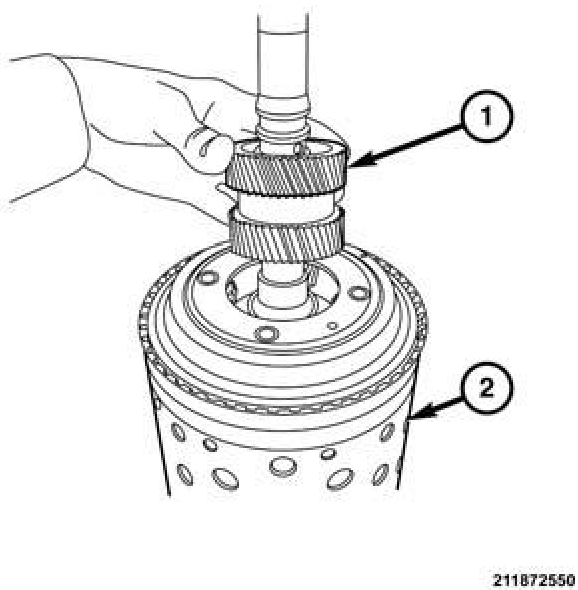

Fig. 70: Sun Gear & Needle Bearing
Courtesy of CHRYSLER GROUP, LLC

62. Remove P1/P2 (1) sun gear from the bottom of the P1 planetary carrier.

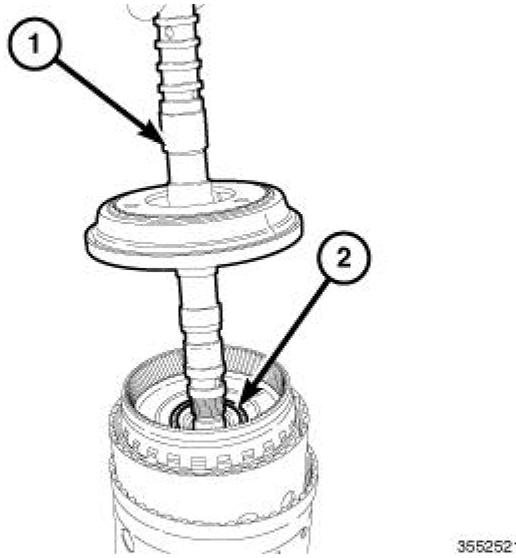

Fig. 71: P2 Planetary Carrier & Needle Bearing
Courtesy of CHRYSLER GROUP, LLC

63. Remove the input shaft with P2 planetary carrier (1) from the drum assembly.
64. Remove the needle bearing (2) and washer.

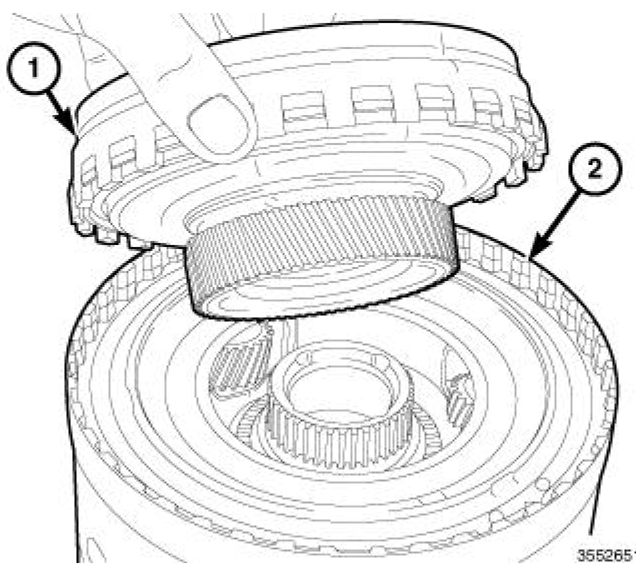

Fig. 72: P2 Annulus/P3 Sun Gear & Drum Assembly
Courtesy of CHRYSLER GROUP, LLC

65. Remove the P2 annulus/P3 sun gear (1) from the drum assembly (2).

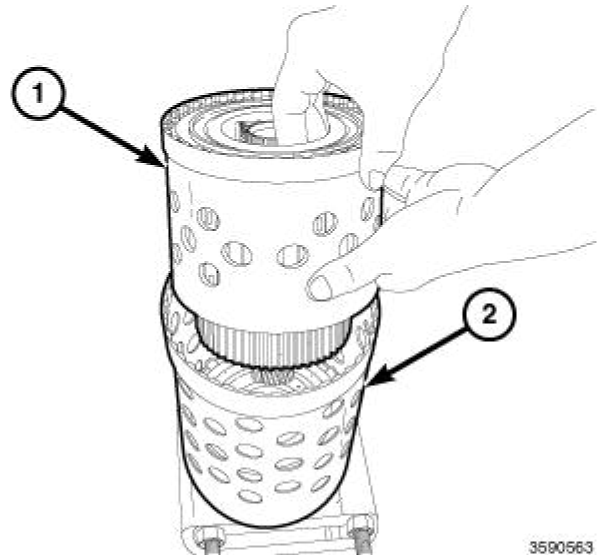

Fig. 73: D-Clutch Drum & P4 Annulus Drum
Courtesy of CHRYSLER GROUP, LLC

66. Remove the D clutch drum (1) from the P4 annulus drum (2).

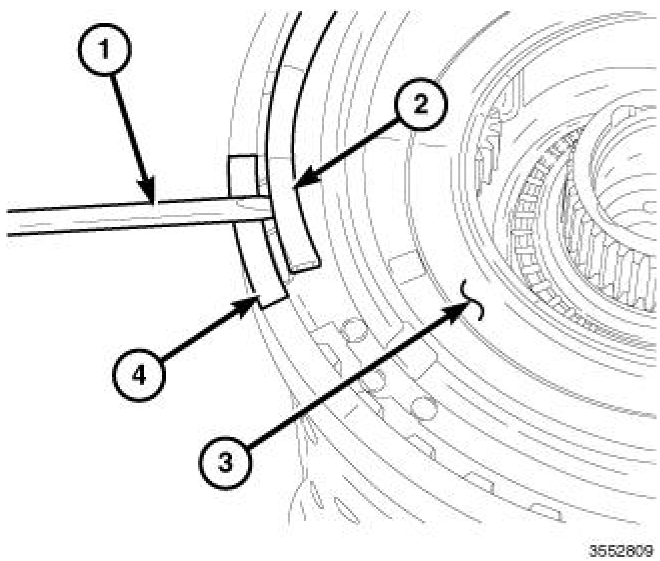

Fig. 74: Support Rings, Tool & P3 Planetary Carrier
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The (special tool #10378, Rings, Support) are three pieces intended to be used in multiple locations around the drum.**

67. Position the (special tool #10378, Rings, Support) (4) on the P4 annulus drum assembly to protect the drum.
68. Using a suitable tool (1), release and remove the snap ring (2).
69. Remove the P3 planetary carrier (3).
70. Remove the needle bearing from the planetary carrier.

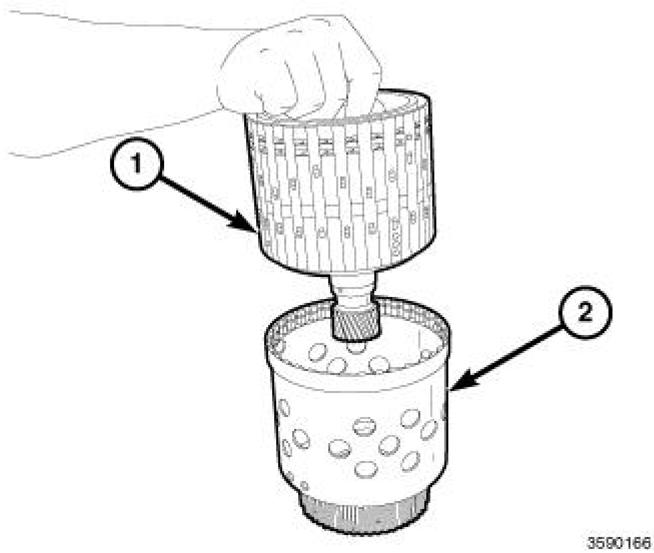

Fig. 75: P4 Sun Gear/C/E Clutch Retainer & D-Clutch Drum
Courtesy of CHRYSLER GROUP, LLC

71. Remove the P4 sun gear/C/E clutch retainer (1) from the D clutch drum (2).

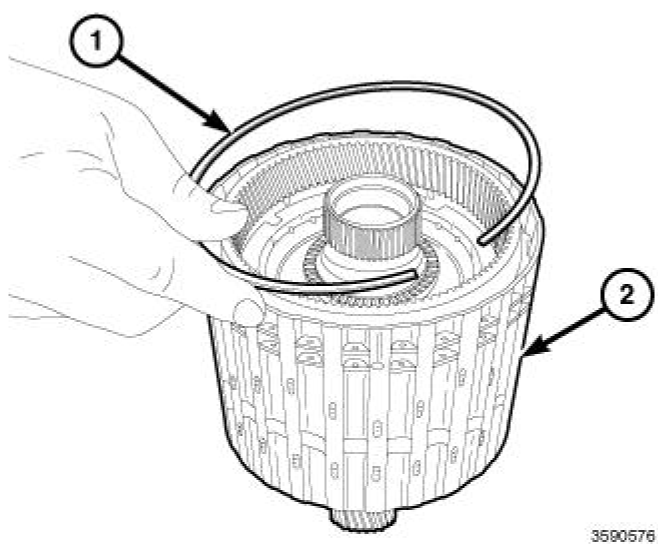

Fig. 76: Snap Ring & P4 Sun Gear/C/E Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

72. Remove the snap ring (1) from the P4 sun gear/C/E clutch retainer (2).

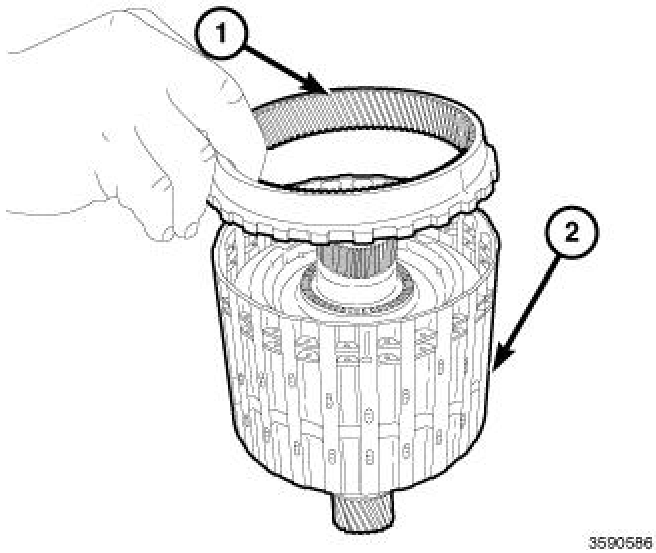

Fig. 77: P3 Annulus & P4 Sun Gear/C/E Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

73. Remove the P3 annulus (1) from the P4 sun gear/C/E clutch retainer (2).

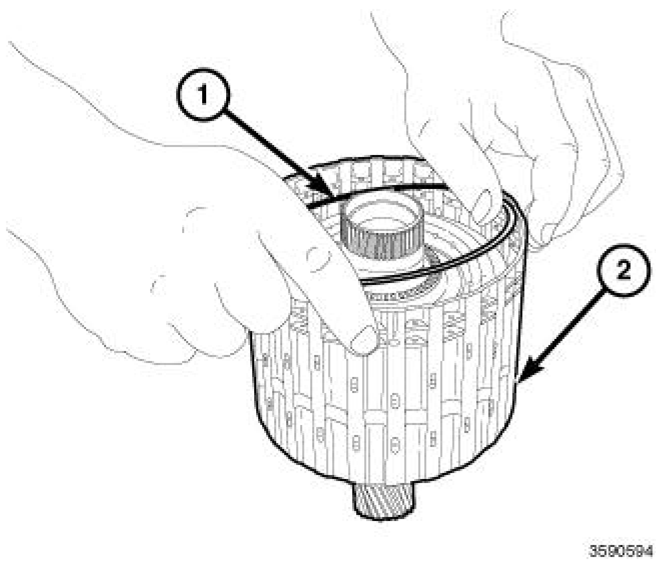

Fig. 78: Snap Ring & P4 Sun Gear/C/E Clutch Retainer

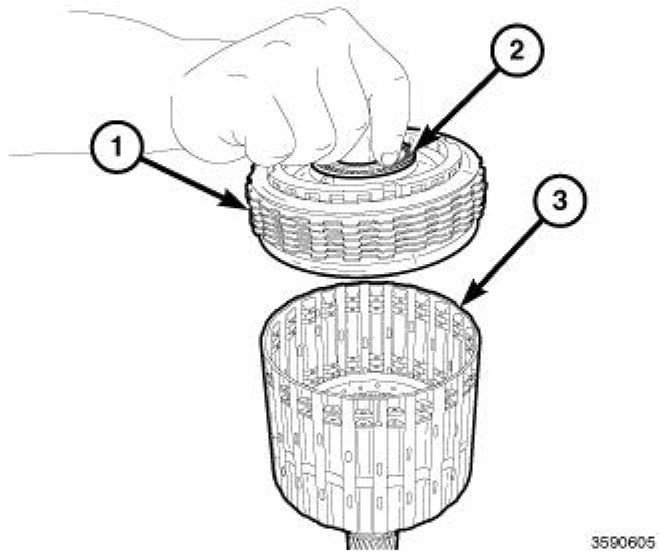
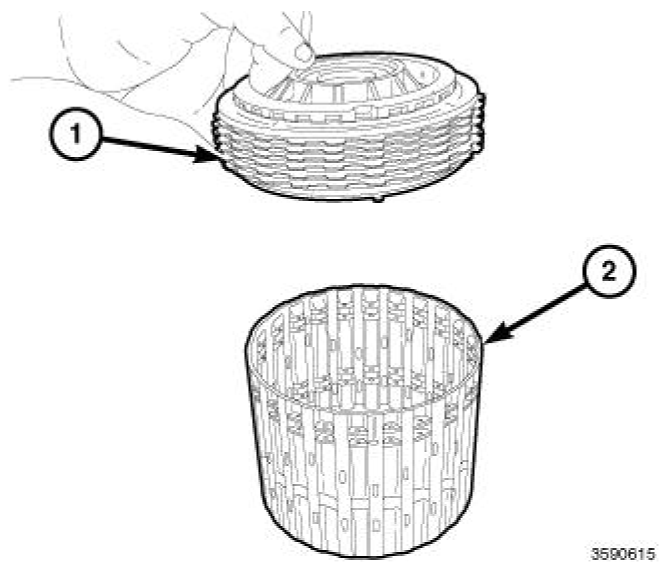
74. Remove the snap ring (1) from the P4 sun gear/C/E clutch retainer (2).



[Fig. 79: E-Clutch & P4 Sun Gear/C/E Clutch Retainer](#)
Courtesy of CHRYSLER GROUP, LLC

75. Remove the E clutch (1) from the P4 sun gear/C/E clutch retainer (3).
76. Remove the needle bearing (2) from the E clutch (1).



[Fig. 80: C-Clutch & P4 Sun Gear/C/E Clutch Retainer](#)
Courtesy of CHRYSLER GROUP, LLC

77. Remove the C clutch (1) from the P4 sun gear/C/E clutch retainer (2).
78. Remove the bearing from top and bottom of C clutch (1).

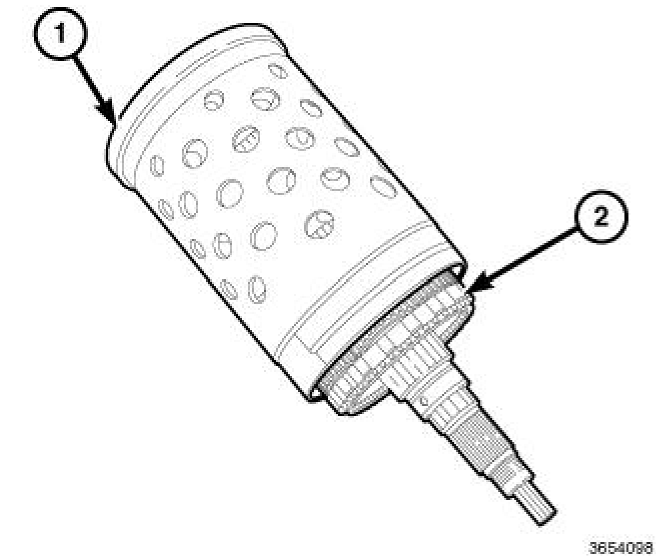


Fig. 81: P4 Planetary Carrier/Output Shaft & P4 Annulus Drum
Courtesy of CHRYSLER GROUP, LLC

79. Remove the P4 planetary carrier/output shaft (2) from the P4 annulus drum (1).

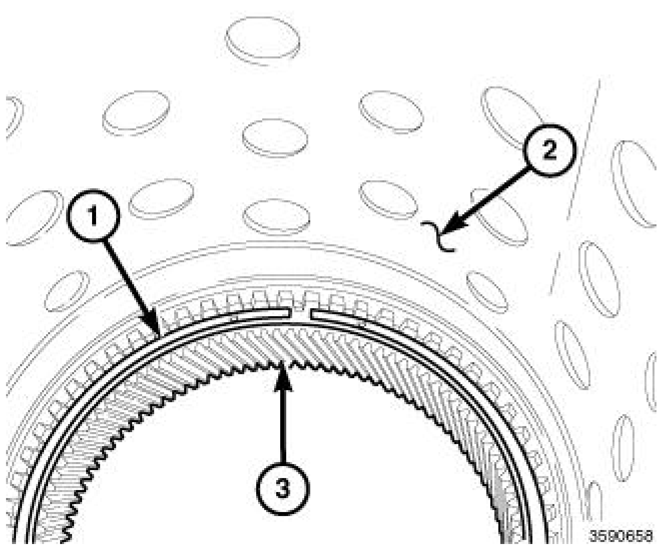

Fig. 82: Snap Ring & P4 Annulus Drum & P4 Annulus
Courtesy of CHRYSLER GROUP, LLC

80. Remove the snap ring (1) from the P4 annulus drum (2).
81. Remove the P4 annulus (3) from the P4 annulus drum (2).

CLEANING

CLEANING

CAUTION: **A unique transmission fluid has been developed for this transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid see VEHICLE QUICK REFERENCE .**

The use of crocus cloth is permissible where necessary, providing it is used carefully. When used on shafts, or valves, use extreme care to avoid rounding off sharp edges. Sharp edges are vital as they prevent foreign matter from getting between the valve and valve bore.

Do not reuse oil seals, seal rings, or O-rings during overhaul. Replace these parts as a matter of course. Also do not reuse snap rings or E-clips that are bent or distorted. Replace these parts as well.

Lubricate transmission parts with the appropriate automatic transmission fluid only during overhaul and assembly.

NOTE: **Do not use shop towels or rags to dry the case (or any other transmission component) unless they are made from lint-free materials. Lint will stick to case surfaces and transmission components and circulate throughout the transmission after assembly. A sufficient quantity of lint can block fluid passages and interfere with valve body operation.**

Flush the case bores and fluid passages thoroughly with approved transmission fluid. Dry the case and all fluid passages with compressed air. Be sure that all fluid passages are clear.

INSPECTION

INSPECTION

Inspect the case for cracks, porous spots, worn bores, or damaged threads. Damaged threads can be repaired with HelicoilÂ® thread inserts. However, the case will have to be replaced if it exhibits any type of damage or wear.

ASSEMBLY

ASSEMBLY

CAUTION: **A unique transmission fluid has been developed for this transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid see VEHICLE QUICK REFERENCE .**

CAUTION: **The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Failure to follow these instructions may result in damage to the TCM/TCMA.**

NOTE: **If the transmission is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the TCM Adaptation Procedure. Refer to MODULE, TRANSMISSION CONTROL, MODULE PROGRAMMING .**

Courtesy of CHRYSLER GROUP, LLC

15. Install the D clutch drum (1) into the P4 annulus drum (2).

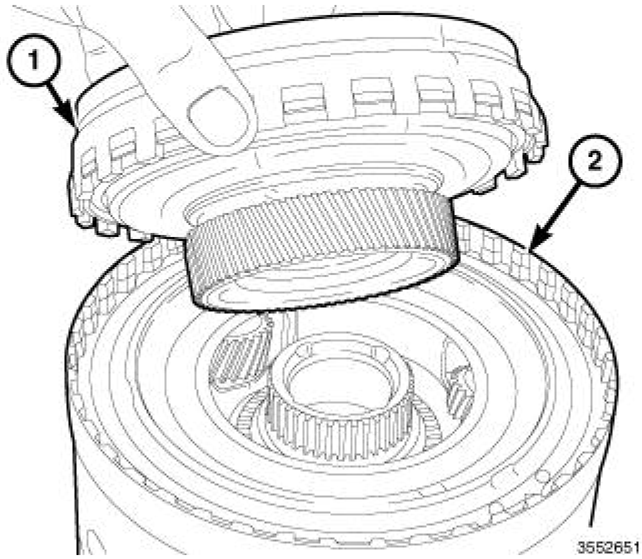

Fig. 93: P2 Annulus/P3 Sun Gear & Drum Assembly
Courtesy of CHRYSLER GROUP, LLC

16. Install the P2 annulus\P3 sun gear (1) onto the drum assembly (2).

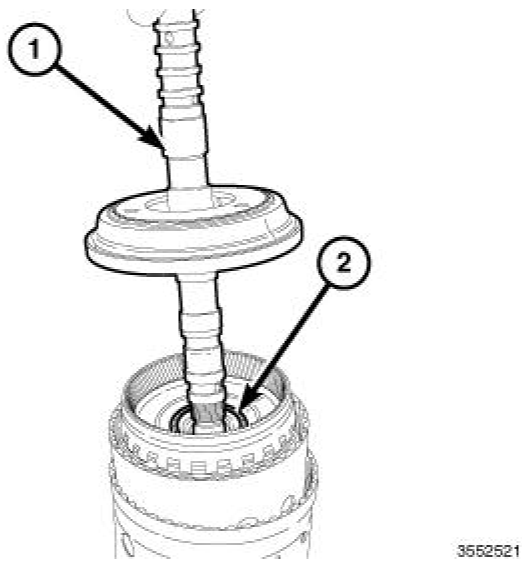

Fig. 94: P2 Planetary Carrier & Needle Bearing
Courtesy of CHRYSLER GROUP, LLC

17. Install the needle bearing (2) and washer.
18. Install the input shaft with P2 planetary carrier (1) into the drum assembly.

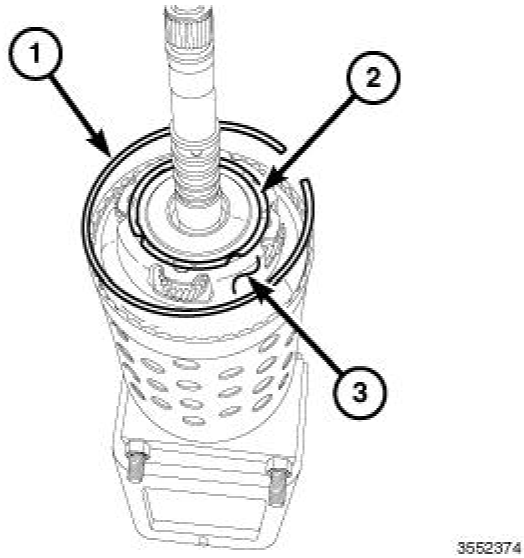

Fig. 95: Snap Ring & P1 Planetary Carrier
Courtesy of CHRYSLER GROUP, LLC

19. Install P1/P2 sun gear into the bottom of the P1 planetary carrier (3).
20. Install the P1 planetary carrier (3).
21. Install the snap ring (1).

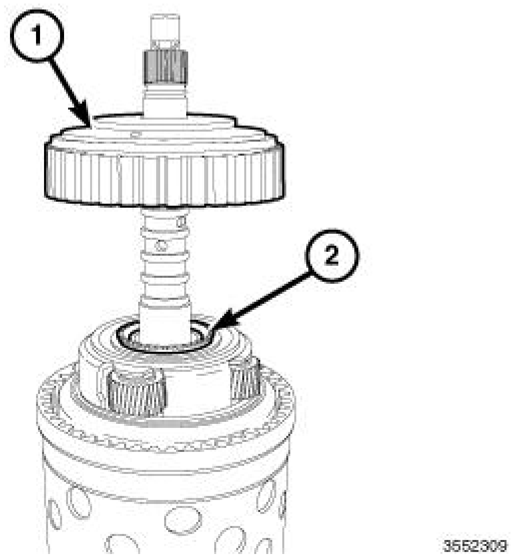

Fig. 96: P1 Annulus/B-Clutch Hub Assembly, Needle Bearing And Holding Plate
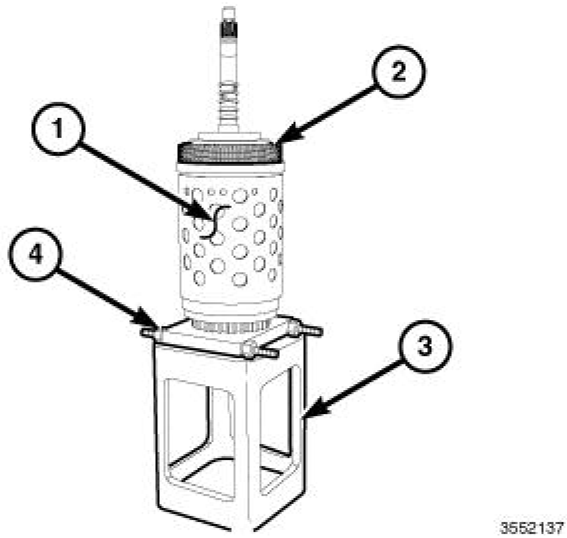
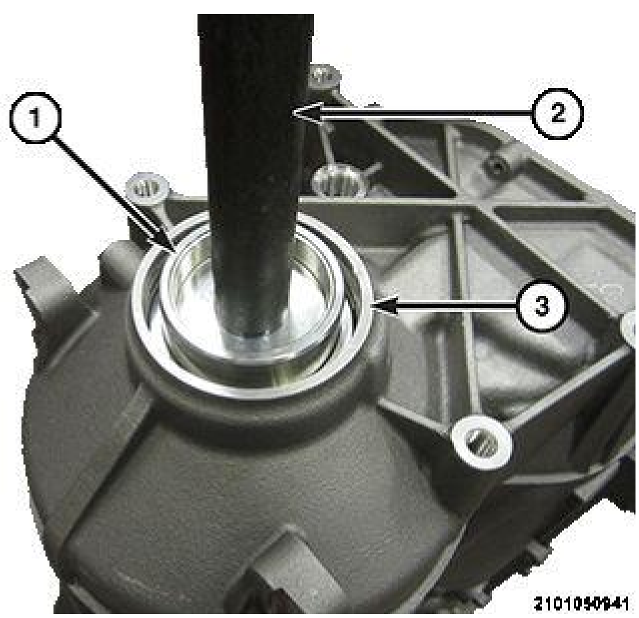
Courtesy of CHRYSLER GROUP, LLC

22. Install the needle bearing and holding plate (2) onto the P1 planetary carrier.
23. Install the selectable shim to the P1 annulus/B clutch hub.
24. Install the P1 annulus\B clutch hub assembly (1) onto the P4 annulus drum.
25. Install the O-ring and five squared O-rings.



[Fig. 97: P4 Annulus Drum Assembly, Press Fixture Assembly & Bearing/Gear Splitter]
Courtesy of CHRYSLER GROUP, LLC

26. Install the clutch pack (2).



[Fig. 98: Installing Output Shaft Inner Needle Bearing & Oil Dam]
Courtesy of CHRYSLER GROUP, LLC

NOTE:	**The (special tool #10373A, Installer, Output Needle Bearing/Rear Oil Dam) (1) is a combination tool that is reversed to install the oil dam and output shaft inner needle bearing. For use to install the output shaft inner needle bearing, use the thick walled side of the tool against the bearing.**

27. Using (special tool #10373A, Installer, Output Needle Bearing/Rear Oil Dam) (1) and (special tool #C-4171, Driver Handle, Universal) (2), install the output shaft inner needle bearing.
28. Install the snap ring.

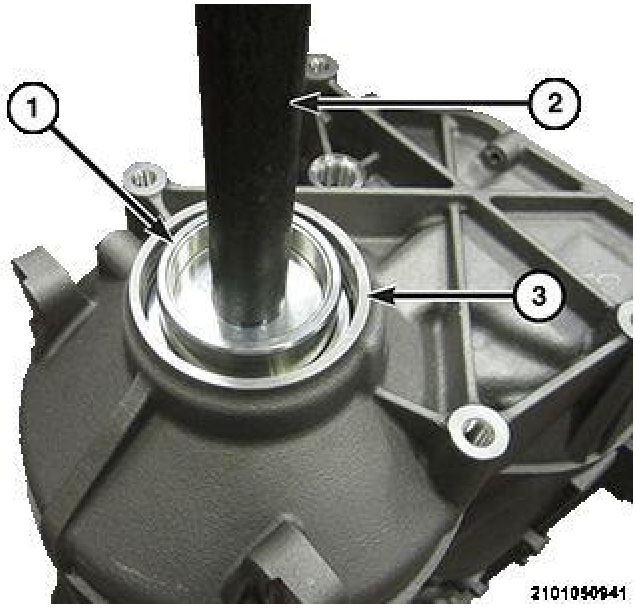


Fig. 99: Installing Output Shaft Inner Needle Bearing & Oil Dam
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The (special tool #10373A, Installer, Output Needle Bearing/Rear Oil Dam) (1) is a combination tool that is reversed to install the oil dam and output shaft inner needle bearing. For use to install the oil dam, use the thin walled side of the tool against the oil dam.**

29. Using (special tool #10373A, Installer, Output Needle Bearing/Rear Oil Dam) (1) and (special tool #C-4171, Driver Handle, Universal) (2), install the oil dam.
30. Install the snap ring.

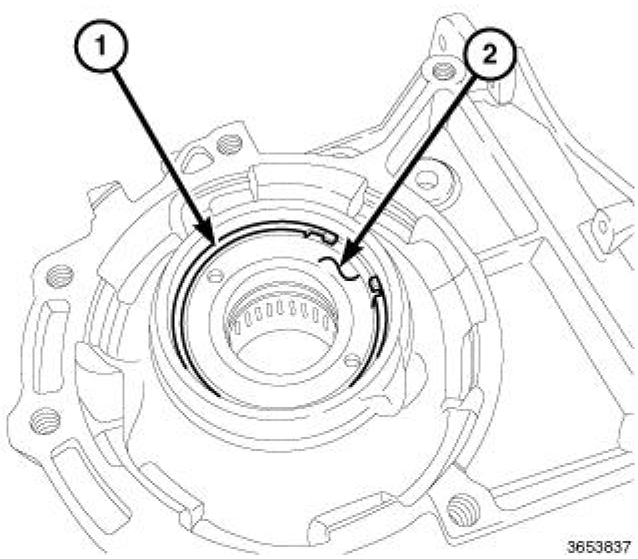

Fig. 100: Outer Bearing Snap Ring & Outer Needle Bearing
Courtesy of CHRYSLER GROUP, LLC

NOTE: **AWD shown, RWD similar.**

31. Install the ball bearing.
32. Install the snap ring (1).

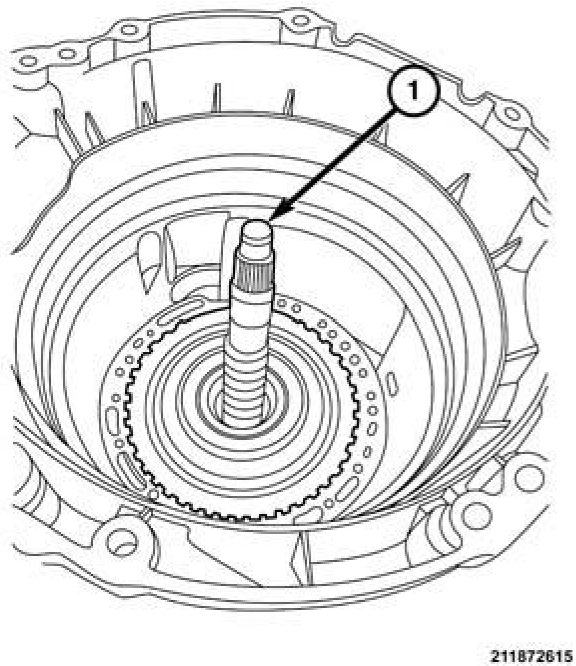

Fig. 101: Park Pawl
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The transmission must be in a upright position when the input/output shaft and the P4 annulus drum assembly (1) is installed.**

33. Install the input/output shaft and P4 annulus drum assembly (1) into the case.

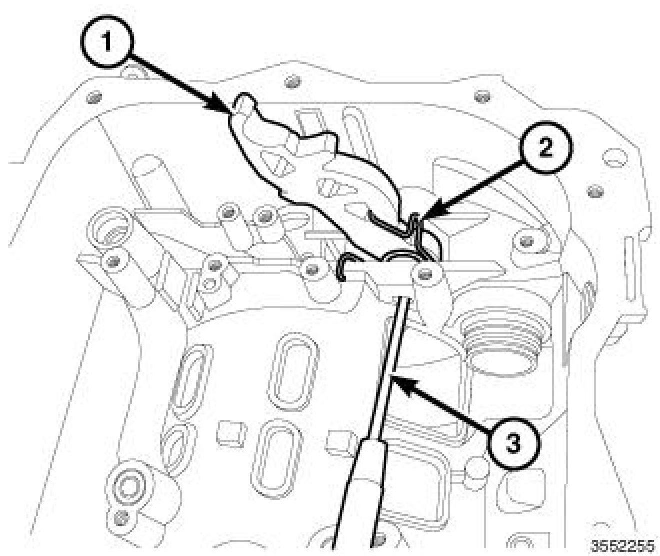

Fig. 102: Removing/Installing Park Pawl Shaft Using A Suitable Pin Punch, Park Pawl And Spring
Courtesy of CHRYSLER GROUP, LLC

34. From outside the transmission case, install the park pawl shaft and install the park pawl (1) and spring

(2).

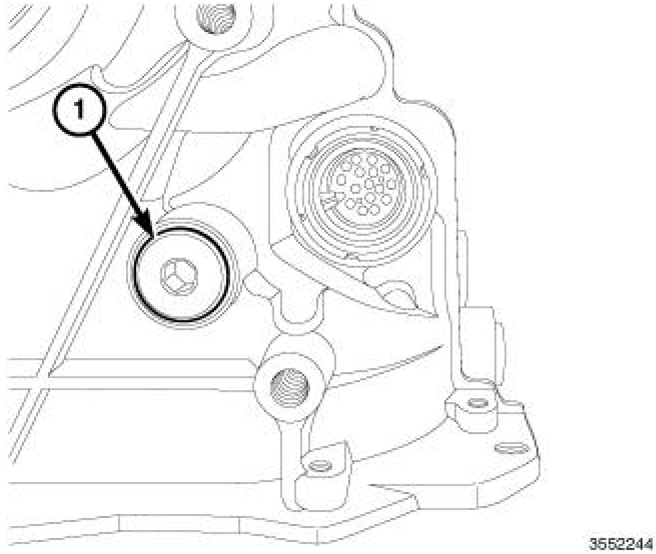

Fig. 103: Park Pawl Shaft Plug
Courtesy of CHRYSLER GROUP, LLC

35. Install the park pawl shaft plug (1) into the rear of the case and tighten to the proper **SPECIFICATIONS**.

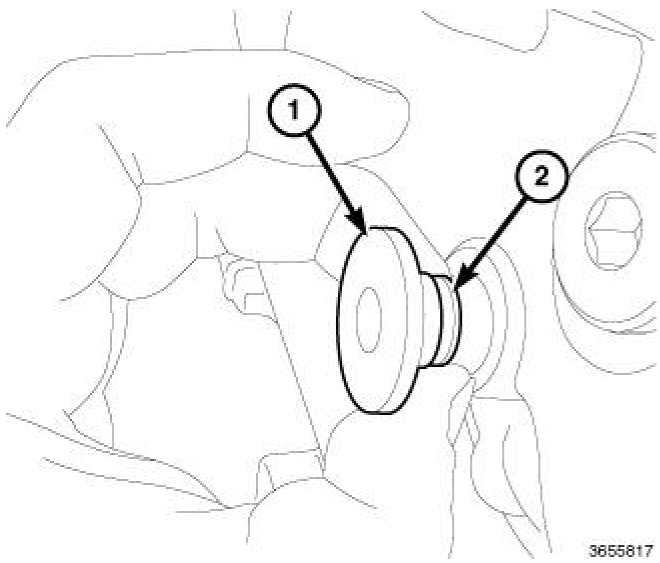

Fig. 104: Spacer & Selector Shaft Seal
Courtesy of CHRYSLER GROUP, LLC

36. Using (special tool #6936, Spacer) (1), install the Manual Park Release (MPR) shaft seal (2).

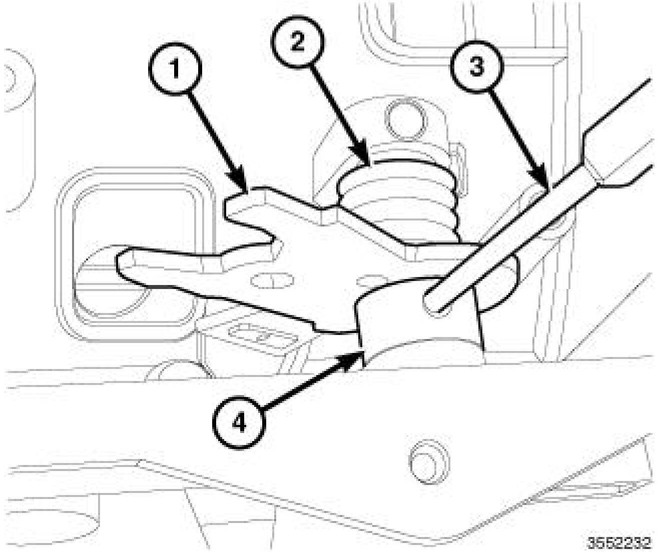

Fig. 105: Selector Shaft, Suitable Pin Punch, Spring & Fork
Courtesy of CHRYSLER GROUP, LLC

37. Install the shaft (4), spring (2), and fork (1) into the case.
38. Install the roll pin into the MPR shaft (4) using a suitable pin punch (3).

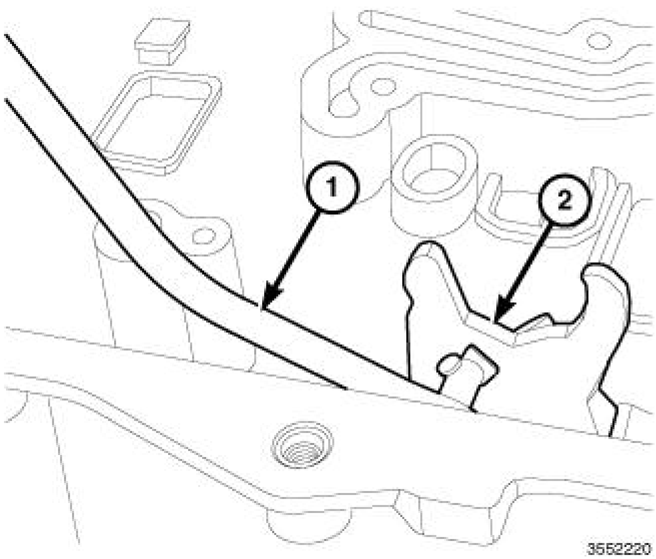

Fig. 106: Park Pawl Lock Rod & Fork
Courtesy of CHRYSLER GROUP, LLC

39. Install the park pawl lock rod (1) onto the fork (2).

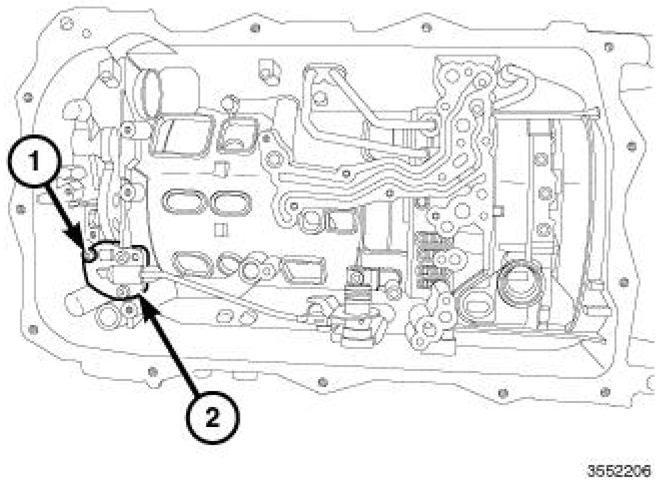

Fig. 107: Three Park Pawl Lock Rod Guide Plate Retaining Screws & Plate
Courtesy of CHRYSLER GROUP, LLC

40. Position the park pawl lock rod guide plate (2), install the three park pawl lock rod guide plate retaining screws (1) and tighten to the proper **SPECIFICATIONS**.

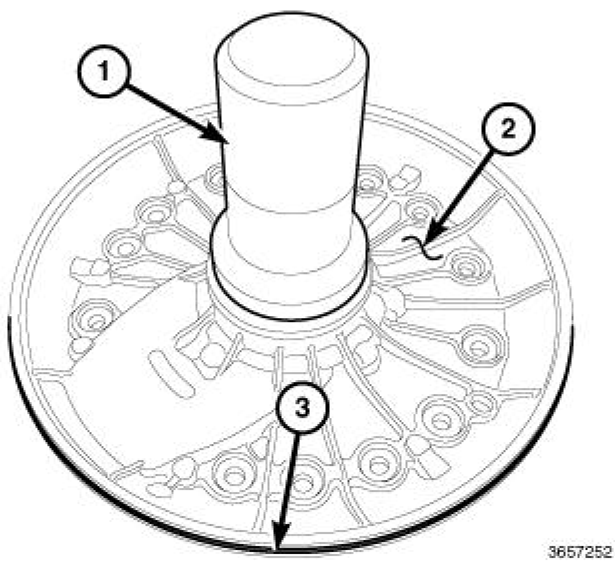

Fig. 108: Oil Pump Cover Lip Seal & Oil Pump Cover
Courtesy of CHRYSLER GROUP, LLC

41. Install the oil pump cover lip seal (3) on the oil pump cover (2).

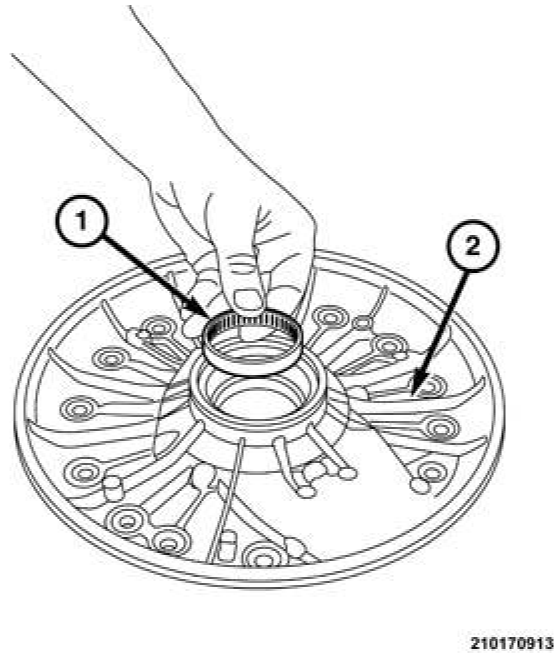

Fig. 109: Oil Pump Needle Bearing & Oil Pump Cover
Courtesy of CHRYSLER GROUP, LLC

42. If removed, install a **NEW** oil pump needle bearing using (special tool #10376, Installer, Input Shaft Needle Bearing)and (special tool #C-4171, Driver Handle, Universal).

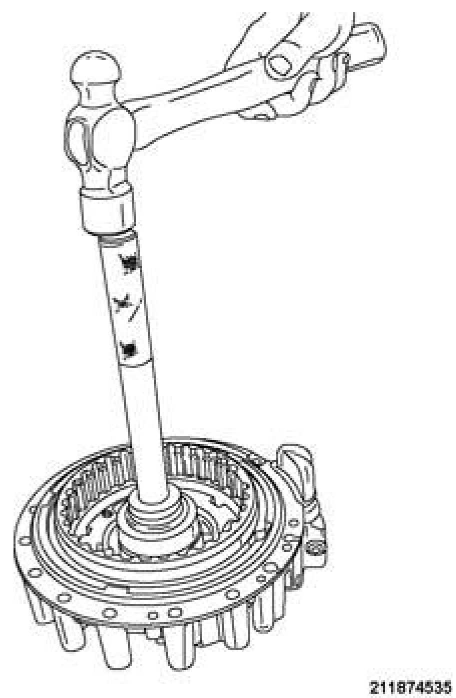

Fig. 110: Installing Oil Pump Housing Needle Bearing
Courtesy of CHRYSLER GROUP, LLC

43. If removed, install the inner oil pump needle bearing using (special tool #10382, Installer, Oil Pump Housing Needle Bearing) and (special tool #C-4171, Driver Handle, Universal)
44. Using (special tool #10375, Installer, Oil Pump Cover Oil Seal) (1), install the input shaft seal in the oil

pump cover (2).

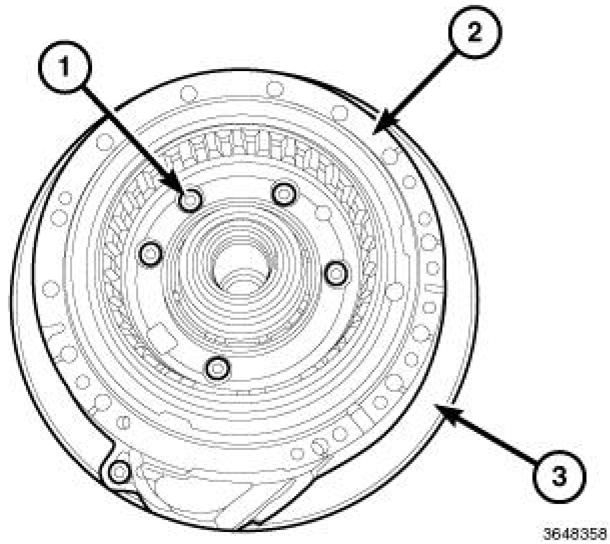

Fig. 111: Six Bolts, Oil Pump Housing & Oil Pump Cover
Courtesy of CHRYSLER GROUP, LLC

45. Position the oil pump housing (2) and oil pump cover (3) together.
46. Install the five bolts (1) and tighten to the proper **SPECIFICATIONS**.

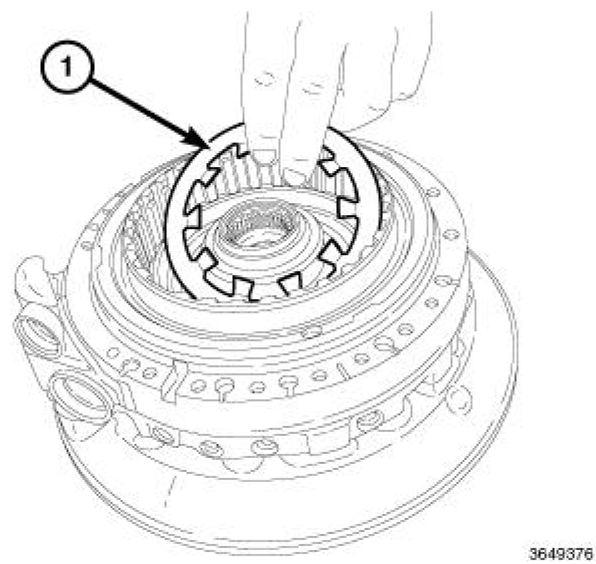

Fig. 112: Piston Retaining Ring And Piston
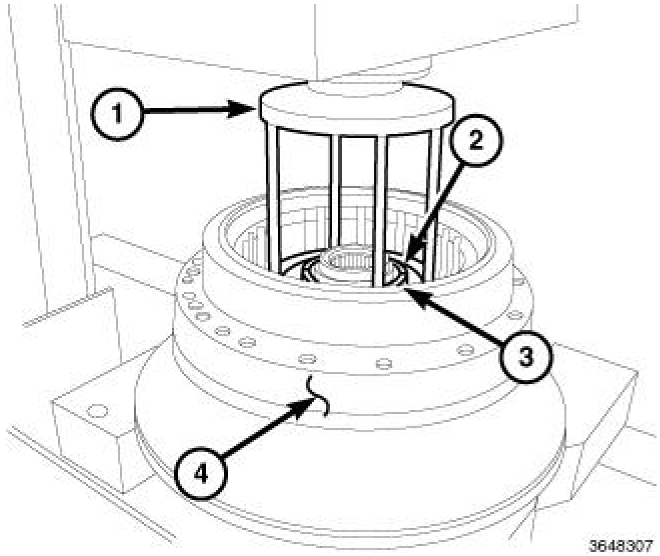
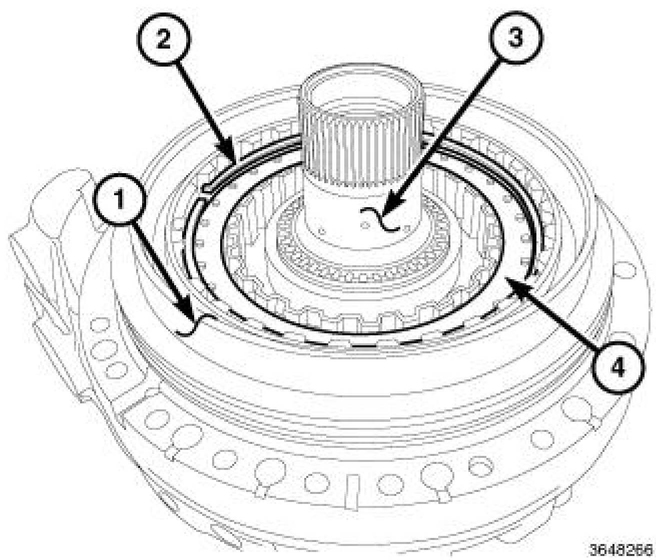
Courtesy of CHRYSLER GROUP, LLC

47. Insert the piston and the retaining ring (1) into the housing.



[Fig. 113: Oil Pump Housing Assembly]
Courtesy of CHRYSLER GROUP, LLC

48. Position the oil pump housing assembly (4) in a suitable arbor press.
49. Using (special tool #8285, Compressor, Spring) (1), press on the fingers of the piston retaining ring to remove tension, and install the two halves of the split retainer ring (2).



[Fig. 114: Outer Ring, Snap Ring, Hub & Spacers]
Courtesy of CHRYSLER GROUP, LLC

50. Install the hub (3).
51. Install the clutches and spacers (4).
52. Install the snap ring (2).
53. Install the outer ring (1) (below B-piston).

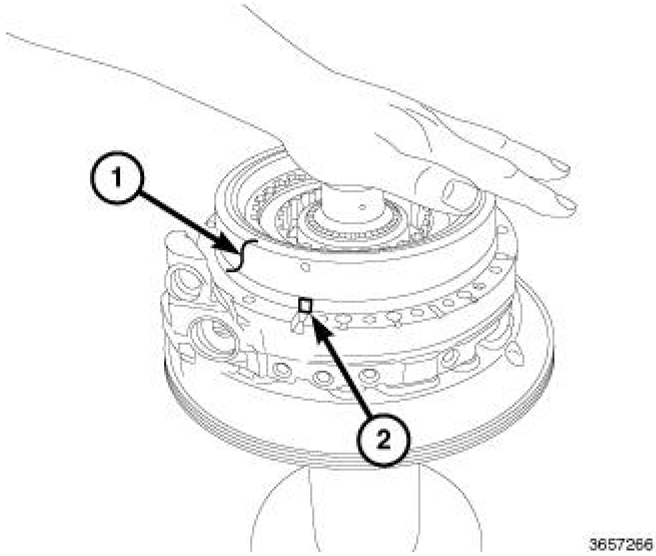


Fig. 115: B-Piston Alignment Tab & B-Piston
Courtesy of CHRYSLER GROUP, LLC

54. Position the B-piston alignment tab (2) above the notch and install B-piston (1) on the assembly.

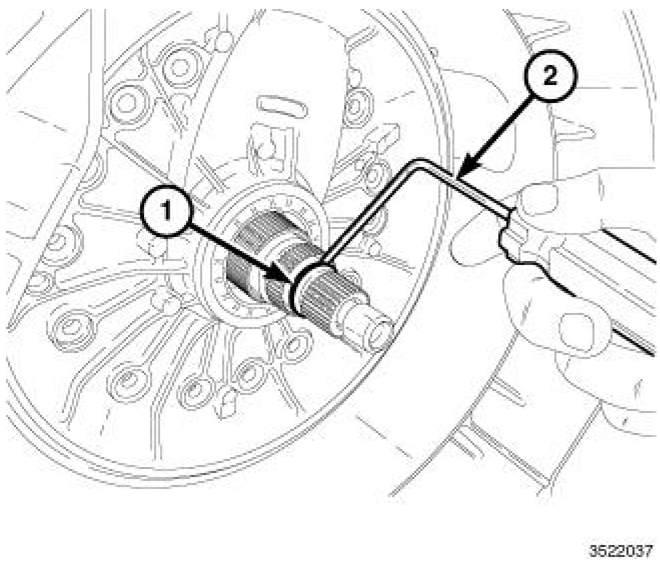

Fig. 116: Input Shaft O-Ring & Small Pick
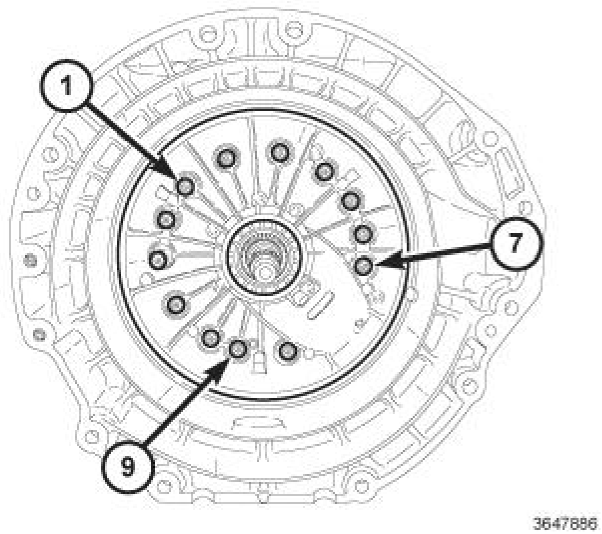
Courtesy of CHRYSLER GROUP, LLC

55. Carefully position the oil pump housing assembly into the case, firmly press the oil pump into place before drawing it in with the bolts.

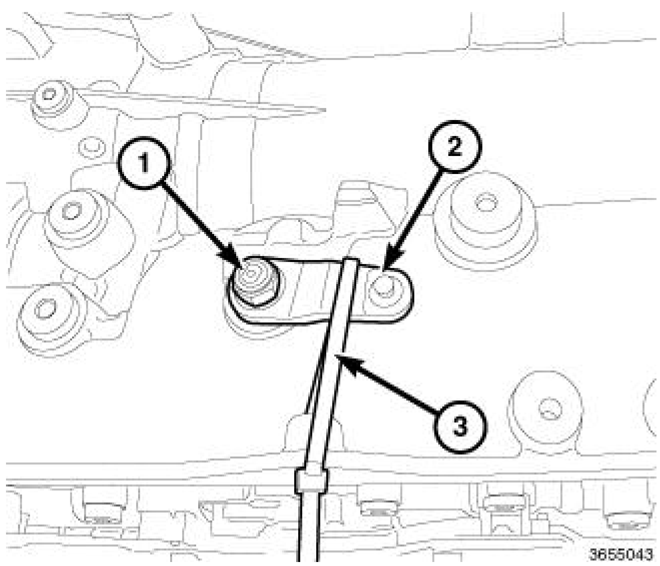
NOTE: **Check the transmission end play before installing the new oil pump bolts, in case adjustment is needed.**

56. Install the **NEW** input shaft O-ring.



[Fig. 117: Pre Tighten Bolts One, Seven And Nine](#)
Courtesy of CHRYSLER GROUP, LLC

57. Install the thirteen oil pump cover retaining bolts and tighten the oil pump cover as follows:
    a. In order to seat the oil pump cover properly, pre tighten bolts one, seven and nine to 6 N.m (53 in. lb.).
    b. Working in a clockwise pattern, beginning with number one, tighten to 10 N.m (89 in. lb.).
    c. Working in a clockwise pattern, beginning with number one, tighten an additional 90Â°.



[Fig. 118: Manual Park Release Lever, Nut & Tie Strap](#)
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The MPR lever (2) can be reversed to release tension and ease the installation of the valve body assembly.**

58. Temporarily install the MPR lever (2) to release tension on the shift fork as follows:
    a. Install the MPR lever (2) 180 degrees offset from its original position.
    b. Install the nut (1) and hand tighten.

c. Turn the MPR lever (2) and using a tie strap (3), secure the lever (2) into position so the park release fork is in the same position as it was before valve body assembly removal.

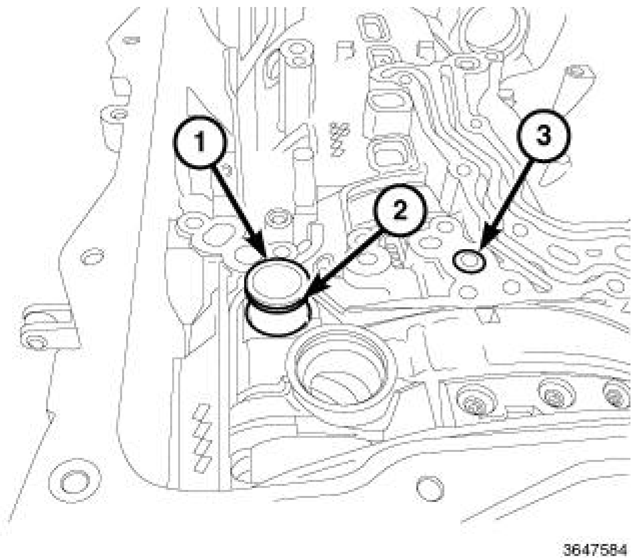


Fig. 119: Fluid Port, Two O-Rings, Compression Seal
Courtesy of CHRYSLER GROUP, LLC

59. Install a new compression seal (3) into the transmission case.
60. Install the fluid port (1) with **NEW** O-rings to the transmission case.

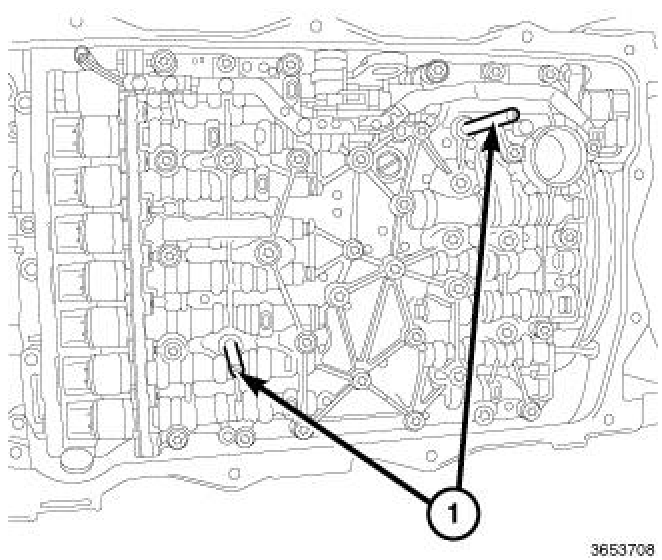

Fig. 120: Valve Body Alignment Pins
Courtesy of CHRYSLER GROUP, LLC

61. Install the (special tool #10379, Pins, Valve Body Alignment) (1) in the transmission case as guides for the valve body assembly.

NOTE: Make sure the shift fork lines up properly.

62. Using the valve body alignment pins (1) to guide, position the valve body assembly to the transmission.

NOTE: **After several bolts have been hand tightened, remove the guide pins (1).**

63. Install the fourteen valve body assembly retaining bolts and hand tighten.

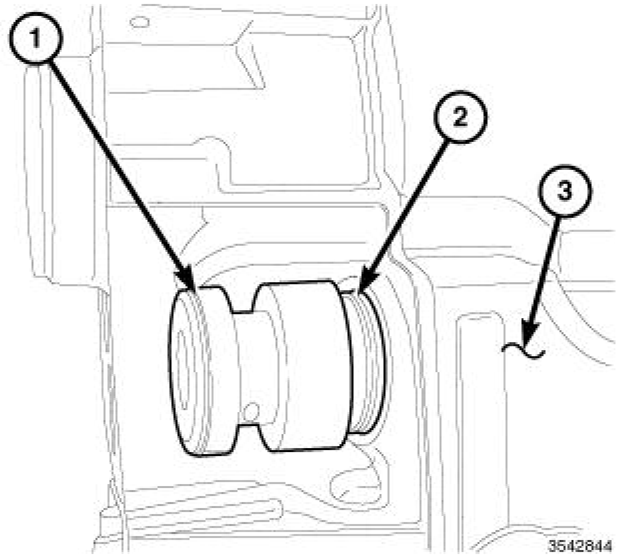

Fig. 121: Remover/Installer, Guide Sleeve, Electrical Harness Insulator & Transmission Case
Courtesy of CHRYSLER GROUP, LLC

64. Using (special tool #10377, Remover/Installer, Guide Sleeve) (1) carefully install the electrical harness insulator (2) into the transmission case (3).

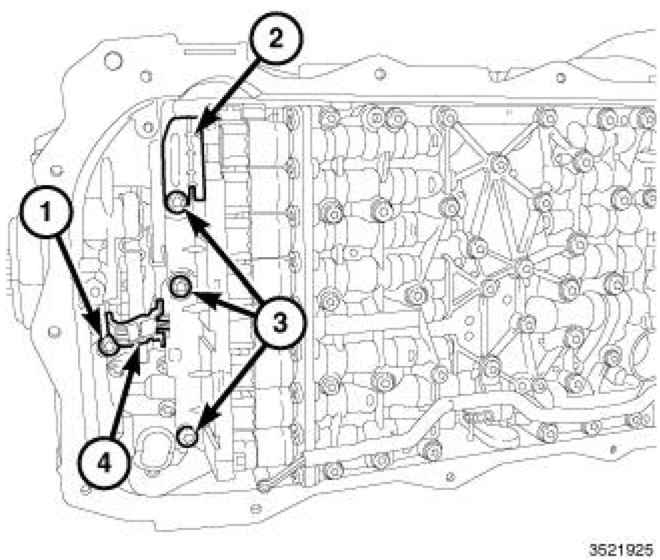

Fig. 122: Valve Body Assembly End Retainer Bolts
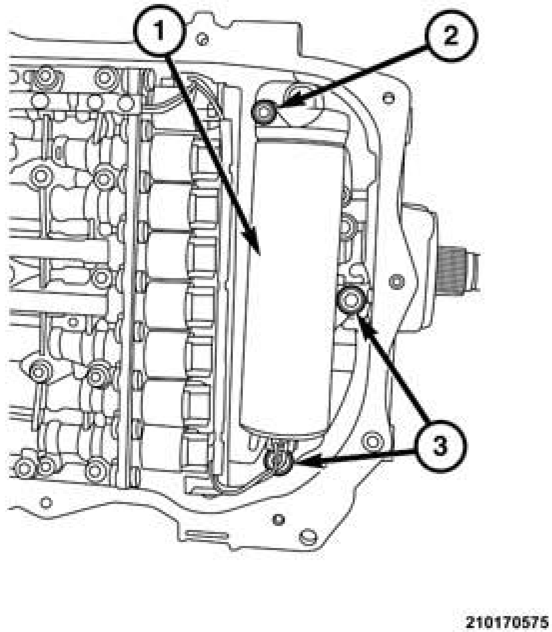
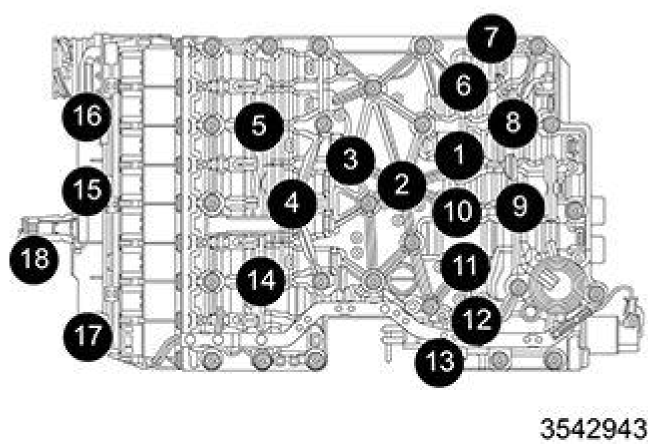
Courtesy of CHRYSLER GROUP, LLC

65. Install the sensor (4) and the sensor retaining bolt (1) and hand tighten.
66. Latch the electrical connector insulator lock (2) by pushing in.



[Fig. 123: Hydraulic Impulse Storage Unit & Bolts]
Courtesy of CHRYSLER GROUP, LLC

67. If equipped, install the Hydraulic Impulse Storage Unit (H.I.S.).
68. Tighten the bolts (2 and 3) to the proper **SPECIFICATIONS**.
69. Install the valve body assembly end retainer bolts (3) and hand tighten.



[Fig. 124: Valve Body Bolts Loosening And Tightening Sequence]
Courtesy of CHRYSLER GROUP, LLC

70. Tighten the valve body assembly retaining bolts 1-18 in the sequence shown to the proper **SPECIFICATIONS**.

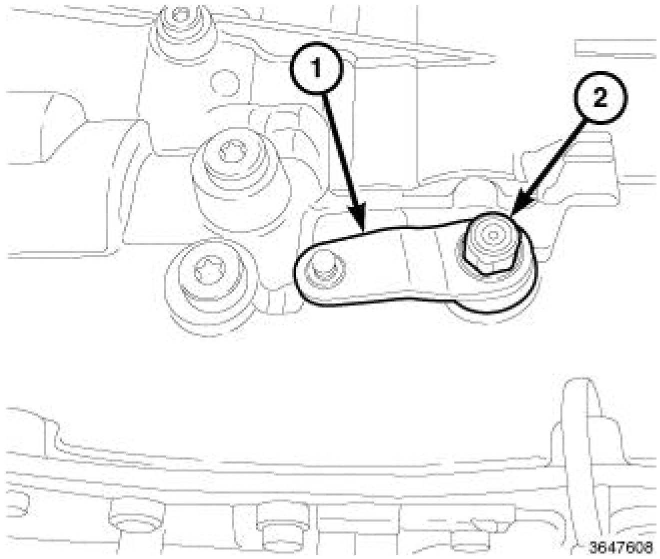


Fig. 125: Manual Park Release Lever Retaining Nut & Lever
Courtesy of CHRYSLER GROUP, LLC

71. Remove the tie strap and return the MPR lever (1) to the original position.
72. Install the nut (2) and tighten to the proper **SPECIFICATIONS**.

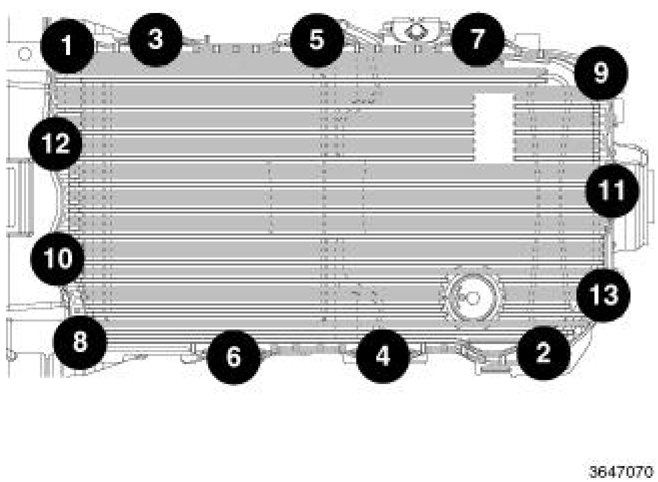

Fig. 126: Oil Pan Retaining Bolts Tightening Sequence
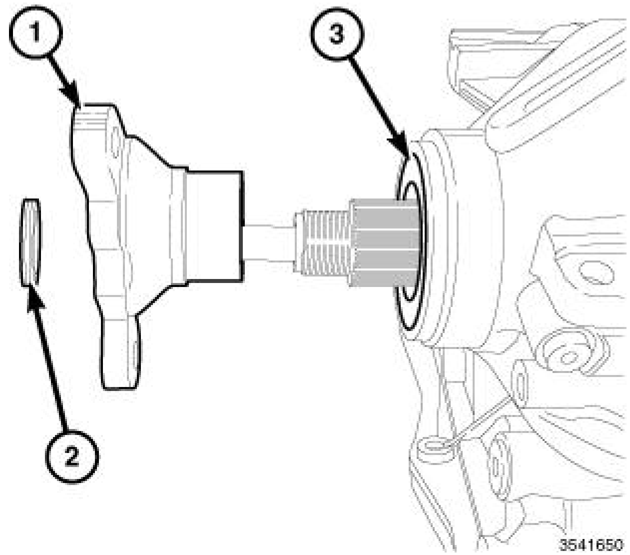
Courtesy of CHRYSLER GROUP, LLC

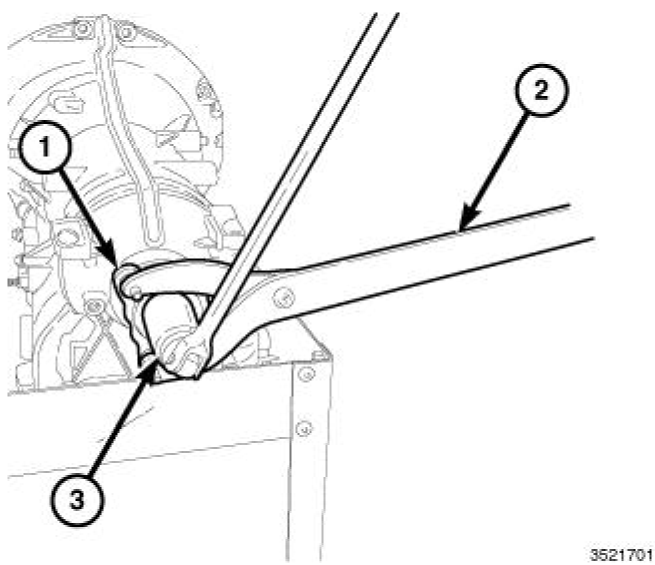
73. Position the oil pan and gasket.
74. Install the thirteen oil pan retaining bolts and using the sequence shown and tighten to the proper **SPECIFICATIONS**.
75. Install the transmission output shaft washer.

CAUTION: The seal must be installed flush with the case. Driving the seal deeper could damage the seal causing a leak.



[Fig. 127: Propeller Shaft Flange, Rear Dust Seal & Rear Oil Seal]
Courtesy of CHRYSLER GROUP, LLC

76. Position the new output shaft seal (3) over the output shaft and against the transmission case.
77. Using (special tool #8481, Installer, Gear) install the output shaft seal.
78. Install the transmission rear dust seal (2).
79. Install the drive shaft flange (1).



[Fig. 128: Flange, Flange Holder & Socket]
Courtesy of CHRYSLER GROUP, LLC

80. Install the **NEW** drive shaft flange nut and washer using a 34 mm 12 point socket (3) and (special tool #C-3281, Holder, Flange) (2) to hold the flange (1). Tighten to the proper SPECIFICATIONS.
81. Stake the nut.

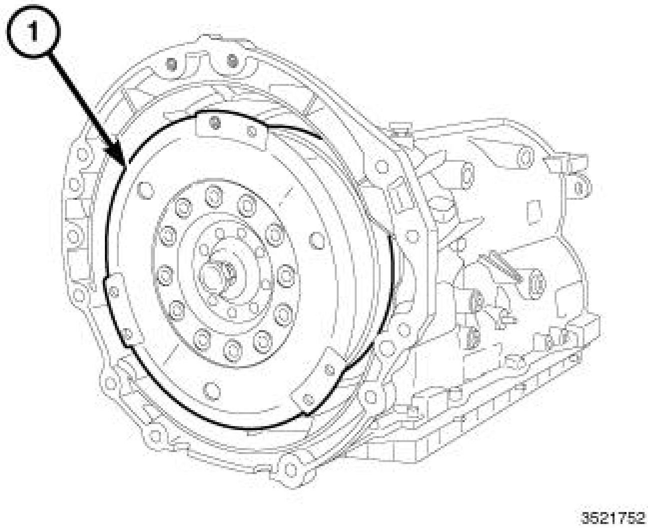


Fig. 129: Torque Converter
Courtesy of CHRYSLER GROUP, LLC

82. Install the torque converter (1). Refer to **TORQUE CONVERTER, INSTALLATION**.
83. Before installing the transmission in the vehicle, pre-fill the transmission as outlined in FILL TRANSMISSION AFTER SERVICE. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

INSTALLATION

INSTALLATION

CAUTION:	**When supporting or lifting the transmission at the oil pan the weight of the transmission must be distributed evenly on the lifting fixture. Failure to do so could damage the oil pan and transmission.**

NOTE:	**Make sure that the transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.**

NOTE:	**If the transmission is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the TRANSMISSION VERIFICATION TEST. Refer to STANDARD PROCEDURE .**

1. Install the torque converter. Refer to **TORQUE CONVERTER, INSTALLATION**.

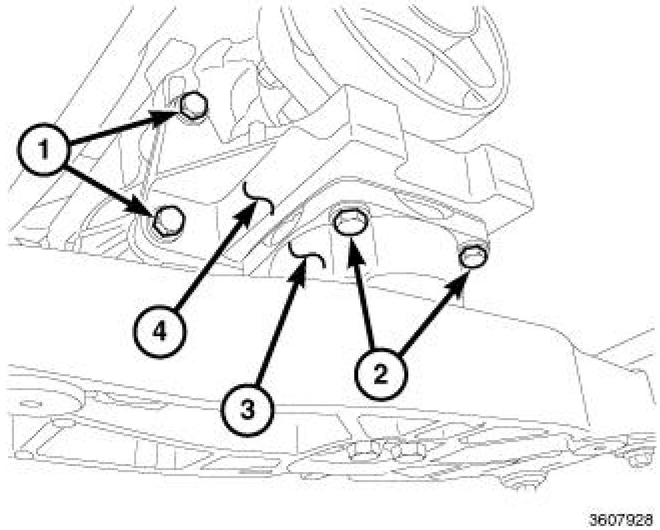

Fig. 130: Transmission Mount Bolts & Transmission Mount
Courtesy of CHRYSLER GROUP, LLC

2. Position the adapter bracket (4) in place, install the adapter bracket bolts (1) and tighten to the proper **SPECIFICATIONS**.
3. Position the transmission mount (3) in place, install the transmission mount bolts (2) and tighten to the proper **SPECIFICATIONS**.

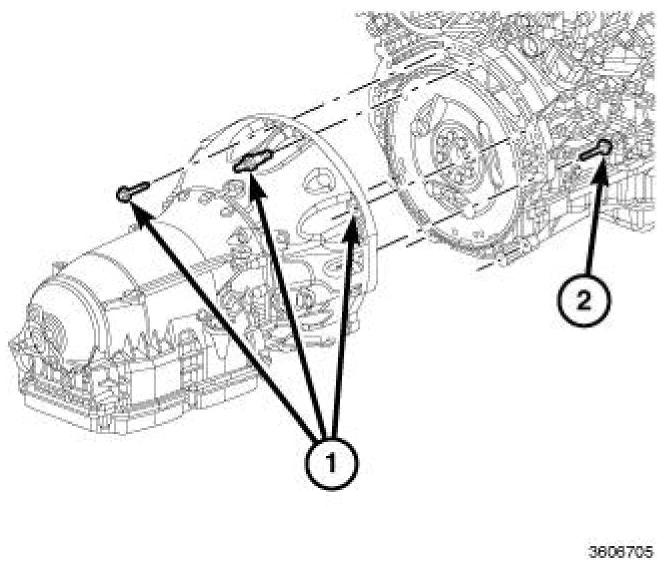

Fig. 131: Remaining Bell Housing Bolts (RWD Shown: AWD Similar)
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Hold torque converter in place during transmission installation.**

4. Position the transmission to the vehicle.
5. Install the upper transmission to engine bolts (1, 2). Do not tighten at this time.

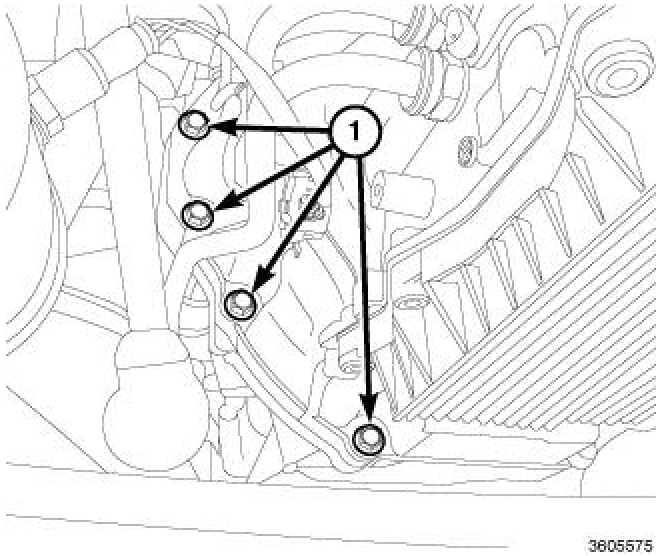

Fig. 132: Bell Housing Bolts (LH)
Courtesy of CHRYSLER GROUP, LLC

6. Install the Left Hand (LH) transmission to engine bolts (1). Do not tighten at this time.

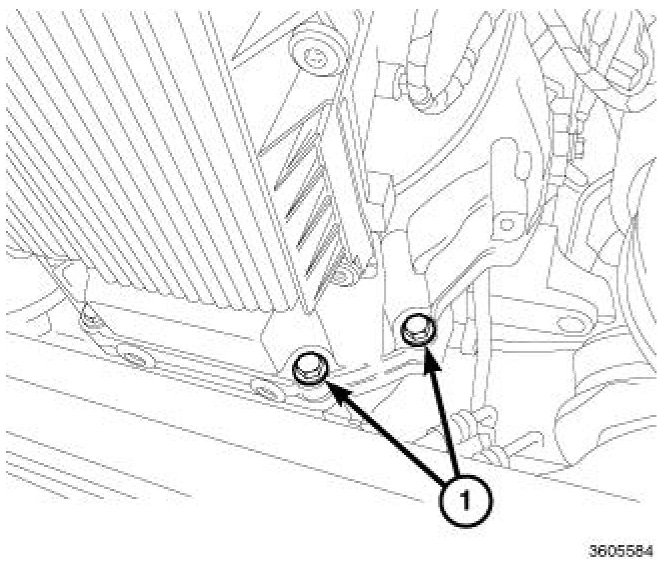

Fig. 133: Bell Housing Bolts (RH)
Courtesy of CHRYSLER GROUP, LLC

7. Install the Right Hand (RH) transmission to engine bolts (1). Tighten all the transmission to engine bolts to the proper **SPECIFICATIONS**.

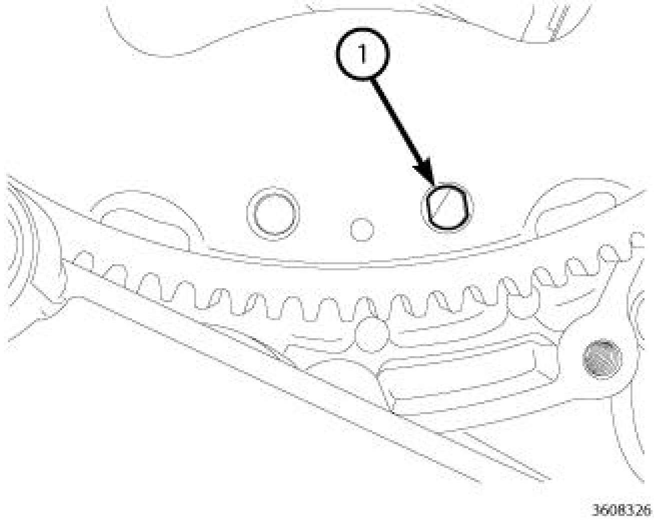

Fig. 134: Alignment Hole
Courtesy of CHRYSLER GROUP, LLC

8. Rotate crankshaft in clockwise direction to line up the alignment hole (1) in the flex plate, then start the first bolt.

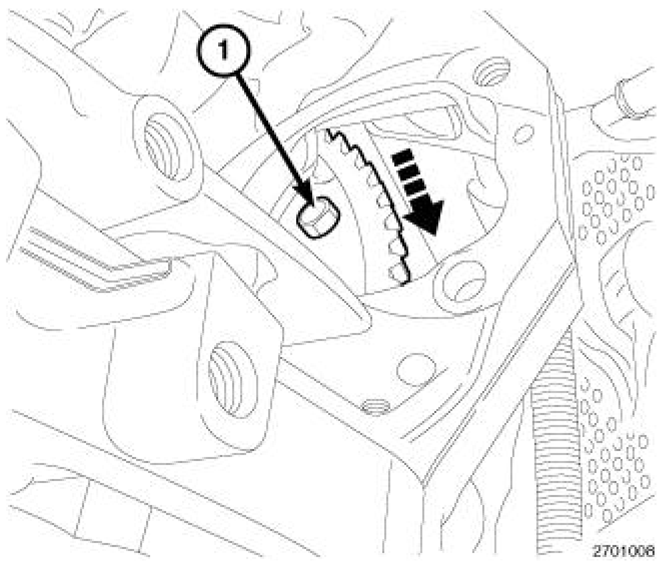

Fig. 135: Torque Converter Bolt
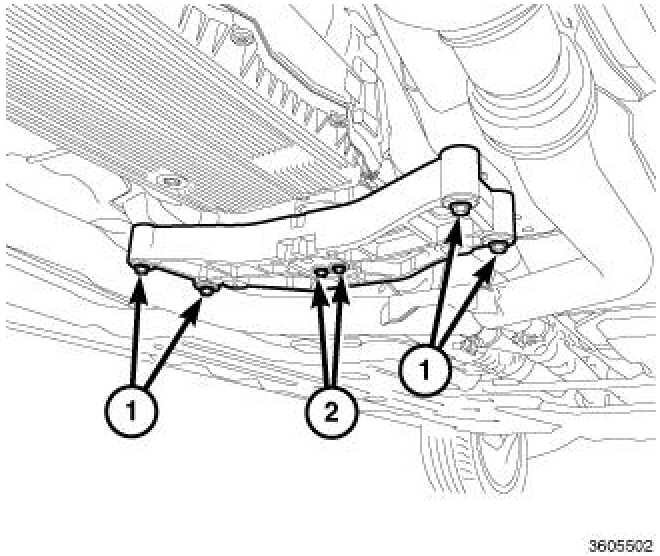
Courtesy of CHRYSLER GROUP, LLC

9. Rotate the crankshaft clockwise until the torque converter bolts (1) are accessible. There are three sets of two bolts 120Â° apart. Install the remaining torque converter bolts and tighten to the proper **SPECIFICATIONS**.



[Fig. 136: Crossmember & Bolts](#)
Courtesy of CHRYSLER GROUP, LLC

10. Position the crossmember in place and install the crossmember bolts (1) and tighten to the proper **SPECIFICATIONS**.
11. Install the transmission mount bolts (2) and tighten to the proper **SPECIFICATIONS**.

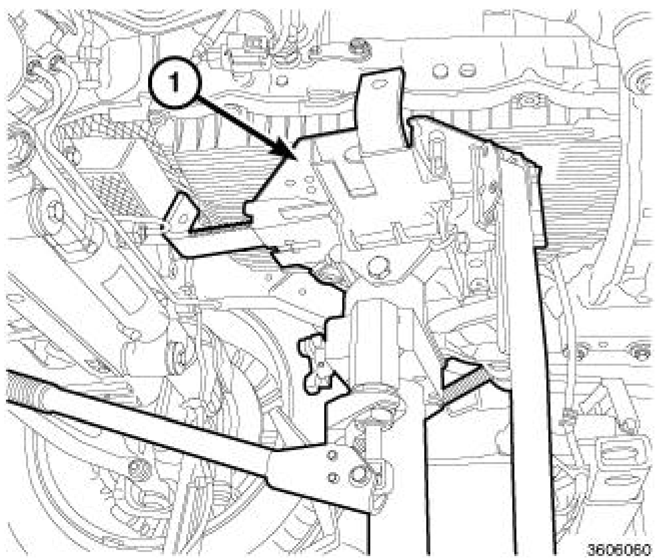


Fig. 137: Service Jack

16. Turn the locking mechanism lock (1) of the transmission wire harness connector (2) clockwise to secure.

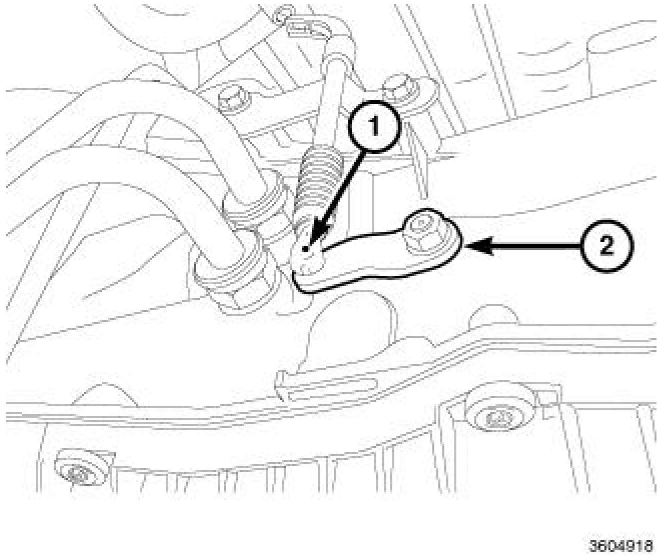

Fig. 142: Manual Park Release Cable & Lever
Courtesy of CHRYSLER GROUP, LLC

17. Connect the parking pawl release cable (1) to the lever (2).

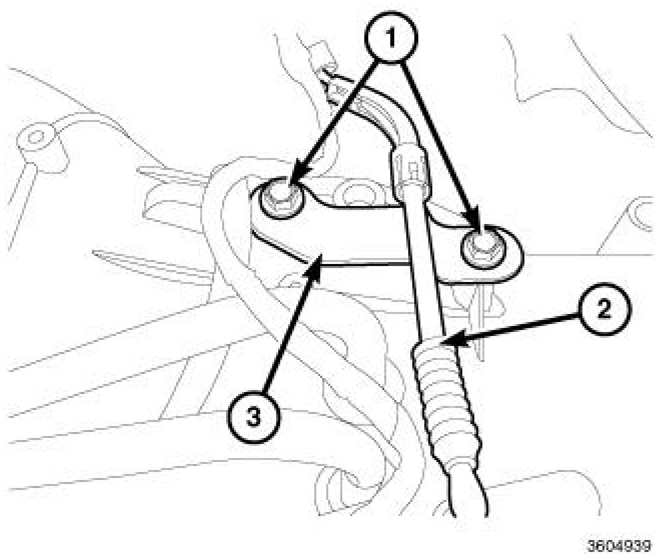

Fig. 143: Bolts, Manual Park Release Cable Bracket & Bracket/Cable
Courtesy of CHRYSLER GROUP, LLC

18. Position the manual park release cable bracket/cable (2, 3), install the bolts (1) and tighten to the proper **SPECIFICATIONS**.
19. Install the starter. Refer to **STARTER, INSTALLATION** .
20. Install the drive shaft. Refer to **INSTALLATION** .
21. Install the exhaust. Refer to **RESONATOR, EXHAUST, INSTALLATION** .
22. Connect the right and left bank up stream oxygen sensors.
23. Connect the negative battery cable.
24. Perform the STANDARD PROCEDURE - TRANSMISSION FILL AFTER SERVICE. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

25. If the valve body is replaced, program the Transmission Control Module (TCM). Refer to **MODULE, TRANSMISSION CONTROL, MODULE PROGRAMMING** .
26. Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

CABLE, MANUAL PARK RELEASE

OPERATION

OPERATION

The 8HP utilizes a fully electronic shifter mechanism with no physical connections to the transmission such as shifter linkage or cables. Due to this design the park function of the transmission is performed using electronic inputs and hydraulic pressure to hold to parking pawl lever in the disengaged position while moving. Once in park this hydraulic pressure is reduced which allows the lever to engage the parking pawl which in turn keeps the vehicle from rolling forward or rearward.

Should the vehicle or any component of the E-Shifter lose power or communication the parking pawl will be engaged and the vehicle cannot be moved. To move the vehicle there is a manual park release mechanism that will allow first responders to disengage the parking pawl and allow the vehicle to be moved further facilitating vehicle recovery such as towing or moving the vehicle to allow jump starting.

REMOVAL

MPR CABLE

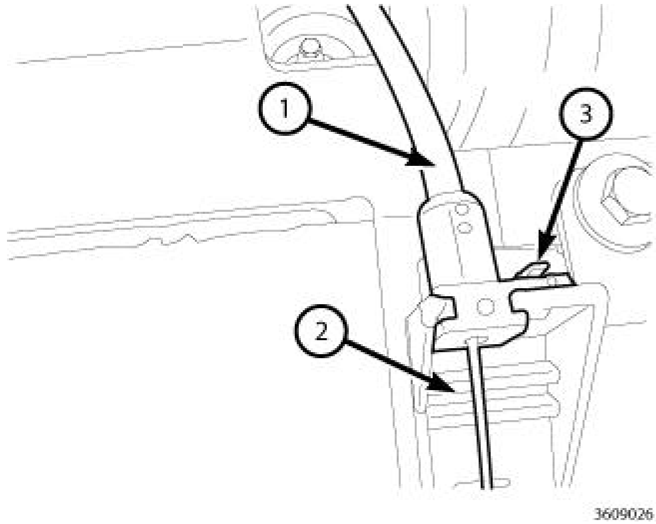

Fig. 144: Cable, Housing & Release Tab
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Apply the parking brake.
3. Remove the Manual Park Release (MPR) lever cover.
4. Disconnect the MPR cable (1) from the housing (2), while holding the release tab (3) open.
5. Disconnect the MPR cable from the lever.
6. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

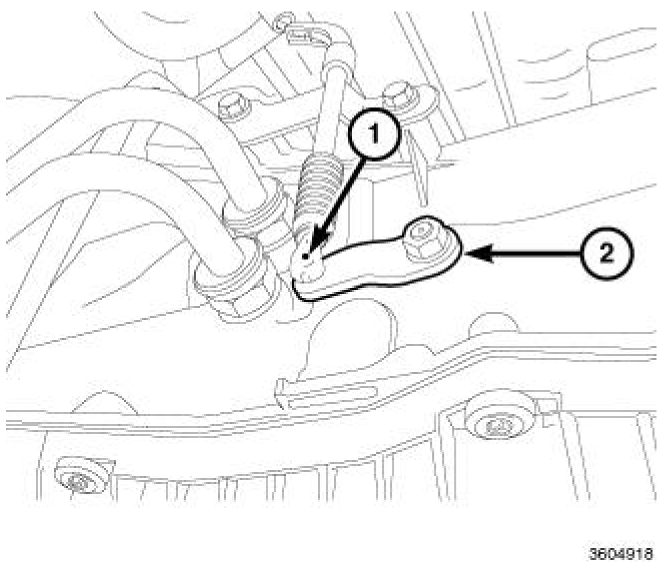

Fig. 145: Manual Park Release Cable & Lever
Courtesy of CHRYSLER GROUP, LLC

7. Disconnect the MPR cable (1) from the MPR lever (2).

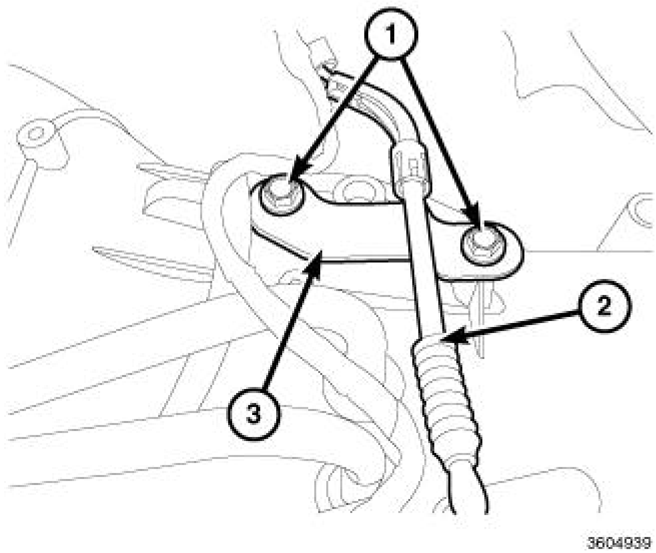

Fig. 146: Bolts, Manual Park Release Cable Bracket & Bracket/Cable
Courtesy of CHRYSLER GROUP, LLC

8. Remove the MPR cable bracket bolts (1) and remove the MPR cable (2) from the vehicle.

INSTALLATION

MPR CABLE

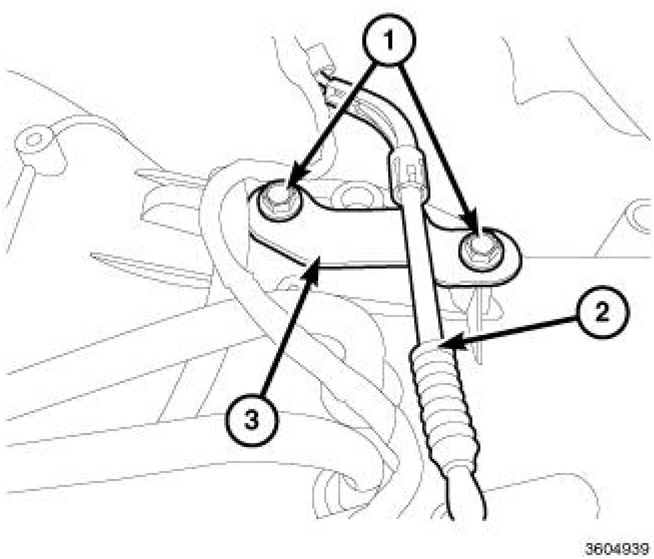

Fig. 147: Bolts, Manual Park Release Cable Bracket & Bracket/Cable
Courtesy of CHRYSLER GROUP, LLC

1. Install the Manual Park Release (MPR) cable (2) in the vehicle. Install the MPR cable bracket bolts (1) and tighten to the proper SPECIFICATIONS.

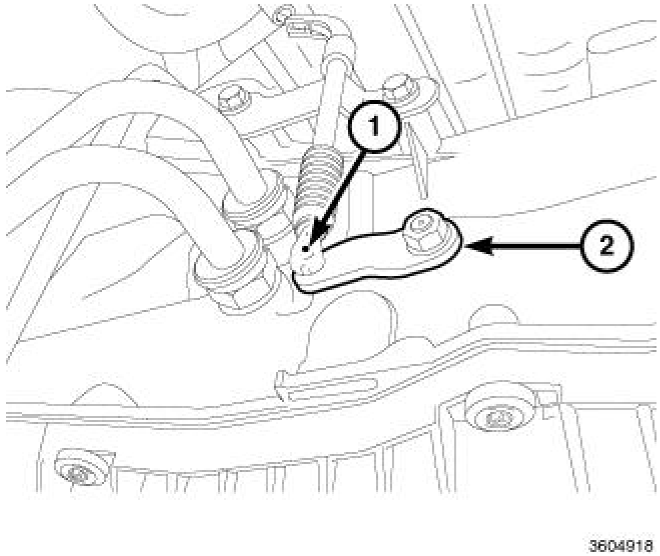

Fig. 148: Manual Park Release Cable & Lever
Courtesy of CHRYSLER GROUP, LLC

2. Connect the MPR cable (1) to the MPR lever (2).
3. Lower the vehicle.

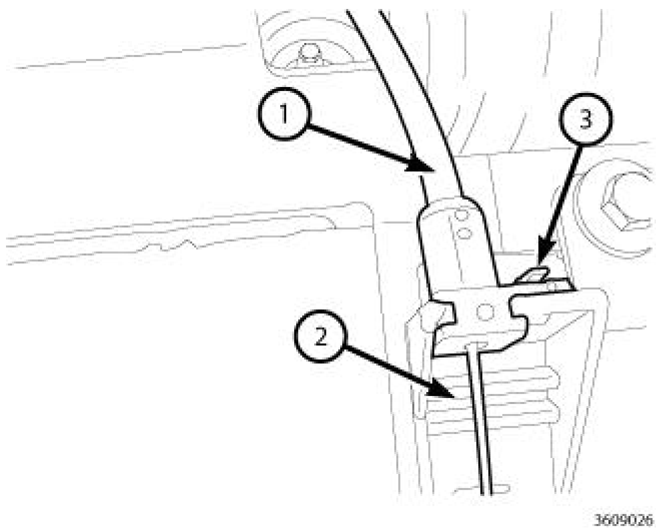

Fig. 149: Cable, Housing & Release Tab
Courtesy of CHRYSLER GROUP, LLC

4. Connect the MPR cable (2) to the MPR lever.
5. Connect the MPR cable (1) to the housing.
6. Install the MPR cover.
7. Connect the negative battery cable.

FLUID AND FILTER

DESCRIPTION

DESCRIPTION

FILTER SERVICE

The 8HP has a conventional fluid sump design, however, the filter is integrated into the oil pan resulting in a lower profile for improved vehicle packaging. The oil pan gasket is reusable providing it is not damaged during removal.

STANDARD PROCEDURE

STANDARD PROCEDURE - CHECK OIL LEVEL

To properly check and fill the transmission, perform the following procedure:

WARNING: **There is a risk of accident from vehicle moving when the engine is running. Secure vehicle to prevent it from moving. There is a risk of injury from contusions and burns if you insert your hands into the engine when it is running. Do not touch hot or rotating parts. Wear properly fitted work clothes.**

CAUTION: **A unique transmission fluid has been developed for this transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid see VEHICLE QUICK REFERENCE .**

NOTE: **Oil dye is not required to find leaks in the 8HP transmission. The oil dye can cause shift quality issues and is not recommended. The 8HP fluid has illuminance that is visible under a black light.**

1. Raise and support the vehicle **on a level hoist** . Refer to **HOISTING, STANDARD PROCEDURE** .
2. Start the engine. The engine must continue to run for the entire test.
3. Using a scan tool or the vehicle information center, verify that the transmission fluid temperature is below 30Ā°C (86Ā°F).
4. Remove the transmission fill plug from the right rear of the transmission case.
5. Add transmission fluid until it trickles from the fill opening.
6. Install the transmission fill plug and tighten to the proper **SPECIFICATIONS**.
7. Lower the vehicle for access to inside of the vehicle, leaving the tires at least 8 inches off the ground.
8. With the brakes applied, place the transmission in Reverse and hold for 5 seconds.
9. Place the transmission in Drive and hold for 5 seconds.
10. Release the brakes, slowly accelerate to 2nd gear and hold for 5 seconds.
11. Apply the brakes and place the transmission in Neutral.
12. Raise the engine speed to 2000 RPM for 5 seconds.
13. Return the engine to idle and place the transmission in Park.

NOTE: **A full transmission will have fluid at the fill hole with the transmission between 30Ā°C (86Ā°F) and 50Ā°C (122Ā°F). Do not over fill.**

14. Remove the transmission fill plug and allow excess fluid to drain from fill hole or add fluid as necessary.
15. Install the transmission fill plug and tighten to the proper **SPECIFICATIONS**.
16. Using a scan tool, clear any DTCs.

STANDARD PROCEDURE - TRANSMISSION FILL AFTER SERVICE

CAUTION: A unique transmission fluid has been developed for this transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid see VEHICLE QUICK REFERENCE .

To properly fill the transmission after an in vehicle service or overhaul, perform the following procedure:

NOTE: If the transmission cooler was replaced, add an additional 0.7L (0.72 qts) of transmission fluid.

1. **If the transmission was overhauled** , prior to installing in the vehicle, tip the transmission on it side, remove the oil fill plug on the right rear side of the case and install 9L (9.5 qts) of transmission fluid. Install the fill plug. After installing the transmission, perform the CHECK OIL LEVEL procedure. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
2. **If an in vehicle service was performed** , raise and support the vehicle **on a level hoist** , and perform the CHECK OIL LEVEL procedure. Refer to **HOISTING, STANDARD PROCEDURE** and **FLUID AND FILTER, STANDARD PROCEDURE**.

STANDARD PROCEDURE - FLUID/FILTER SERVICE

NOTE: The oil pan and filter are an integrated assembly that cannot be serviced separately.

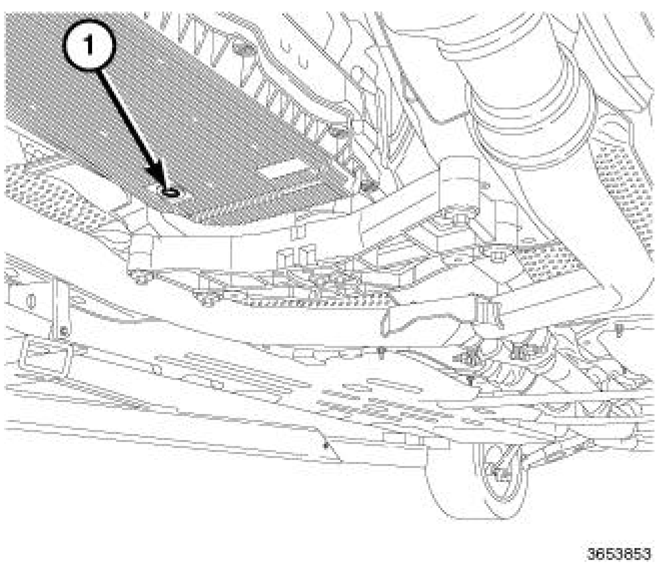

Fig. 235: Transmission Oil Pan Plug
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the transmission oil pan plug (1) and drain the transmission fluid.

NOTE: **Inspect the gasket for reuse. If the seal is cut or torn, replace the gasket.**

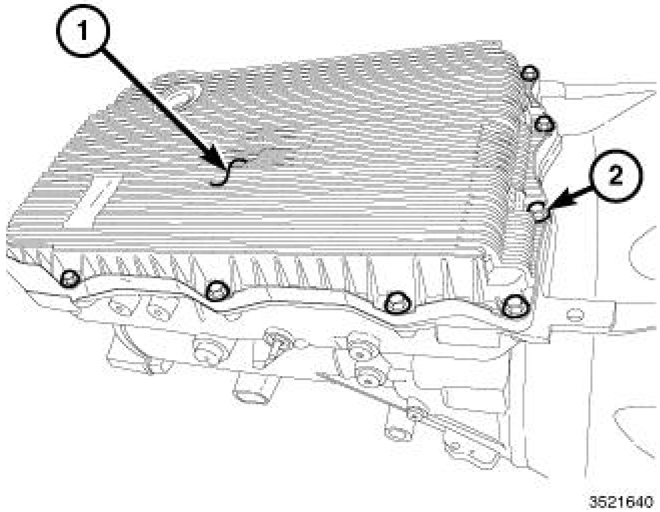

Fig. 236: Thirteen Oil Pan Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the 13 oil pan retaining bolts (2).
4. Remove the oil pan (1) and gasket. If the pan is being removed for contamination concerns discard the pan.
5. Install the **NEW** oil pan (1) and gasket.

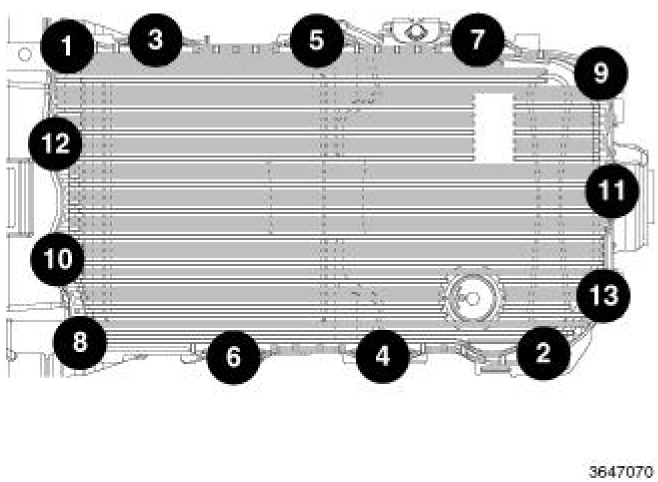

Fig. 237: Oil Pan Retaining Bolts Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

6. Install the 13 oil pan retaining bolts in the sequence shown and tighten to 10 N.m (89 in. lbs.).

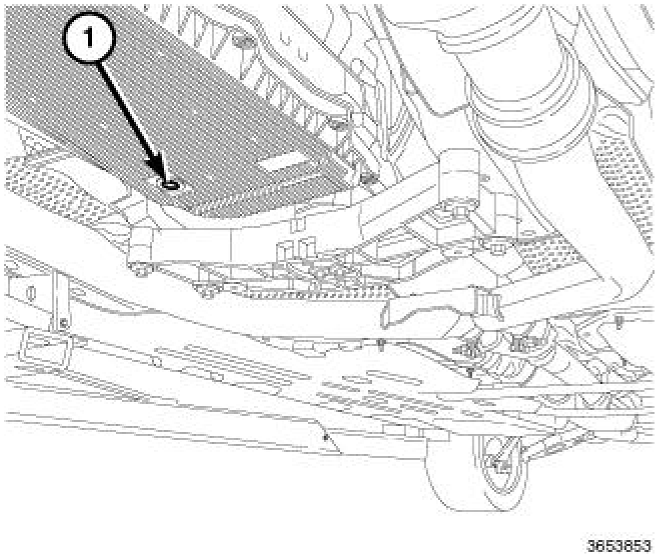

Fig. 238: Transmission Oil Pan Plug
Courtesy of CHRYSLER GROUP, LLC

7. Verify the transmission oil pan plug (1) is installed.
8. Inspect and adjust the fluid level. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
9. Lower the vehicle.

LEVER, MANUAL PARK RELEASE

REMOVAL

REMOVAL

1. Remove the shifter bezel storage bin liner.
2. Remove the Manual Park Release (MPR) lever bolts.

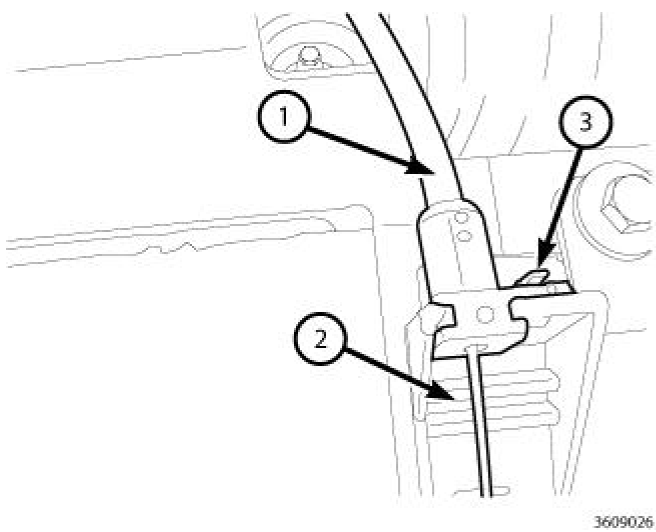

Fig. 239: Cable, Housing & Release Tab
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the MPR cable (1) from the housing (2), while holding the release tab (3) open.
4. Remove the MPR cable (1) from the MPR lever and remove the MPR lever from the vehicle.

INSTALLATION

INSTALLATION

1. Connect the Manual Park Release (MPR) cable to the MPR lever.
2. Install the MPR lever bolts and tighten to the proper **SPECIFICATIONS** .

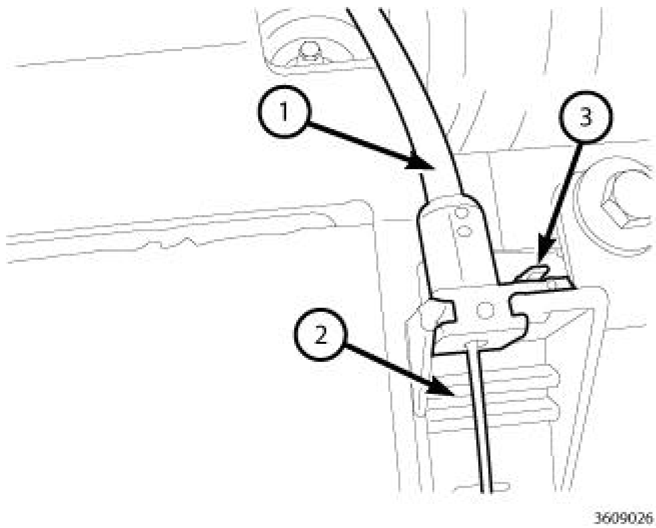

Fig. 240: Cable, Housing & Release Tab
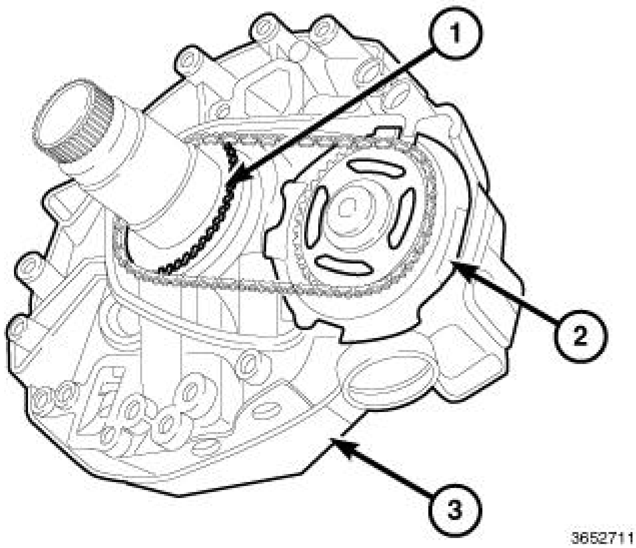
Courtesy of CHRYSLER GROUP, LLC

3. Connect the MPR cable (1) to the housing (2) and make sure the locking tab (3) is locked.
4. Install the shifter bezel storage bin liner.

PUMP, TRANSMISSION OIL

DESCRIPTION

DESCRIPTION

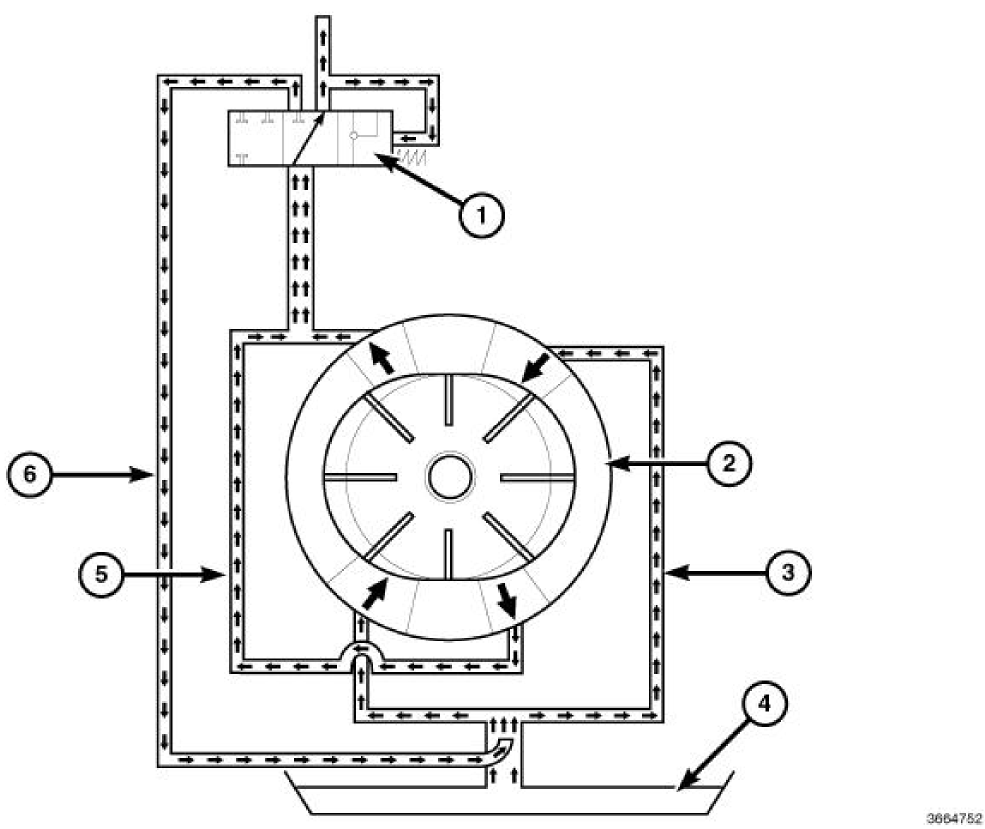


[Fig. 241: Transmission Oil Pump, Chain And Sprocket & Oil Pump Housing]
Courtesy of CHRYSLER GROUP, LLC

The transmission oil pump (2) is driven by a chain and sprocket (1). The oil pump is located just behind the torque converter, inside of the pump housing (3). The pump is a double-stroke vane pump. The pump has dual chambers, two inlet and two outlet ports. The pump provides necessary lubrication and cooling throughout all phases of transmission operation.

OPERATION

OPERATION



[Fig. 242: Transmission Oil Pump Flow Diagram]

Courtesy of CHRYSLER GROUP, LLC

1- SYSTEM PRESSURE VALVE	4 - SUMP
2 - PUMP	5 - PRESSURE PIPE
3 - INTAKE PIPE	6 - RETURN OF REDUNDANT OIL

The transmission oil pump is driven by a chain and sprocket. The oil pump has two intake ports and two exhaust ports. The pump draws fluid through a filter and pressurizes the fluid as the pump rotates. After the fluid is pressurized, it exits the pump through two exhaust ports that feed the system pressure valve. The system pressure valve maintains fluid pressure and allows excess pressure to return to the pump. This reduces cavitation and noise.

REMOVAL

REMOVAL

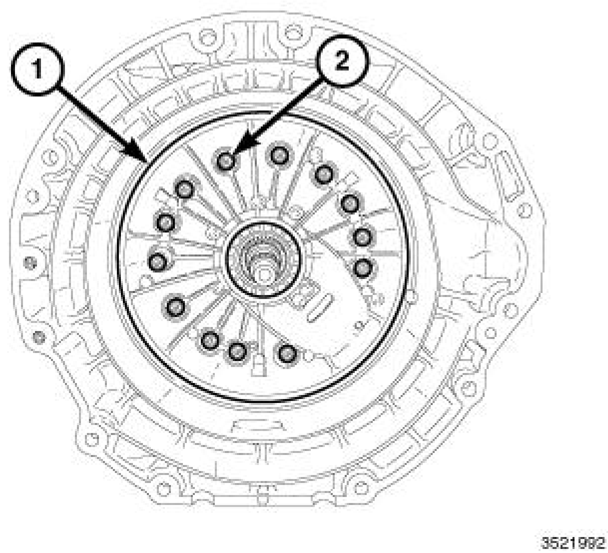


Fig. 243: Thirteen Oil Pump Housing Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Remove the transmission. Refer to **REMOVAL**.
2. Remove the valve body. Refer to **VALVE BODY, REMOVAL**.
3. Remove the thirteen oil pump assembly to case bolts (2).

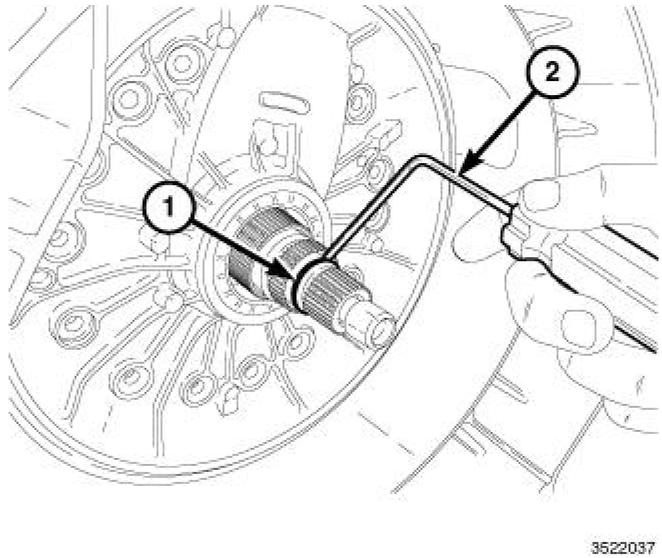

Fig. 244: Input Shaft O-Ring & Small Pick
Courtesy of CHRYSLER GROUP, LLC

4. Remove the input shaft O-ring (1) using a small pick (2) or equivalent.

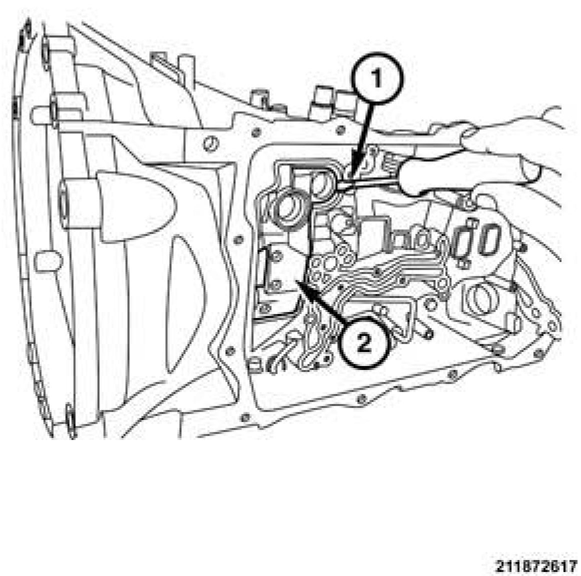

Fig. 245: Prying Oil Pump Housing Away From Case
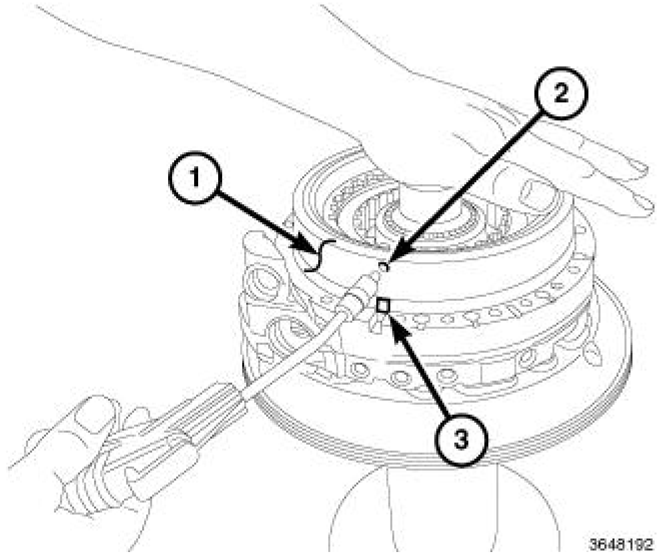
Courtesy of CHRYSLER GROUP, LLC

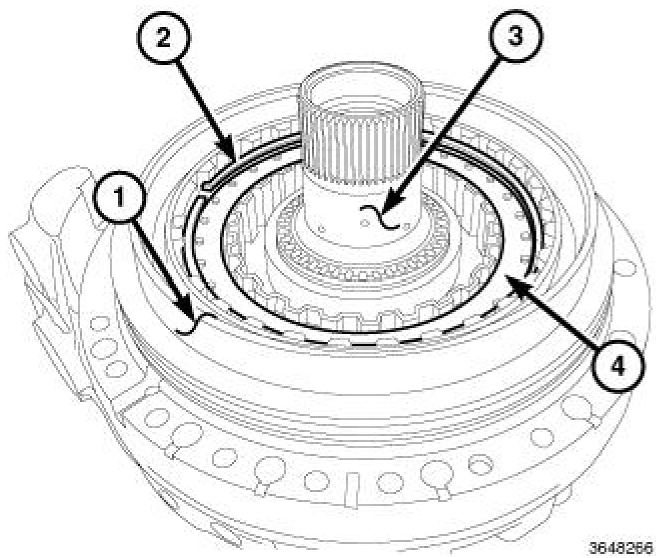
5. Carefully pry the oil pump housing (1) away from the case (2) with a small flat blade screwdriver or equivalent through the case opening.
6. From the front of the transmission, remove the oil pump housing.



[Fig. 246: B-Piston, Hole & B-Piston Alignment Tab](#)
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Apply air pressure slowly, oil may spray when B-piston releases from the assembly.**

7. With one hand above B-piston (1), carefully apply air pressure into the hole directly above the B-piston alignment tab (3) to remove B-piston (2) from the assembly.



[Fig. 247: Outer Ring, Snap Ring, Hub & Spacers](#)
Courtesy of CHRYSLER GROUP, LLC

8. Remove the outer ring (1) (inside B-piston).
9. Remove the snap ring (2).
10. Remove the clutches and spacers (4).
11. Remove the hub (3).

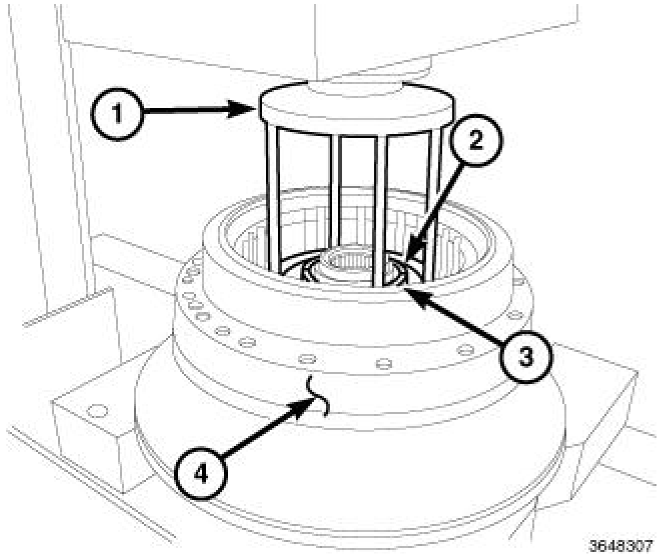


Fig. 248: Oil Pump Housing Assembly
Courtesy of CHRYSLER GROUP, LLC

12. Position the oil pump housing assembly (4) in a suitable press.
13. Using (special tool #8285, Compressor, Spring) (1), press on the fingers of the piston retainer to remove tension on the split retaining ring (2), and remove the two halves of the retaining ring (2).

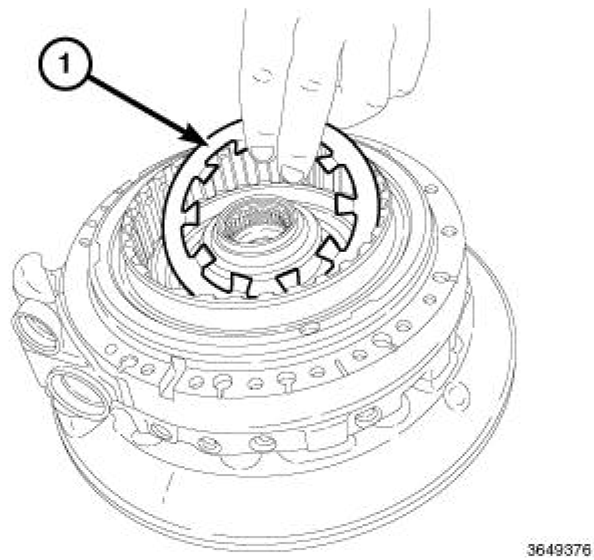

Fig. 249: Piston Retaining Ring And Piston

16. Remove the oil pump seal (2).

ASSEMBLY

TRANSMISSION OIL PUMP

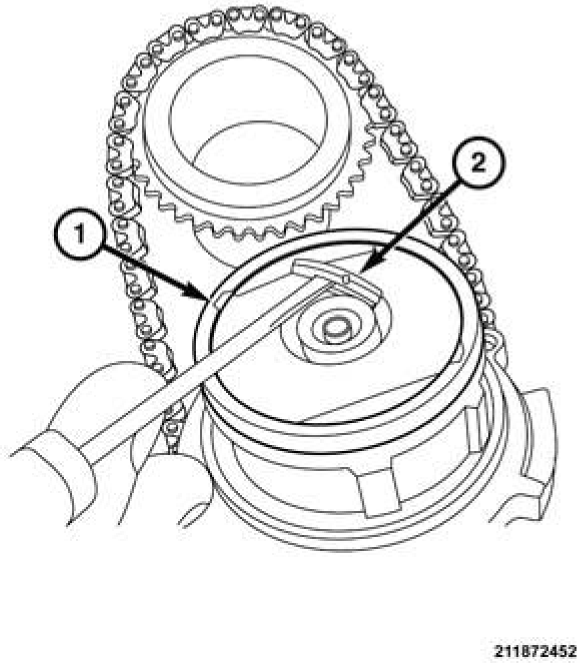

Fig. 264: Removing Oil Pump O-Ring
Courtesy of CHRYSLER GROUP, LLC

1. Install the transmission oil pump seal (2).

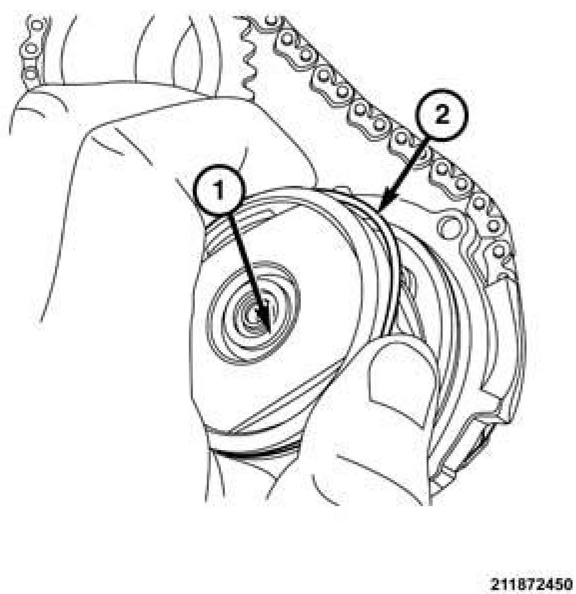

Fig. 265: Oil Pump Housing & O-Ring
Courtesy of CHRYSLER GROUP, LLC

2. Install the transmission oil pump O-ring (2).
3. Carefully seat the transmission oil pump into the housing, make sure the pump is seated properly.

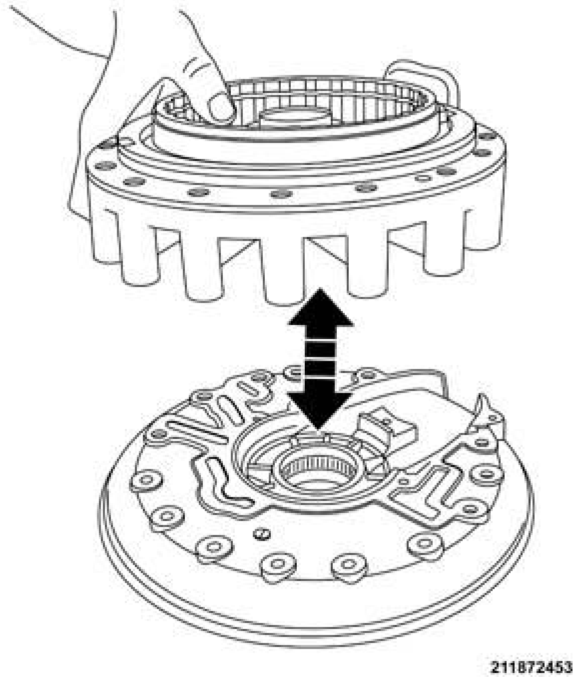

Fig. 266: Two Halves Of Oil Pump
Courtesy of CHRYSLER GROUP, LLC

4. Install the two transmission oil pump housing halves together.

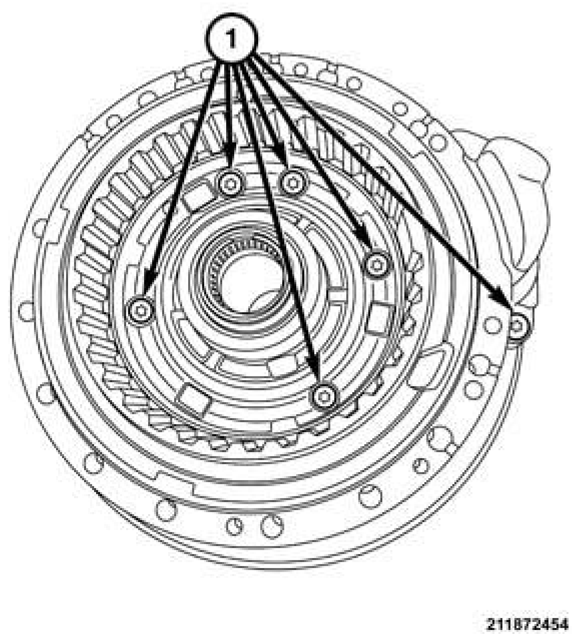

Fig. 267: Oil Pump Torx(R) Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Install six

NEW

transmission oil pump housing TorxÂ® bolts (1).

6. Tighten the bolts to 5 N.m (44 in. lbs). plus 45Â°.

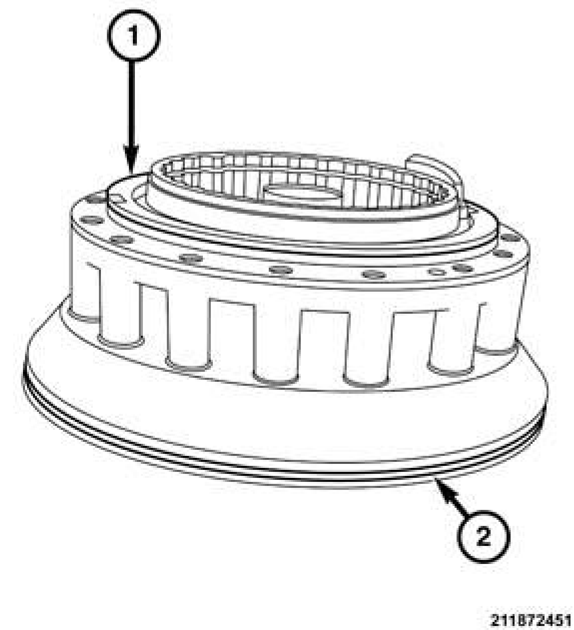

Fig. 268: Inner & Outer Oil Pump O-Rings
Courtesy of CHRYSLER GROUP, LLC

7. Replace the inner and outer transmission oil pump housing O-rings (1).

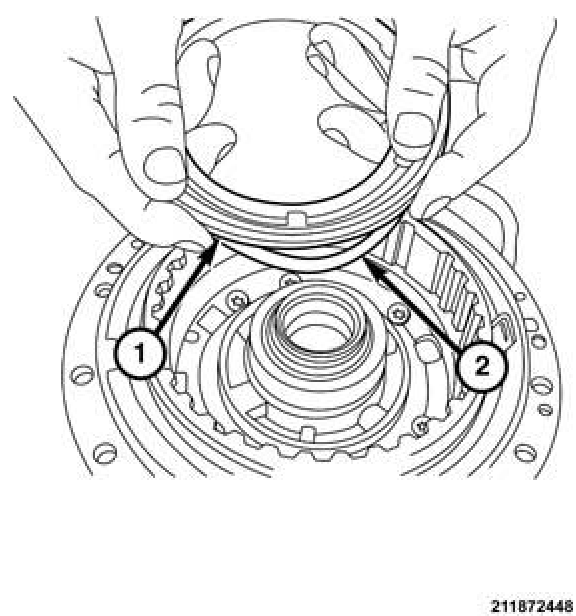

Fig. 269: A-Piston & Seal
Courtesy of CHRYSLER GROUP, LLC

8. Replace the A- piston seal (2) and install the A-piston (1).

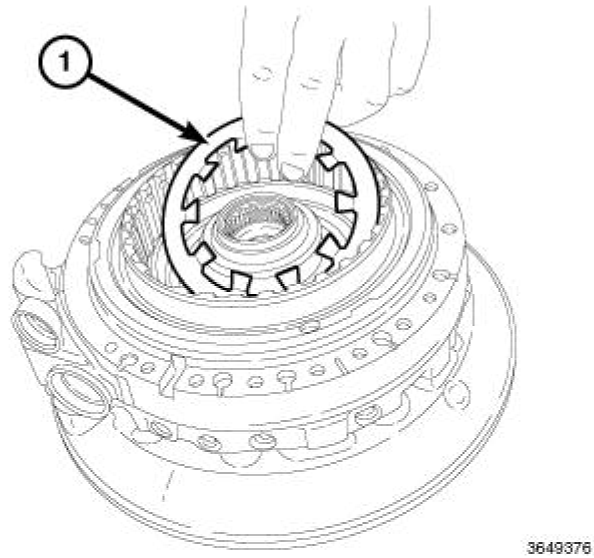

Fig. 270: Piston Retaining Ring And Piston
Courtesy of CHRYSLER GROUP, LLC

9. Install the belleville spring (1).

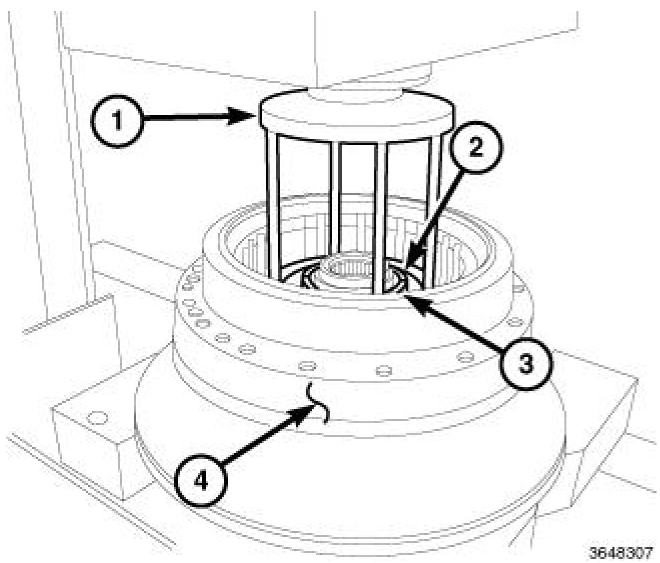

Fig. 271: Oil Pump Housing Assembly
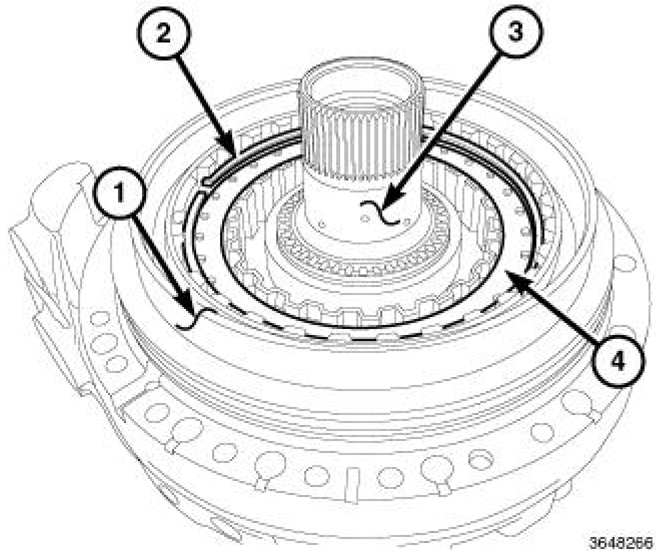
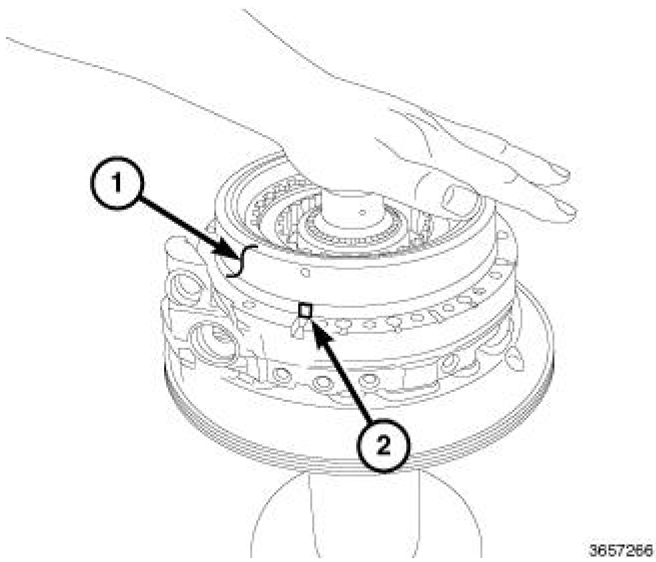
Courtesy of CHRYSLER GROUP, LLC

10. Position the transmission oil pump housing assembly (4) in a suitable arbor press.
11. Using (special tool #8285, Compressor, Spring) (1), press on the fingers of the piston retaining ring to remove tension, and install the two halves of the split retainer ring (2).



[Fig. 272: Outer Ring, Snap Ring, Hub & Spacers](#)
Courtesy of CHRYSLER GROUP, LLC

12. Install the hub (3).
13. Install the clutches and spacers (4).
14. Install the snap ring (2).
15. Install the outer ring (1) (below B-piston).



[Fig. 273: B-Piston Alignment Tab & B-Piston](#)
Courtesy of CHRYSLER GROUP, LLC

16. Position the B-piston alignment tab (2) above the notch and install B-piston (1) on the assembly.
17. Install the transmission oil pump. Refer to **PUMP, TRANSMISSION OIL, INSTALLATION** .

INSTALLATION

INSTALLATION

NOTE: **If oil pump was disassembled, replace all O-rings.**

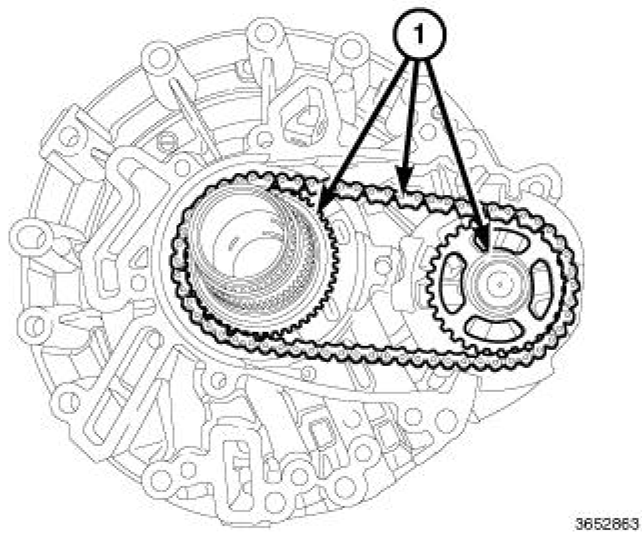


Fig. 274: Drive Sprocket, Chain And Pump Body
Courtesy of CHRYSLER GROUP, LLC

1. Install the drive sprocket, chain and pump body (1) as an assembly into the oil pump housing.

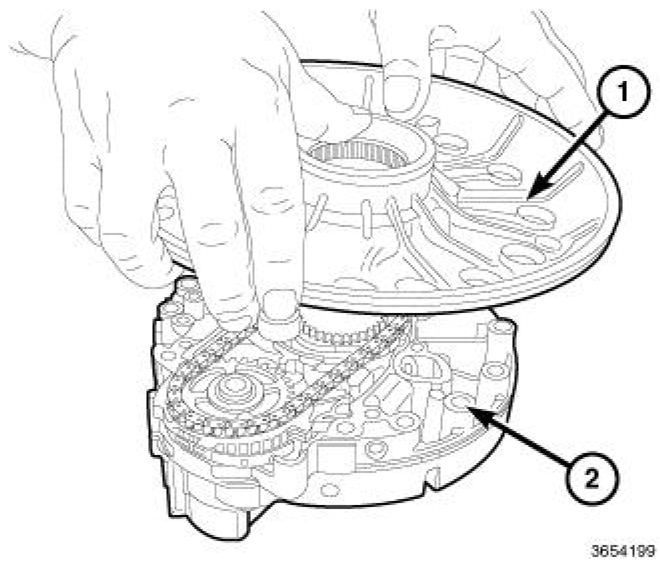

Fig. 275: Front Cover & Oil Pump Housing
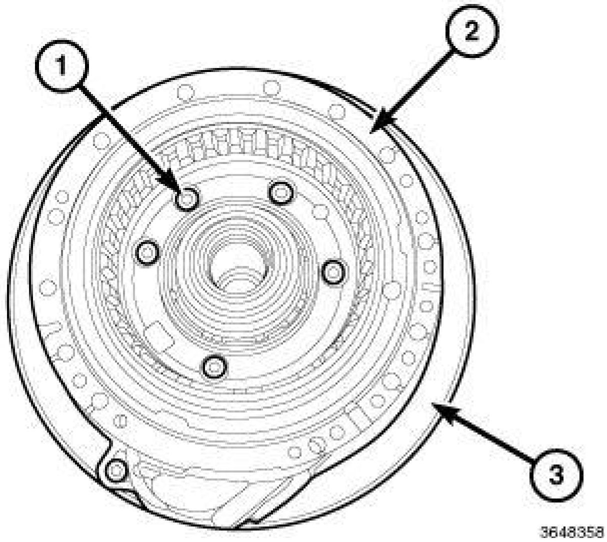
Courtesy of CHRYSLER GROUP, LLC

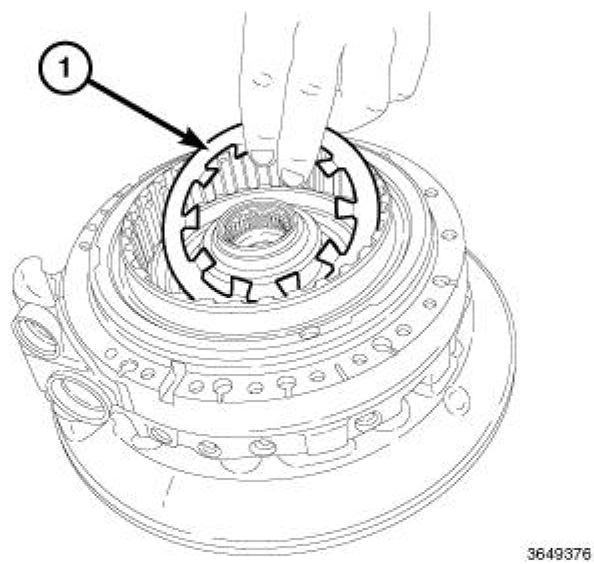
2. Set the pump cover (1) onto the oil pump housing (2).



[Fig. 276: Oil Pump Bolts](#)
Courtesy of CHRYSLER GROUP, LLC

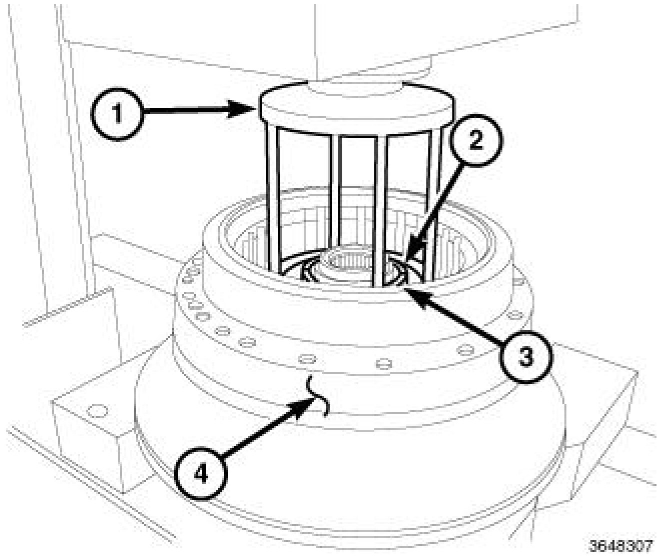
NOTE: The oil pump bolts under the A-clutch must be replaced.

3. Install the **NEW** six bolts (1) and tighten to 5 N.m (44 in. lbs.) plus 45Â°.



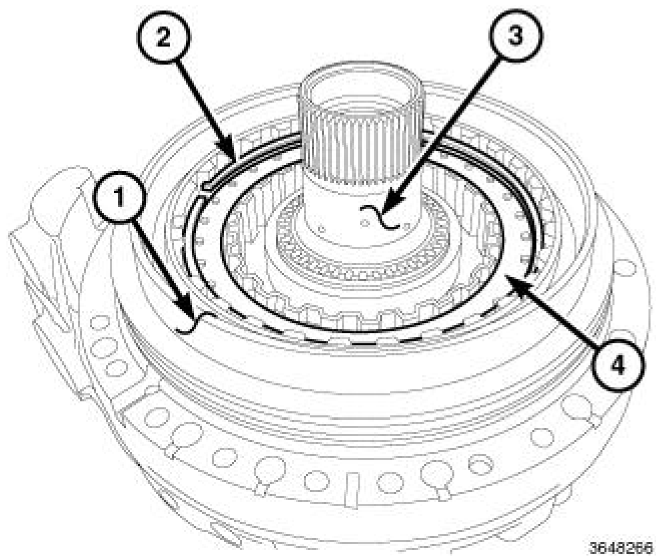
[Fig. 277: Piston Retaining Ring And Piston](#)
Courtesy of CHRYSLER GROUP, LLC

4. Install the piston plate and the piston retainer.



[Fig. 278: Oil Pump Housing Assembly]
Courtesy of CHRYSLER GROUP, LLC

5. Position the oil pump housing assembly (4) in a suitable arbor press.
6. Using (special tool #8285, Compressor, Spring) (1), press on the fingers of the piston retainer and install the two halves of the retaining ring (2).



[Fig. 279: Outer Ring, Snap Ring, Hub & Spacers]
Courtesy of CHRYSLER GROUP, LLC

7. Install the hub (3).
8. Install the clutches and spacers (4).
9. Install the snap ring (2).
10. Install the outer ring (1) (inside B-piston).
11. Install the B-piston.

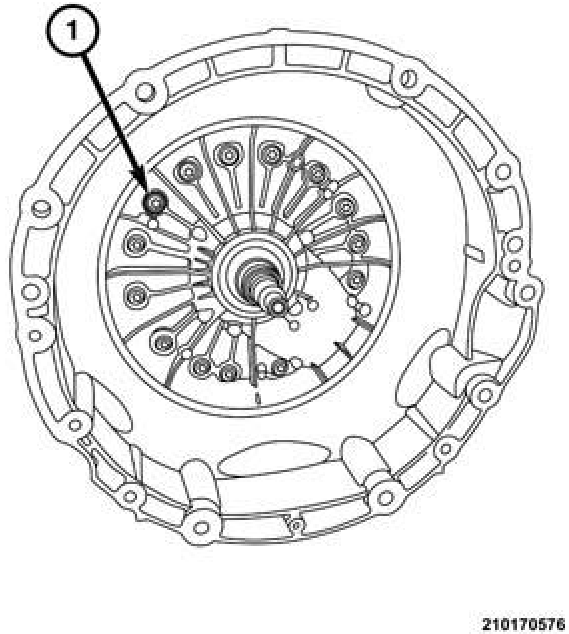


Fig. 280: Oil Pump Assembly To Case Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Firmly press the oil pump in place hand before drawing it in with bolts.

12. Install the 14 **new** oil pump cover retaining bolts (2) and tighten the oil pump cover as follows:
    a. In order to seat the oil pump cover properly, pre tighten bolts one, seven and nine to 6 N.m (53 in. lb.).
    b. Working in a clockwise pattern, beginning with number one, tighten to 10 N.m (89 in. lb.).
    c. Working in a clockwise pattern, beginning with number one, tighten an additional 90Â°.

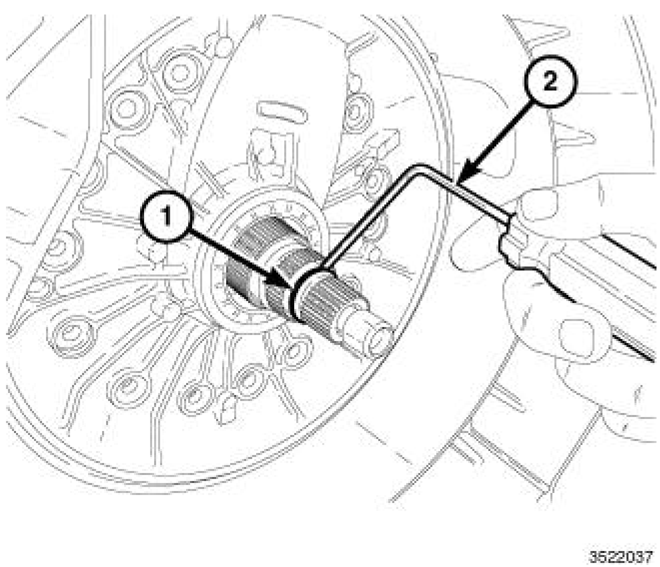

Fig. 281: Input Shaft O-Ring & Small Pick
Courtesy of CHRYSLER GROUP, LLC

13. Install the **new** input shaft O-ring (1).
14. Install the valve body. Refer to **VALVE BODY, INSTALLATION**.
15. Install the transmission. Refer to **INSTALLATION**.

SEAL, OUTPUT SHAFT

REMOVAL

OUTPUT SHAFT SEAL

CAUTION: Do not allow the propeller shaft to hang from the vehicle unsupported. Damage may occur to the joint, boot, and center bearing from over-angulation.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

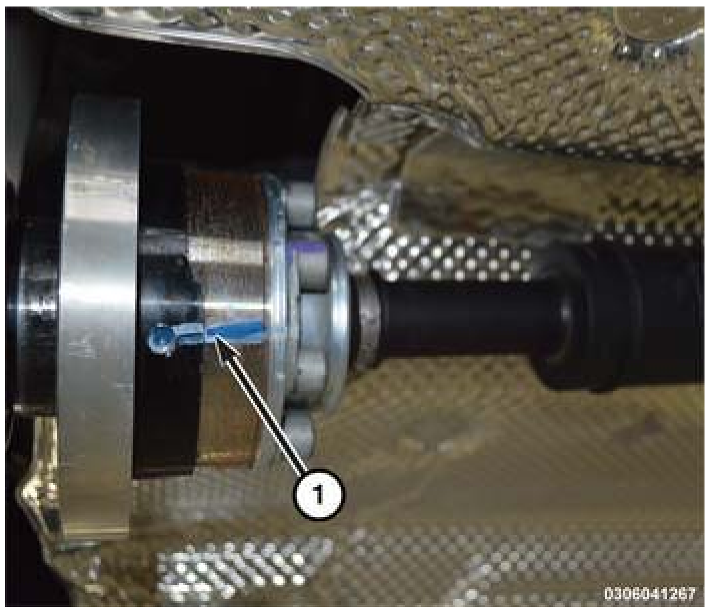

Fig. 282: Alignment Index Marks
Courtesy of CHRYSLER GROUP, LLC

2. Apply alignment index mark (1) to the transmission flange.

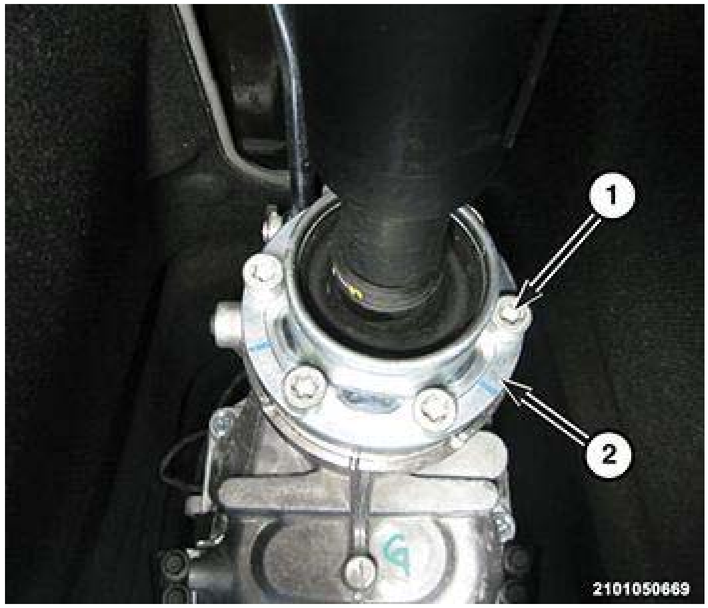

Fig. 283: Bolts And Washers & Transmission Flange
Courtesy of CHRYSLER GROUP, LLC

3. Remove the drive shaft bolts to transmission flange and position aside the drive shaft. Secure the drive shaft with a strap or equivalent.

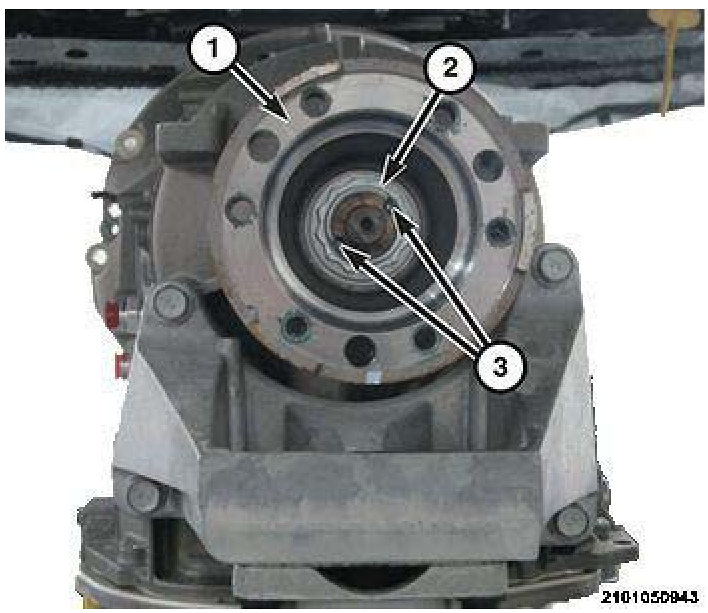

Fig. 284: Drive Shaft Flange, Nut & Staking Area
Courtesy of CHRYSLER GROUP, LLC

4. Using a suitable punch, remove the staking (3) from the drive shaft nut (2).
5. Remove the drive shaft flange nut (2) using a 34 mm 12 point socket (3) and (special tool #C-3281, Holder, Flange) (2) to hold the flange (1).
6. Remove the flange and flange dust seal.
7. Remove the output shaft seal with suitable screw and slide hammer.

INSTALLATION

OUTPUT SHAFT SEAL

CAUTION: The seal must be installed flush with the case. Driving the seal deeper could damage the seal causing a leak.

1. Position the new output shaft seal over the output shaft and against the transmission case.
2. Using (special tool #9677, Installer, Seal) install the output shaft seal.
3. Verify that the transmission is in PARK in order to prepare for the installation of the output shaft nut.

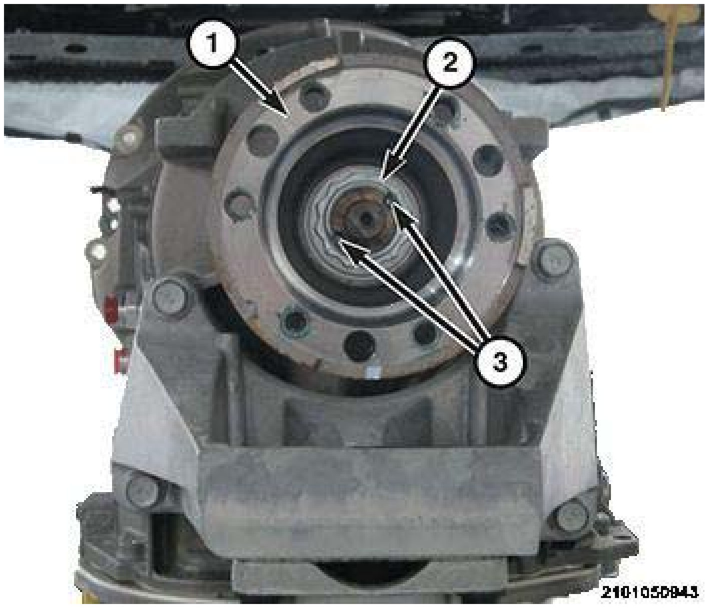

Fig. 285: Drive Shaft Flange, Nut & Staking Area
Courtesy of CHRYSLER GROUP, LLC

4. Install the drive shaft flange (1) onto the output shaft and install a **NEW** flange nut (2). Tighten the nut, with a 34 mm 12 point socket, to the proper **SPECIFICATIONS**.
5. Stake (3) the nut.
6. Install the drive shaft. Refer to **INSTALLATION** .
7. Perform the CHECK OIL LEVEL procedure. Refer to **FLUID AND FILTER, STANDARD PROCEDURE** or **FLUID AND FILTER, STANDARD PROCEDURE**.

SEAL, TORQUE CONVERTER HUB

REMOVAL

REMOVAL

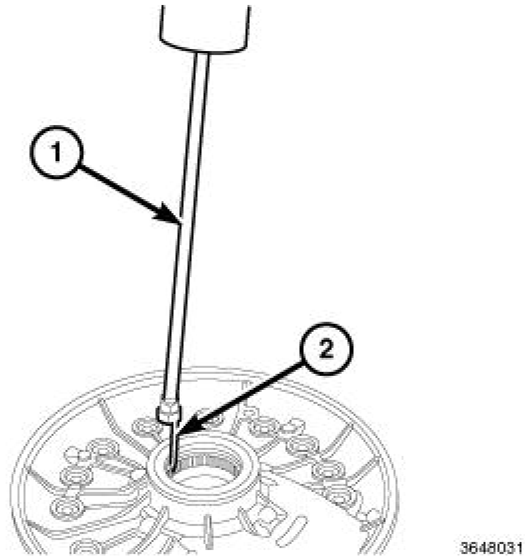

Fig. 286: Seal Remover & Slide Hammer
Courtesy of CHRYSLER GROUP, LLC

1. Remove the torque converter. Refer to **TORQUE CONVERTER, REMOVAL**.
2. Using (special tool #9667, Remover, Seal) and (special tool #C-3752, Slide Hammers) remove the torque converter hub seal.

INSTALLATION

INSTALLATION

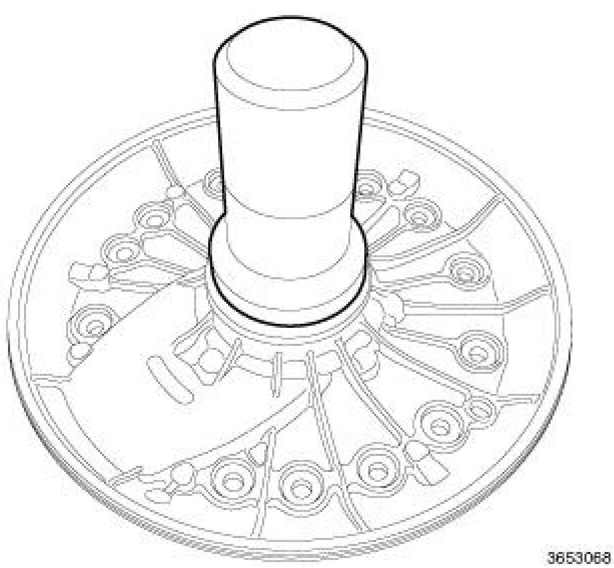

Fig. 287: Oil Pump Cover Oil Seal
Courtesy of CHRYSLER GROUP, LLC

1. Position the torque converter hub seal over the input shaft and against the transmission oil pump cover.
2. Using (special tool #10375, Installer, Oil Pump Cover Oil Seal) install a new torque converter hub seal.
3. Install the torque converter. Refer to **TORQUE CONVERTER, INSTALLATION**.

SENSOR, SPEED

DESCRIPTION

DESCRIPTION

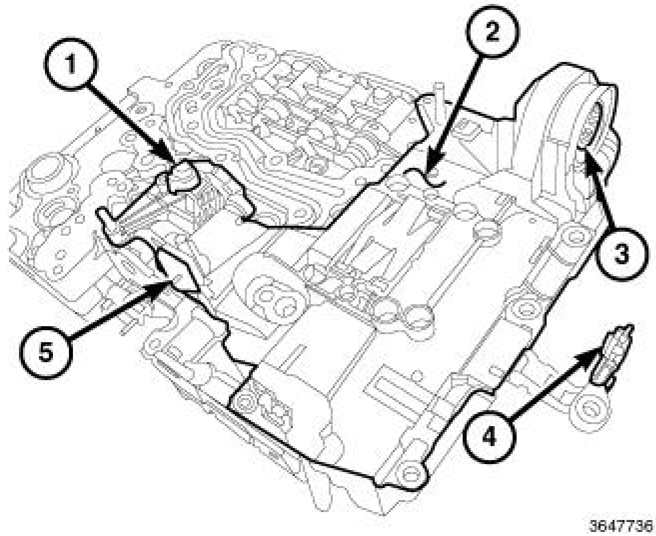

Fig. 288: Input Speed Sensor, Output Speed Sensor, Tcm (Includes Transmission Temperature Sensor) & Park Position Sensor
Courtesy of CHRYSLER GROUP, LLC

1 - Input Speed Sensor
2 - TCM (Includes Transmission Temperature Sensor)
3 - External Wire Harness Connector
4 - Output Speed Sensor
5 - Park Position Sensor
Ā

CAUTION: **The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Failure to follow these instructions may result in damage to the TCM/TCMA.**

The input speed sensor (1) and the output speed sensor (4) are integrated components of the TCMA and not serviced individually.

OPERATION

OPERATION

CAUTION: **The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Failure to follow these instructions may result in damage to the TCM/TCMA.**

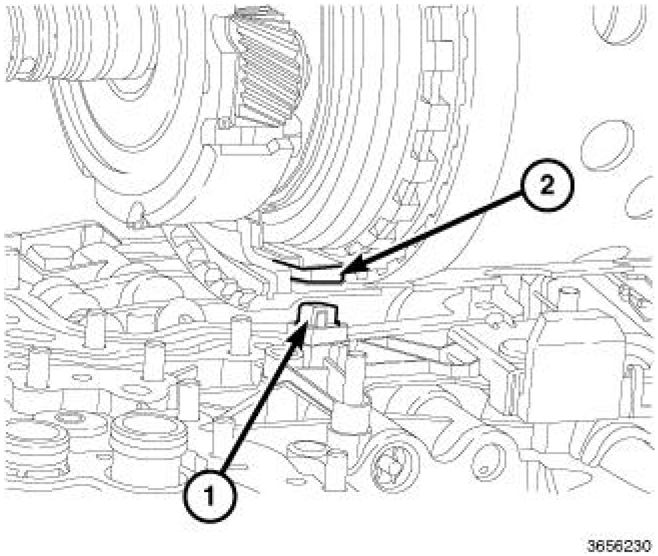

Fig. 289: ISS & Magnetic Ring
Courtesy of CHRYSLER GROUP, LLC

The input speed sensor (ISS) and output speed sensor (OSS) are Hall-effect sensors that measure shaft rotational speed. The ISS (1) is located at the front of the TCMA and reads input shaft speed from the magnetic ring (2) on the P2 carrier.

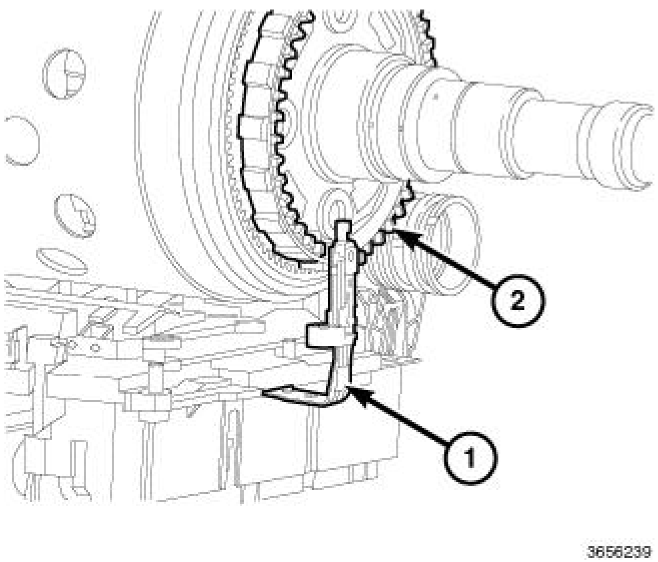

Fig. 290: OSS & P4 Carrier
Courtesy of CHRYSLER GROUP, LLC

The OSS (1) is located at the back of the TCMA and reads output shaft speed from the P4 carrier (2).

SHIFTER, TRANSMISSION

DESCRIPTION

FLOOR SHIFT

The Electronic Shifter (E-Shifter) is an electronic switch/module floor mounted device, using CAN messaging to communicate driver requests for transmission gear changes without a mechanical connection.

PADDLE SHIFT

Some vehicles may be equipped with optional paddle shift. For more information on paddle shift, refer to **SWITCH, REMOTE RADIO, DESCRIPTION** .

OPERATION

FLOOR SHIFT

The E-Shifter:

- communicates with the Transmission Control Module (TCM) via a Controller Area Network (CAN).
- incorporates a solenoid that allows the lever to be locked for purposes of Brake Transmission Shift Interlock (BTSI) function.
- lever-lock function is controlled electronically by the TCM via CAN message, and mechanically by the release trigger on the knob.
- indicates the selected/non-selected gears provided via illumination of PRNDM+- characters on knob.
- lever-position feedback is provided via mechanical detents, which also keep the lever in the desired position.
- communicates driver requests for transmission gear changes without a mechanical connection.
- is comprised of an upper knob and a lower base, which can be serviced separately.
- on some models, may have steering wheel-mounted paddle shifters available. Refer to **SWITCH, REMOTE RADIO, DESCRIPTION** .

The Electronic Shifter (E-Shifter) offers (P, R, N, D, M) modes of function.

The M selection (manual mode) is engaged by moving the shift-lever sideways to M. Requests to up/down shift are achieved by moving the lever fore/aft once in the manual position.

PADDLE SHIFT

Some vehicles may be equipped with optional steering wheel paddle shifters.

The steering wheel paddle shifters may be enabled or disabled in the default drive mode. The vehicle will start in default mode unless it is in valet mode.

To enable the steering wheel paddle shifters, press the **ON** button on the touchscreen.

To disable the steering wheel paddle shifters, press the **OFF** button on the touchscreen.

Fig. 291: Paddle Shifter Enable/Disable Screen
Courtesy of CHRYSLER GROUP, LLC

For additional information, refer to **SWITCH, REMOTE RADIO, OPERATION** .

STANDARD PROCEDURE

MANUAL PARK RELEASE DISENGAGE

The Manual Park Release (MPR) lever is used for putting the transmission in neutral anytime the vehicle needs to be moved with the engine off in neutral. This is achieved by a cable attached to the transmission park pawl. When the cable is pulled, the transmission is put into neutral, and when the cable is released, the transmission is back into park.

WARNING: **Always secure your vehicle by fully applying the parking brake, before activating the Manual Park Release. Activating the Manual Park Release will allow your vehicle to roll away if it is not secured by the parking brake or by proper connection to a tow vehicle. Activating the Manual Park Release on an unsecured vehicle could lead to serious injury or death for those in or around the vehicle.**

NOTE: **Apply the parking brake.**

Fig. 292: Manual Park Release Lever Access Panel
Courtesy of CHRYSLER GROUP, LLC

1. Remove the Manual Park Release (MPR) lever access panel (1).

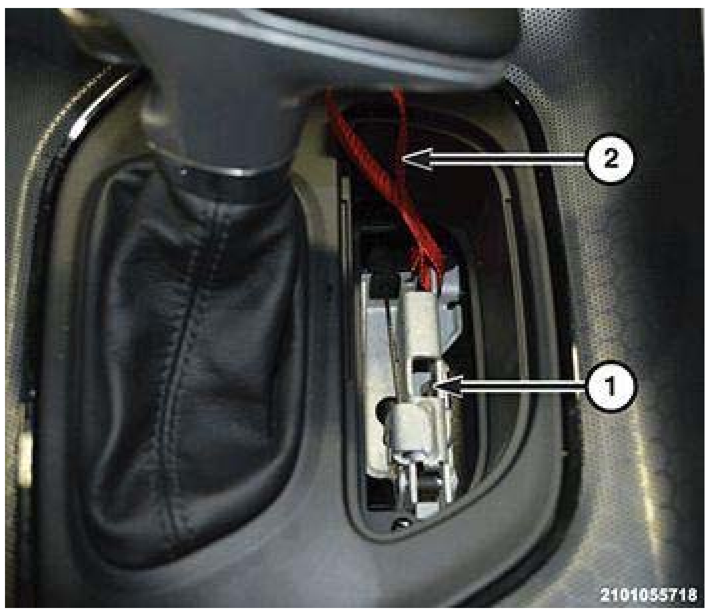

Fig. 293: Locking Tab & Tether
Courtesy of CHRYSLER GROUP, LLC

2. Release the locking tab (1) with a screw driver or equivalent and pull the tether (2).
3. While holding the locking tab (1) to the right, pull the tether (2) up and rearward, until it locks in place in the vertical position. The transmission is now out of park, and the vehicle can be moved.

MANUAL PARK RELEASE ENGAGE

Fig. 294: Releasing Locking Tab
Courtesy of CHRYSLER GROUP, LLC

1. Push the Manual Park Release (MPR) lever rearward, and use a small screwdriver or equivalent to release the locking tab (1).

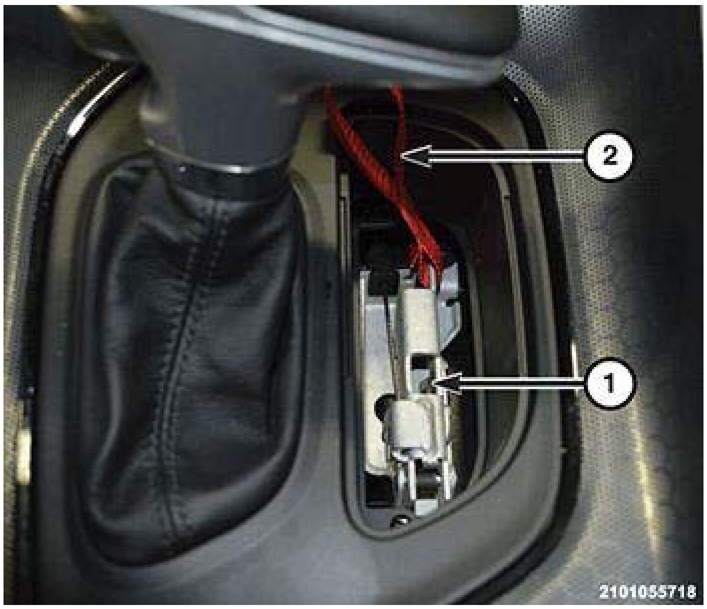

Fig. 295: Locking Tab & Tether
Courtesy of CHRYSLER GROUP, LLC

2. Allow the MPR lever to return to the engaged position.
3. Make sure that the locking tab (1) is in position, gently pull on the tether (2) to confirm the lever is locked.

Fig. 296: Manual Park Release Lever Access Panel
Courtesy of CHRYSLER GROUP, LLC

4. Install the MPR lever access panel.

REMOVAL

REMOVAL

1. Apply the parking brake.
2. Using a trim stick or equivalent, carefully release the retaining clips and lift the shifter bezel.

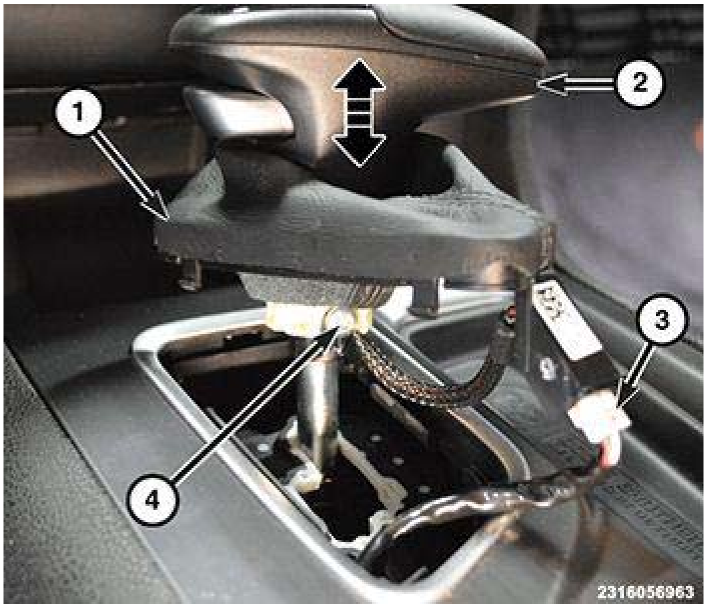

Fig. 297: Shifter Bezel, Knob, Connector & Screw
Courtesy of CHRYSLER GROUP, LLC

3. Unplug the wire harness connector (3) between the knob and lower base.

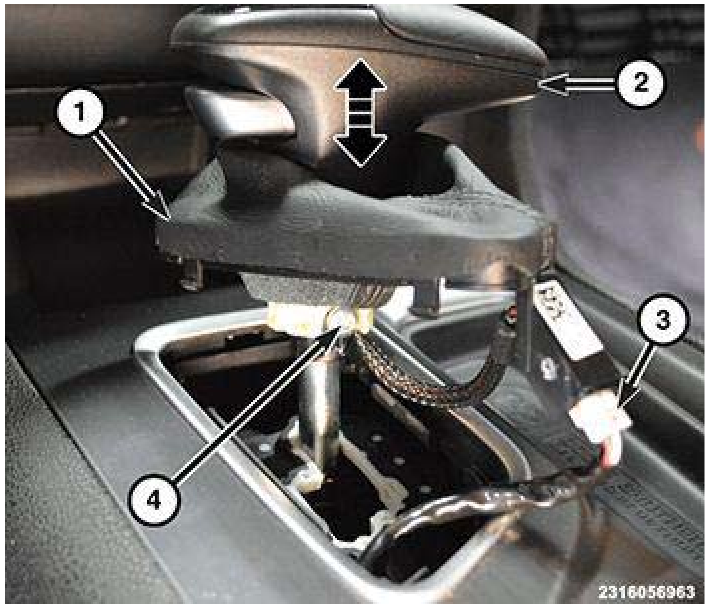

Fig. 298: Shifter Bezel, Knob, Connector & Screw
Courtesy of CHRYSLER GROUP, LLC

4. Remove the shifter knob screw (4) and remove the shifter knob (2) and shifter bezel (1).

Fig. 299: Bezel Panel & Trim Stick
Courtesy of CHRYSLER GROUP, LLC

5. Using a trim stick (2) or equivalent, starting at the rear of the console bezel panel (1), carefully release the retaining clip and lift the console bezel panel. Disconnect the wire harness connectors and remove the console bezel panel.

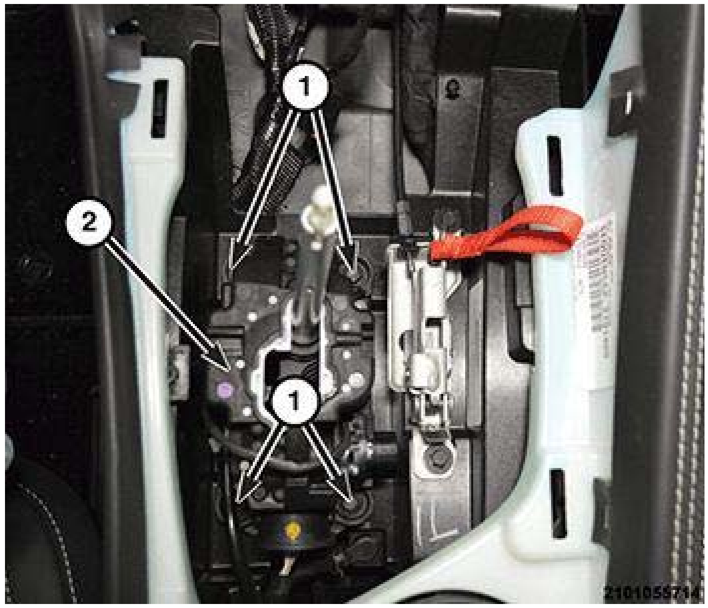

Fig. 300: Shifter Assembly & Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Remove the shifter bolts (1) and lift the shifter assembly (2) up enough to allow access to the shifter wire harness connector.

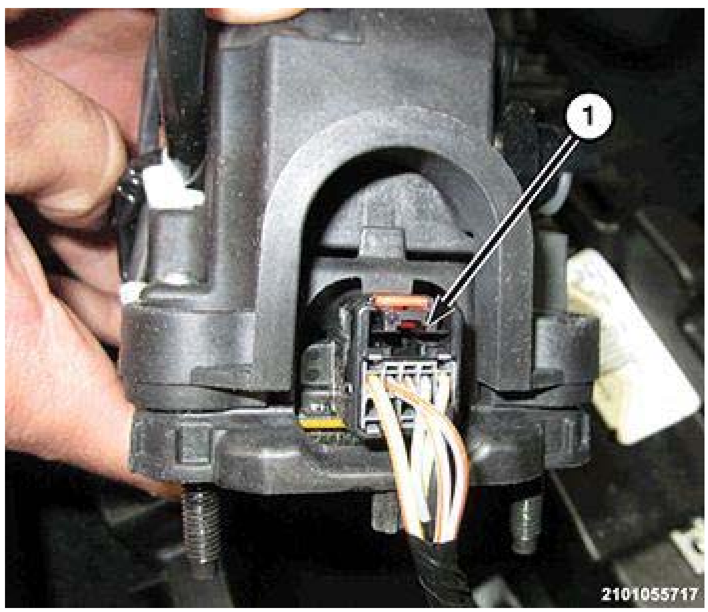

Fig. 301: Shifter Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

7. Disconnect the shifter wire harness connector (1).
8. Remove the shifter from the vehicle.

INSTALLATION

INSTALLATION

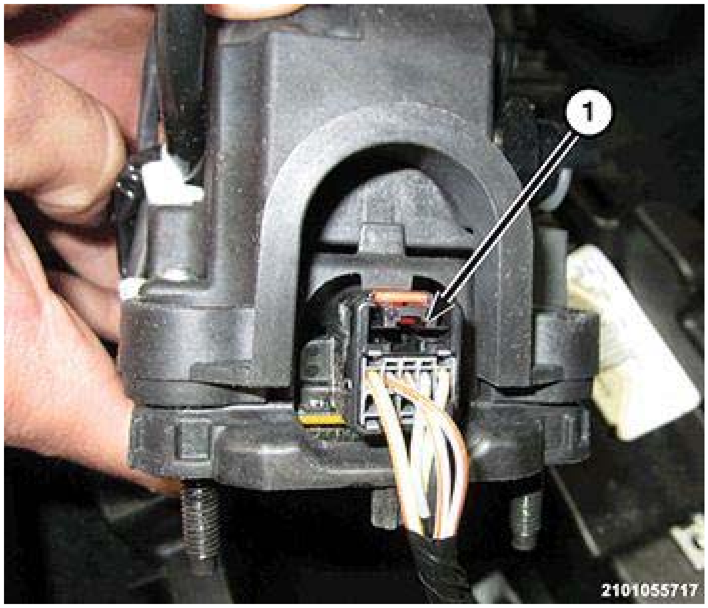

Fig. 302: Shifter Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Position the shifter assembly in place and connect the shifter wire harness connector (1).

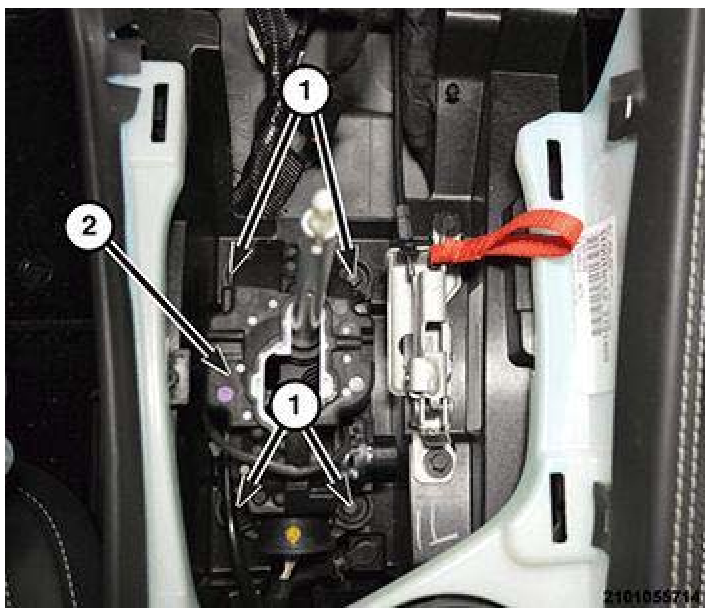

Fig. 303: Shifter Assembly & Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Install the shifter bolts (1) and tighten to the proper **SPECIFICATIONS** .

Fig. 304: Bezel Panel & Trim Stick
Courtesy of CHRYSLER GROUP, LLC

3. Install the shifter bezel panel (1).

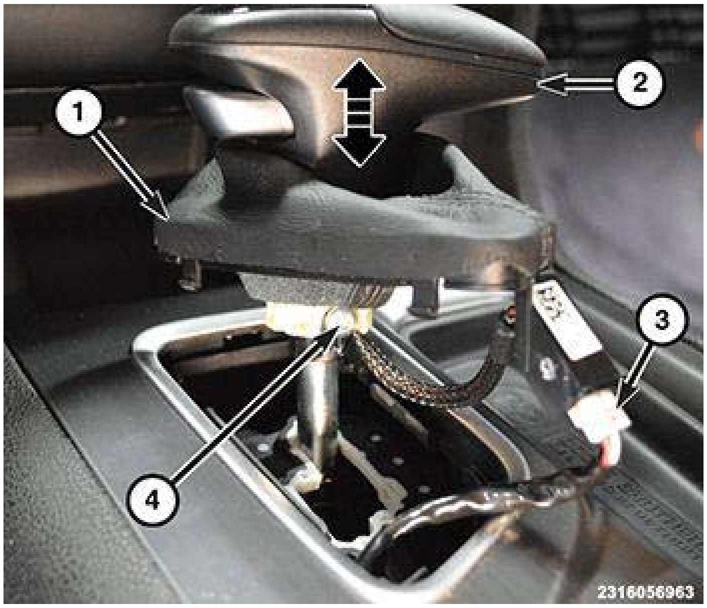

Fig. 305: Shifter Bezel, Knob, Connector & Screw
Courtesy of CHRYSLER GROUP, LLC

4. Install the shifter knob (2) and bezel (1).
5. Install the shifter knob screw (4).
6. Connect the shifter wire harness connector (3).

SOLENOID, TRANSMISSION

DESCRIPTION

DESCRIPTION

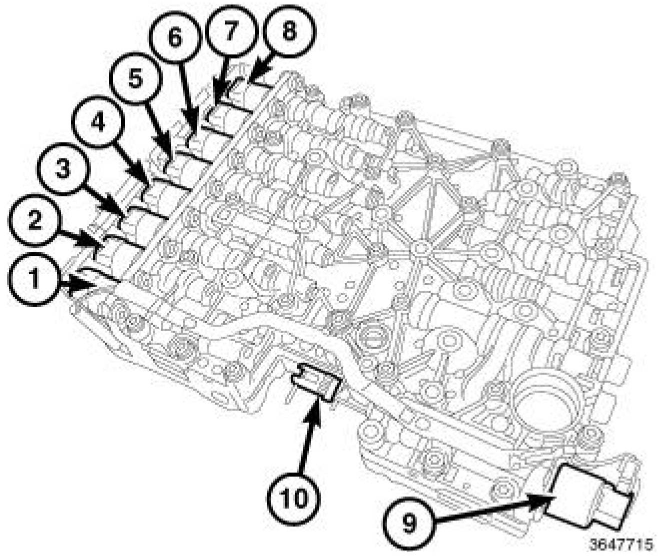

Fig. 306: Solenoid A D E C & Park Release Mechanical Valve
Courtesy of CHRYSLER GROUP, LLC

1 - Solenoid A
2- Solenoid D
3 - Solenoid B
4 - Solenoid E
5 - Solenoid C
6 - TCC Solenoid
7 - Line Pressure Solenoid
8 - Park Release Solenoid
9 - Park Hold Mechanical Solenoid
10 - Park Release Mechanical Valve

CAUTION: The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Failure to follow these instructions may result in damage to the TCM/TCMA.

The solenoids are integrated into the Transmission Control Module Assembly (TCMA) of the 8HP transmission and are not replaceable individually.

OPERATION

OPERATION

CAUTION: The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Failure to follow these instructions may result in damage to the TCM/TCMA.

The TCM will actuate the valves via solenoids based on the position of the shifter, transmission fluid temperature, engine operating conditions, traction conditions, and driver demands. During a shift, the TCM will actuate the solenoids to match the gear ranges to the optimal torque range of the engine based on the position of the accelerator pedal, shifter, and vehicle speed as determined by the PCM based on input from the Vehicle Speed Sensor (VSS) and ABS module.

TORQUE CONVERTER

DESCRIPTION

DESCRIPTION

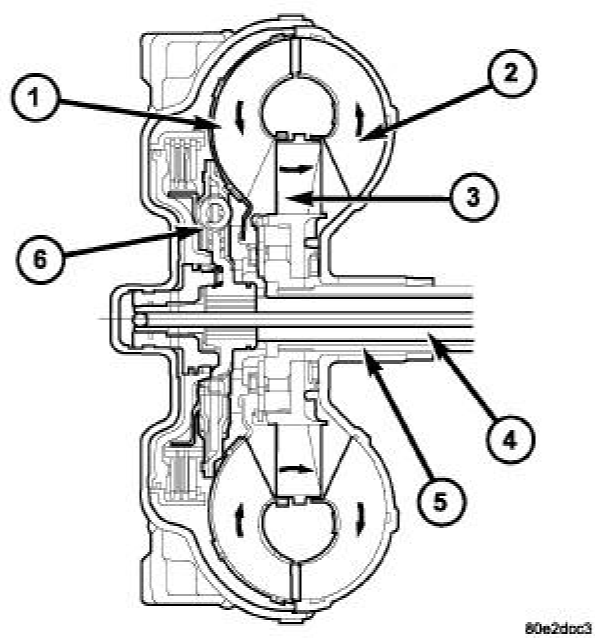

Fig. 307: Torque Converter
Courtesy of CHRYSLER GROUP, LLC

1 - TURBINE
2 - IMPELLER
3 - STATOR
4 - INPUT SHAFT
5 - STATOR SHAFT
6 - TURBINE DAMPER

CAUTION: The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid.

The torque converter is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine (1), a stator (3), an overrunning clutch, an impeller (2), and an electronically applied converter clutch. The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The converter clutch engages in third through fifth gears. The torque converter hub drives the transmission oil

(fluid) pump.

A turbine damper (6) has been added for some applications to help improve vehicle noise, vibration, and harshness (NVH) characteristics.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

IMPELLER

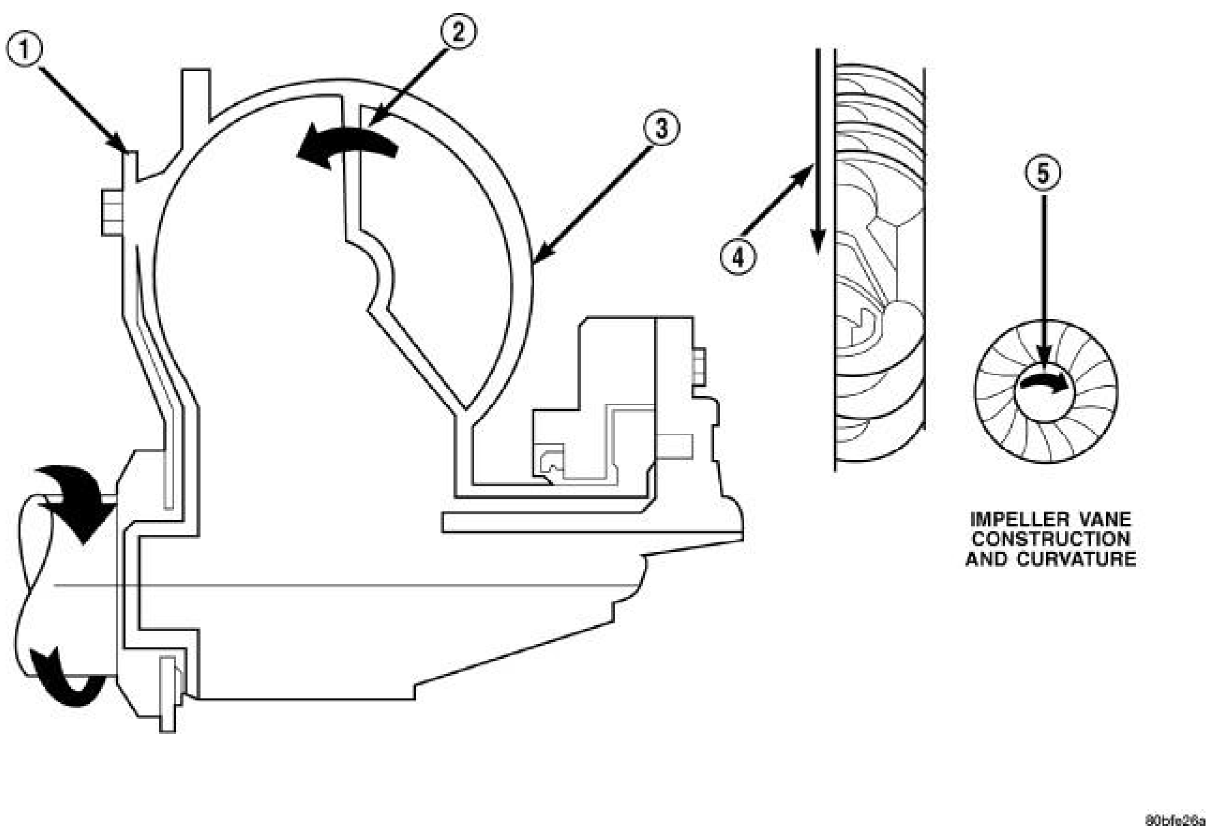

Fig. 308: Identifying Impeller

1 - ENGINE FLEXPLATE
2 - OIL FLOW FROM IMPELLER SECTION INTO TURBINE SECTION
3 - IMPELLER VANES AND COVER ARE INTEGRAL
4 - ENGINE ROTATION
5 - ENGINE ROTATION

The impeller (3) is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving members of the system.

TURBINE

1 - TURBINE VANE
2 - ENGINE ROTATION
3 - INPUT SHAFT
4 - PORTION OF TORQUE CONVERTER COVER
5 - ENGINE ROTATION
6 - OIL FLOW WITHIN TURBINE SECTION

The turbine (1) is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

STATOR

2 - ROLLER
3 - SPRING
4 - INNER RACE

The stator assembly (1-4) is mounted on a stationary shaft which is an integral part of the oil pump.

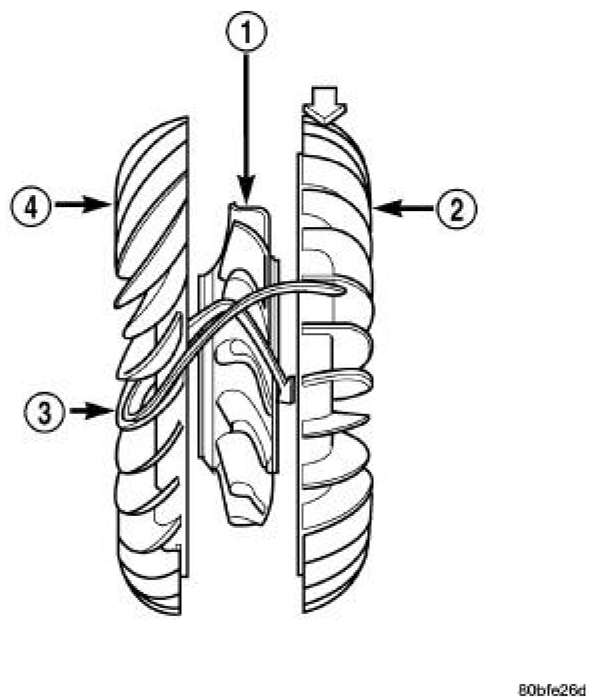

Fig. 311: Identifying Stator Components
Courtesy of CHRYSLER GROUP, LLC

1 - STATOR
2 - IMPELLER
3 - FLUID FLOW

4 - TURBINE

The stator (1) is located between the impeller (2) and turbine (4) within the torque converter case. The stator contains a freewheeling clutch, which allows the stator to rotate only in a clockwise direction. When the stator is locked against the freewheeling clutch, the torque multiplication feature of the torque converter is operational.

TORQUE CONVERTER CLUTCH (TCC)

5 - STATOR SHAFT
6 - PISTON
7 - COVER SHELL
8 - INTERNALLY TOOTHED DISC CARRIER
9 - CLUTCH PLATE SET
10 - EXTERNALLY TOOTHED DISC CARRIER
11 - TURBINE DAMPER

The TCC (9) was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller and turbine were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston with friction material was added to the turbine assembly to provide this mechanical lock-up.

In order to reduce heat build-up in the transmission and buffer the powertrain against torsional vibrations, the TCM can duty cycle the torque converter lock-up solenoid to achieve a smooth application of the torque converter clutch. This function, referred to as Electronically Modulated Converter Clutch (EMCC) can occur at various times depending on the following variables:

- Shift lever position
- Current gear range
- Transmission fluid temperature
- Engine coolant temperature
- Input speed
- Throttle angle
- Engine speed

OPERATION

OPERATION

11 - TURBINE DAMPER	

The torque converter housing has a unique shape to incorporate the torque converter clutch and flex plate connection. The torque converter uses the typical turbine, impeller and stator assemblies found in a standard torque converter assembly. The torque converter drives the pump through the splines on the inside of the hub. The torque converter uses a multi-disc torque converter clutch system that improves the durability and the holding pressure in the lock-up circuit. The torque converter incorporates a turbine dampening system. This system suppresses torsional vibrations from the engine to ensure optimal shift quality and reduce noise and vibration concerns.

TCC RELEASE When the TCC is open, the TCC piston is pushed to its default position by torque converter chamber pressure. The torque converter switch valve (SV-TC) provides pressure for torque converter operation which has been regulated by the converter pressure regulating valve (TC-V). After exiting the torque converter, fluid moves into the cooling and lubrication circuits. The converter pressure retention valve (TCH1-V) ensures the torque converter pressure is a minimum of 0.35 bar (5 psi) when the TCC is open.

TCC APPLY When the TCC solenoid is energized, fluid is directed to the torque converter switch valve (SV-TC) and TCC lockup valve (TCC-V). The TCC lockup valve directs fluid to the TCC and torque converter chamber. The torque converter switch valve directs fluid exiting the converter chamber to a secondary pressure retention valve (TCH2-V) which is calibrated to retain 1.0 bar (14.5 psi) of pressure in the converter. The torque converter switch valve also directs line pressure to the cooler and lubrication circuit.

TURBINE

When the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

STATOR

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft. Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counterclockwise direction. When this happens the over-running clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.0:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such as way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling

TORQUE CONVERTER CLUTCH (TCC)

In a standard torque converter, the impeller (2) and turbine are rotating at about the same speed and the stator (3) is freewheeling, providing no torque multiplication. By applying the turbines piston and friction material (9) a total converter engagement can be obtained. The result of this engagement is a direct 1:1 mechanical link

between the engine and the transmission.

HYDRO-MECHANICAL AND ELECTRICAL

The Torque Converter Clutch (TCC) is engaged and released by the Transmission Control Module Assembly (TCMA). The TCC can be engaged and controlled in any forward gear from 1 through 8. In addition, the 8HP transmission incorporates a neutral idle control (NIC) function. Instead of the engine continuing to drive the converter when the vehicle comes to rest, the converter is partially disconnected from the driveline so only a slight residual load remains. Decoupling of the torque converter during NIC is accomplished by allowing clutch B to slip.

REMOVAL

REMOVAL

1. Remove the transmission from the vehicle. Refer to **REMOVAL**.
2. Place a suitable drain pan under the torque converter housing end of the transmission.

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

3. Pull the torque converter forward until the center hub clears the oil pump seal.
4. Separate the torque converter from the transmission.

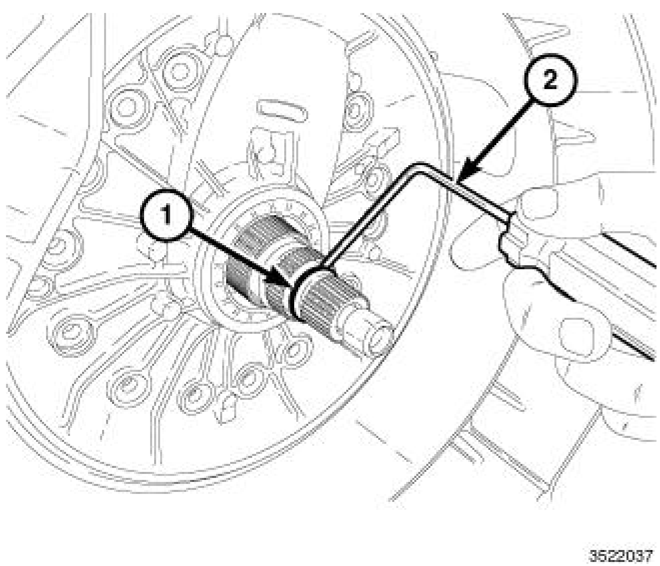

Fig. 314: Input Shaft O-Ring & Small Pick
Courtesy of CHRYSLER GROUP, LLC

5. Check the input shaft O-ring (1) for damage, replace if necessary.

INSTALLATION

INSTALLATION

NOTE: **Check the torque converter hub for sharp edges, burrs, scratches, or nicks. Polish the hub with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.**

1. Lubricate the oil pump seal lip with transmission fluid.

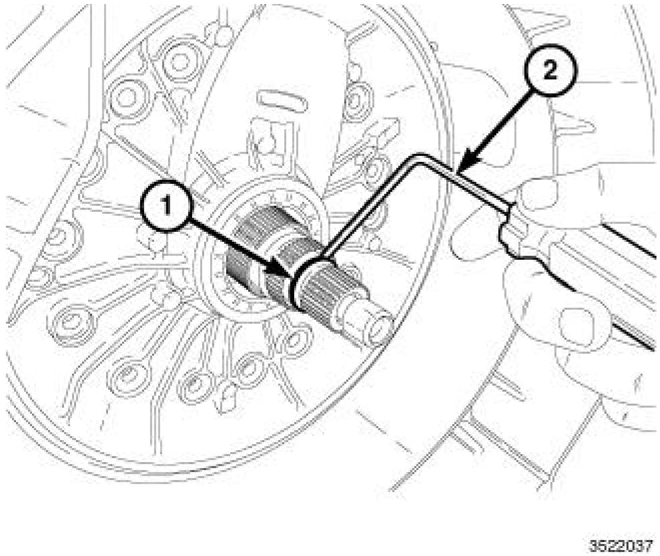

Fig. 315: Input Shaft O-Ring & Small Pick
Courtesy of CHRYSLER GROUP, LLC

2. Check the input shaft O-ring (1) for any damage. Replace if necessary.
3. Place the torque converter in position on the transmission.

CAUTION: **Do not damage oil pump seal or converter hub while inserting torque converter into the front of the transmission.**

4. Align the torque converter to the oil pump seal opening.
5. Insert the torque converter hub into the oil pump drive gear.
6. While pushing the torque converter inward, rotate the torque converter until the torque converter is fully seated into the oil pump drive gear.

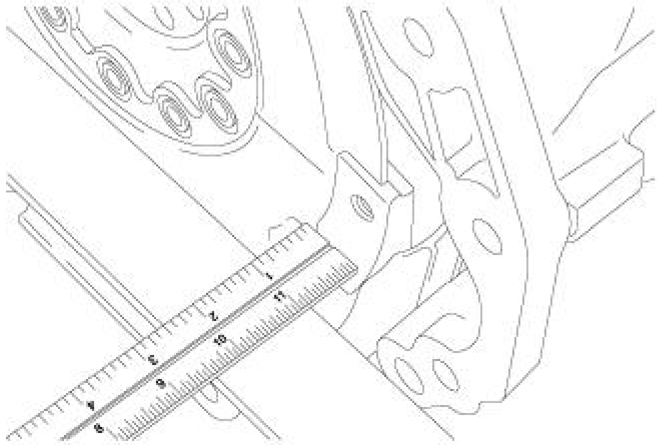

Fig. 316: Straightedge
Courtesy of CHRYSLER GROUP, LLC

7. Check the torque converter seating with a scale and straightedge. The surface of the torque converter lugs should be at least 19 mm (3/4 in.) to the rear of the straightedge when the torque converter is fully seated.
8. If necessary, temporarily secure the torque converter with a C-clamp attached to the torque converter housing.
9. Install the transmission in the vehicle. Refer to **INSTALLATION**.
10. Perform the TRANSMISSION FILL AFTER SERVICE procedure. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

VALVE BODY

DESCRIPTION

DESCRIPTION

CAUTION: The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Failure to follow these instructions may result in damage to the TCM/TCMA.

The valve body includes the Transmission Control Module (TCM), all solenoids and sensors, and can be referred to as the Transmission Control Module Assembly (TCMA). The TCM is attached to the valve body between the transmission case and the valve body. If any component of the valve body **including the TCM** sensors or solenoids need replaced, the complete TCMA (valve body) must be replaced. For replacement of the TCMA (valve body), refer to **VALVE BODY, REMOVAL**.

OPERATION

8-SPEED TCM OPERATION

2 - TCM (Includes Transmission Temperature Sensor)
3 - External Wire Harness Connector
4 - Output Speed Sensor
5 - Park Position Sensor

CAUTION: The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Failure to follow these instructions may result in damage to the TCM/TCMA.

The valve body, which includes the Transmission Control Module (TCM), controls the delivery and pressure of transmission fluid. The TCM is integrated into the valve body. The TCM regulates the amount of hydraulic pressure used to engage the clutches and the Torque Converter Clutch (TCC), in addition to directing hydraulic pressure to engage or release any given clutch for any given required gear. The TCM will actuate the valves via solenoids based on the position of the shifter, transmission fluid temperature, engine operating conditions, traction conditions and driver demands. During a shift, the TCM will actuate the solenoids to match the gear ranges to the optimal torque range of the engine based on the position of the accelerator pedal, shifter and vehicle speed as determined by the PCM based on input from the Vehicle Speed Sensor (VSS) and ABS module. Due to the complexity of the 8HP45 transmission control system, always refer to the appropriate transmission electrical/electronic Diagnostics & Testing article when attempting to diagnose transmission problems.

If the Transmission Control Module Assembly (TCMA) is replaced, it **must** be programmed and a drive learn needs to be performed before returning the vehicle to the customer. Refer to **STANDARD PROCEDURE** for programming and drive learn procedures .

REMOVAL

REMOVAL 8HP70

CAUTION: The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Failure to follow these instructions may result in damage to the TCM/TCMA.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Drain the transmission fluid into a clean container. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

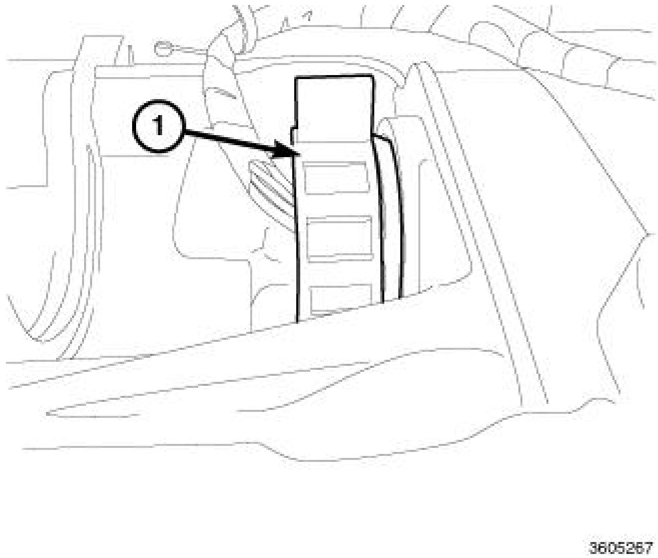

Fig. 319: Adapter Plug Connector
Courtesy of CHRYSLER GROUP, LLC

3. Turn the locking mechanism lock (1) of the transmission harness connector counter-clockwise and disconnect the connector from the transmission.

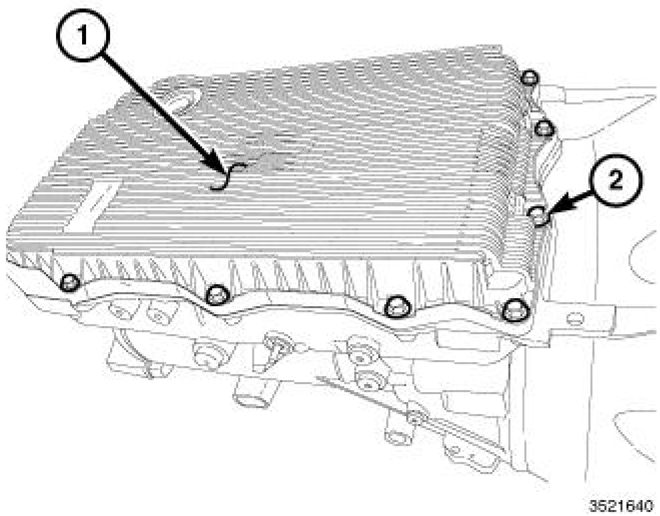

Fig. 320: Thirteen Oil Pan Retaining Bolts
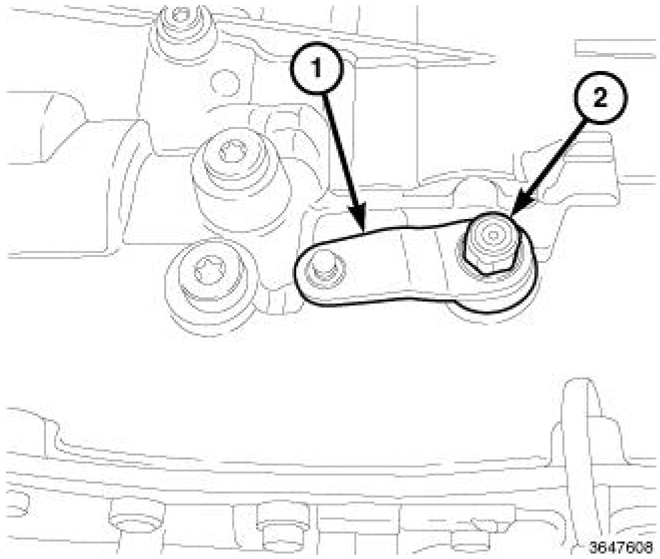
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Inspect the gasket for reuse. If the seal is cut or torn, replace the gasket.**

4. Remove the thirteen oil pan retaining bolts (2).
5. Carefully detach the oil pan (1) and gasket.



[Fig. 321: Manual Park Release Lever Retaining Nut & Lever](#)
Courtesy of CHRYSLER GROUP, LLC

6. Remove the Manual Park Release (MPR) lever retaining nut (2) and remove the lever (1).
7. Reinstall the MPR lever 180 degrees offset. Using a tie strap, secure the lever into position so the park release fork remains in the same position for installation of the valve body assembly.

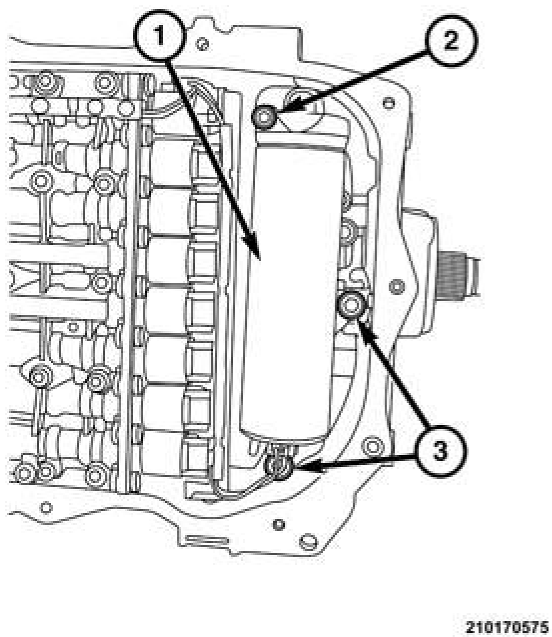


Fig. 322: Hydraulic Impulse Storage Unit & Bolts

14 - INPUT SHAFT

CAUTION: A unique transmission fluid has been developed for this transmission. This

fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid see VEHICLE QUICK REFERENCE .

The transmission case is a single-piece unit. The starter pocket, cooler line fittings, and manual park release lever are located on the driver's side of the case. The electrical connector and oil fill plug are located on the passenger side of the case. The transmission uses a flanged output shaft connection.

OPERATION

OPERATION

CAUTION: A unique transmission fluid has been developed for this transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid see VEHICLE QUICK REFERENCE .

The 8HP90 is an electronic eight-speed automatic transmission. The Transmission Control Module Assembly (TCMA), which is integrated into the valve body, provides fully synchronized clutch-to-clutch shifting through four planetary gear sets. The TCMA includes a mounting plate that holds the Transmission Control Module (TCM) and a molded wiring harness for connection to various transmission sensors and solenoids. The valve body assembly contains all the sensors and solenoids required for operation, completely inside the transmission. Eight speeds allow the engine to maintain its optimal rpm range, increasing fuel economy and performance.

Transmission control is performed by the TCM based on hard-wired and Controller Area Network (CAN) bus signals from sensors and modules. The TCM receives driveability data from the Powertrain Control Module (PCM) and other modules over the CAN-C bus. It also receives shift lever position information from the electronic shifter over a dedicated transmission CAN bus. The TCM processes this input data and controls operation of the torque converter clutch, park lock system, solenoid valves, and pressure regulating valve.

The input and output speed sensors are Hall-effect sensors that measure shaft rotational speed. The input speed sensor is located at the top, near the center, of the TCMA and reads input shaft speed from the magnetic ring on the P2 carrier. The output speed sensor is located at the back of the TCMA and reads output shaft speed from the P4 carrier

FILTER SERVICE The 8HP90 has a conventional fluid sump design, the filter is separate from the oil pan and can be replaced independently of the oil pan. The oil pan gasket is reusable providing it is not damaged during removal.

FLUID CHECK AND FILL A fluid fill tube and indicator are not provided. All work is performed under the vehicle while raised on a hoist. In the event of a transmission shift quality concern, a fluid leak, or in conjunction with a transmission repair, the transmission fluid level must be validated and topped off as necessary. The procedure involves the use of a scan tool to monitor transmission fluid temperature. Specific service procedures are necessary to check and fill the transmission with fluid. Refer to **FLUID AND FILTER, STANDARD PROCEDURE** .

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - PRELIMINARY

CAUTION: A unique transmission fluid has been developed for this transmission. This

fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid see VEHICLE QUICK REFERENCE .

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for disabled vehicles (will not back up or move forward).

VEHICLE IS DRIVABLE

1. Check for transmission fault codes using the appropriate scan tool.
2. Road test and note how transmission upshifts, downshifts, and engages.
3. Check fluid level and condition.

VEHICLE IS DISABLED

1. Check for transmission fault codes using the appropriate scan tool.
2. Check for cracked, leaking cooler lines.
3. Check fluid level and condition.
4. With the transmission in the Park position, attempt to rotate drive shaft(s) to ensure transmission output shaft coupler/flange is secure.
5. Raise and support vehicle on safety stands, start engine with transmission in the Park position and allow to idle for several minutes, shift transmission into gear, and note following:
   a. If propeller shaft turns but wheels do not, problem is with differential or axle shafts.
   b. If propeller shaft does not turn and transmission is noisy, stop engine. Remove oil pan, and check for debris. If pan is clear, remove transmission and check for damaged driveplate, converter, oil pump, or input shaft.
6. Check the TCMA, Wiring, Valve body, and Solenoids (Utilize fault codes to diagnose if available).

DIAGNOSIS AND TESTING - ROAD TESTING

CAUTION: A unique transmission fluid has been developed for this transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid see VEHICLE QUICK REFERENCE .

Before road testing, be sure the fluid level has been checked and adjusted if necessary. Verify that all diagnostic trouble codes have been resolved.

Verify that all diagnostic trouble codes have been resolved.

Observe engine performance during the road test. A poorly tuned engine will not allow accurate analysis of transmission operation.

Operate the transmission in all gear ranges. Check for shift variations and engine flare which indicates slippage. Note if shifts are harsh, spongy, delayed, early, or if part throttle downshifts are sensitive.

Slippage indicated by engine flare, usually means clutch, overrunning clutch, or line pressure problems.

A slipping clutch can often be determined by comparing which internal units are applied in the various gear ranges. The Clutch Application chart provides a basis for analyzing road test results.

CLUTCH APPLICATION

GEAR	A	B	C	D	E	RATIO
1	X	X	X	Ā	Ā	4.69: 1

DIAGNOSIS AND TESTING - AUTOMATIC TRANSMISSION - GENERAL CONDITIONS

CAUTION: Before attempting any repair on an automatic transmission, check for Diagnostic Trouble Codes with the appropriate scan tool.

CAUTION: A unique transmission fluid has been developed for this transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid see VEHICLE QUICK REFERENCE .

Transmission malfunctions may be caused by these general conditions:

- Poor engine performance.
- Improper adjustments.
- Hydraulic malfunctions.
- Mechanical malfunctions.
- Electronic malfunctions.

Diagnosis of these problems should always begin by checking the easily accessible variables: fluid level, fluid condition, and transmission fault codes using the appropriate scan tool. Then perform a road test to determine if the problem has been corrected or if more diagnosis is necessary.

CLUTCH AIR PRESSURE TESTS

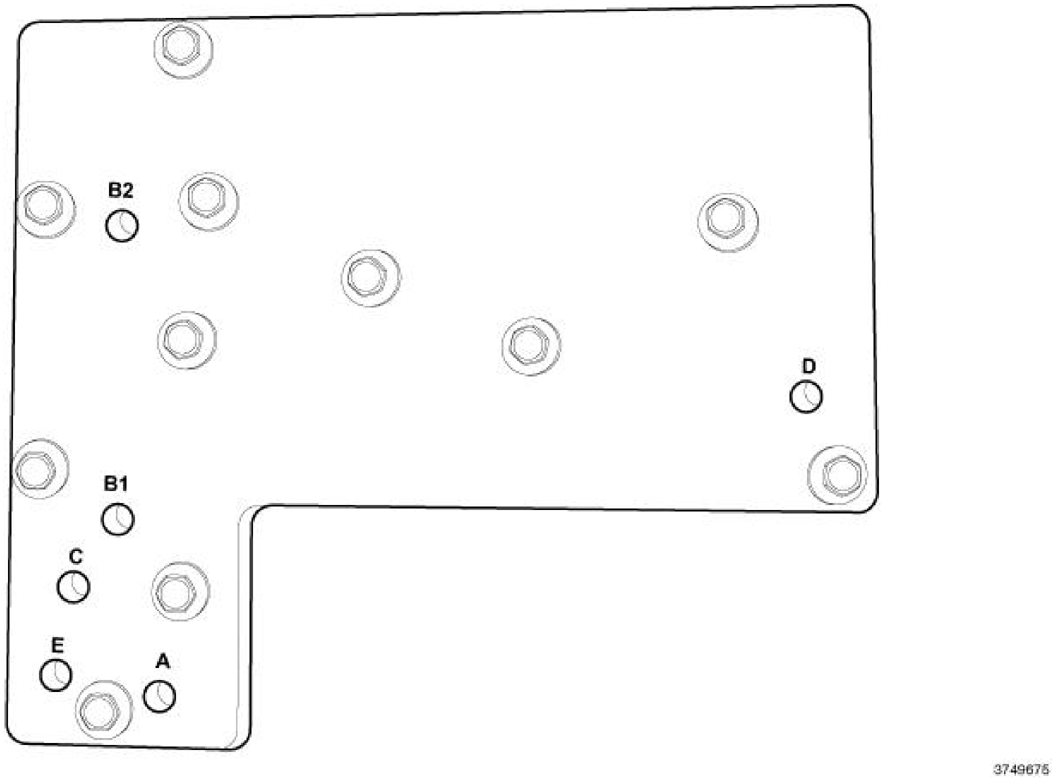

Fig. 2: Clutch Pressure Test Passages
Courtesy of CHRYSLER GROUP, LLC

Inoperative clutches can be located using a series of tests by substituting air pressure for fluid pressure using (special tool #10383, Plate, Clutch Pressure Test).

The clutches may be tested by applying air pressure to their respective passages. The valve body must be removed. To make air pressure tests, proceed as follows:

NOTE:	**The compressed air supply must be free of all dirt and moisture. Use a pressure of 5-8 bar (73-116 psi).**

Remove the valve body. Refer to **VALVE BODY, REMOVAL**. Install (special tool #10383, Plate, Clutch Pressure Test) and tighten bolts to 6 N.m (50 in. lbs.). When testing is finished install valve body. Refer to **VALVE BODY, INSTALLATION**. Fill the transmission. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

NOTE:	**If any clutch does not appear to be functioning with the air, add some 8HP transmission fluid and try the test again. Some circuits will not operate without fluid.**

A CLUTCH

Apply air pressure to the feed hole located on the test plate marked **A** , listen for an audible thud. The piston should return to its starting position when the air pressure is removed.

B CLUTCH FUNCTION

Apply air pressure to the feed hole located on the test plate marked **B1** , listen for an audible thud. The piston should not return to its starting position when the air pressure is removed. If air pressure is applied to the B2 circuit, the B1 should return. An audible hiss may be heard when testing this clutch as the seal is designed to allow fluid/air to pass.

C CLUTCH

Apply air pressure to the feed hole located on the test plate marked **C** , listen for an audible thud. The piston should return to its starting position when the air pressure is removed.

D CLUTCH

Apply air pressure to the feed hole located on the test plate marked **D** , listen for an audible thud. The piston should return to its starting position when the air pressure is removed.

E CLUTCH

Apply air pressure to the feed hole located on the test plate marked **E** , listen for an audible thud. The piston should return to its starting position when the air pressure is removed.

STANDARD PROCEDURE

A-CLUTCH MEASUREMENT

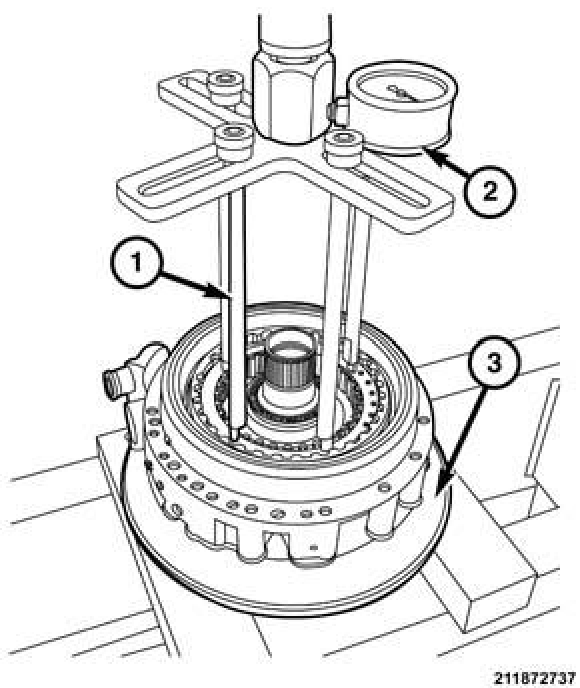

Fig. 3: Adapter & Pressing Tool
Courtesy of CHRYSLER GROUP, LLC

1. Using (special tool #10428, Adapter, Pressing Tool) (1) and (special tool #10429, Gauge, Force) (2) Place the A-clutch/oil pump assembly in a suitable arbor press.
2. Apply 200 N (45 lbs.) of force to the A-clutch backing plate to compress the wave plate.

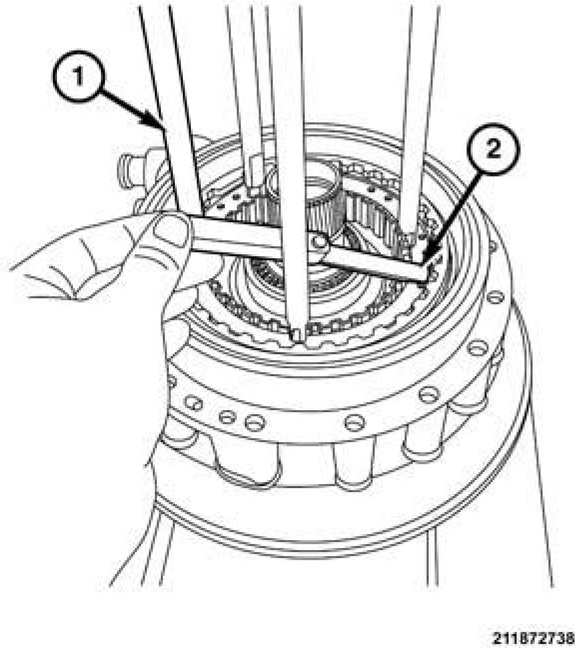

Fig. 4: Measuring Gap Between A-Clutch Backing Plate & Snap Ring
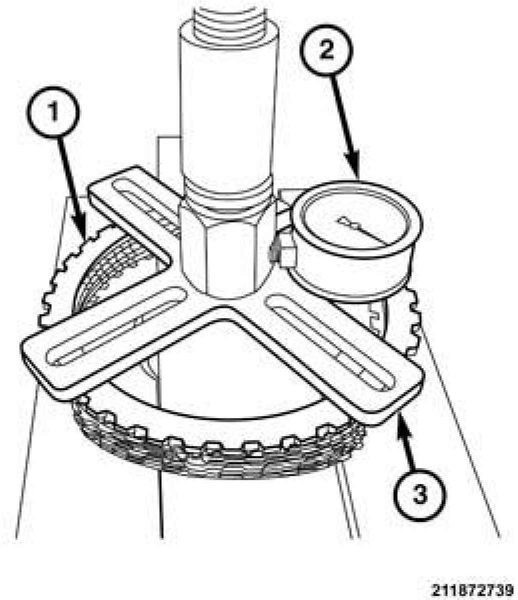
Courtesy of CHRYSLER GROUP, LLC

3. With a suitable feeler gauge (2) measure the gap between the A-clutch backing plate and the snap ring.
4. Refer to **CLUTCH A SELECTABLE SNAP RINGS TABLE** for specs. If clearance is not within specification, a thinner or thicker selectable snap ring can be installed for proper clearance.

B-CLUTCH MEASUREMENT

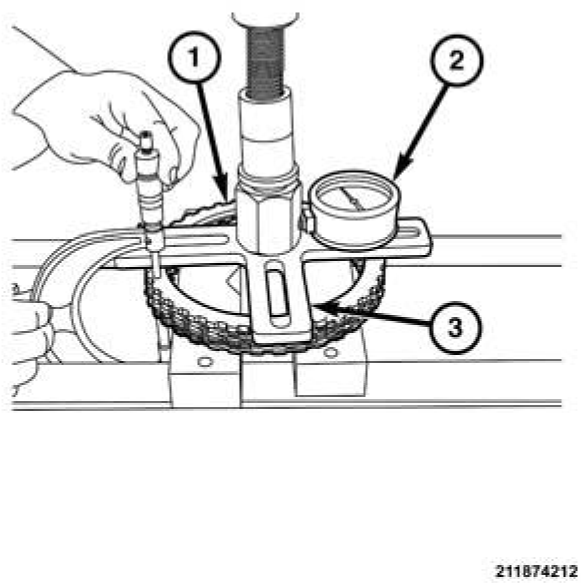
When the B-clutch is replaced, the proper selectable shim must be installed to achieve specified clearance.

Measurement (special tool #8901A, Pressing Tool), (special tool #10429, Gauge, Force)



[**Fig. 5: Pressing Tool**]
Courtesy of CHRYSLER GROUP, LLC

1. Place the B-clutch, with the wave plate on top, on a suitable arbor press.
2. Position tools (special tool #8901A, Pressing Tool) (3) (using just the cross bar) (3) and (special tool #10429, Gauge, Force) (2) on top of the B-clutch wave plate (1) and under the press ram.



[**Fig. 6: Gauge, Pressing Tool & B-Clutch**]
Courtesy of CHRYSLER GROUP, LLC

3. Apply 500 N (112 lbs.) of downward force on the B-clutch to compress the wave plate.

4. Using a suitable micrometer, measure the thickness of the compressed B-clutch (3). **Record the measurement as (A)** to calculate the B-clutch clearance in order to determine the correct selectable shim thickness.

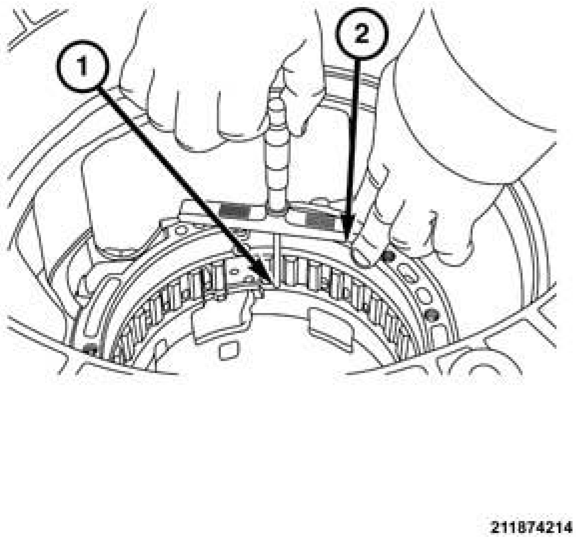


Fig. 7: Transmission Oil Pump & B-Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

5. With a suitable depth micrometer, place it at the mounting surface of the transmission oil pump (2) and measure to the base of the B-clutch retainer on the case (1). This measurement should be 61.05 mm. **Record the measurement as (B)** to calculate the B-clutch clearance in order to determine the correct selectable shim thickness.

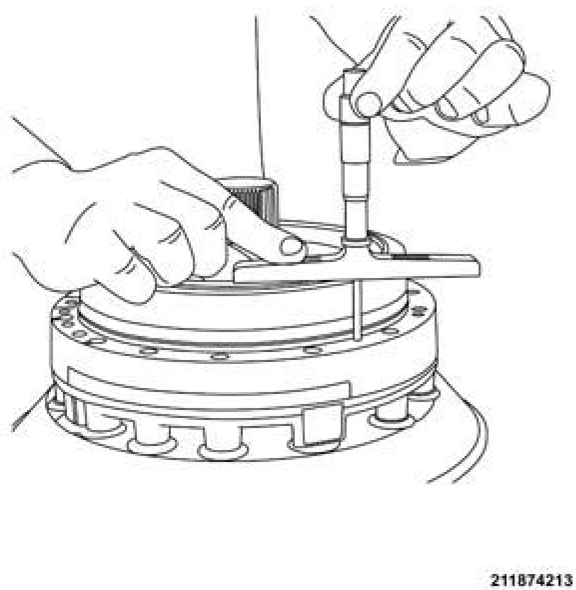

Fig. 8: Measuring B-Clutch Piston Using Depth Micrometer
Courtesy of CHRYSLER GROUP, LLC

6. Using a suitable depth micrometer, measure the B-clutch piston.
7. Measure between the fluid pump sealing surface and the bottom of the straight edge. **Record the measurement as (C)** to calculate the B-clutch clearance in order to determine the correct selectable shim thickness.

Calculation

Take the case depth (B) subtract (C) subtract (A) remainder is the clearance of the B-clutch. If the clearance is not within specification a thinner or thicker reaction plate can be installed to achieve proper clearance.

C-CLUTCH MEASUREMENT

1. Using (special tool #8901A, Pressing Tool) (2) and (special tool #10429, Gauge, Force) (1) place the C-clutch (3) in a suitable arbor press (with the backing plate facing up).
2. Apply 200 N (45 lbs.) of force to the C-clutch to compress the wave plate.
3. With a suitable feeler gauge, measure the gap between the C-clutch backing plate and the C-clutch retainer.
4. Refer to **CLUTCH C AND E SELECTABLE BACKING PLATES TABLE** for specs. If clearance is not within specification a thinner or thicker selectable backing plate can be installed to achieve proper clearance.

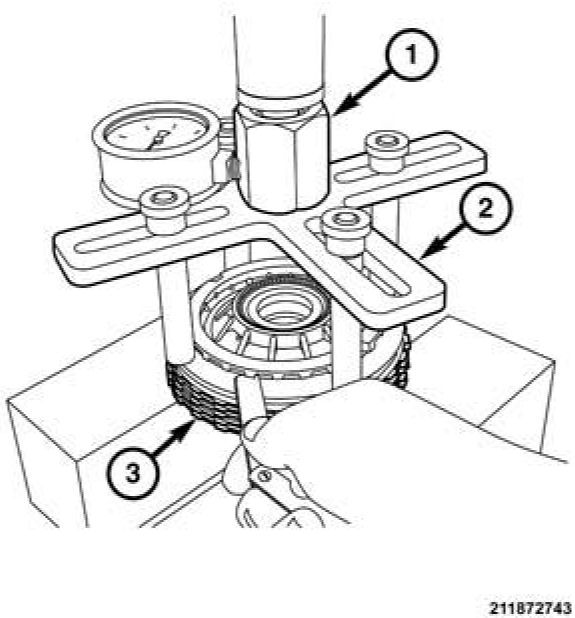

Fig. 9: Measuring Gap Between C-Clutch Backing Plate & C-Clutch Retainer
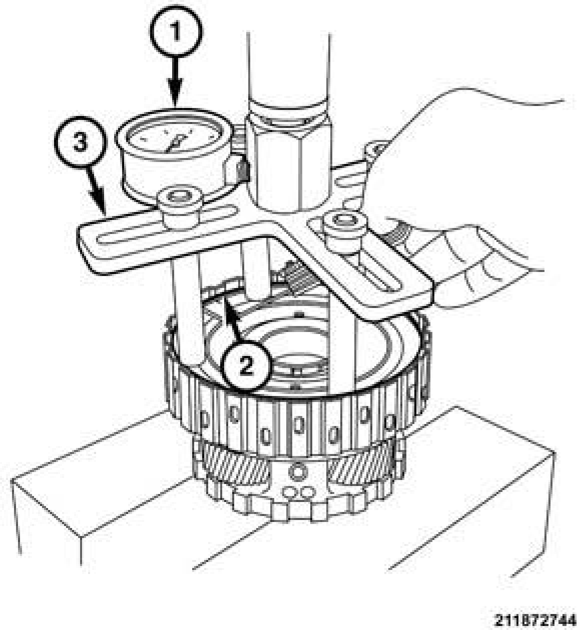
Courtesy of CHRYSLER GROUP, LLC

D-CLUTCH MEASUREMENT



[Fig. 10: Measuring Gap Between D-Clutch Backing Plate & D-Clutch Retainer](#)
Courtesy of CHRYSLER GROUP, LLC

1. Using (special tool #8901A, Pressing Tool) (3) and (special tool #10429, Gauge, Force) (1) place the D-clutch in a suitable arbor press.
2. Apply 200 N (45 lbs.) of force to the D-clutch backing plate to compress the wave plate.
3. With a suitable feeler gauge (2), measure the gap between the C-clutch backing plate and the C-clutch retainer.
4. Refer to **CLUTCH D SELECTABLE SNAP RINGS TABLE** for specs. If clearance is not within specification a thinner or thicker selectable snap ring can be Installed to achieve proper clearance.

E-CLUTCH MEASUREMENT

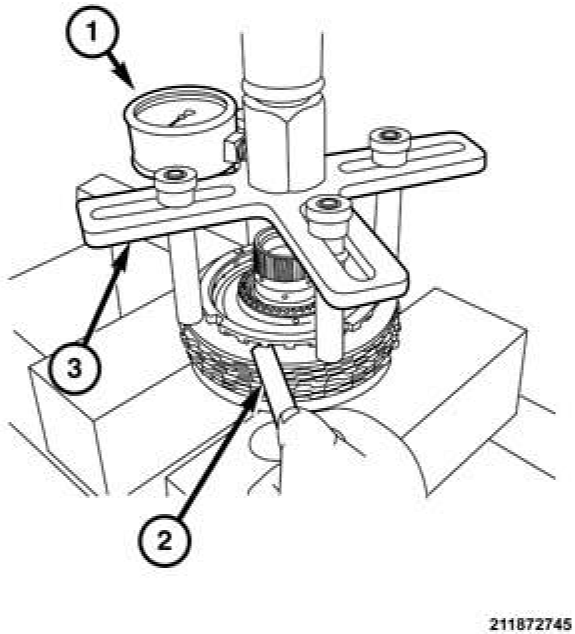


Fig. 11: Measuring Gap Between Backing Plate & Retainer Of E-Clutch
Courtesy of CHRYSLER GROUP, LLC

1. Place the E-clutch in a suitable arbor press.
2. Using (special tool #10429, Gauge, Force) (1) and (special tool #8901A, Pressing Tool) (3) apply 200 N (45 lbs.) to the backing plate of the E-clutch.
3. Using a set of feeler gauges (2), measure the gap between the backing plate and the retainer of the E-clutch.
4. Refer to **CLUTCH C AND E SELECTABLE BACKING PLATES TABLE** for specifications. If clearance is not within specifications, a thinner or thicker selectable backing plate can be installed to achieve proper clearance.

REMOVAL

TRANSMISSION

1. Put transmission in neutral.
2. Disconnect and isolate the negative battery cable.
3. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
4. Remove the drive shaft. Refer to **REMOVAL** .
5. Remove the starter. Refer to **STARTER, REMOVAL** .

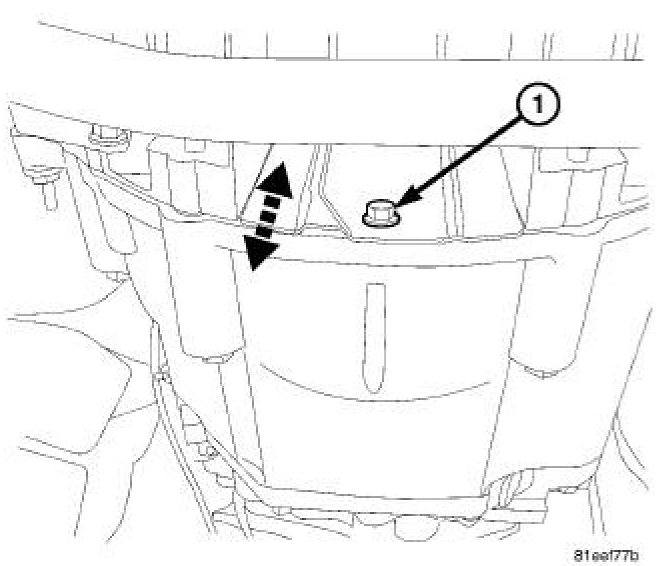

Fig. 12: Inspection Cover
Courtesy of CHRYSLER GROUP, LLC

6. Remove the inspection cover bolt (1) and the inspection cover.

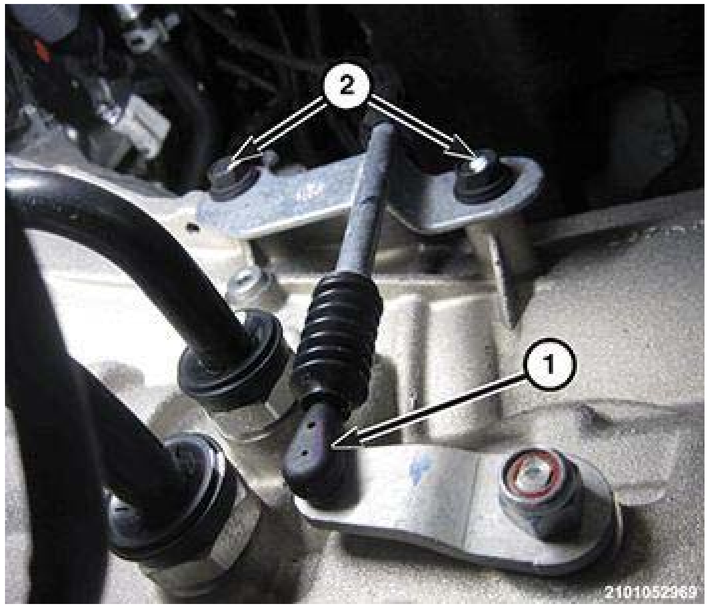

Fig. 13: Manual Park Release Cable & Bracket Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Disconnect the Manual Park Release (MPR) cable (1) from the MPR lever, remove the MPR cable bracket bolts (2) and position aside.

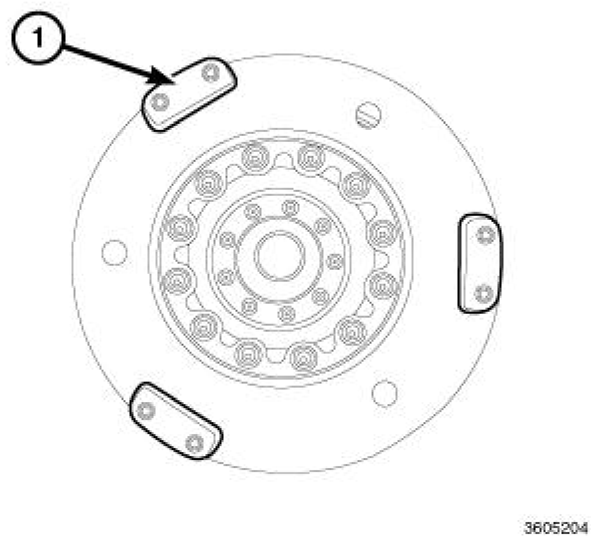

Fig. 14: Two Bolts
Courtesy of CHRYSLER GROUP, LLC

8. The torque converter is attached with three sets of two bolts (1) 120Ā° apart as shown.

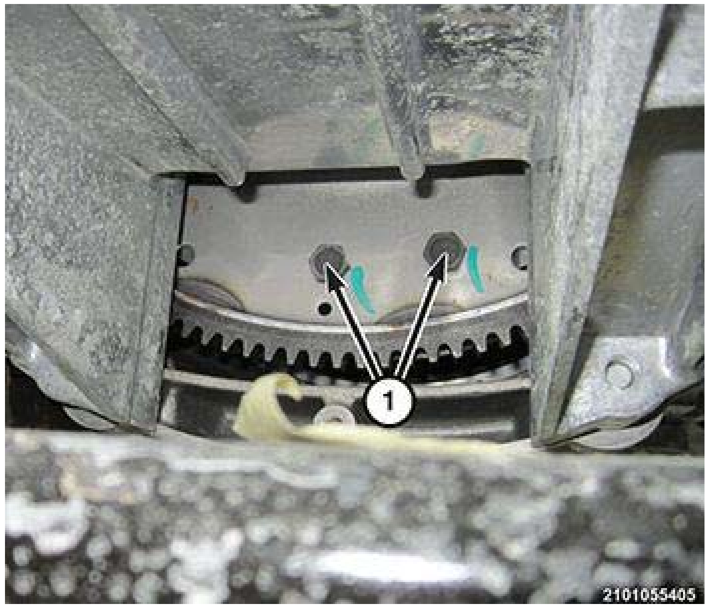

Fig. 15: Torque Converter Bolts
Courtesy of CHRYSLER GROUP, LLC

9. Rotate the crankshaft in a clockwise direction and remove the six torque converter bolts (1).

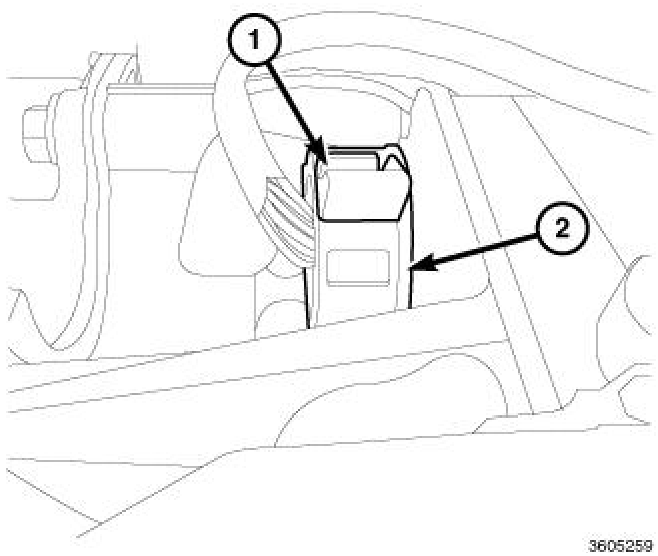

Fig. 16: Locking Mechanism Lock & Adapter Plug Connector
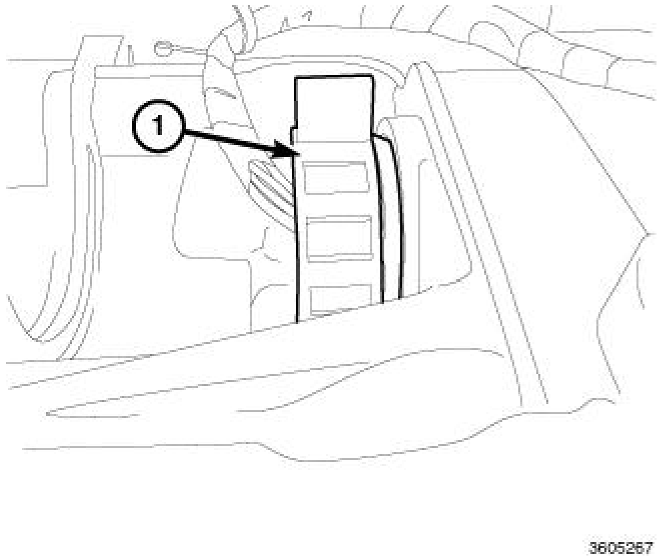
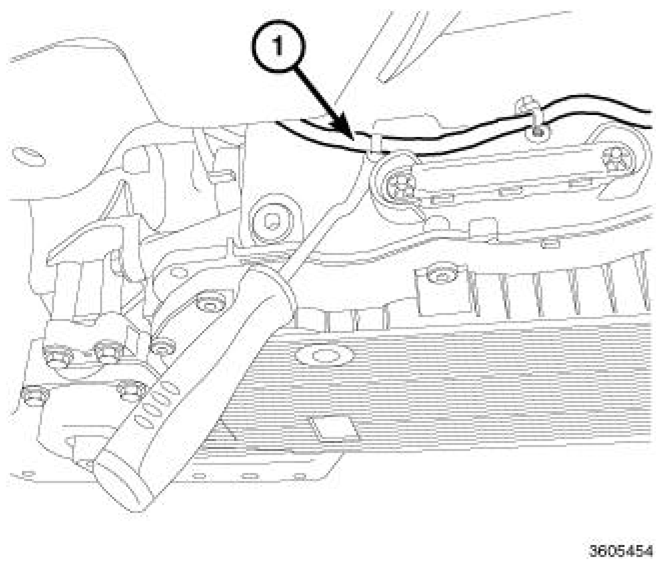
Courtesy of CHRYSLER GROUP, LLC

10. Turn the locking mechanism lock (1) of the adapter plug connector (2) counter-clockwise to release the lock.



[Fig. 17: Adapter Plug Connector]
Courtesy of CHRYSLER GROUP, LLC

11. Remove the adapter plug connector (1) from the transmission.



[Fig. 18: Wiring Harness]
Courtesy of CHRYSLER GROUP, LLC

12. Disconnect the wiring harness (1) from the transmission.

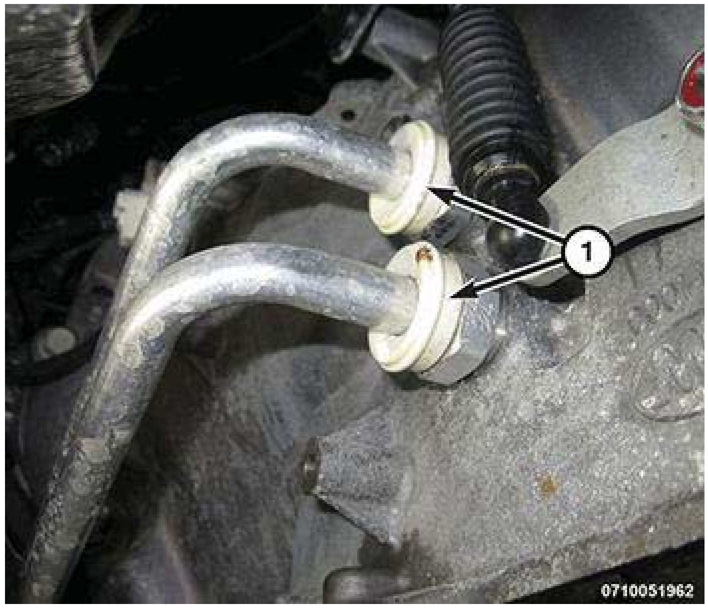


Fig. 19: Transmission Fluid Cooler Lines
Courtesy of CHRYSLER GROUP, LLC

13. Disconnect the transmission fluid cooler lines (1) from the transmission and cap the transmission cooler lines. (Refer to **STANDARD PROCEDURE**).

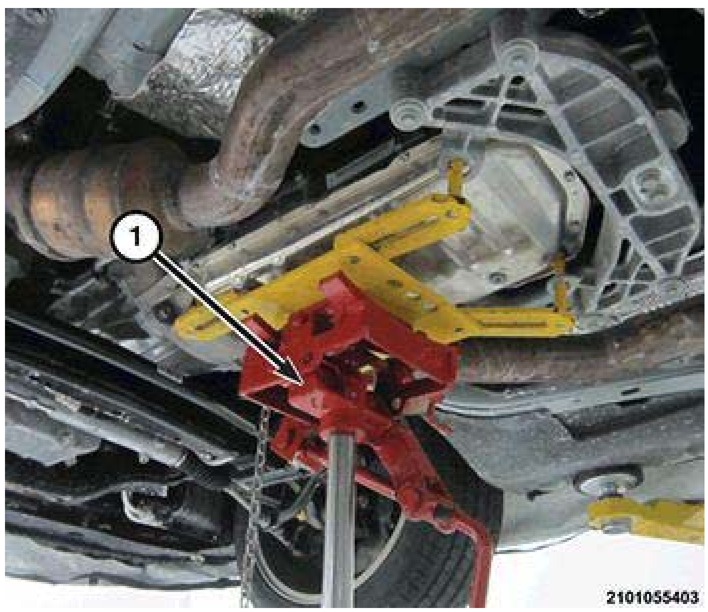

Fig. 20: Transmission Jack
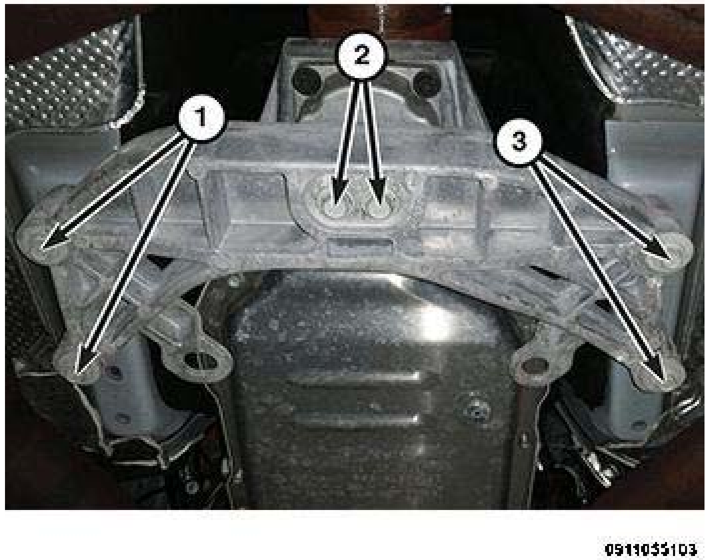
Courtesy of CHRYSLER GROUP, LLC

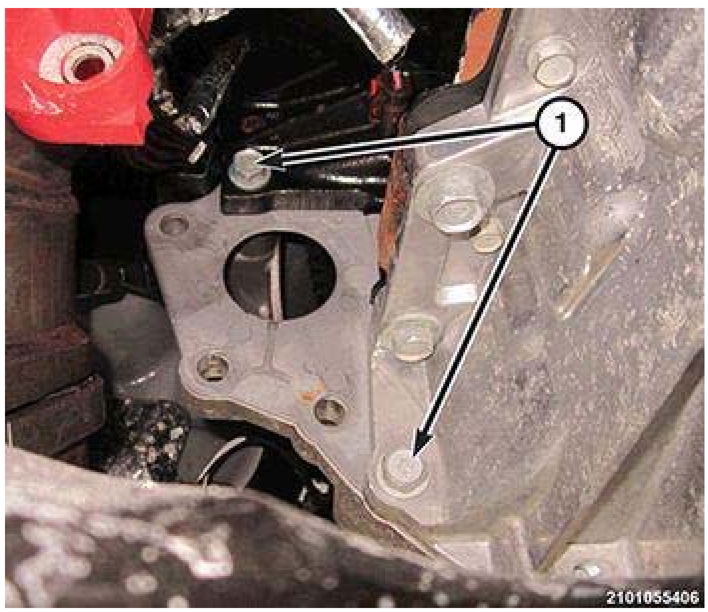
CAUTION: When supporting or lifting the transmission at the oil pan the weight of the transmission must be distributed evenly on the lifting fixture. Failure to do so could damage the oil pan and transmission.

14. Raise the transmission slightly with a transmission jack (1) to relieve load on the crossmember.



[Fig. 21: Rear Support Isolator And Crossmember Bolts](#)
Courtesy of CHRYSLER GROUP, LLC

15. Remove the rear support isolator bolts (2), the crossmember bolts (1 and 3) and remove the crossmember.



[Fig. 22: Right Transmission To Engine Bolts](#)
Courtesy of CHRYSLER GROUP, LLC

16. Remove the Right Hand (RH) transmission to engine bolts (1).

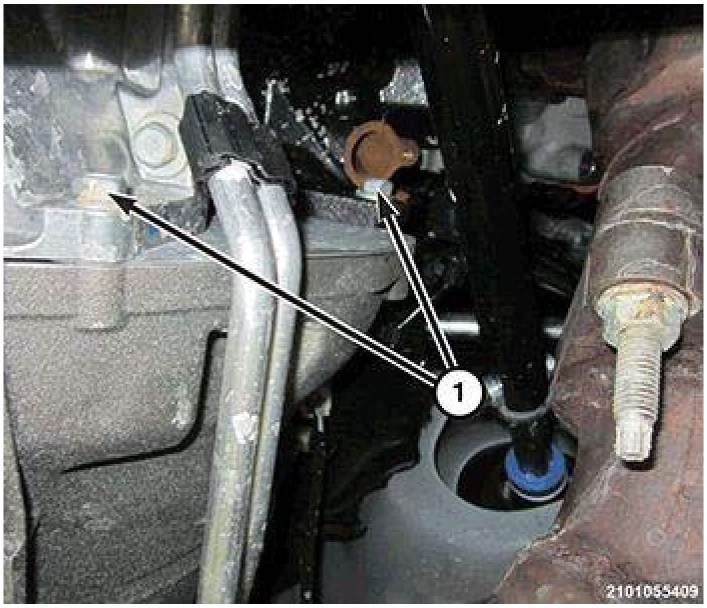


Fig. 23: Left Transmission To Engine Bolts
Courtesy of CHRYSLER GROUP, LLC

17. Remove the Left Hand (LH) transmission to engine bolts (1).

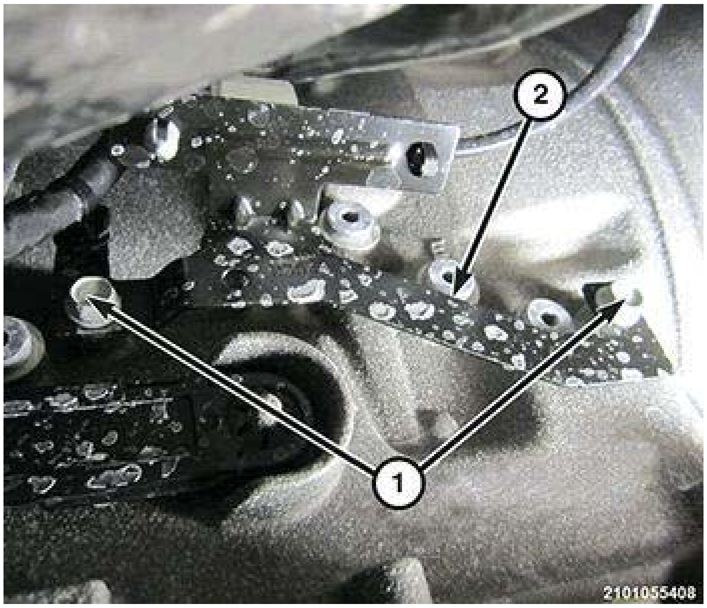

Fig. 24: Wiring Harness Bracket & Bolts
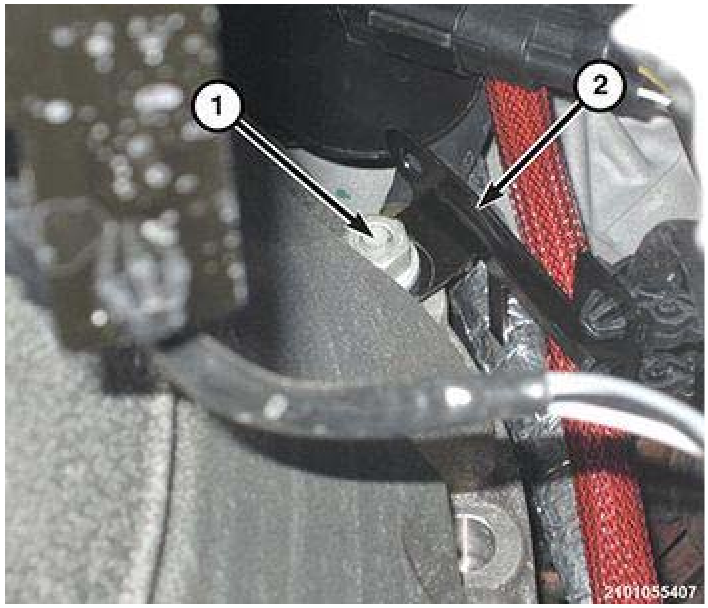
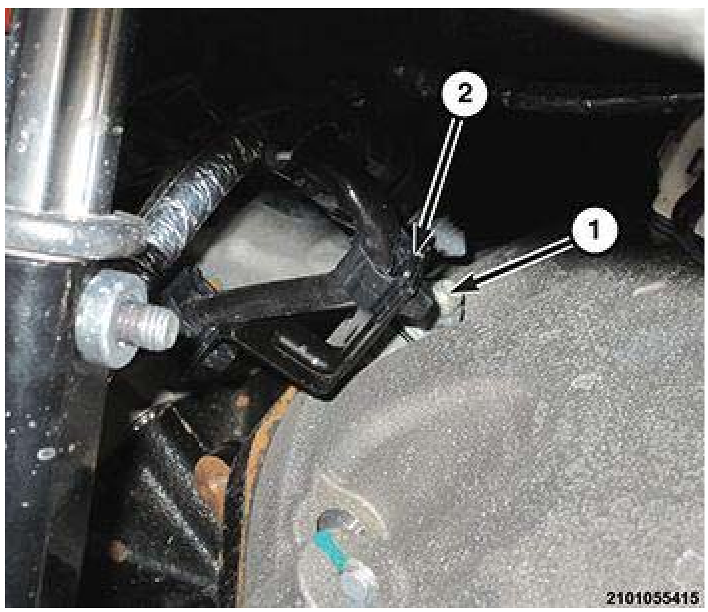
Courtesy of CHRYSLER GROUP, LLC

18. Remove the wiring harness bracket bolts (1) and position aside the wiring harness bracket (2).



[**Fig. 25: Right Wiring Harness Bracket & Nut**]
Courtesy of CHRYSLER GROUP, LLC

19. Remove the RH wiring harness bracket nut (1) and position aside the wiring harness bracket (2).



[**Fig. 26: Left Wiring Harness Bracket & Nut**]
Courtesy of CHRYSLER GROUP, LLC

20. Remove the LH wiring harness bracket nut (1) and position aside the wiring harness bracket (2).

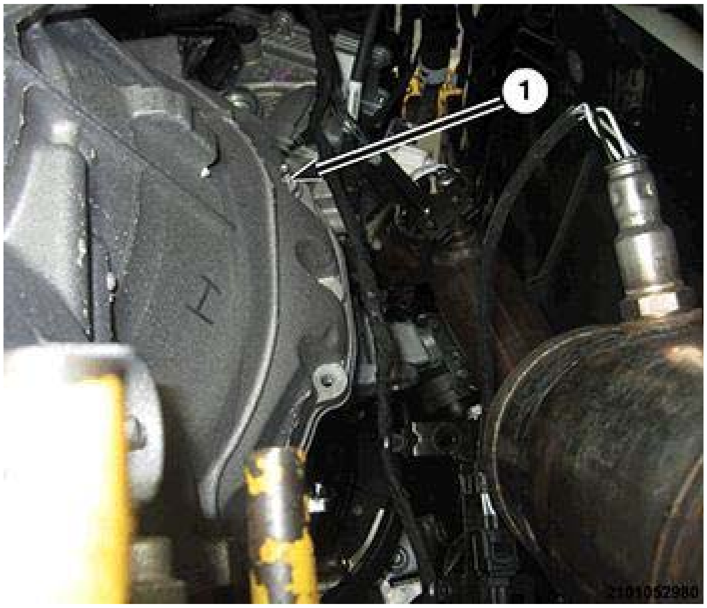


Fig. 27: Transmission To Engine Studbolt
Courtesy of CHRYSLER GROUP, LLC

21. Remove the RH and LH transmission to engine studbolts (1).

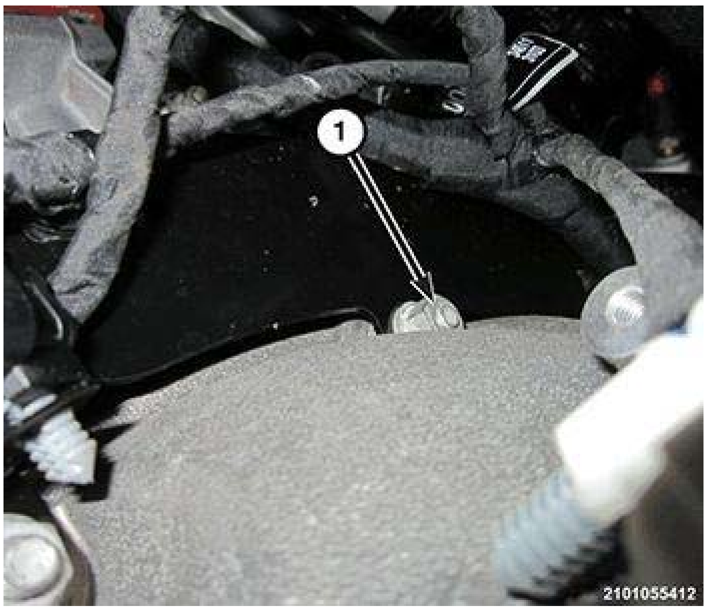

Fig. 28: Left Wiring Harness Bracket Nut
Courtesy of CHRYSLER GROUP, LLC

22. Remove the LH wiring harness bracket nut (1).

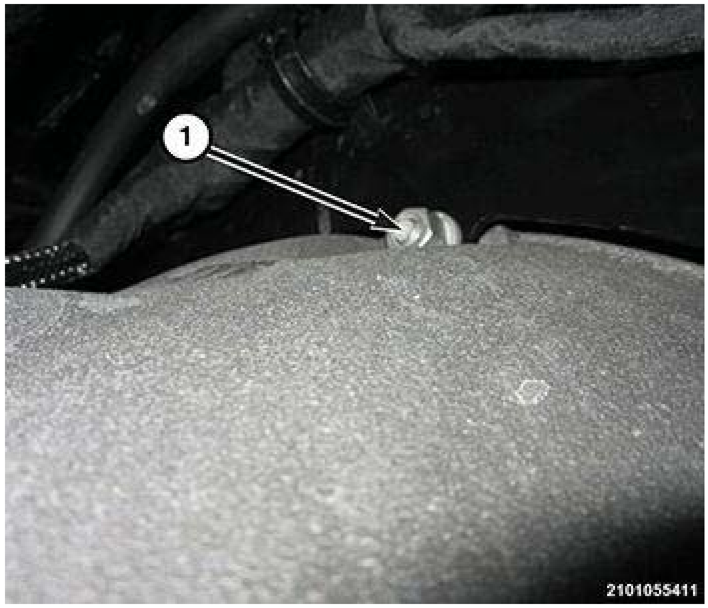

Fig. 29: Right Wiring Harness Bracket Nut
Courtesy of CHRYSLER GROUP, LLC

23. Remove the RH wiring harness bracket nut (1).

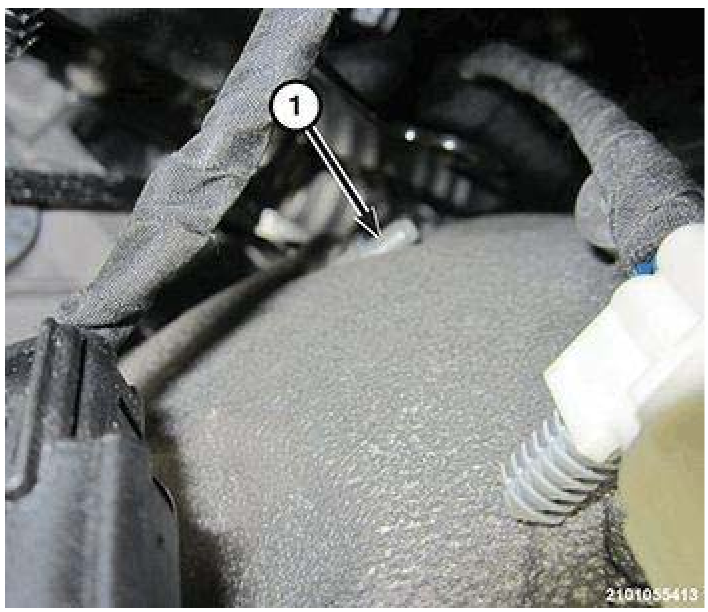

Fig. 30: Left Transmission To Engine Studbolt
Courtesy of CHRYSLER GROUP, LLC

24. Remove the LH transmission to engine studbolt (1).

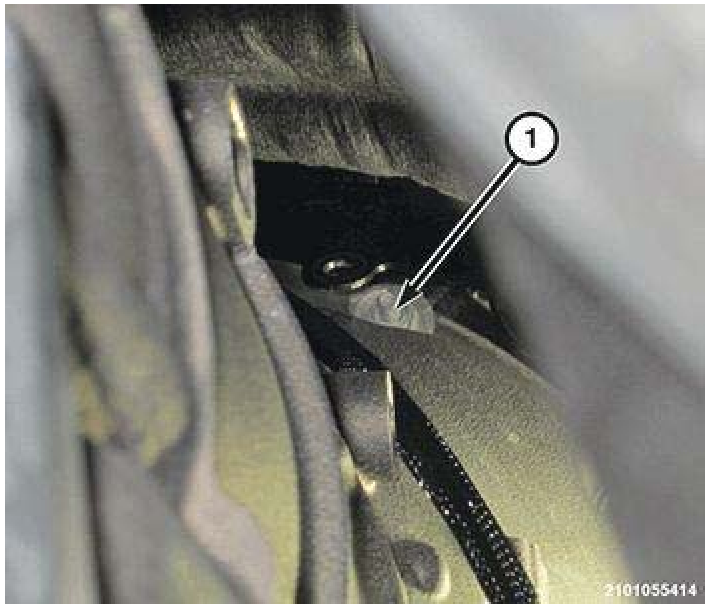

Fig. 31: Right Transmission To Engine Studbolt
Courtesy of CHRYSLER GROUP, LLC

25. Remove the RH transmission to engine studbolt (1).

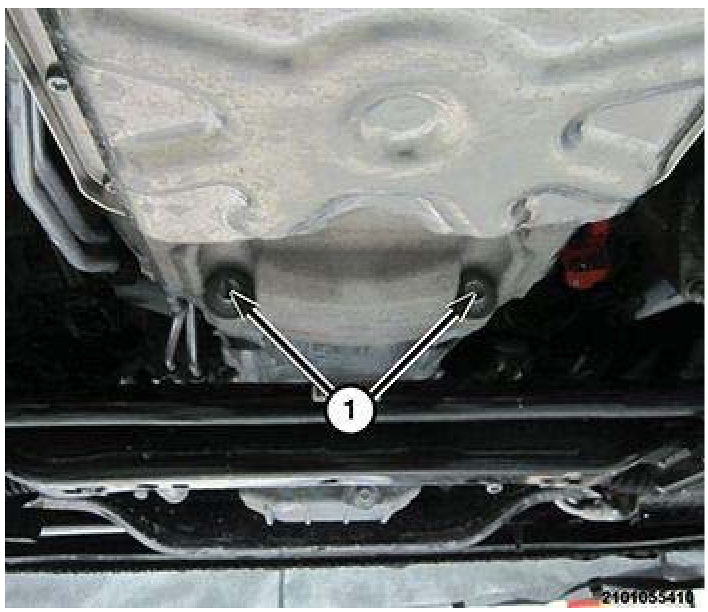

Fig. 32: Bottom Transmission To Engine Bolts
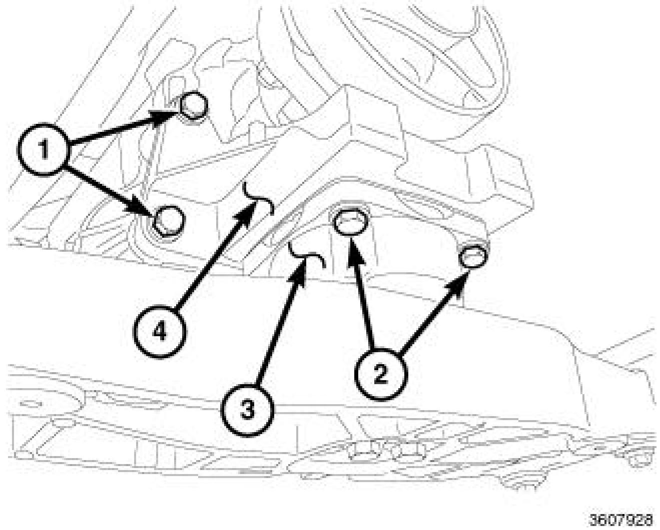
Courtesy of CHRYSLER GROUP, LLC

26. Remove the bottom two transmission to engine bolts (1).
27. Hold the torque converter in place during transmission removal.
28. Lower the transmission and remove the assembly from the vehicle.



[Fig. 33: Transmission Mount Bolts & Transmission Mount]

Courtesy of CHRYSLER GROUP, LLC

29. Remove the transmission mount bolts (2) and the transmission mount (3).
30. Remove the four adapter bracket bolts (1) and the adapter bracket (4).

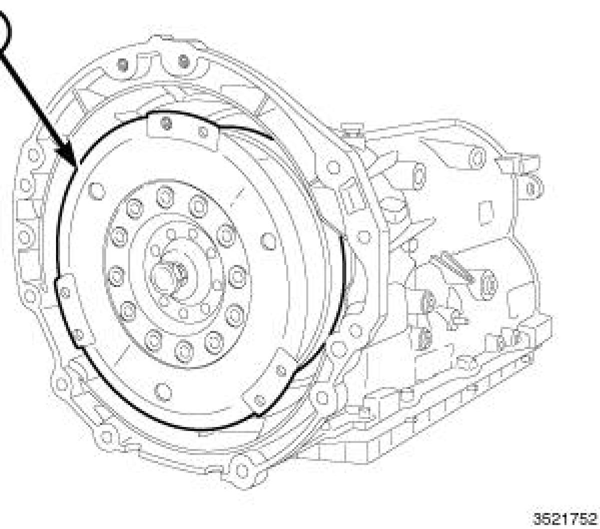
DISASSEMBLY

DISASSEMBLY

CAUTION: **The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Failure to follow these instructions may result in damage to the TCM/TCMA.**

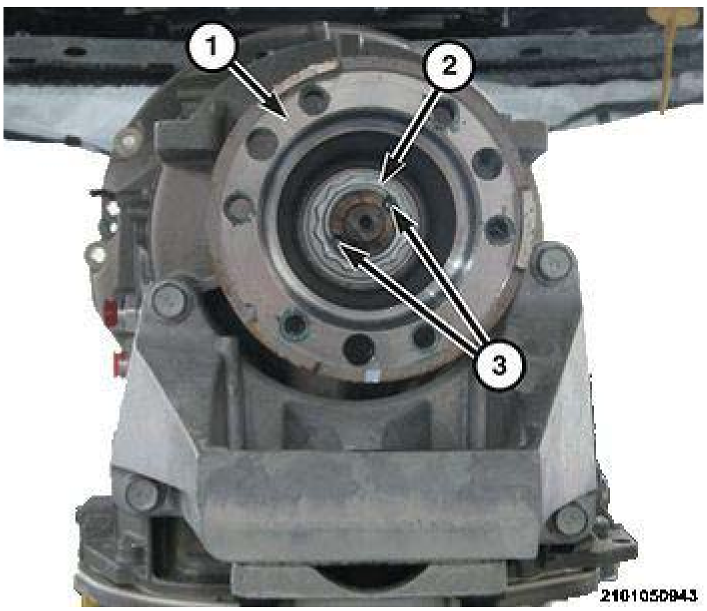
NOTE: **If the transmission is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the TCM Adaptation Procedure. Refer to STANDARD PROCEDURE .**

NOTE: **Tag all clutch pack assemblies, as they are removed, for reassembly identification.**



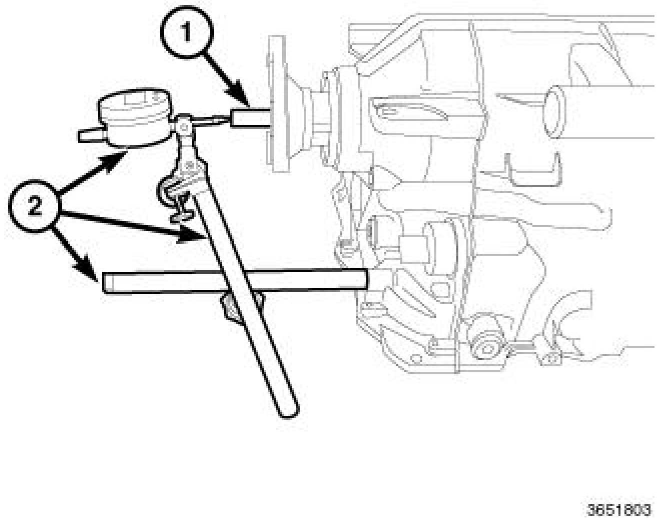
[Fig. 34: Torque Converter]
Courtesy of CHRYSLER GROUP, LLC

1. Remove the torque converter (1).



[Fig. 35: Drive Shaft Flange, Nut & Staking Area]
Courtesy of CHRYSLER GROUP, LLC

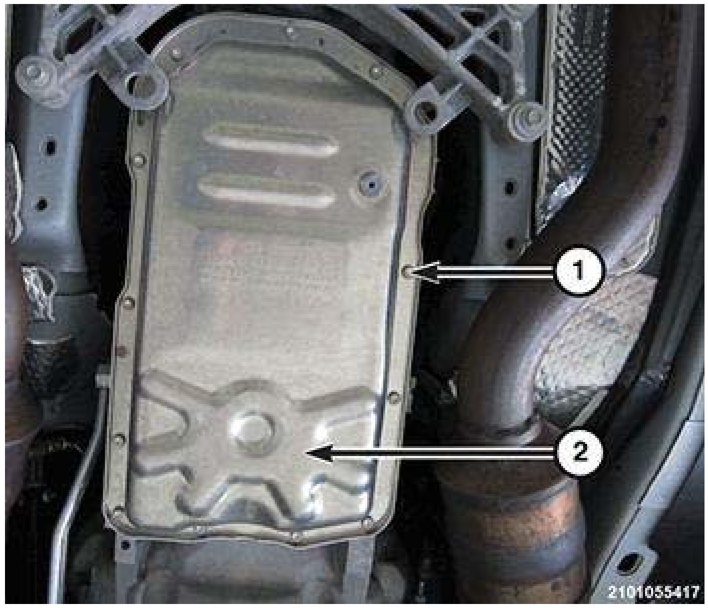
2. Using a suitable punch, remove the staking (3) from the transmission output flange nut (2).
3. Using (special tool #C-3281, Holder, Flange) loosen the transmission output flange nut (2) about 1 thread using a 34 mm 12 point socket.



[Fig. 36: Measuring End Play]
Courtesy of CHRYSLER GROUP, LLC

NOTE: **End play specification is between 0.11 - 0.42 mm (0.0043 - 0.0165 in.). If end play is outside this range, a different selectable end play shim must be used during assembly.**

4. Measure the output shaft (1) end play as follows:
    a. Attach a dial indicator (2) and position the plunger against the end of the output shaft (1).
    b. Zero the dial indicator (2).
    c. Move the output shaft (1) in and out, and record the maximum travel for assembly reference.
5. Finish removing the transmission output flange nut.
6. Remove the transmission output flange.
7. Remove the transmission rear dust seal.
8. Remove the transmission rear output shaft seal with a suitable slide hammer and screw.
9. Remove the transmission output shaft washer.

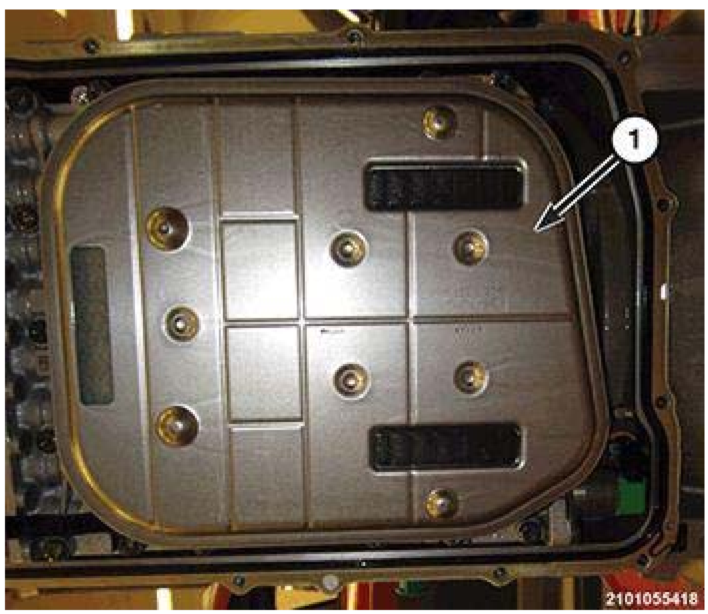


[Fig. 37: Transmission Oil Pan & Bolts](#)
Courtesy of CHRYSLER GROUP, LLC

10. Remove the 13 transmission oil pan bolts (1).

NOTE: **Inspect the gasket for reuse. If the gasket is cut or torn, replace the gasket.**

11. Remove the transmission oil pan (2) and gasket.



[Fig. 38: Transmission Oil Filter](#)
Courtesy of CHRYSLER GROUP, LLC

12. Remove the transmission oil filter (1).

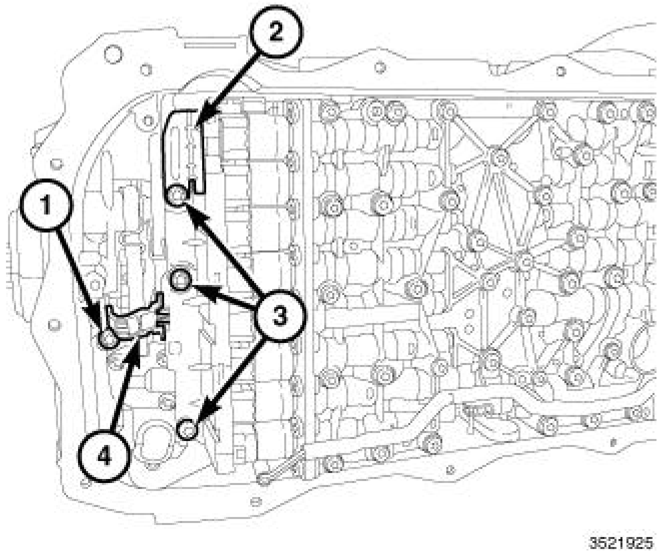


Fig. 39: Valve Body Assembly End Retainer Bolts
Courtesy of CHRYSLER GROUP, LLC

13. Remove the valve body assembly end bolts (3).
14. Lift the electrical connector lock (2) to release the internal harness end from inside the transmission for valve body assembly removal.
15. Remove the sensor bolt (1) and pull the sensor (4) loose from the case.

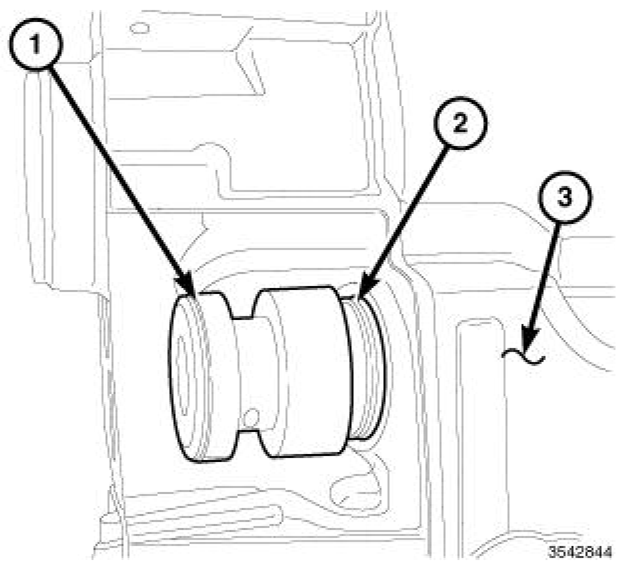

Fig. 40: Remover/Installer, Guide Sleeve, Electrical Harness Insulator & Transmission Case
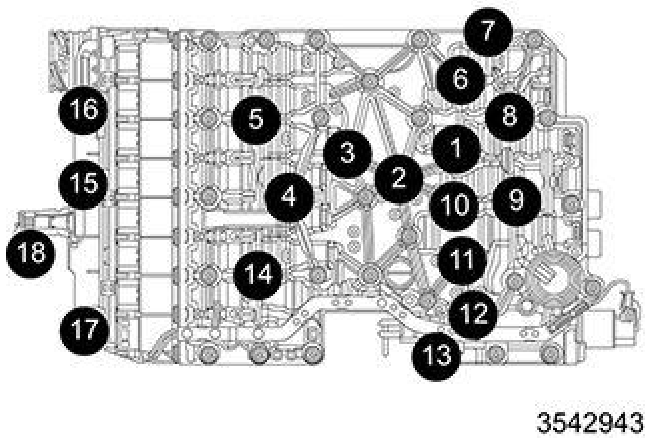
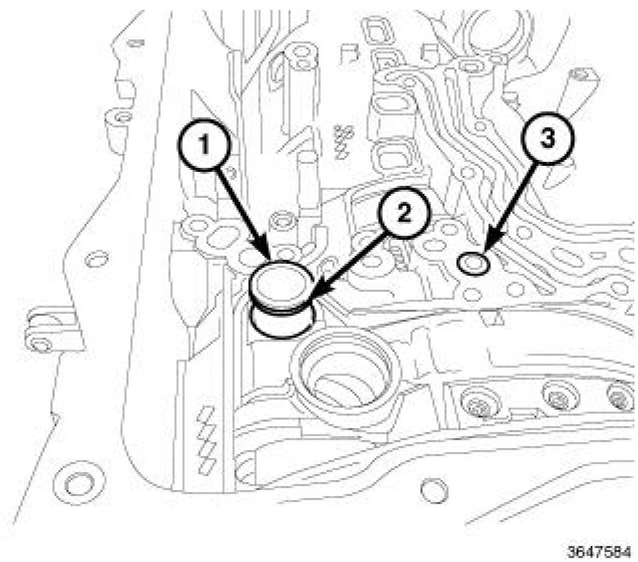
Courtesy of CHRYSLER GROUP, LLC

16. Using (special tool #10377, Remover/Installer, Guide Sleeve) (1) carefully pull the electrical harness insulator (2) straight out from the transmission case (3).



[Fig. 41: Valve Body Bolts Loosening And Tightening Sequence]
Courtesy of CHRYSLER GROUP, LLC

17. Remove valve body assembly bolts 1-14 (15-18 are already removed).
18. Remove the valve body assembly from the transmission.



[Fig. 42: Fluid Port, Two O-Rings, Compression Seal]
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The fluid port (1) may be in the transmission or the valve body assembly.**

19. Pull the fluid port (1) from the transmission or valve body assembly.
20. Remove the two O-rings (2).
21. Remove the compression seal (3) from the transmission.

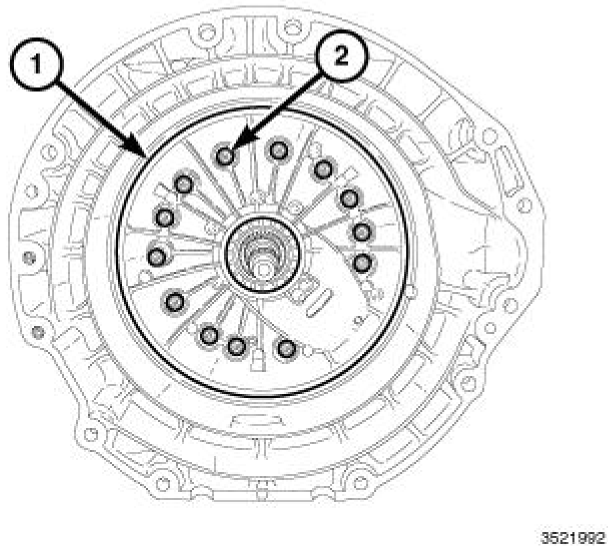


Fig. 43: Thirteen Oil Pump Housing Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

22. Remove the 13 oil pump housing bolts (2).

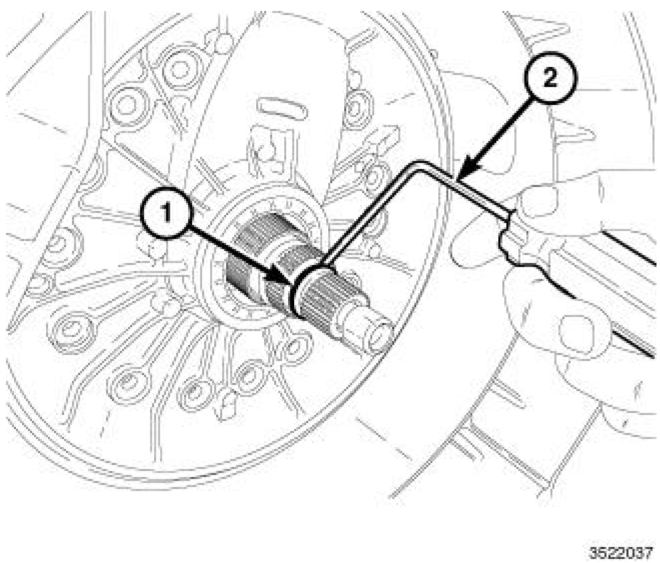

Fig. 44: Input Shaft O-Ring & Small Pick
Courtesy of CHRYSLER GROUP, LLC

23. Remove the input shaft O-ring (1) using a small pick (2) or equivalent.

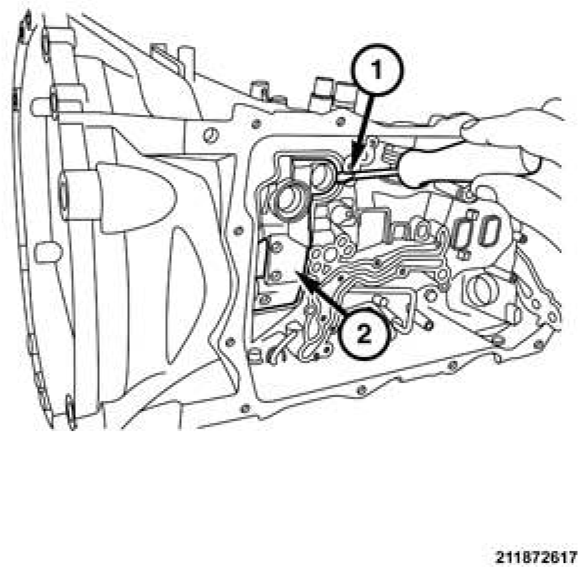

Fig. 45: Prying Oil Pump Housing Away From Case
Courtesy of CHRYSLER GROUP, LLC

24. Pry the oil pump housing (1) away from the case (2) with a small flat blade screwdriver or equivalent through the case opening.
25. From the front of the transmission, remove the oil pump housing.

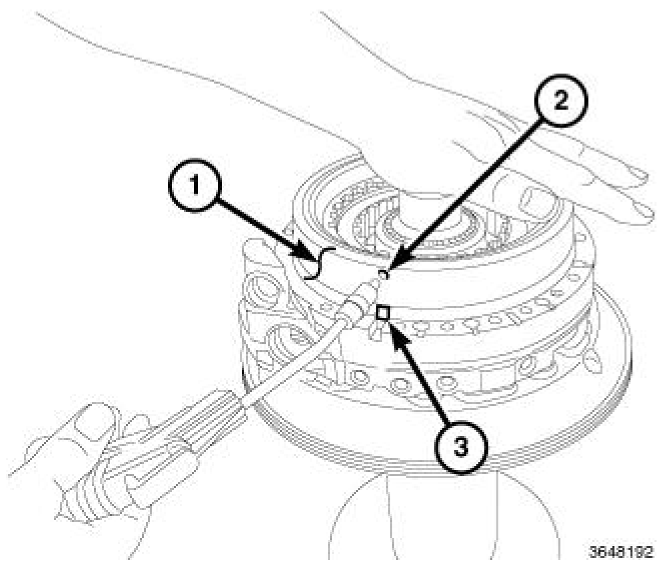

Fig. 46: B-Piston, Hole & B-Piston Alignment Tab
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Apply air pressure slowly because oil may spray when B-piston releases from the assembly.**

26. With one hand above B-piston (1), carefully apply air pressure into the hole (2) directly above the B-piston alignment tab (3) to remove B-piston (1) from the assembly.

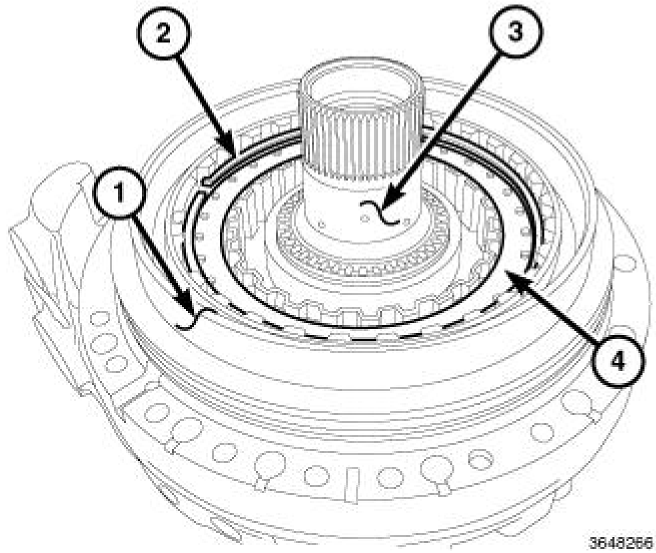

Fig. 47: Outer Ring, Snap Ring, Hub & Spacers
Courtesy of CHRYSLER GROUP, LLC

27. Remove the outer ring (1) (under B-piston).
28. Remove the snap ring (2).
29. Remove the clutches and spacers (4).
30. Remove the hub (3).

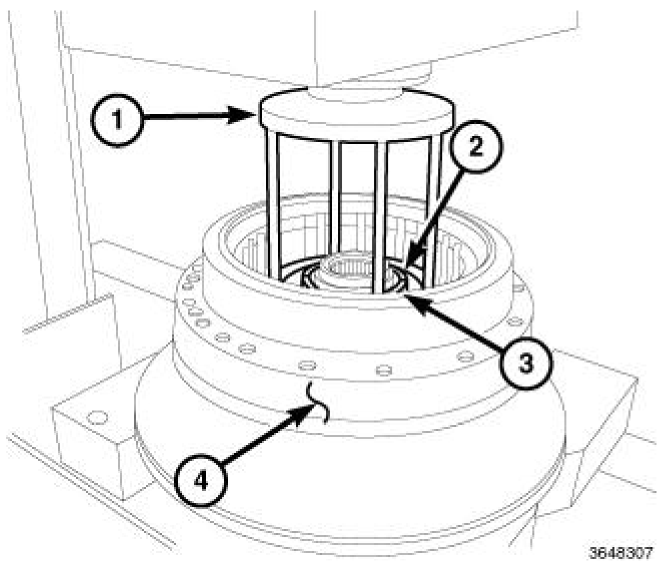

Fig. 48: Oil Pump Housing Assembly
Courtesy of CHRYSLER GROUP, LLC

31. Position the oil pump housing assembly (4) in a suitable arbor press.
32. Using (special tool #8285, Compressor, Spring) (1), press on the fingers of the piston retaining ring to remove tension, and remove the two halves of the split retainer ring (2, 3).

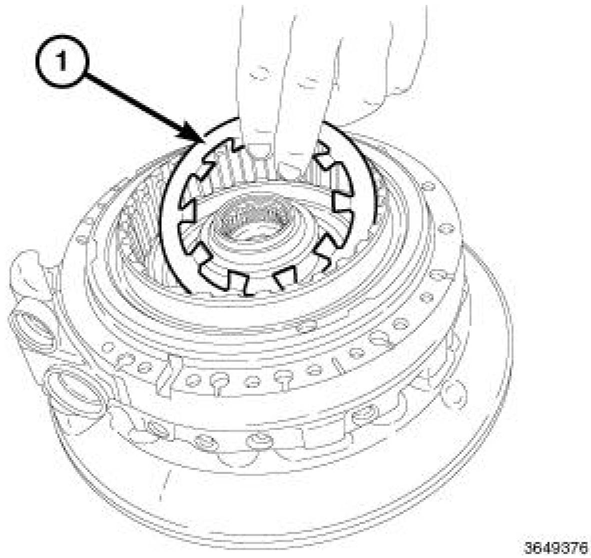

Fig. 49: Piston Retaining Ring And Piston
Courtesy of CHRYSLER GROUP, LLC

33. Remove the piston retaining ring and piston below it.

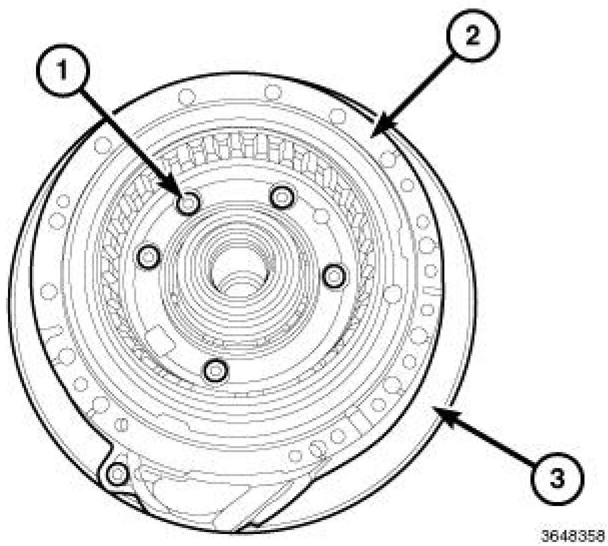

Fig. 50: Six Bolts, Oil Pump Housing & Oil Pump Cover
Courtesy of CHRYSLER GROUP, LLC

34. Remove the six bolts (1) and separate the oil pump housing (2) from the oil pump cover (3).

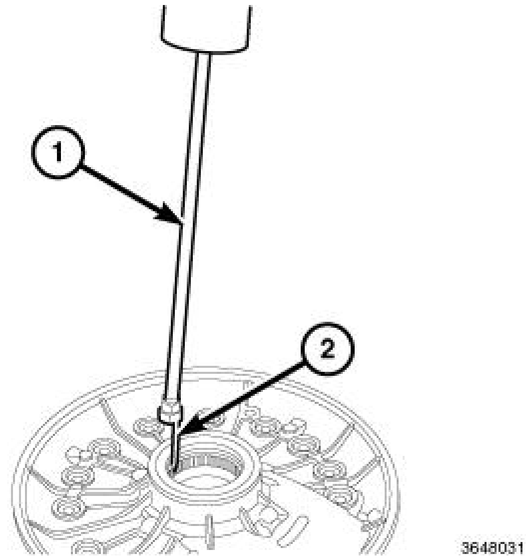

Fig. 51: Seal Remover & Slide Hammer
Courtesy of CHRYSLER GROUP, LLC

35. Using (special tool #9667, Remover, Seal) (2) and (special tool #C-3752, Slide Hammers) (1), remove the oil seal from the front pump cover.
36. Remove the outer lip seal from the front pump cover.

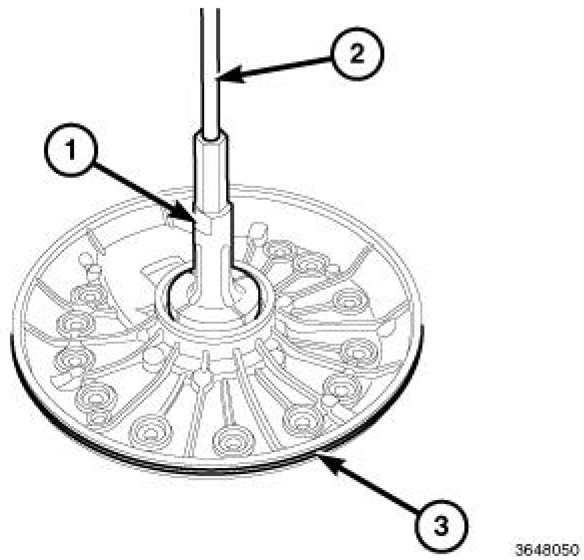

Fig. 52: Remover, Bearing Cup & Slide Hammers
Courtesy of CHRYSLER GROUP, LLC

37. Remove the snap ring.
38. Using (special tool #6787A, Remover, Bearing Cup) (1) and (special tool #C-3752, Slide Hammers) (2) remove the needle bearing from the front cover (3).
39. Remove the snap ring.
40. Using (special tool #9585, Remover, Bearing Cup) and (special tool #C-637, Slide Hammer, Universal) remove the needle bearing.

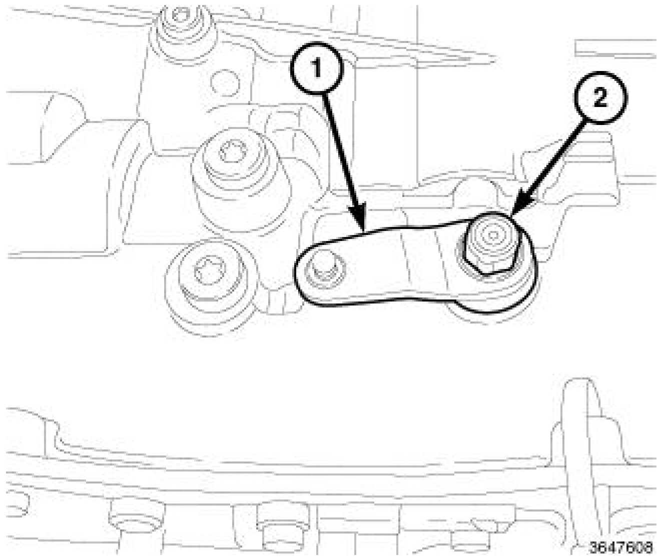

Fig. 53: Manual Park Release Lever Retaining Nut & Lever
Courtesy of CHRYSLER GROUP, LLC

41. Remove the Manual Park Release (MPR) lever retaining nut (2) and remove the lever (1).

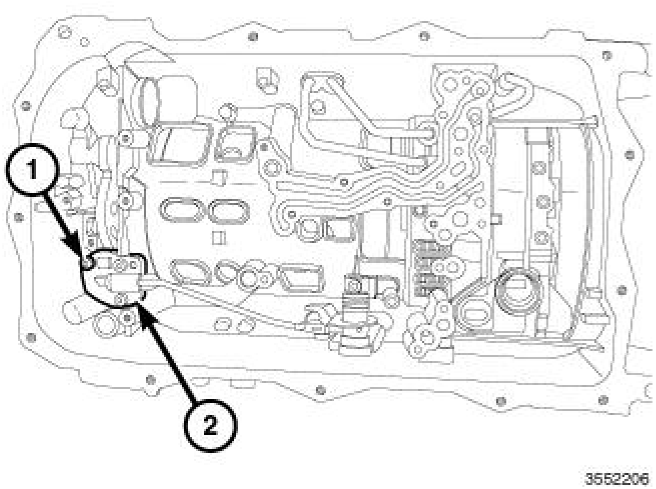

Fig. 54: Three Park Pawl Lock Rod Guide Plate Retaining Screws & Plate
Courtesy of CHRYSLER GROUP, LLC

42. Remove the three park pawl lock rod guide plate retaining screws (1) and remove the plate (2).

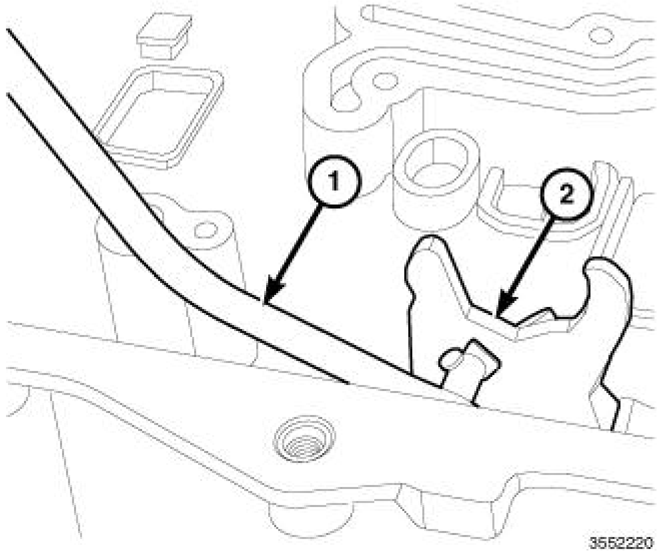

Fig. 55: Park Pawl Lock Rod & Fork
Courtesy of CHRYSLER GROUP, LLC

43. Remove the park pawl lock rod (1) from the fork (2).

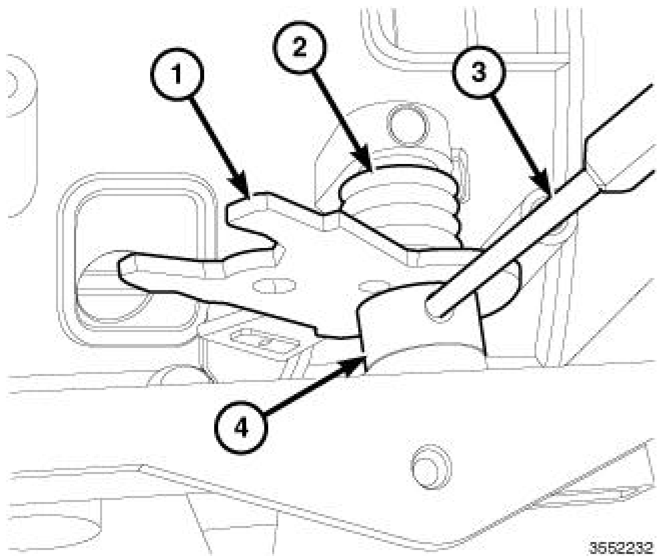

Fig. 56: Selector Shaft, Suitable Pin Punch, Spring & Fork
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Pay attention to the spring position for installation.**

44. Remove the roll pin from the MPR shaft (4) using a suitable pin punch (3).
45. Remove the shaft (4), spring (2) and fork (1) from the case.
46. Remove the MPR shaft seal using a small screwdriver or equivalent.

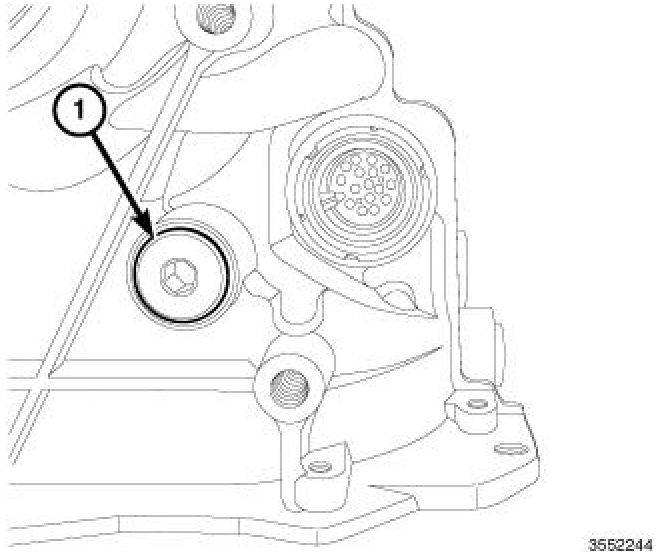

Fig. 57: Park Pawl Shaft Plug
Courtesy of CHRYSLER GROUP, LLC

47. Remove the park pawl shaft plug (1) from the rear of the case.

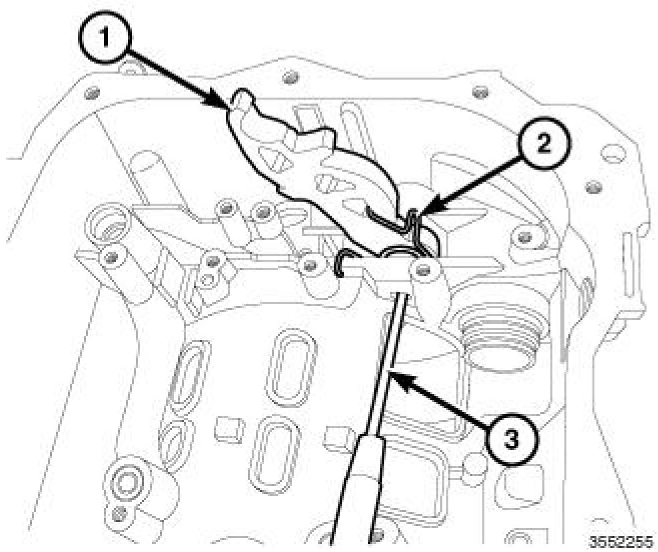

Fig. 58: Removing/Installing Park Pawl Shaft Using A Suitable Pin Punch, Park Pawl And Spring
Courtesy of CHRYSLER GROUP, LLC

NOTE: Pay attention to the spring position for installation.

48. Remove the park pawl shaft using a suitable pin punch (3), remove the park pawl (1) and spring (2).

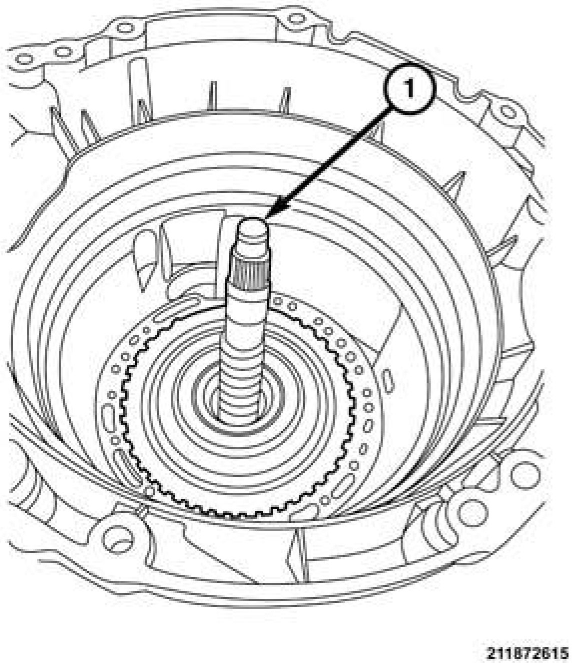

Fig. 59: Park Pawl
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The transmission must be in the upright position to remove the assembly to avoid damage to the drums.**

49. Remove the input/output shaft and P4 annulus drum assembly (1) from the case.

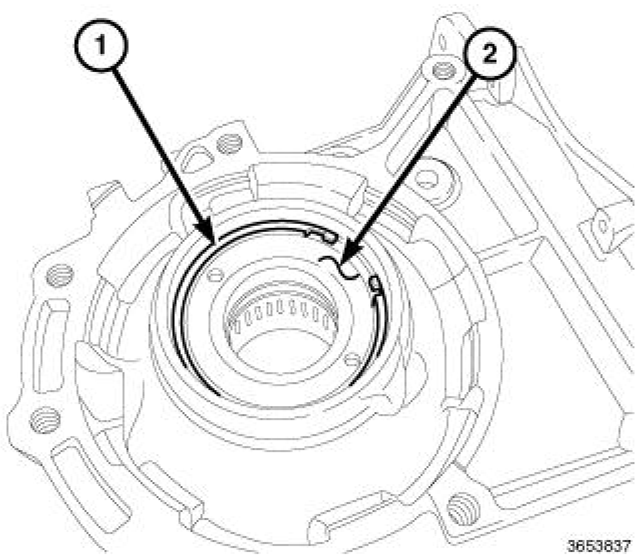

Fig. 60: Outer Bearing Snap Ring & Outer Needle Bearing
Courtesy of CHRYSLER GROUP, LLC

50. Remove the outer bearing snap ring (1), and the outer ball bearing.

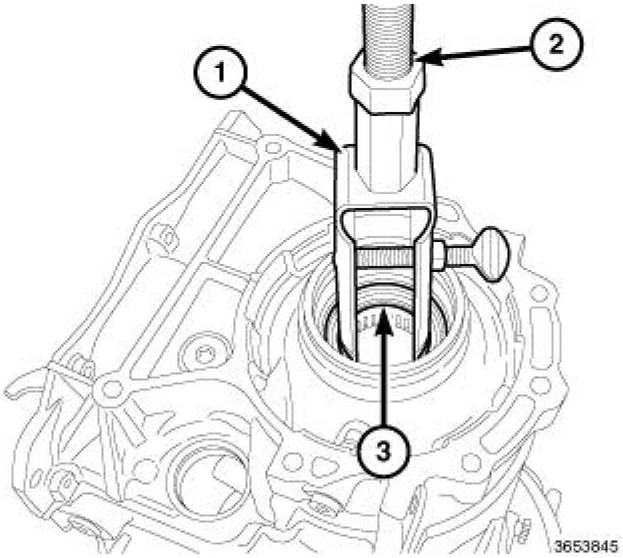

Fig. 61: Bearing Cup, Slide Hammer, Universal & Oil Dam
Courtesy of CHRYSLER GROUP, LLC

51. Remove the oil dam snap ring.
52. Using (special tool #9664, Remover, Bearing Cup) (1) and (special tool #C-637, Slide Hammer, Universal) (2), remove the oil dam (3).

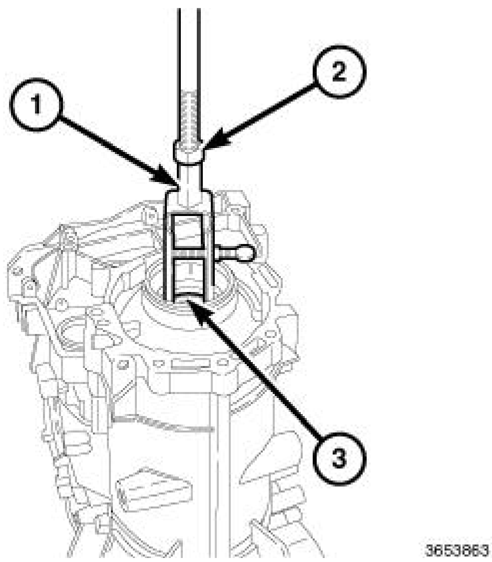

Fig. 62: Bearing Cup, Slide Hammer & Inner Needle Bearing
Courtesy of CHRYSLER GROUP, LLC

53. Remove the output shaft inner needle bearing snap ring.
54. Using (special tool #9664, Remover, Bearing Cup) (1) and (special tool #C-637, Slide Hammer, Universal) (2), remove the inner needle bearing (3).

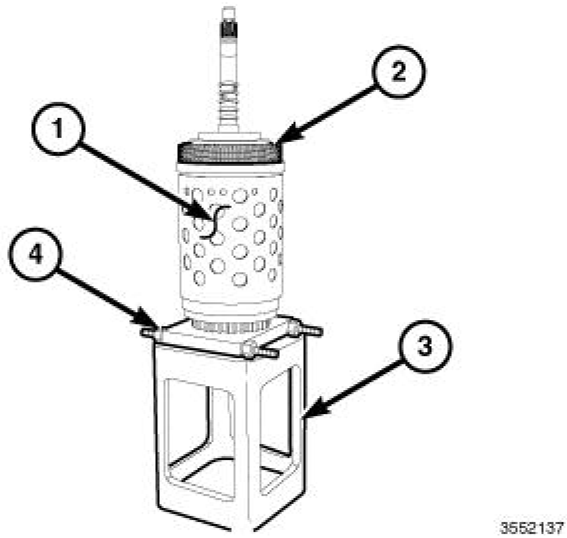

Fig. 63: P4 Annulus Drum Assembly, Press Fixture Assembly & Bearing/Gear Splitter
Courtesy of CHRYSLER GROUP, LLC

55. Position the input/output shaft and P4 annulus drum assembly (1) on (special tool #8925-3, Assembly, Press Fixture) (3) and (special tool #1130, Splitter, Bearing/Gear) (4).
56. Remove the clutch pack (2).

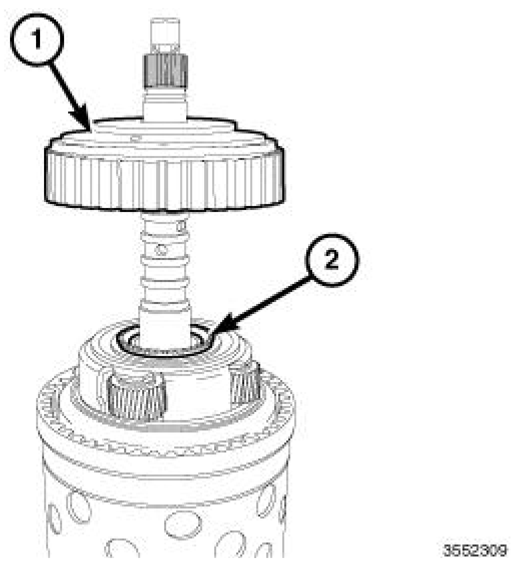

Fig. 64: P1 Annulus/B-Clutch Hub Assembly, Needle Bearing And Holding Plate
Courtesy of CHRYSLER GROUP, LLC

57. Remove the O-ring and 5 squared O-rings.
58. Remove the P1 annulus/B clutch hub assembly (1) from the P4 annulus drum.

NOTE: **The washer may stick to the bottom of the P1 annulus/B clutch hub assembly (1).**

59. Remove the selectable shim from the P1 annulus/B clutch hub.
60. Remove the needle bearing and holding plate (2) from the P1 planetary carrier.

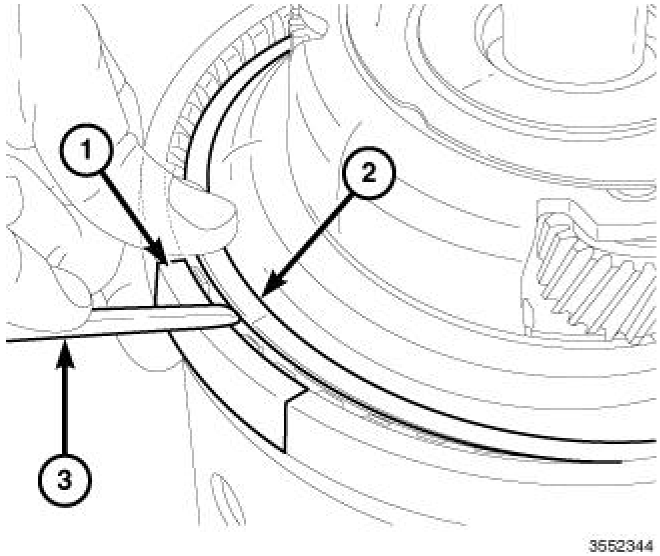

Fig. 65: Tool & Snap Ring
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The (special tool #10378, Rings, Support) are three pieces intended to be used in multiple locations around the drum.**

61. Position the (special tool #10378, Rings, Support) (1) on the P4 annulus drum assembly to protect the drum.

NOTE: **Pry the snap ring from the opposite side of the snap ring openings to release.**

NOTE: **When the snap ring is removed the internal clutch drum may drop slightly.**

62. Using a suitable tool (3), release the snap ring (2) by prying in and up from the opposite side of the snap ring openings.

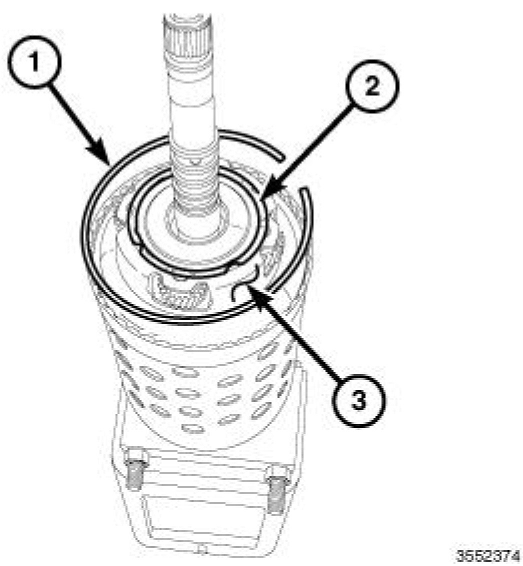

Fig. 66: Snap Ring & P1 Planetary Carrier
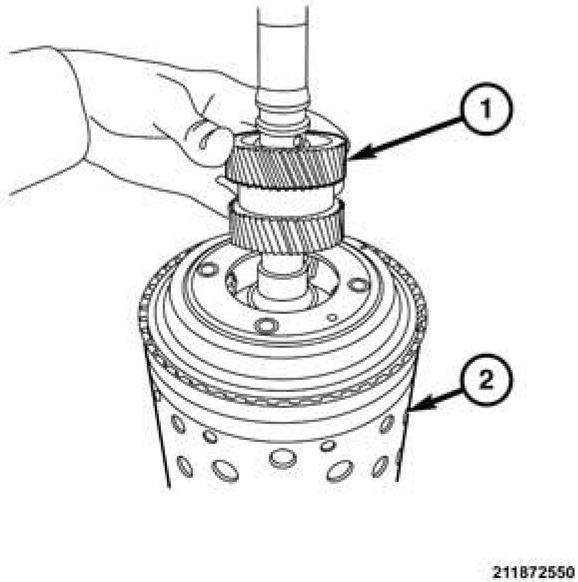
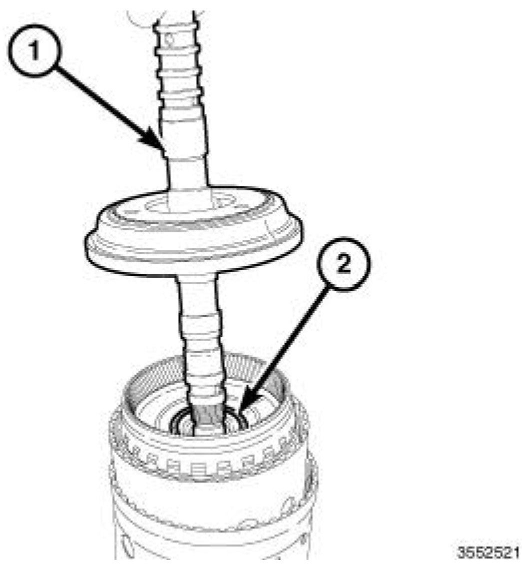
Courtesy of CHRYSLER GROUP, LLC

63. Remove the P1 planetary carrier (3).



[Fig. 67: Sun Gear & Needle Bearing](#)
Courtesy of CHRYSLER GROUP, LLC

64. Remove P1/P2 (1) sun gear from the bottom of the P1 planetary carrier.



[Fig. 68: P2 Planetary Carrier & Needle Bearing](#)
Courtesy of CHRYSLER GROUP, LLC

65. Remove the input shaft with P2 planetary carrier (1) from the drum assembly.

66. Remove the needle bearing (2) and washer.

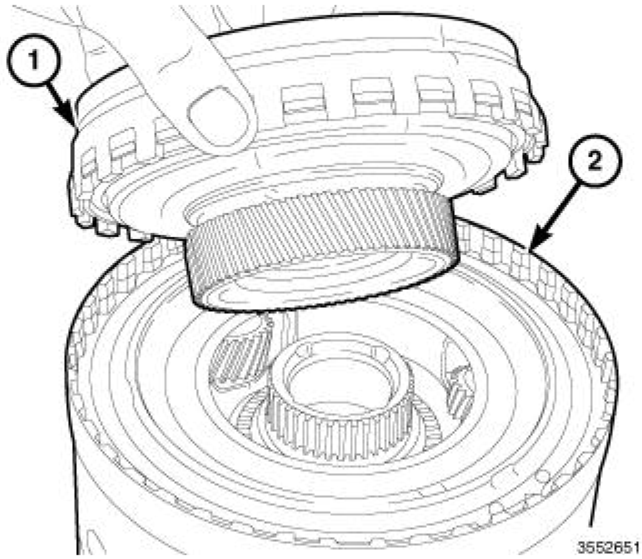


Fig. 69: P2 Annulus/P3 Sun Gear & Drum Assembly
Courtesy of CHRYSLER GROUP, LLC

67. Remove the P2 annulus/P3 sun gear (1) from the drum assembly (2).

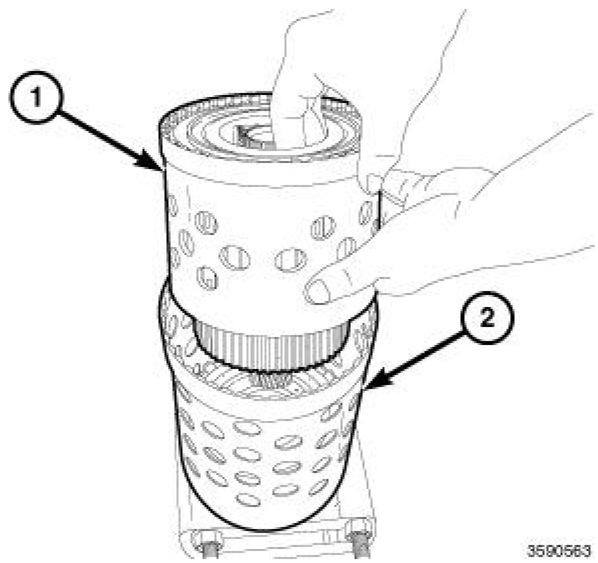

Fig. 70: D-Clutch Drum & P4 Annulus Drum
Courtesy of CHRYSLER GROUP, LLC

68. Remove the D clutch drum (1) from the P4 annulus drum (2).

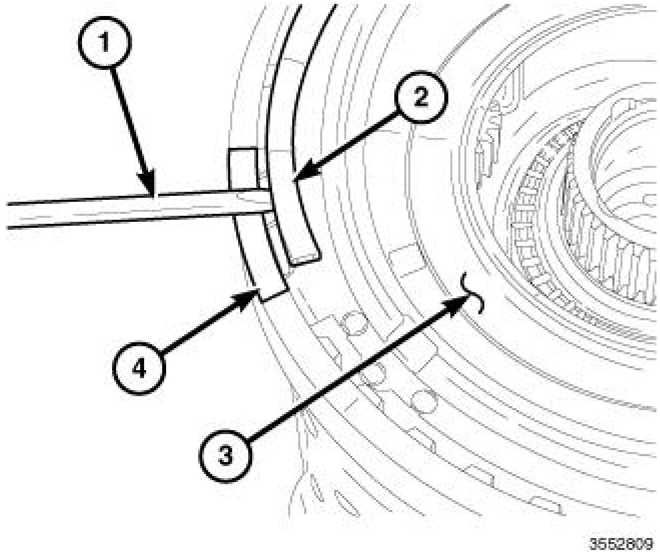

Fig. 71: Support Rings, Tool & P3 Planetary Carrier
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The (special tool #10378, Rings, Support) are three pieces intended to be used in multiple locations around the drum.**

69. Position the (special tool #10378, Rings, Support) (4) on the P4 annulus drum assembly to protect the drum.
70. Using a suitable tool (1), release and remove the snap ring (2).
71. Remove the P3 planetary carrier (3).
72. Remove the needle bearing from the planetary carrier.

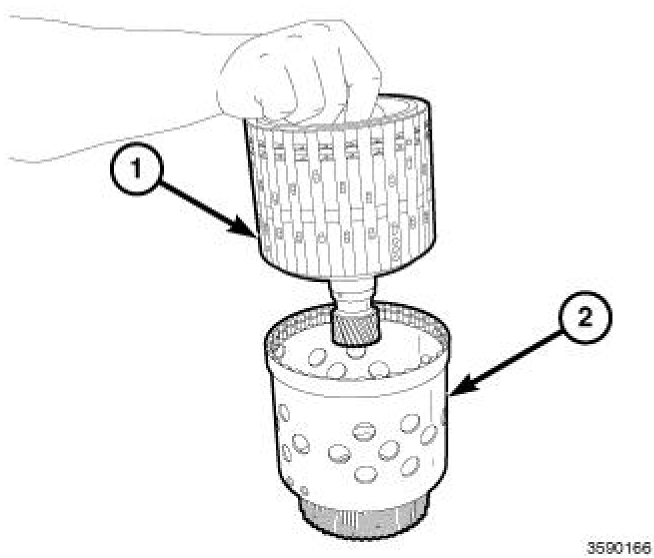

Fig. 72: P4 Sun Gear/C/E Clutch Retainer & D-Clutch Drum

76. Remove the snap ring (1) from the P4 sun gear/C/E clutch retainer (2).

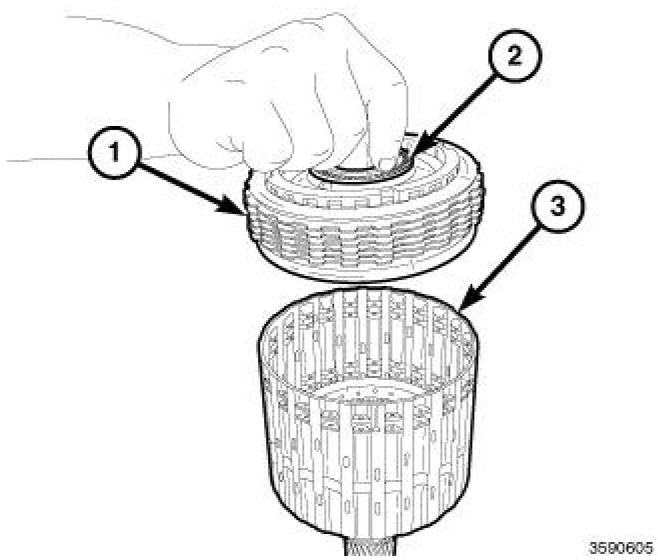

Fig. 76: E-Clutch & P4 Sun Gear/C/E Clutch Retainer
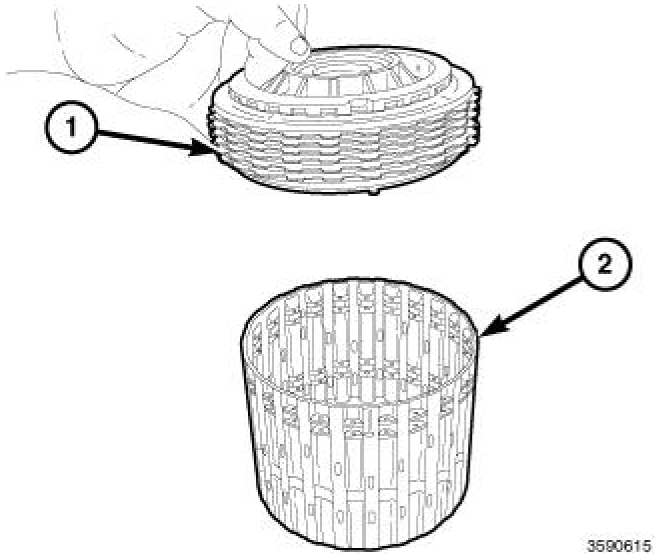
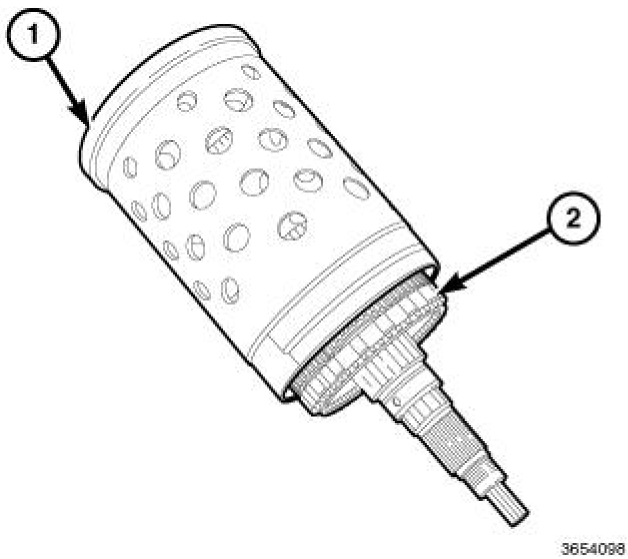
Courtesy of CHRYSLER GROUP, LLC

77. Remove the E clutch (1) from the P4 sun gear/C/E clutch retainer (3).
78. Remove the needle bearing (2) from the E clutch (1).



[Fig. 77: C-Clutch & P4 Sun Gear/C/E Clutch Retainer]
Courtesy of CHRYSLER GROUP, LLC

79. Remove the C clutch (1) from the P4 sun gear/C/E clutch retainer (2).
80. Remove the bearing from top and bottom of C clutch (1).



[Fig. 78: P4 Planetary Carrier/Output Shaft & P4 Annulus Drum]
Courtesy of CHRYSLER GROUP, LLC

81. Remove the P4 planetary carrier/output shaft (2) from the P4 annulus drum (1).

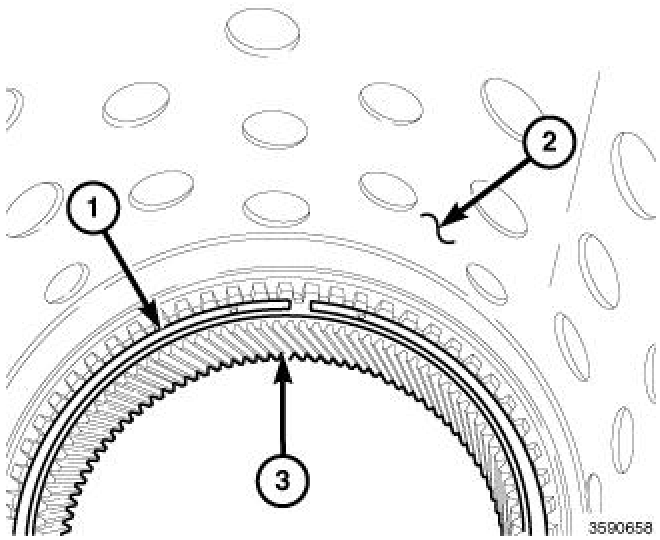


Fig. 79: Snap Ring & P4 Annulus Drum & P4 Annulus
Courtesy of CHRYSLER GROUP, LLC

82. Remove the snap ring (1) from the P4 annulus drum (2).
83. Remove the P4 annulus (3) from the P4 annulus drum (2).

CLEANING

CLEANING

CAUTION: **A unique transmission fluid has been developed for this transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid see VEHICLE QUICK REFERENCE .**

The use of crocus cloth is permissible where necessary, providing it is used carefully. When used on shafts, or valves, use extreme care to avoid rounding off sharp edges. Sharp edges are vital as they prevent foreign matter from getting between the valve and valve bore.

Do not reuse oil seals, seal rings, or O-rings during overhaul. Replace these parts as a matter of course. Also do not reuse snap rings or E-clips that are bent or distorted. Replace these parts as well.

Lubricate transmission parts with the appropriate automatic transmission fluid only during overhaul and assembly.

NOTE: **Do not use shop towels or rags to dry the case (or any other transmission component) unless they are made from lint-free materials. Lint will stick to case surfaces and transmission components and circulate throughout the transmission after assembly. A sufficient quantity of lint can block fluid passages and interfere with valve body operation.**

Flush the case bores and fluid passages thoroughly with approved transmission fluid. Dry the case and all fluid passages with compressed air. Be sure that all fluid passages are clear.

INSPECTION

INSPECTION

Inspect the case for cracks, porous spots, worn bores, or damaged threads. Damaged threads can be repaired with HelicoilÃ® thread inserts. However, the case will have to be replaced if it exhibits any type of damage or wear.

ASSEMBLY

ASSEMBLY

CAUTION: **A unique transmission fluid has been developed for this transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid see VEHICLE QUICK REFERENCE .**

CAUTION: **The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Failure to follow these instructions may result in damage to the TCM/TCMA.**

NOTE: **If the transmission is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the TCM Adaptation Procedure. Refer to STANDARD PROCEDURE .**

10. Install the snap ring (1) into the P4 sun gear/C/E clutch retainer (2).

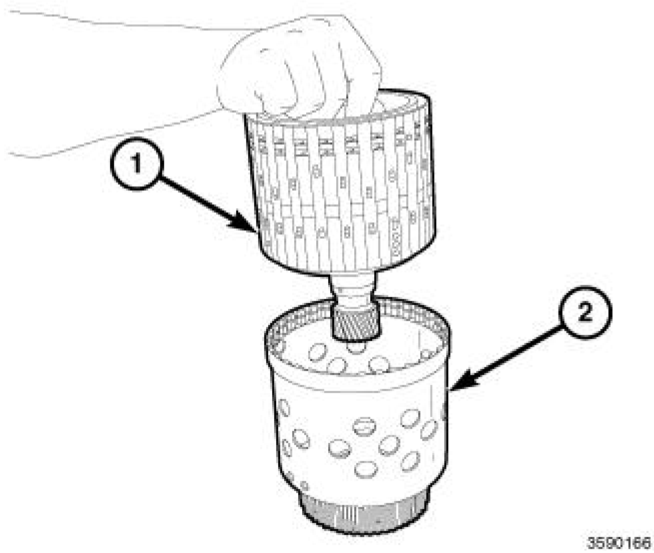

Fig. 87: P4 Sun Gear/C/E Clutch Retainer & D-Clutch Drum
Courtesy of CHRYSLER GROUP, LLC

11. Install the P4 sun gear/C/E clutch retainer (1) into the D clutch drum (2).

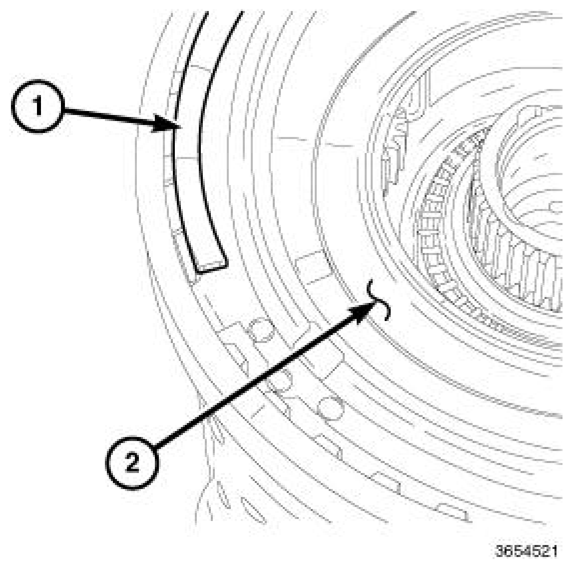

Fig. 88: P3 Planetary Carrier & Snap Ring
Courtesy of CHRYSLER GROUP, LLC

12. Install the needle bearing onto the planetary carrier.
13. Install the P3 planetary carrier (2) in the D clutch drum.
14. Install the snap ring (1).

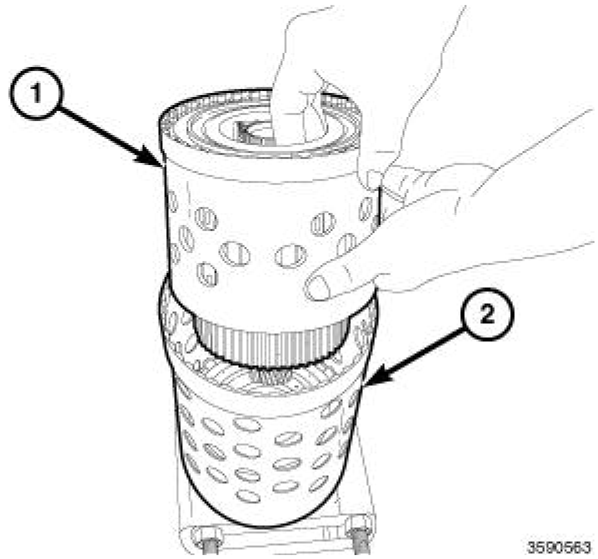

Fig. 89: D-Clutch Drum & P4 Annulus Drum
Courtesy of CHRYSLER GROUP, LLC

15. Install the D clutch drum (1) into the P4 annulus drum (2).

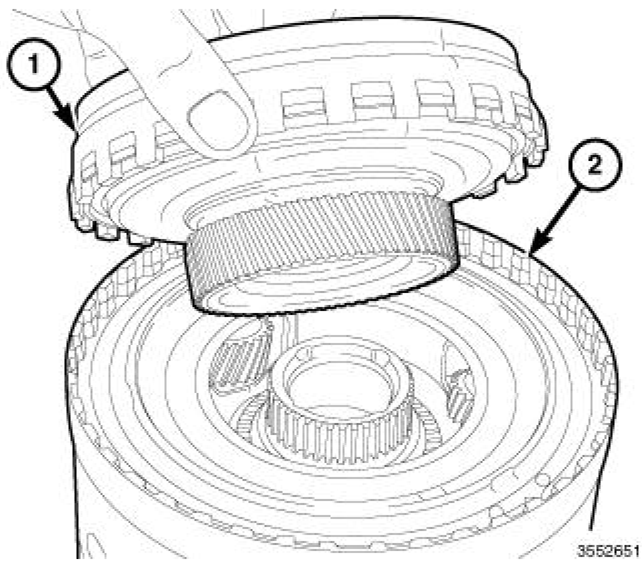

Fig. 90: P2 Annulus/P3 Sun Gear & Drum Assembly
Courtesy of CHRYSLER GROUP, LLC

16. Install the P2 annulus\P3 sun gear (1) onto the drum assembly (2).

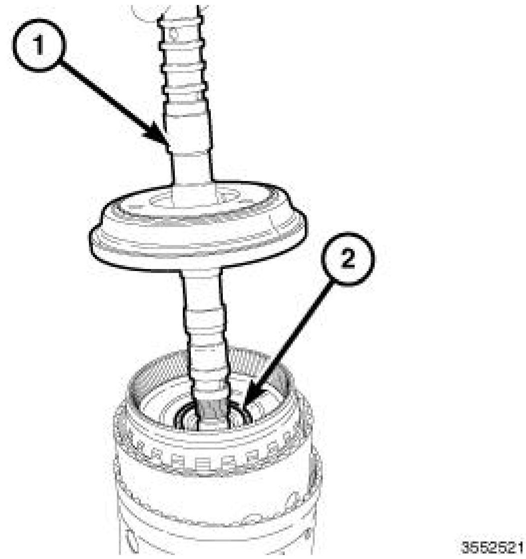

Fig. 91: P2 Planetary Carrier & Needle Bearing
Courtesy of CHRYSLER GROUP, LLC

17. Install the needle bearing (2) and washer.
18. Install the input shaft with P2 planetary carrier (1) into the drum assembly.

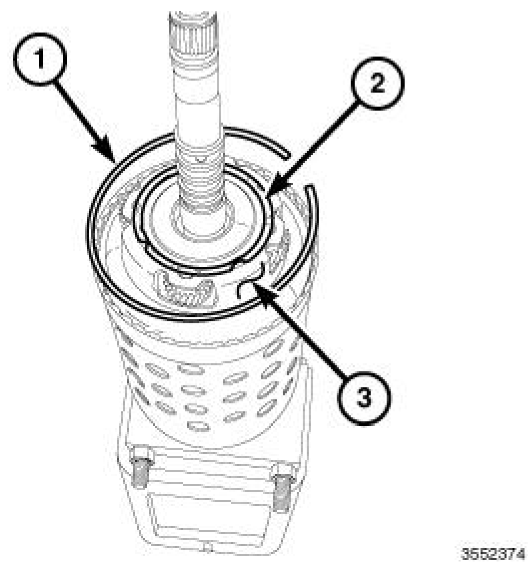

Fig. 92: Snap Ring & P1 Planetary Carrier
Courtesy of CHRYSLER GROUP, LLC

19. Install P1/P2 sun gear into the bottom of the P1 planetary carrier (3).
20. Install the P1 planetary carrier (3).
21. Install the snap ring (1).

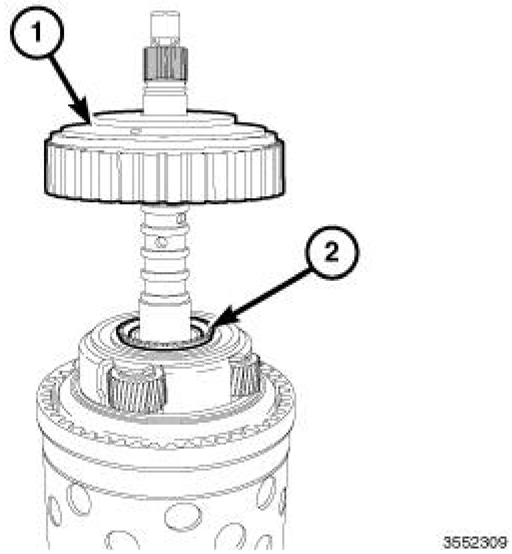

Fig. 93: P1 Annulus/B-Clutch Hub Assembly, Needle Bearing And Holding Plate
Courtesy of CHRYSLER GROUP, LLC

22. Install the needle bearing and holding plate (2) onto the P1 planetary carrier.
23. Install the selectable shim to the P1 annulus/B clutch hub.
24. Install the P1 annulus\B clutch hub assembly (1) onto the P4 annulus drum.
25. Install the O-ring and five squared O-rings.

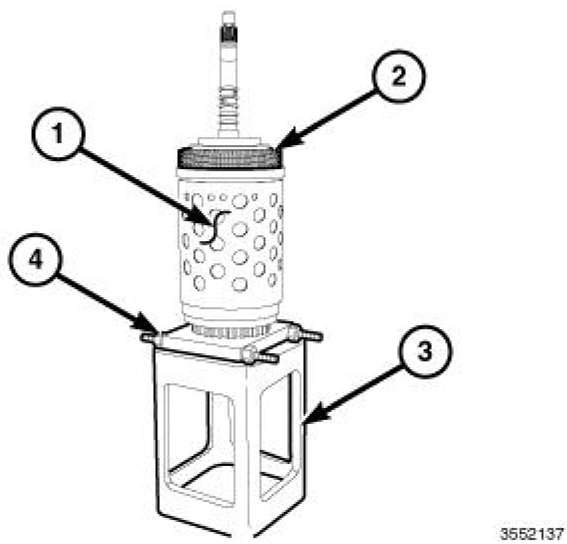

Fig. 94: P4 Annulus Drum Assembly, Press Fixture Assembly & Bearing/Gear Splitter
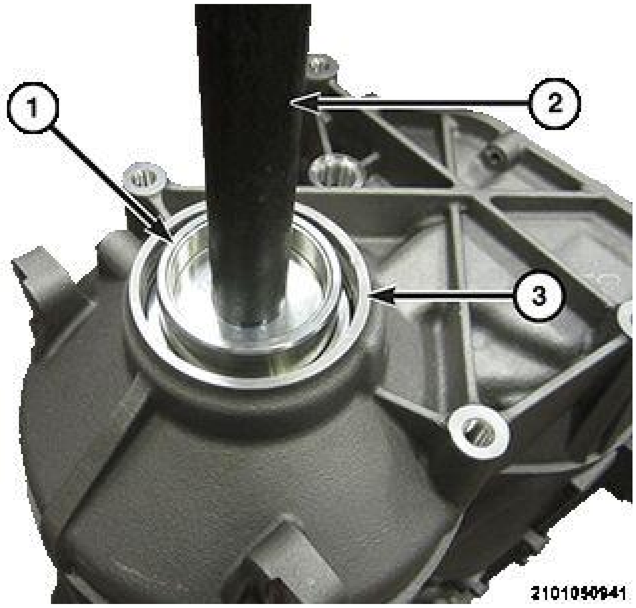
Courtesy of CHRYSLER GROUP, LLC

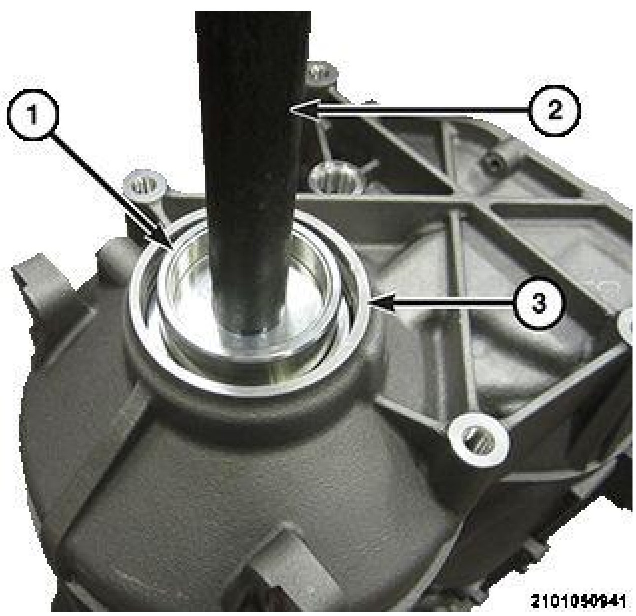
26. Install the clutch pack (2).



[Fig. 95: Installing Output Shaft Inner Needle Bearing & Oil Dam]
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The (special tool #10373A, Installer, Output Needle Bearing/Rear Oil Dam) (1) is a combination tool that is reversed to install the oil dam and output shaft inner needle bearing. For use to install the output shaft inner needle bearing, use the thick walled side of the tool against the bearing.**

27. Using (special tool #10373A, Installer, Output Needle Bearing/Rear Oil Dam) (1) and (special tool #C-4171, Driver Handle, Universal) (2), install the output shaft inner needle bearing.
28. Install the snap ring.



[Fig. 96: Installing Output Shaft Inner Needle Bearing & Oil Dam]
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The (special tool #10373A, Installer, Output Needle Bearing/Rear Oil Dam)**

(1) is a combination tool that is reversed to install the oil dam and output shaft inner needle bearing. For use to install the oil dam, use the thin walled side of the tool against the oil dam.

29. Using (special tool #10373A, Installer, Output Needle Bearing/Rear Oil Dam) (1) and (special tool #C-4171, Driver Handle, Universal) (2), install the oil dam.
30. Install the snap ring.

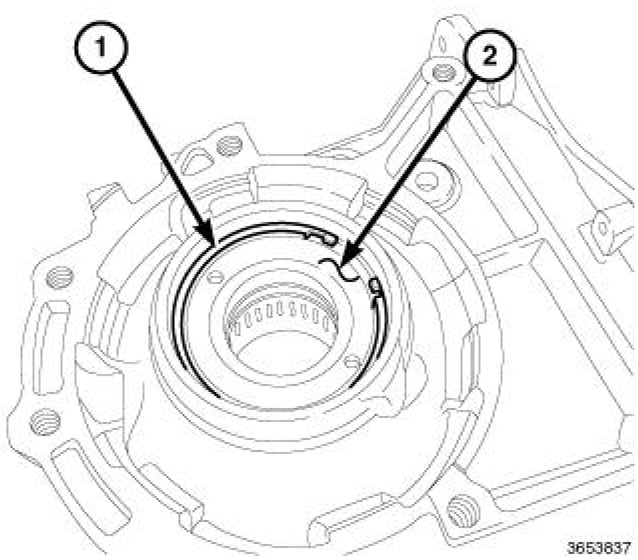


Fig. 97: Outer Bearing Snap Ring & Outer Needle Bearing
Courtesy of CHRYSLER GROUP, LLC

NOTE: **AWD shown, RWD similar.**

31. Install the ball bearing.
32. Install the snap ring (1).

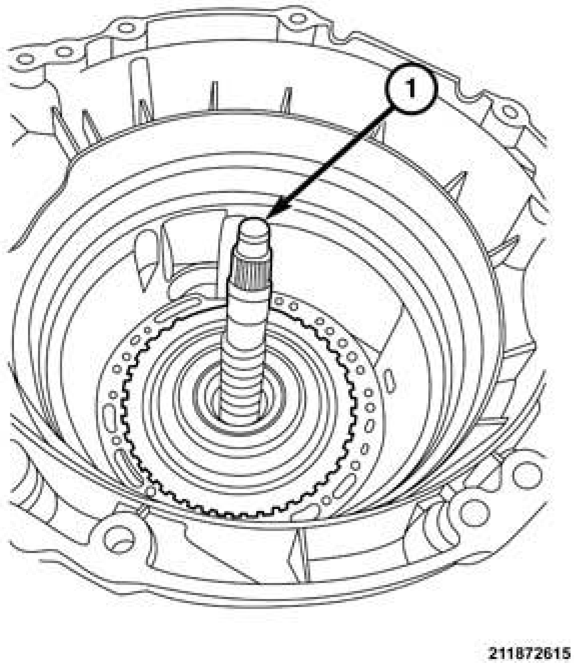

Fig. 98: Park Pawl
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The transmission must be in a upright position when the input/output shaft and the P4 annulus drum assembly (1) is installed.**

33. Install the input/output shaft and P4 annulus drum assembly (1) into the case.

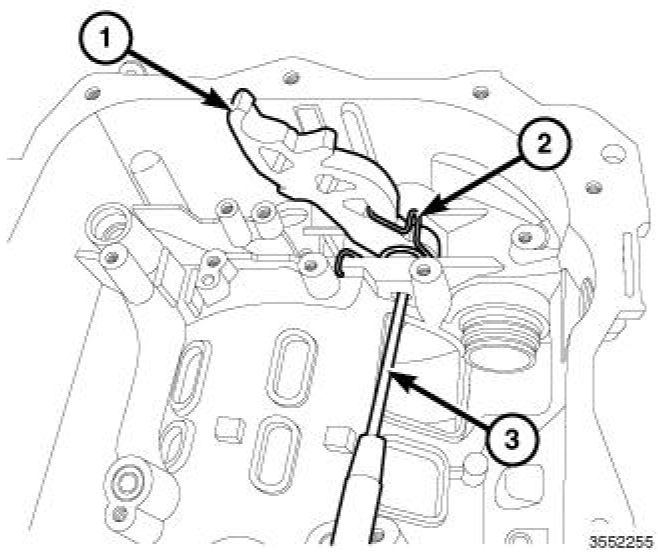

Fig. 99: Removing/Installing Park Pawl Shaft Using A Suitable Pin Punch, Park Pawl And Spring
Courtesy of CHRYSLER GROUP, LLC

34. From outside the transmission case, install the park pawl shaft and install the park pawl (1) and spring (2).

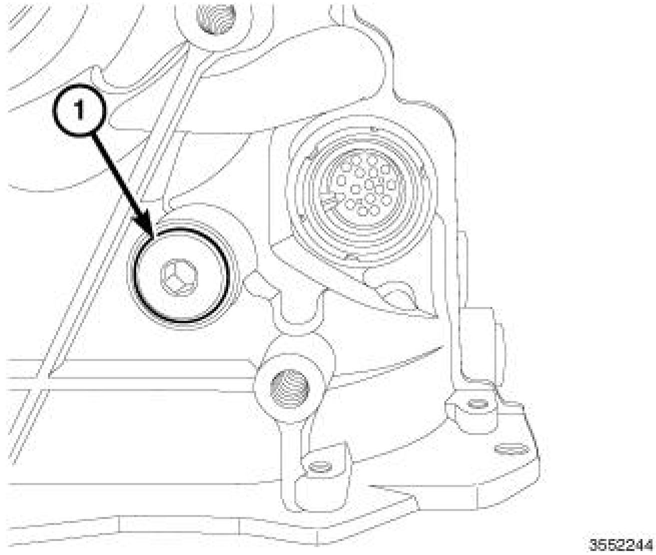

Fig. 100: Park Pawl Shaft Plug
Courtesy of CHRYSLER GROUP, LLC

35. Install the park pawl shaft plug (1) into the rear of the case and tighten to the proper **SPECIFICATIONS**
.

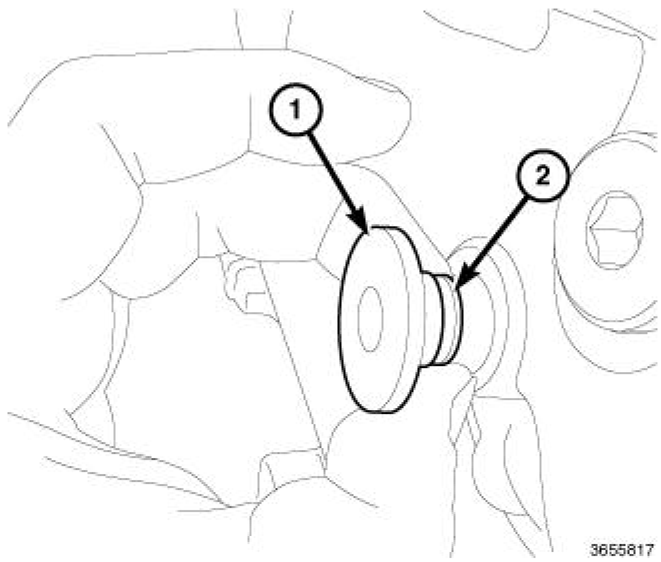

Fig. 101: Spacer & Selector Shaft Seal
Courtesy of CHRYSLER GROUP, LLC

36. Using (special tool #6936, Spacer) (1), install the Manual Park Release (MPR) shaft seal (2).

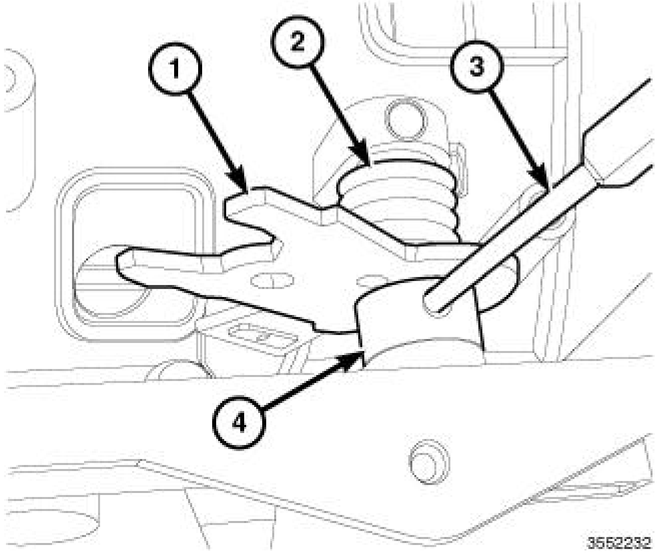

Fig. 102: Selector Shaft, Suitable Pin Punch, Spring & Fork
Courtesy of CHRYSLER GROUP, LLC

37. Install the shaft (4), spring (2), and fork (1) into the case.
38. Install the roll pin into the MPR shaft (4) using a suitable pin punch (3).

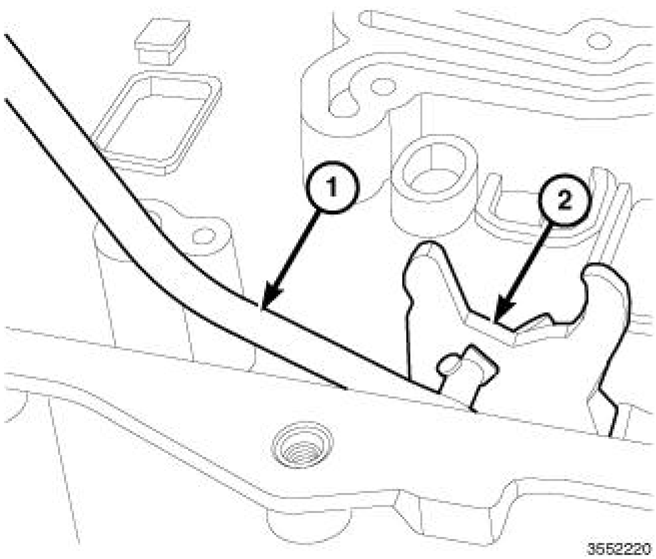

Fig. 103: Park Pawl Lock Rod & Fork
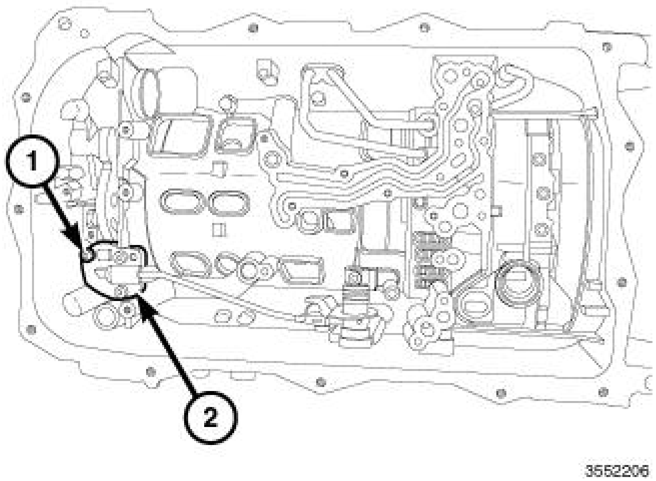
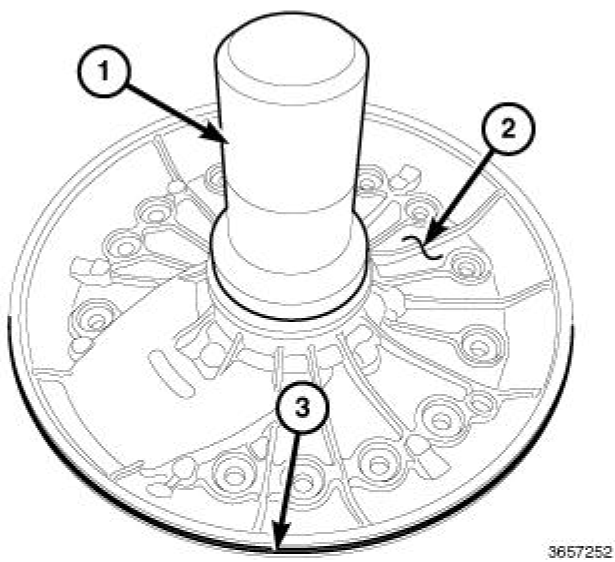
Courtesy of CHRYSLER GROUP, LLC

39. Install the park pawl lock rod (1) onto the fork (2).



[Fig. 104: Three Park Pawl Lock Rod Guide Plate Retaining Screws & Plate](#)
Courtesy of CHRYSLER GROUP, LLC

40. Position the park pawl lock rod guide plate (2), install the three park pawl lock rod guide plate retaining screws (1) and tighten to the proper **SPECIFICATIONS**.



[Fig. 105: Oil Pump Cover Lip Seal & Oil Pump Cover](#)
Courtesy of CHRYSLER GROUP, LLC

41. Install the oil pump cover lip seal (3) on the oil pump cover (2).

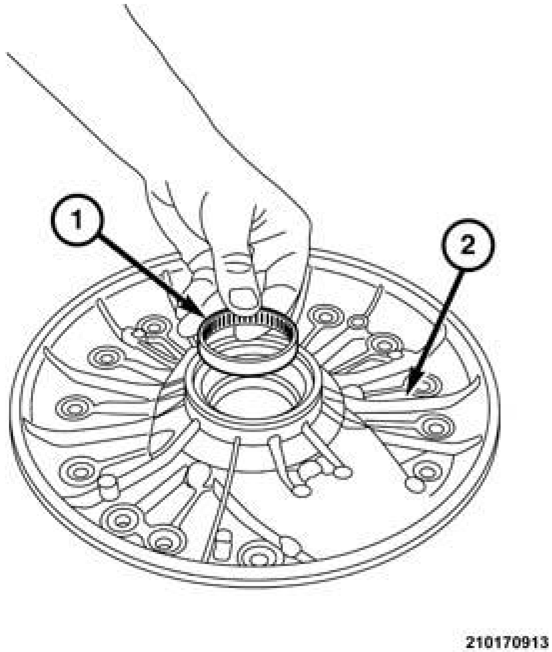


Fig. 106: Oil Pump Needle Bearing & Oil Pump Cover
Courtesy of CHRYSLER GROUP, LLC

42. If removed, install a **NEW** oil pump needle bearing using (special tool #10376, Installer, Input Shaft Needle Bearing)and (special tool #C-4171, Driver Handle, Universal).

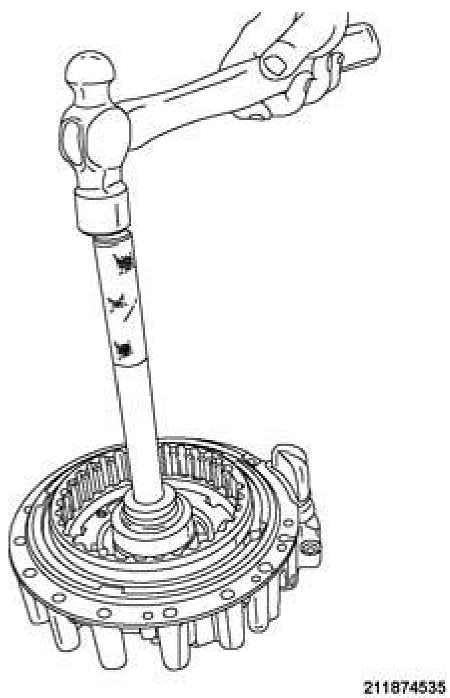

Fig. 107: Installing Oil Pump Housing Needle Bearing
Courtesy of CHRYSLER GROUP, LLC

43. If removed, install the inner oil pump needle bearing using (special tool #10382, Installer, Oil Pump Housing Needle Bearing)and (special tool #C-4171, Driver Handle, Universal)
44. Using (special tool #10375, Installer, Oil Pump Cover Oil Seal) (1), install the input shaft seal in the oil

pump cover (2).

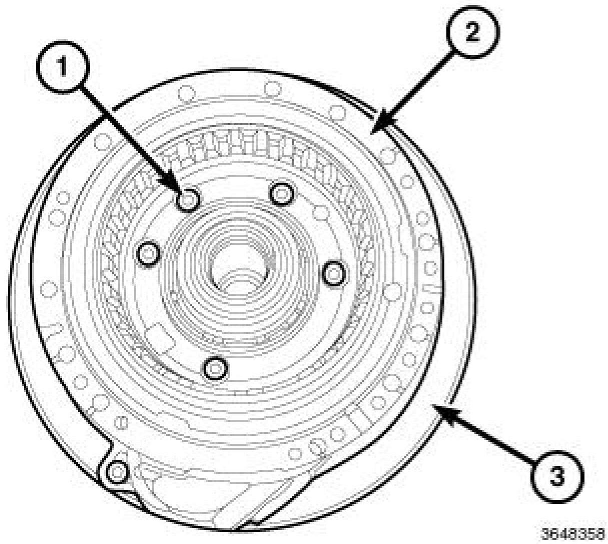

Fig. 108: Six Bolts, Oil Pump Housing & Oil Pump Cover
Courtesy of CHRYSLER GROUP, LLC

45. Position the oil pump housing (2) and oil pump cover (3) together.
46. Install the five bolts (1) and tighten to the proper **SPECIFICATIONS**.

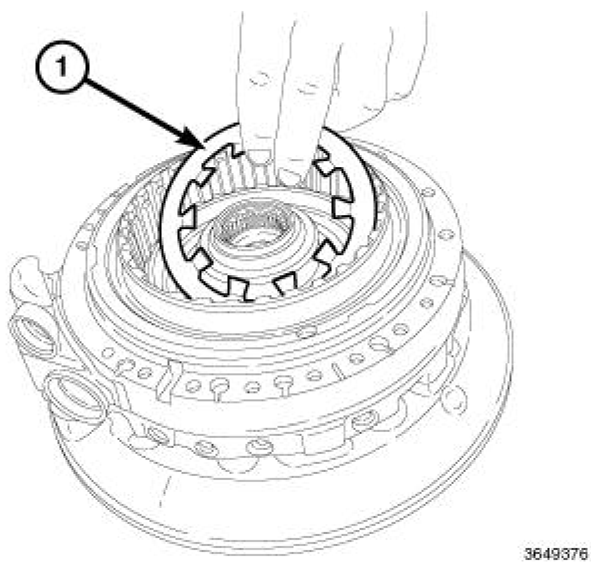

Fig. 109: Piston Retaining Ring And Piston
Courtesy of CHRYSLER GROUP, LLC

47. Insert the piston and the retaining ring (1) into the housing.

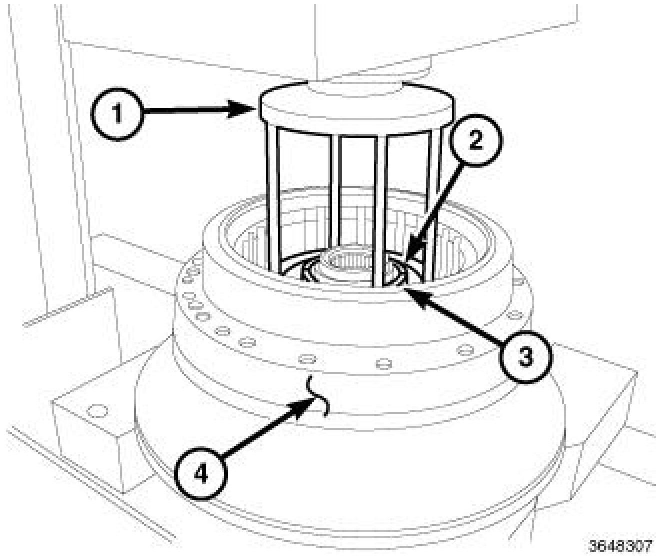

Fig. 110: Oil Pump Housing Assembly
Courtesy of CHRYSLER GROUP, LLC

48. Position the oil pump housing assembly (4) in a suitable arbor press.
49. Using (special tool #8285, Compressor, Spring) (1), press on the fingers of the piston retaining ring to remove tension, and install the two halves of the split retainer ring (2).

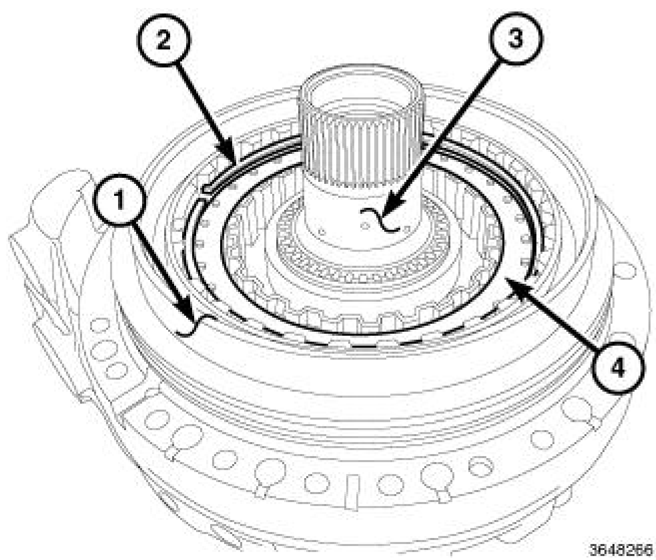

Fig. 111: Outer Ring, Snap Ring, Hub & Spacers
Courtesy of CHRYSLER GROUP, LLC

50. Install the hub (3).
51. Install the clutches and spacers (4).
52. Install the snap ring (2).
53. Install the outer ring (1) (below B-piston).

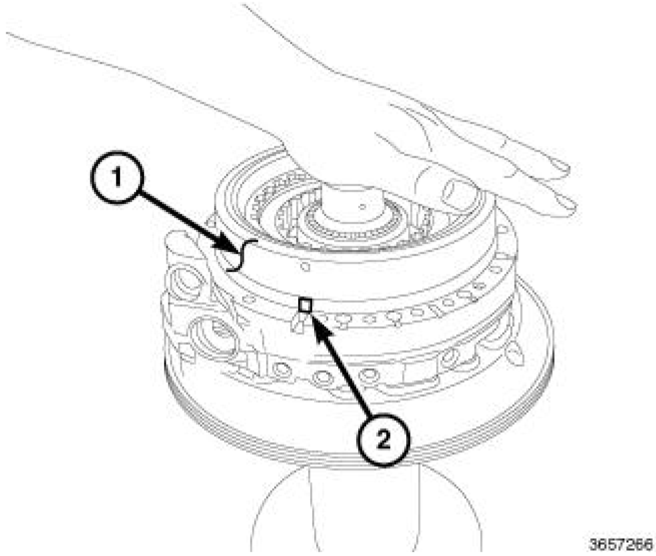

Fig. 112: B-Piston Alignment Tab & B-Piston
Courtesy of CHRYSLER GROUP, LLC

54. Position the B-piston alignment tab (2) above the notch and install B-piston (1) on the assembly.

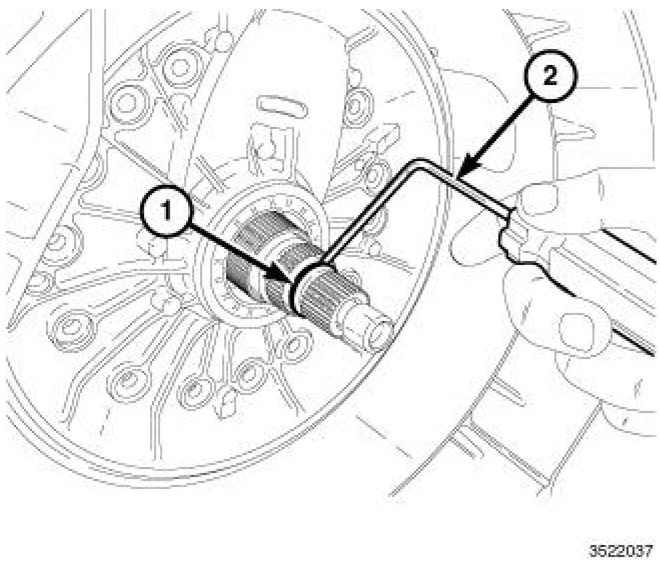

Fig. 113: Input Shaft O-Ring & Small Pick
Courtesy of CHRYSLER GROUP, LLC

55. Carefully position the oil pump housing assembly into the case, firmly press the oil pump into place before drawing it in with the bolts.

NOTE: **Check the transmission end play before installing the new oil pump bolts, in case adjustment is needed.**

56. Install the **NEW** input shaft O-ring.

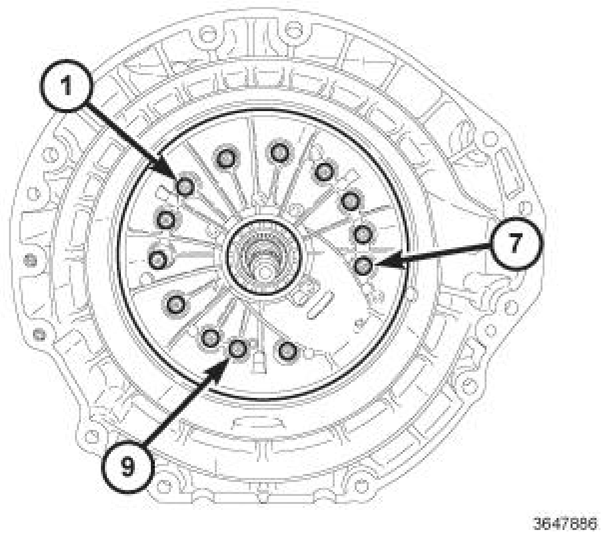

Fig. 114: Pre Tighten Bolts One, Seven And Nine
Courtesy of CHRYSLER GROUP, LLC

57. Install the thirteen oil pump cover retaining bolts and tighten the oil pump cover as follows:
    a. In order to seat the oil pump cover properly, pre tighten bolts one, seven and nine to 6 N.m (53 in. lb.).
    b. Working in a clockwise pattern, beginning with number one, tighten to 10 N.m (89 in. lb.).
    c. Working in a clockwise pattern, beginning with number one, tighten an additional 90Â°.

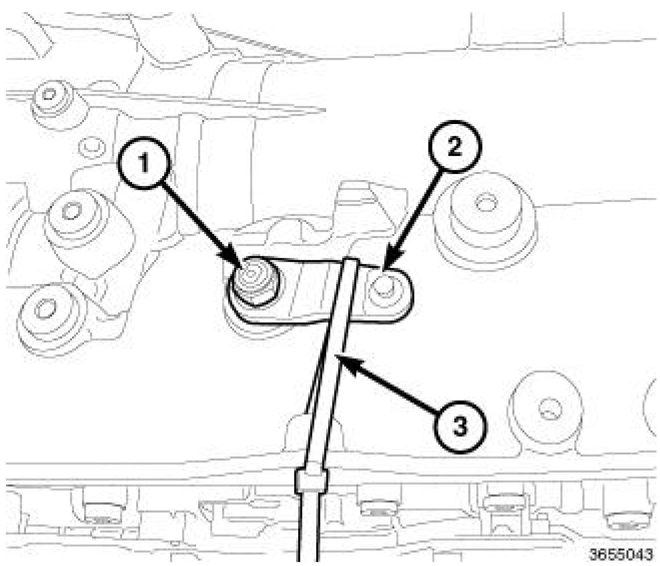

Fig. 115: Manual Park Release Lever, Nut & Tie Strap
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The MPR lever (2) can be reversed to release tension and ease the installation of the valve body assembly.**

58. Temporarily install the MPR lever (2) to release tension on the shift fork as follows:
    a. Install the MPR lever (2) 180 degrees offset from its original position.
    b. Install the nut (1) and hand tighten.

c. Turn the MPR lever (2) and using a tie strap (3), secure the lever (2) into position so the park release fork is in the same position as it was before valve body assembly removal.

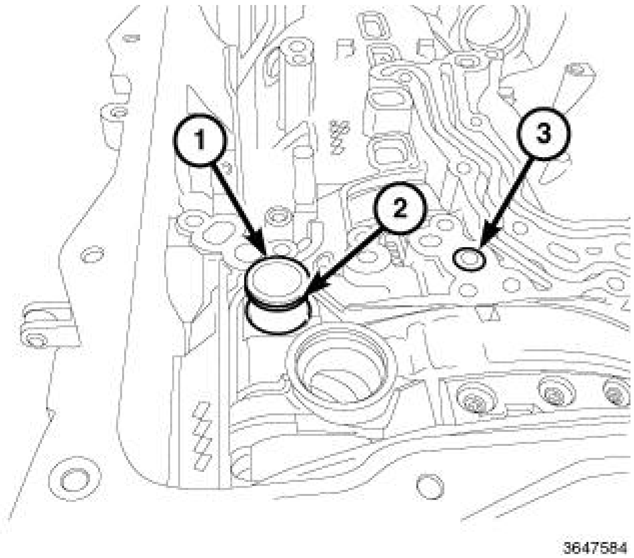

Fig. 116: Fluid Port, Two O-Rings, Compression Seal
Courtesy of CHRYSLER GROUP, LLC

59. Install a new compression seal (3) into the transmission case.
60. Install the fluid port (1) with **NEW** O-rings to the transmission case.

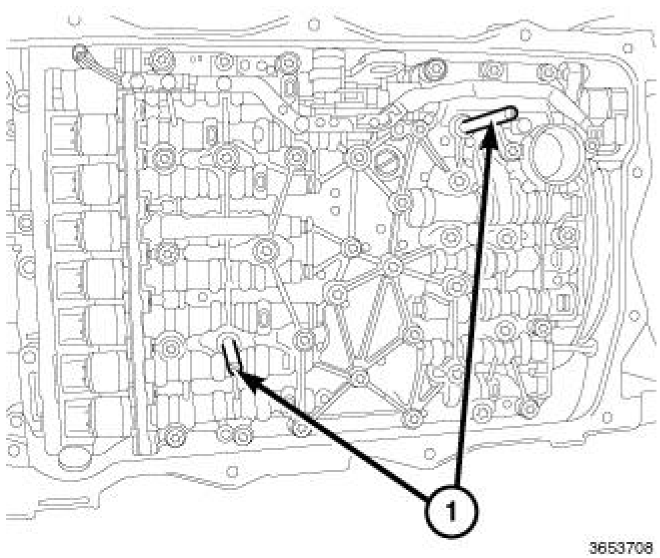

Fig. 117: Valve Body Alignment Pins
Courtesy of CHRYSLER GROUP, LLC

61. Install the (special tool #10379, Pins, Valve Body Alignment) (1) in the transmission case as guides for the valve body assembly.

NOTE: **Make sure the shift fork lines up properly.**

62. Using the valve body alignment pins (1) to guide, position the valve body assembly to the transmission.

NOTE: **After several bolts have been hand tightened, remove the guide pins (1).**

63. Install the fourteen valve body assembly retaining bolts and hand tighten.

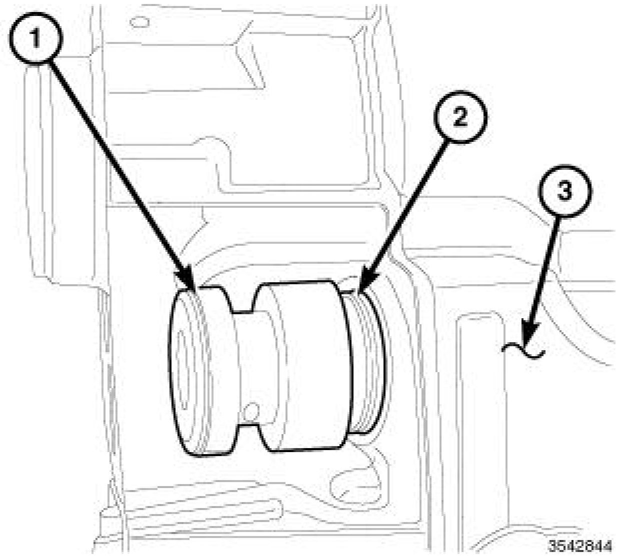

Fig. 118: Remover/Installer, Guide Sleeve, Electrical Harness Insulator & Transmission Case
Courtesy of CHRYSLER GROUP, LLC

64. Using (special tool #10377, Remover/Installer, Guide Sleeve) (1) carefully install the electrical harness insulator (2) into the transmission case (3).

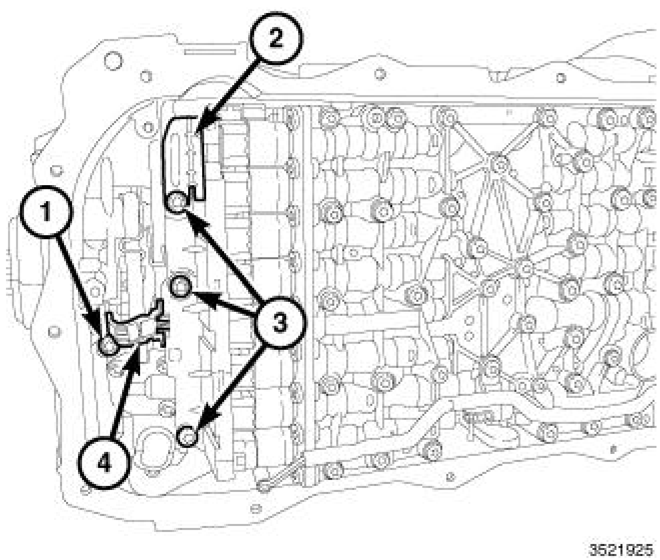

Fig. 119: Valve Body Assembly End Retainer Bolts
Courtesy of CHRYSLER GROUP, LLC

65. Install the sensor (4) and the sensor bolt (1) and hand tighten.
66. Latch the electrical connector insulator lock (2) by pushing in.

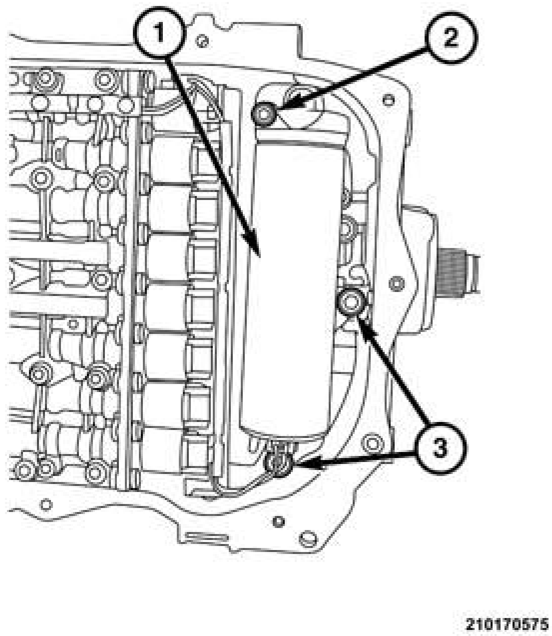

Fig. 120: Hydraulic Impulse Storage Unit & Bolts
Courtesy of CHRYSLER GROUP, LLC

67. If equipped, install the Hydraulic Impulse Storage Unit (H.I.S.).
68. Tighten the bolts (2 and 3) to the proper **SPECIFICATIONS**.
69. Install the valve body assembly end bolts (3) and hand tighten.

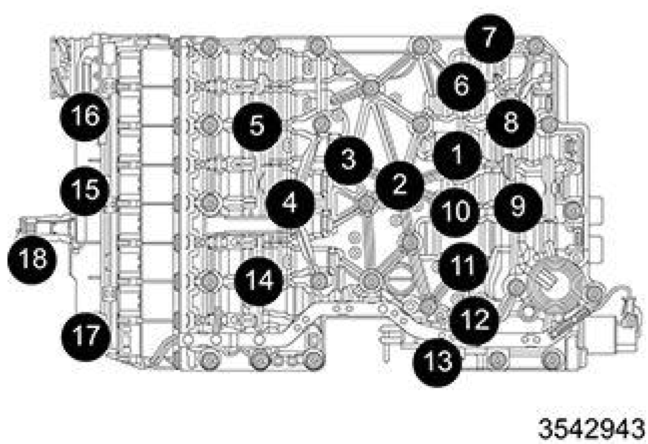

Fig. 121: Valve Body Bolts Loosening And Tightening Sequence
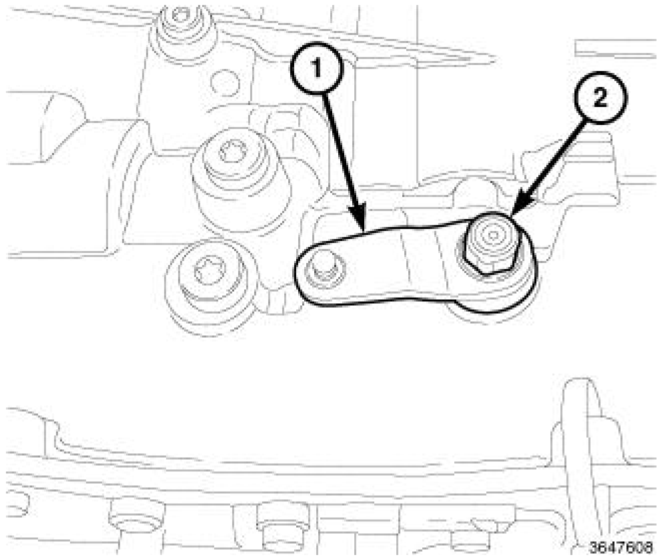
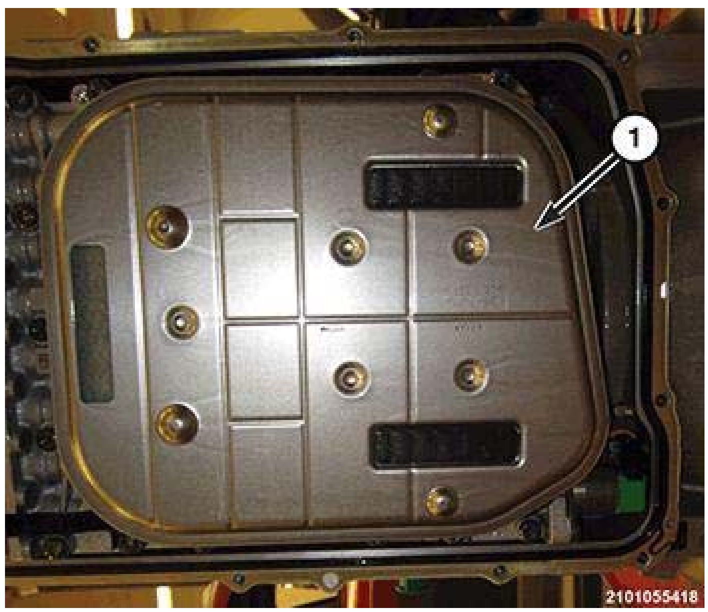
Courtesy of CHRYSLER GROUP, LLC

70. Tighten the valve body assembly retaining bolts 1-18 in the sequence shown to 6 Nm (53 in.-lbs.).



[Fig. 122: Manual Park Release Lever Retaining Nut & Lever](#)
Courtesy of CHRYSLER GROUP, LLC

71. Remove the tie strap and return the Manual Park Release (MPR) lever (1) to the original position.
72. Install the MPR lever nut (2) and tighten to the proper **SPECIFICATIONS**.



[Fig. 123: Transmission Oil Filter](#)
Courtesy of CHRYSLER GROUP, LLC

73. Install the **NEW** transmission oil filter (1).

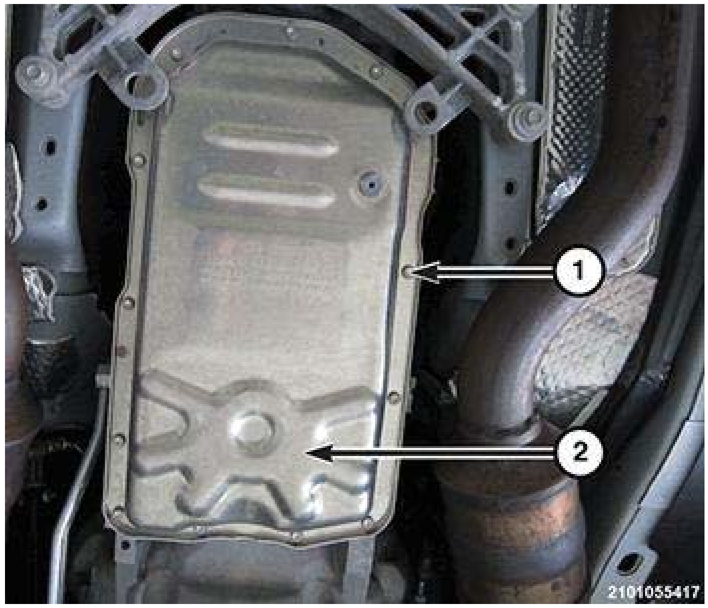


Fig. 124: Transmission Oil Pan & Bolts
Courtesy of CHRYSLER GROUP, LLC

74. Install the 13 transmission oil pan bolts and tighten to 10 N.m (89 in. lbs.) in a crisscross pattern.

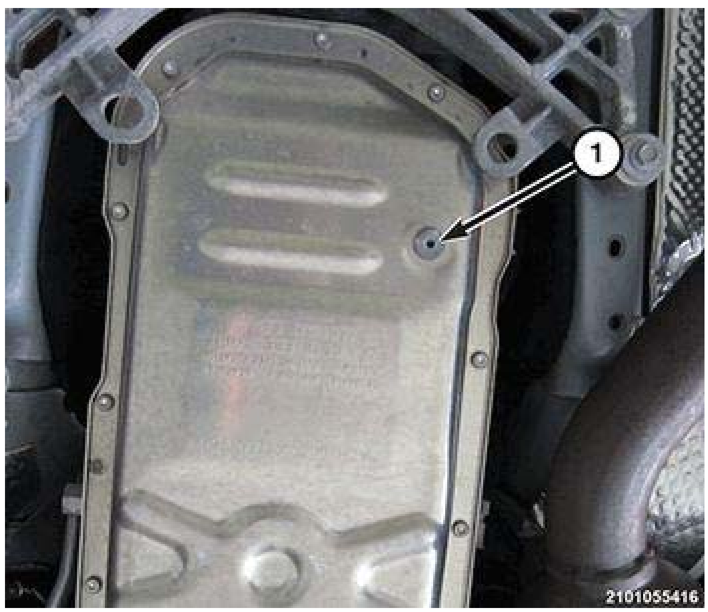

Fig. 125: Transmission Oil Pan Plug
Courtesy of CHRYSLER GROUP, LLC

75. Verify the transmission oil pan plug (1) is installed.

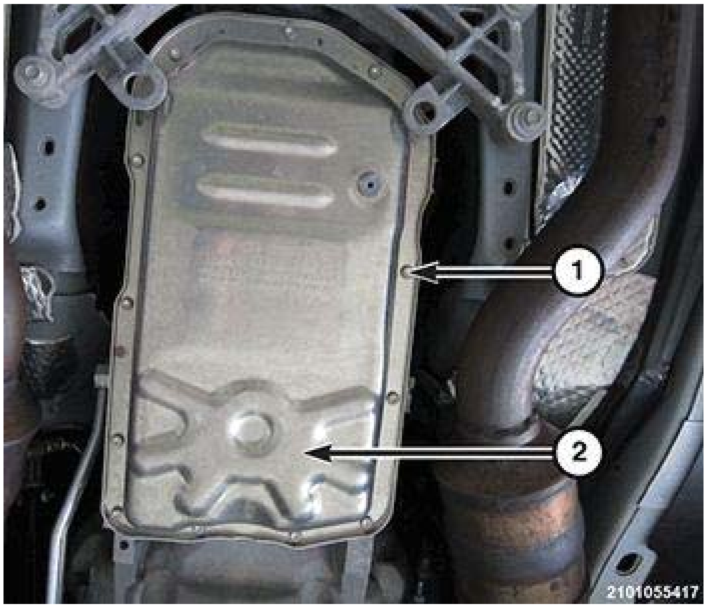

Fig. 126: Transmission Oil Pan & Bolts
Courtesy of CHRYSLER GROUP, LLC

76. Position the oil pan (2) and gasket.
77. Install the 13 transmission oil pan bolts (1) using crisscross pattern and tighten to 10 Nm (89 in.-lbs.).
78. Install the transmission output shaft washer.

CAUTION: The seal must be installed flush with the case. Driving the seal deeper could damage the seal causing a leak.

79. Position the new output shaft seal over the output shaft and against the transmission case.
80. Using (special tool #8481, Installer, Gear) install the output shaft seal.
81. Install the transmission rear dust seal.

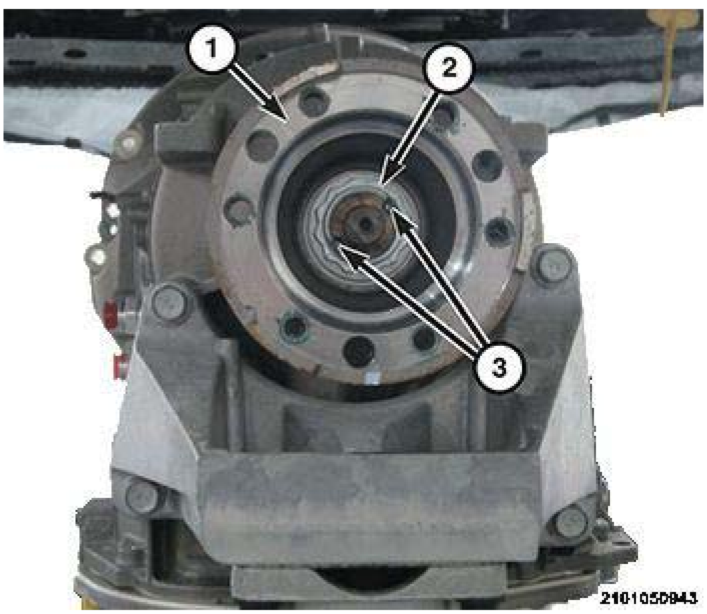

Fig. 127: Drive Shaft Flange, Nut & Staking Area

Courtesy of CHRYSLER GROUP, LLC

82. Install the drive shaft flange (1).
83. Install the **NEW** transmission output flange nut (2) and washer using a 34 mm 12 point socket and (special tool #C-3281, Holder, Flange) (2). Tighten to the proper **SPECIFICATIONS**.
84. Stake (3) the transmission output flange nut.

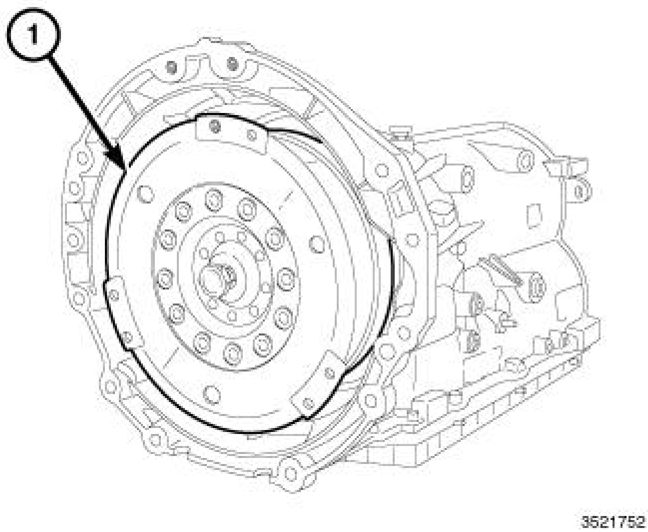

Fig. 128: Torque Converter
Courtesy of CHRYSLER GROUP, LLC

85. Install the torque converter (1). Refer to **TORQUE CONVERTER, INSTALLATION**.
86. Before installing the transmission in the vehicle, pre-fill the transmission as outlined in FILL TRANSMISSION AFTER SERVICE. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

INSTALLATION

INSTALLATION

CAUTION: **When supporting or lifting the transmission at the oil pan the weight of the transmission must be distributed evenly on the lifting fixture. Failure to do so could damage the oil pan and transmission.**

NOTE: **Make sure that the transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.**

1. Install the torque converter. Refer to **TORQUE CONVERTER, INSTALLATION**.
2. If removed, install the rear transmission mount isolator. Refer to **INSULATOR, ENGINE MOUNT, REAR, INSTALLATION** .

NOTE: **Hold torque converter in place during transmission installation.**

3. Position the transmission in the vehicle.

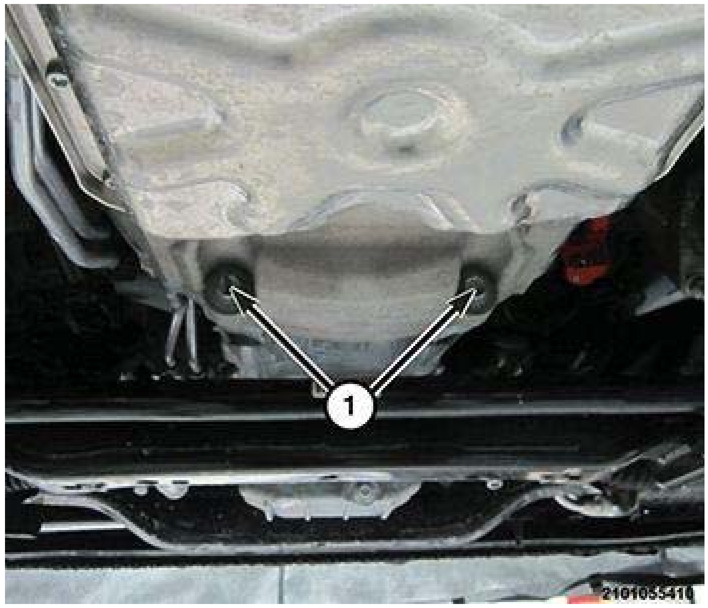

Fig. 129: Bottom Transmission To Engine Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Install the bottom two transmission to engine bolts (1).

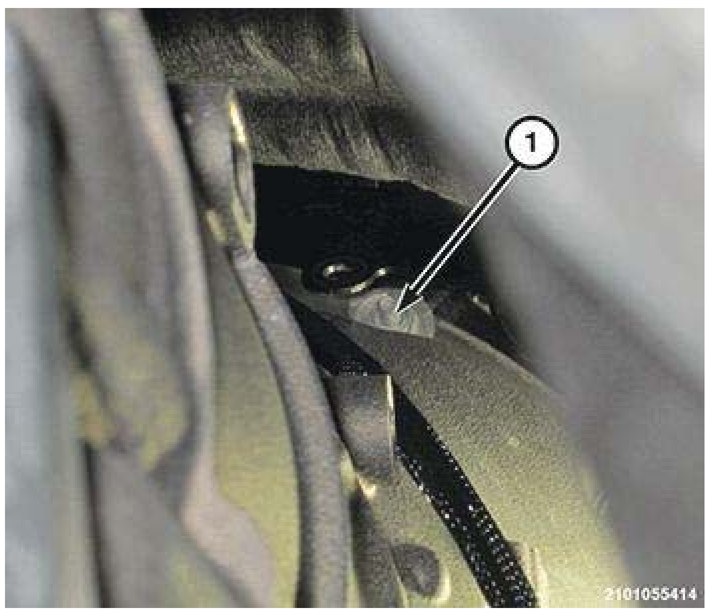

Fig. 130: Right Transmission To Engine Studbolt

5. Install the LH transmission to engine studbolt (1).

Fig. 131: Left Transmission To Engine Studbolt
Courtesy of CHRYSLER GROUP, LLC

6. Install the RH transmission to engine studbolt (1).

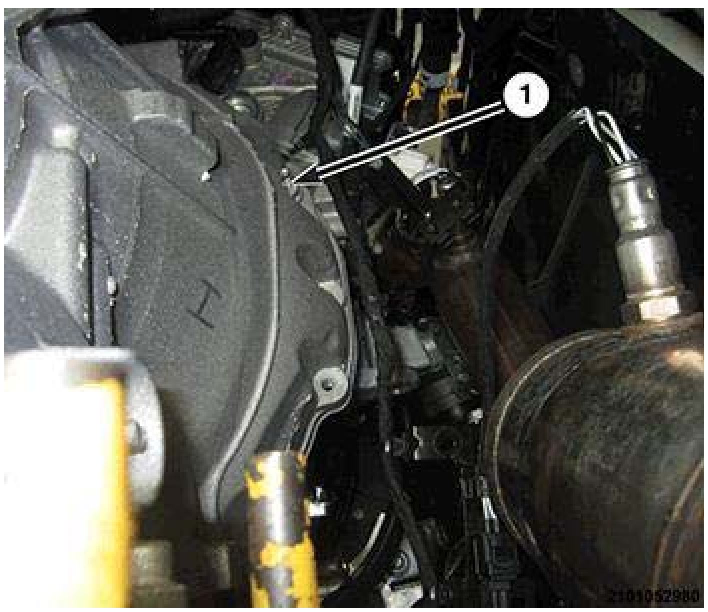

Fig. 132: Transmission To Engine Studbolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: **RH shown, LH similar.**

7. Install the RH and LH transmission to engine studbolts (1).

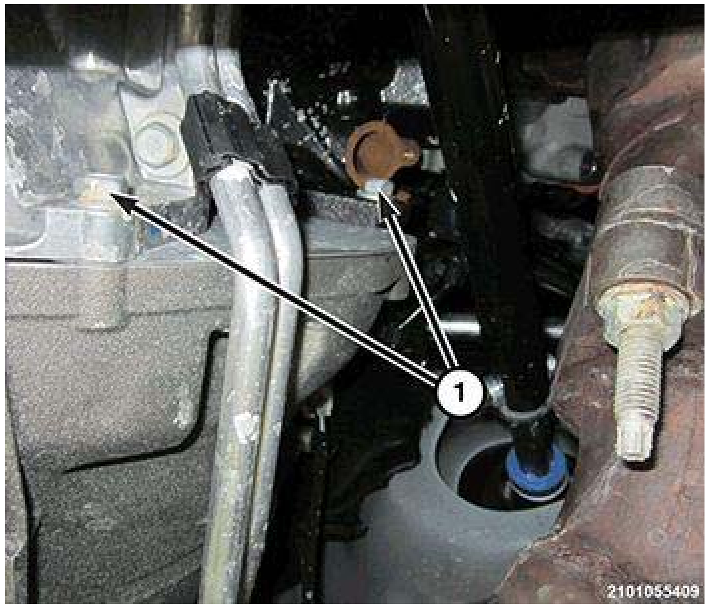

Fig. 133: Left Transmission To Engine Bolts
Courtesy of CHRYSLER GROUP, LLC

8. Install the Left Hand (LH) transmission to engine bolts (1).

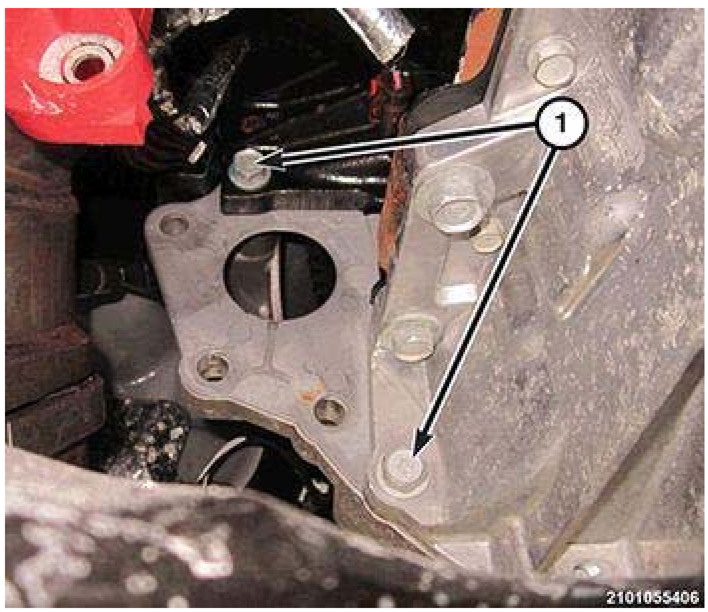

Fig. 134: Right Transmission To Engine Bolts
Courtesy of CHRYSLER GROUP, LLC

9. Install the Right Hand (RH) transmission to engine bolts (1).
10. Tighten all the transmission to engine bolts to the proper **SPECIFICATIONS**.

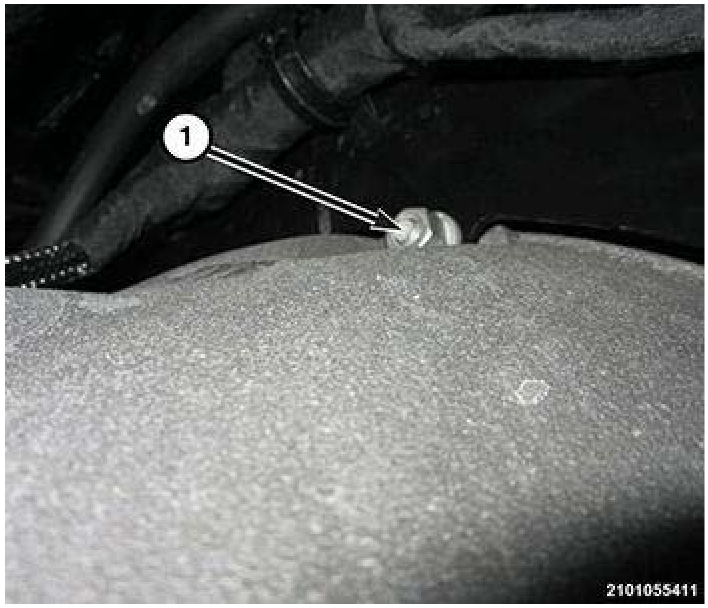

Fig. 135: Right Wiring Harness Bracket Nut
Courtesy of CHRYSLER GROUP, LLC

11. Install the RH wiring harness bracket nut (1) and tighten to the proper **SPECIFICATIONS**.

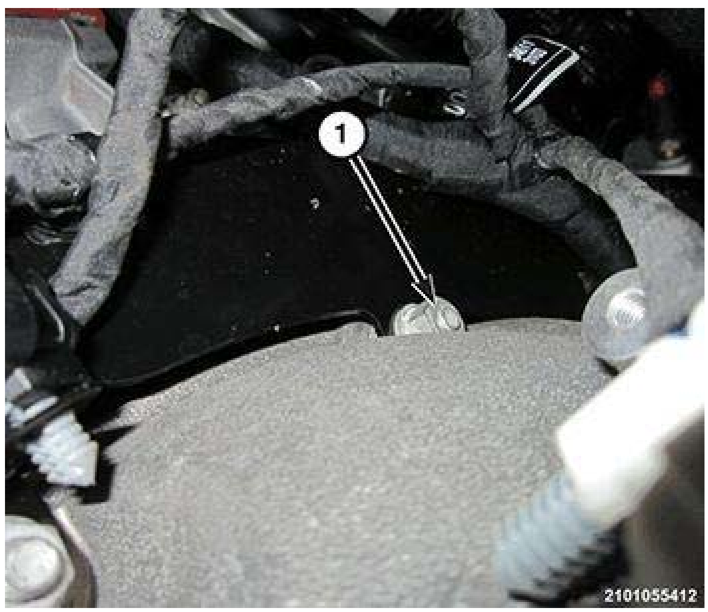

Fig. 136: Left Wiring Harness Bracket Nut
Courtesy of CHRYSLER GROUP, LLC

12. Install the LH wiring harness bracket nut (1) and tighten to the proper **SPECIFICATIONS**.

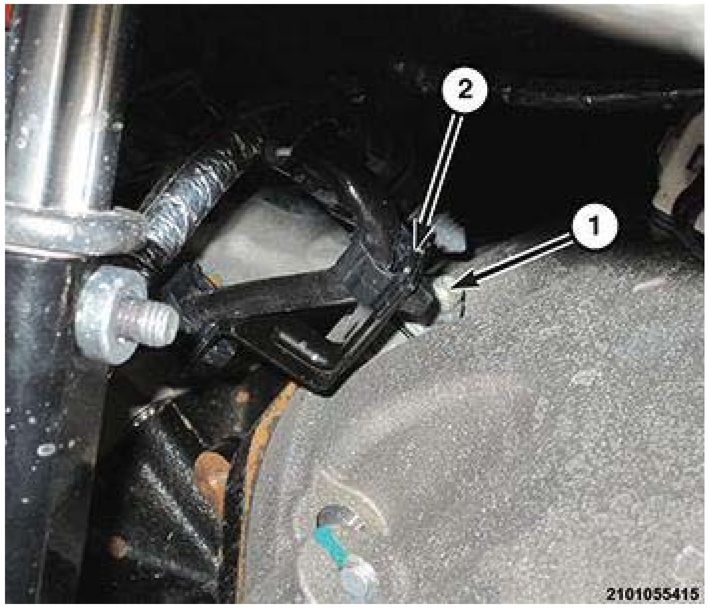

Fig. 137: Left Wiring Harness Bracket & Nut
Courtesy of CHRYSLER GROUP, LLC

13. Install the LH wiring harness bracket (2), the wiring harness bracket nut (1) and tighten to the proper **SPECIFICATIONS**.

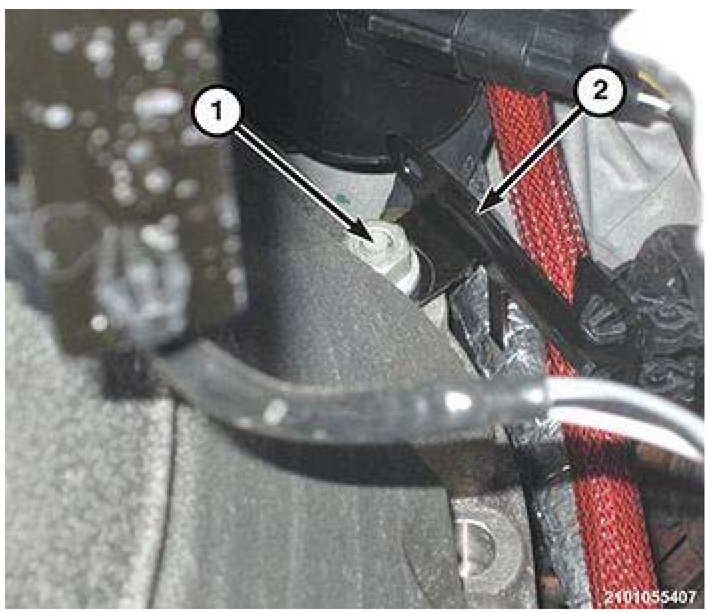

Fig. 138: Right Wiring Harness Bracket & Nut
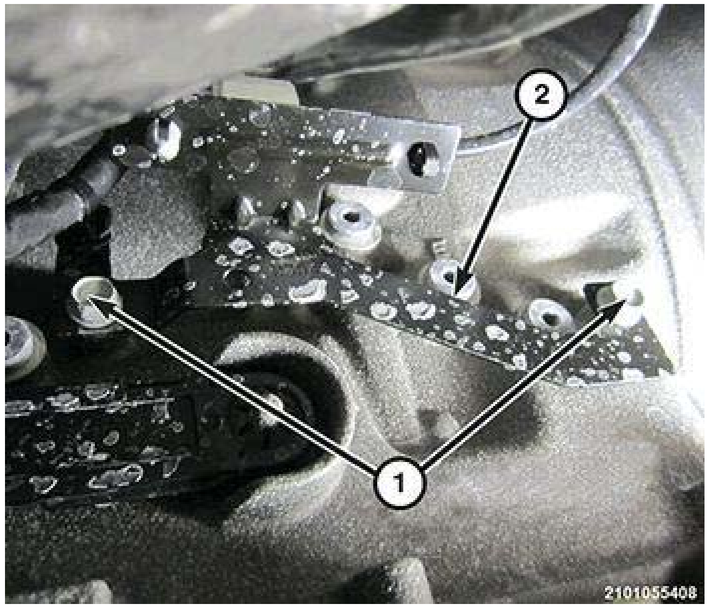
Courtesy of CHRYSLER GROUP, LLC

14. Install the RH wiring harness bracket (2), the wiring harness bracket nut (1) and tighten to the proper **SPECIFICATIONS**.



[**Fig. 139: Wiring Harness Bracket & Bolts**]
Courtesy of CHRYSLER GROUP, LLC

15. Install the wiring harness bracket (2), the wiring harness bracket bolts (1) and tighten to the proper **SPECIFICATIONS**.

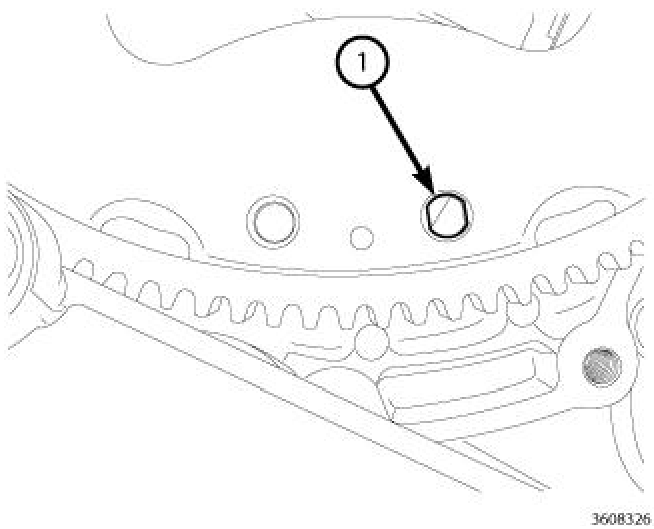


Fig. 140: Alignment Hole
Courtesy of CHRYSLER GROUP, LLC

16. Rotate crankshaft in clockwise direction to line up the alignment hole (1) in the flex plate, then start the first bolt.

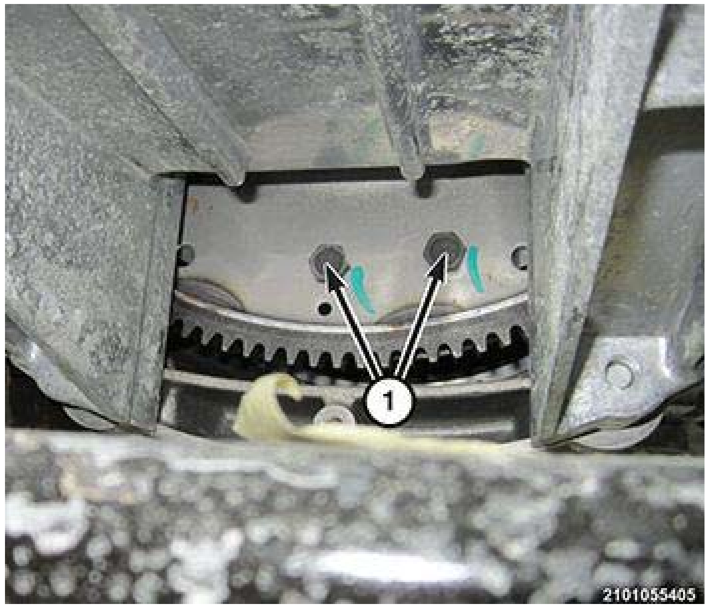

Fig. 141: Torque Converter Bolts
Courtesy of CHRYSLER GROUP, LLC

17. Rotate the crankshaft clockwise until the torque converter bolts (1) are accessible. There are three sets of two bolts 120Â° apart. Install the remaining torque converter bolts and tighten to the proper **SPECIFICATIONS**.

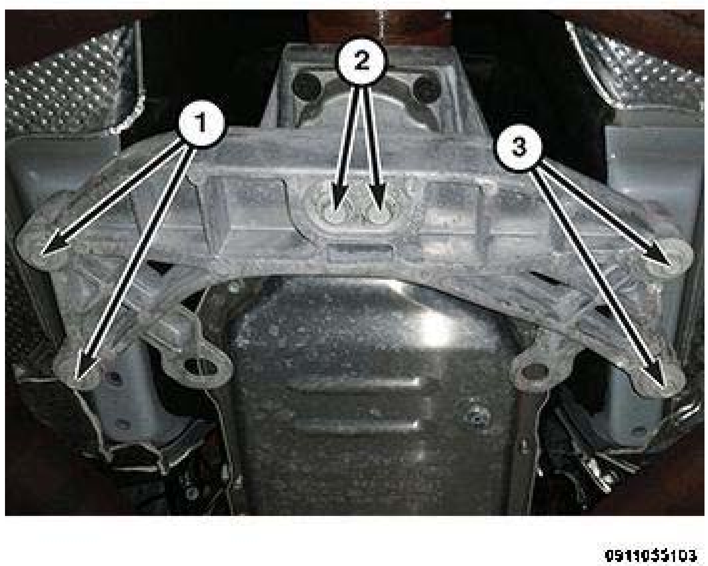

Fig. 142: Rear Support Isolator And Crossmember Bolts
Courtesy of CHRYSLER GROUP, LLC

18. Position the crossmember in place and install the crossmember bolts (1 and 3) and tighten to the proper **SPECIFICATIONS**.
19. Install the rear support isolator bolts (2) and tighten to the proper **SPECIFICATIONS**.

Fig. 143: Transmission Jack
Courtesy of CHRYSLER GROUP, LLC

20. Remove the transmission jack (1).

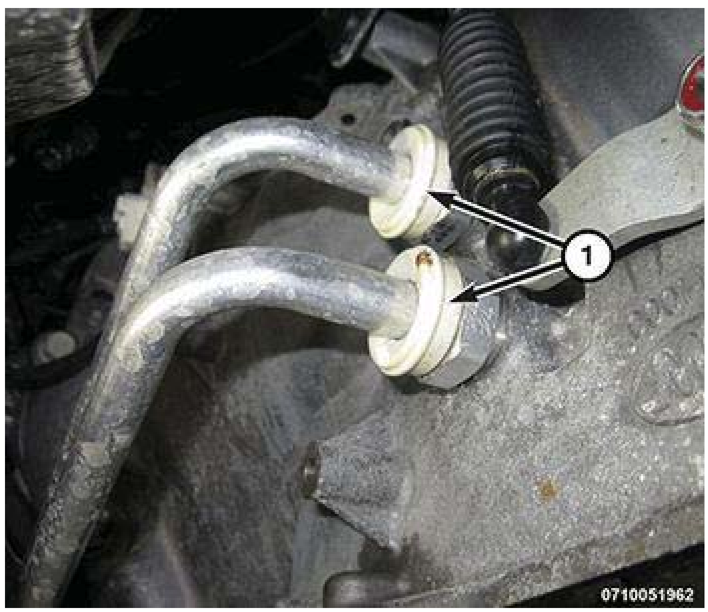

Fig. 144: Transmission Fluid Cooler Lines
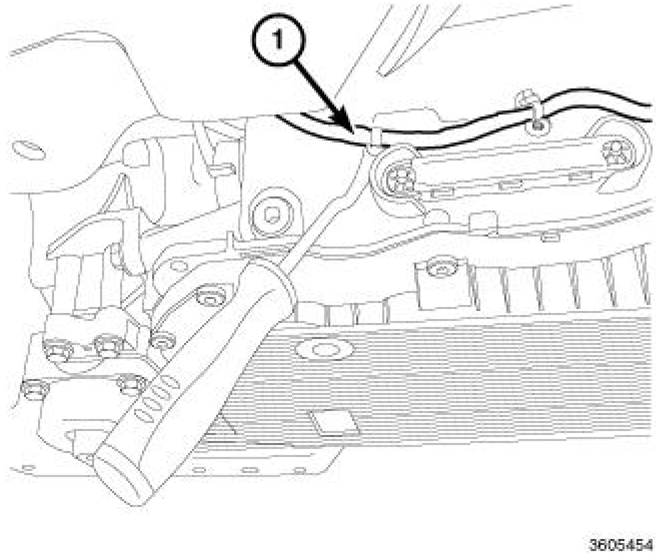
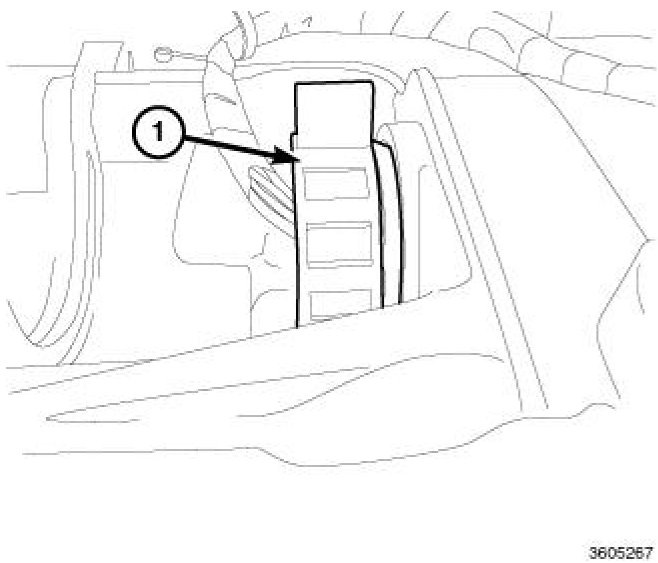
Courtesy of CHRYSLER GROUP, LLC

21. Connect transmission fluid cooler lines (1) to the transmission fittings (2) and install the clips (3).



[Fig. 145: Wiring Harness](#)
Courtesy of CHRYSLER GROUP, LLC

22. Connect the wiring harness (1) push pins to the transmission.



[Fig. 146: Adapter Plug Connector](#)
Courtesy of CHRYSLER GROUP, LLC

23. Connect the transmission wire harness connector (1) to the transmission.

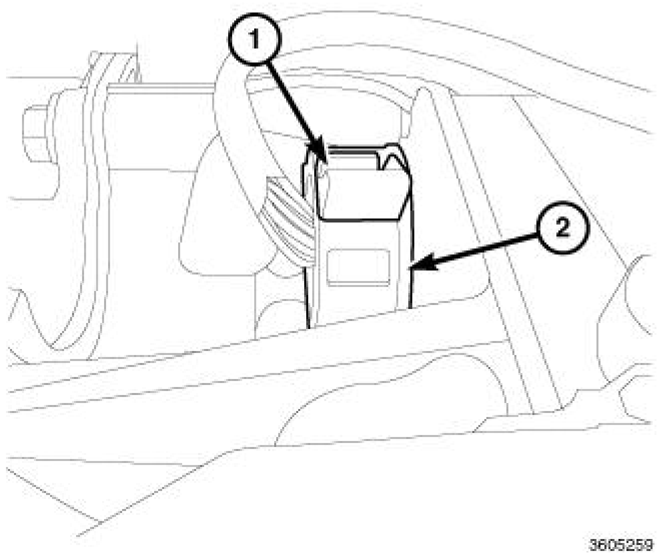


Fig. 147: Locking Mechanism Lock & Adapter Plug Connector
Courtesy of CHRYSLER GROUP, LLC

24. Turn the locking mechanism lock (1) of the transmission wire harness connector (2) clockwise to secure.

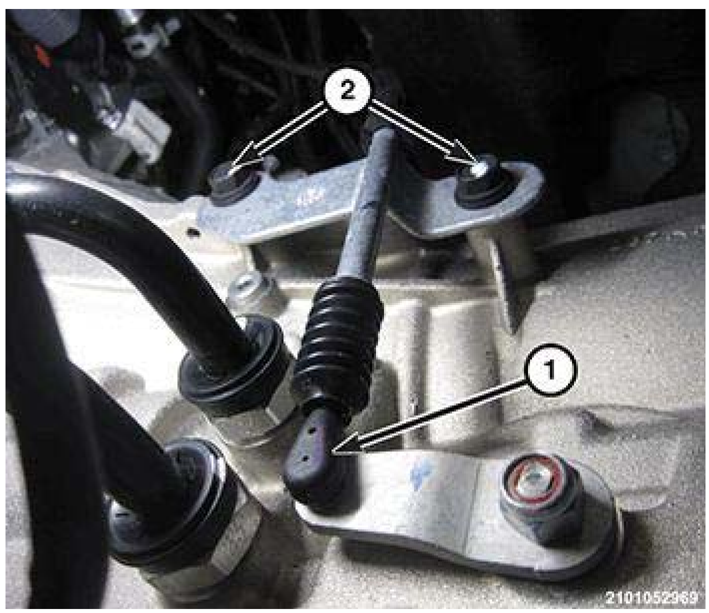

Fig. 148: Manual Park Release Cable & Bracket Bolts
Courtesy of CHRYSLER GROUP, LLC

25. Position the MPR cable bracket/cable, install the bolts (2) and tighten to the proper **SPECIFICATIONS**.
26. Install the MPR cable (1) on the MPR lever.
27. Install the starter. Refer to **STARTER, INSTALLATION** .
28. Install the drive shaft. Refer to **INSTALLATION** .
29. Install the exhaust. Refer to **RESONATOR, EXHAUST, INSTALLATION** .
30. Connect the right and left bank up stream oxygen sensors.
31. Connect the negative battery cable.
32. Perform the STANDARD PROCEDURE - TRANSMISSION FILL AFTER SERVICE. Refer to **FLUID**

AND FILTER, STANDARD PROCEDURE.

CABLE, MANUAL PARK RELEASE

OPERATION

OPERATION

The 8HP utilizes a fully electronic shifter mechanism with no physical connections to the transmission such as shifter linkage or cables. Due to this design the park function of the transmission is performed using electronic inputs and hydraulic pressure to hold to parking pawl lever in the disengaged position while moving. Once in park this hydraulic pressure is reduced which allows the lever to engage the parking pawl which in turn keeps the vehicle from rolling forward or rearward.

Should the vehicle or any component of the E-Shifter lose power or communication the parking pawl will be engaged and the vehicle cannot be moved. To move the vehicle there is a manual park release mechanism that will allow first responders to disengage the parking pawl and allow the vehicle to be moved further facilitating vehicle recovery such as towing or moving the vehicle to allow jump starting.

REMOVAL

MPR CABLE

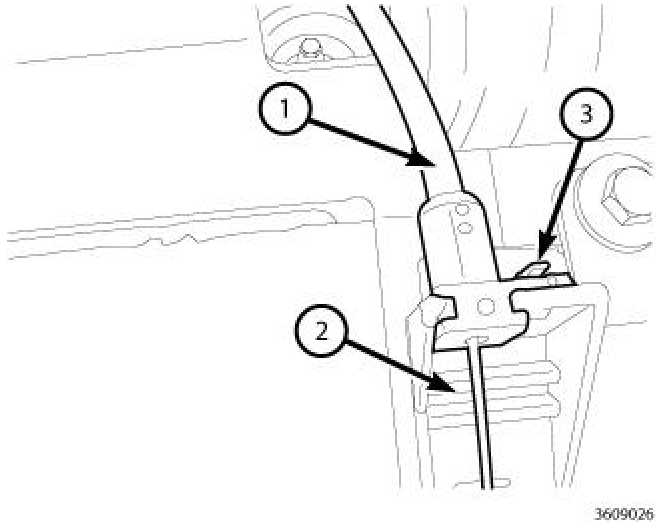

Fig. 149: Cable, Housing & Release Tab
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Apply the parking brake.
3. Remove the Manual Park Release (MPR) lever cover.
4. Disconnect the MPR cable (1) from the housing (2), while holding the release tab (3) open.
5. Disconnect the MPR cable from the lever.
6. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

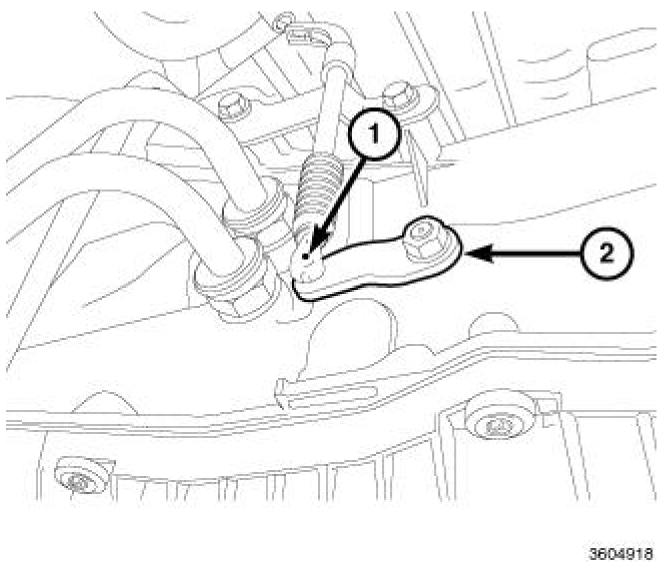

Fig. 150: Manual Park Release Cable & Lever
Courtesy of CHRYSLER GROUP, LLC

7. Disconnect the MPR cable (1) from the MPR lever (2).

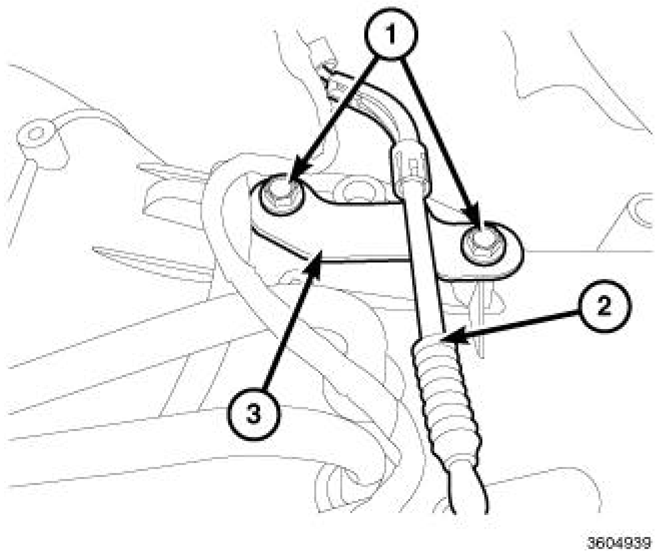

Fig. 151: Bolts, Manual Park Release Cable Bracket & Bracket/Cable
Courtesy of CHRYSLER GROUP, LLC

8. Remove the MPR cable bracket bolts (1) and remove the MPR cable (2) from the vehicle.

INSTALLATION

MPR CABLE

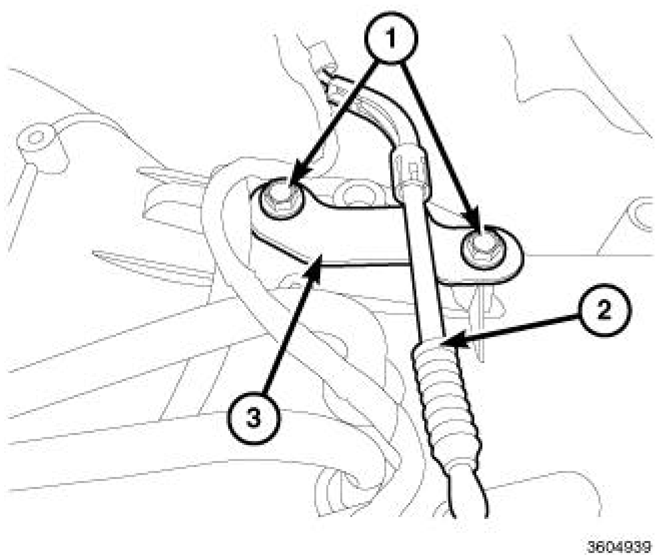

Fig. 152: Bolts, Manual Park Release Cable Bracket & Bracket/Cable
Courtesy of CHRYSLER GROUP, LLC

1. Install the Manual Park Release (MPR) cable (2) in the vehicle. Install the MPR cable bracket bolts (1) and tighten to the proper SPECIFICATIONS .

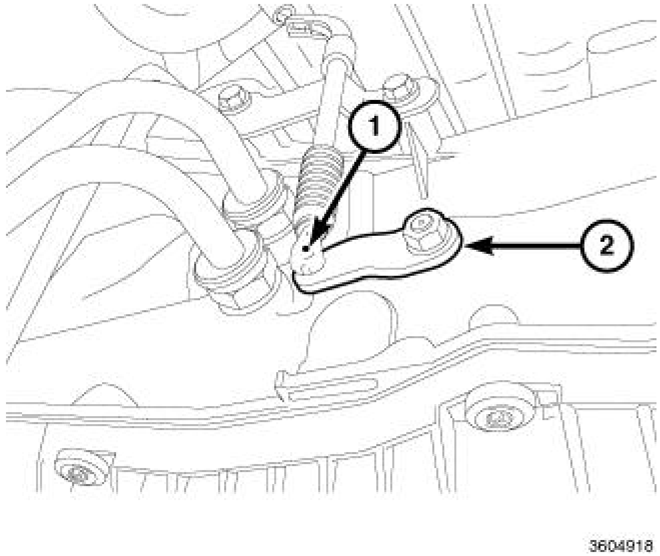

Fig. 153: Manual Park Release Cable & Lever
Courtesy of CHRYSLER GROUP, LLC

2. Connect the MPR cable (1) to the MPR lever (2).
3. Lower the vehicle.

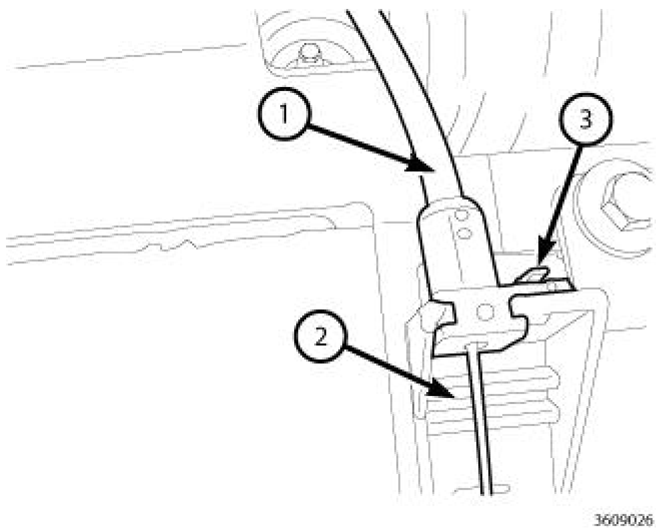

Fig. 154: Cable, Housing & Release Tab
Courtesy of CHRYSLER GROUP, LLC

4. Connect the MPR cable (2) to the MPR lever.
5. Connect the MPR cable (1) to the housing.
6. Install the MPR cover.
7. Connect the negative battery cable.

FLUID AND FILTER

DESCRIPTION

DESCRIPTION

FILTER SERVICE

The 8HP90 has a conventional fluid sump design and the filter is serviced separately from the oil pan. The oil pan gasket is reusable providing it is not damaged during removal. Oil dye is not required to find leaks in the 8HP transmission. The oil dye can cause shift quality issues and is not recommended. The fluid has illuminance that is visible under a black light.

STANDARD PROCEDURE

STANDARD PROCEDURE - CHECK OIL LEVEL

To properly check and fill the transmission, perform the following procedure:

WARNING: **There is a risk of accident from vehicle moving when the engine is running. Secure vehicle to prevent it from moving. There is a risk of injury from contusions and burns if you insert your hands into the engine when it is running. Do not touch hot or rotating parts. Wear properly fitted work clothes.**

CAUTION: **A unique transmission fluid has been developed for this transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid see VEHICLE QUICK REFERENCE .**

NOTE: **Oil dye is not required to find leaks in the 8HP transmission. The oil dye can cause shift quality issues and is not recommended. The 8HP fluid has illuminance that is visible under a black light.**

1. Raise and support the vehicle **on a level hoist** . Refer to **HOISTING, STANDARD PROCEDURE** .
2. Start the engine. The engine must continue to run for the entire test.
3. Using a scan tool or the vehicle information center, verify that the transmission fluid temperature is below 30Ā°C (86Ā°F).
4. Remove the transmission fill plug from the right rear of the transmission case.
5. Add transmission fluid until it trickles from the fill opening.
6. Install the transmission fill plug and tighten to the proper **SPECIFICATIONS** .
7. Lower the vehicle for access to inside of the vehicle, leaving the tires at least 8 inches off the ground.
8. With the brakes applied, place the transmission in Reverse and hold for 5 seconds.
9. Place the transmission in Drive and hold for 5 seconds.
10. Release the brakes, slowly accelerate to 2nd gear and hold for 5 seconds.
11. Apply the brakes and place the transmission in Neutral.
12. Raise the engine speed to 2000 RPM for 5 seconds.
13. Return the engine to idle and place the transmission in Park.

NOTE: **A full transmission will have fluid at the fill hole with the transmission between 30Ā°C (86Ā°F) and 50Ā°C (122Ā°F). Do not over fill.**

14. Remove the transmission fill plug and allow excess fluid to drain from fill hole or add fluid as necessary.
15. Install the transmission fill plug and tighten to the proper **SPECIFICATIONS** .
16. Using a scan tool, clear any DTCs.

STANDARD PROCEDURE - TRANSMISSION FILL AFTER SERVICE

CAUTION: A unique transmission fluid has been developed for this transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid see VEHICLE QUICK REFERENCE .

To properly fill the transmission after an in vehicle service or overhaul, perform the following procedure:

NOTE: If the transmission cooler was replaced, add an additional 0.7L (0.72 qts) of transmission fluid.

1. **If the transmission was overhauled** , prior to installing in the vehicle, tip the transmission on it side, remove the oil fill plug on the right rear side of the case and install 9L (9.5 qts) of transmission fluid. Install the fill plug. After installing the transmission, perform the CHECK OIL LEVEL procedure. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
2. **If an in vehicle service was performed** , raise and support the vehicle **on a level hoist** , refer to **HOISTING, STANDARD PROCEDURE** . Refer to **FLUID AND FILTER, STANDARD PROCEDURE** and perform the CHECK OIL LEVEL procedure.

STANDARD PROCEDURE - FILTER SERVICE

REMOVAL

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

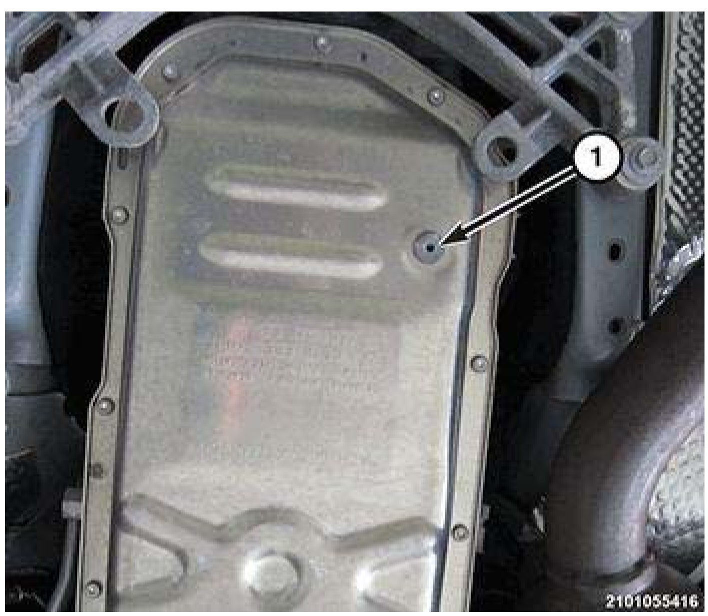

Fig. 240: Transmission Oil Pan Plug
Courtesy of CHRYSLER GROUP, LLC

2. Remove the transmission oil pan plug (1) and drain the transmission fluid.

NOTE: **Inspect the gasket for reuse. If the seal is cut or torn, replace the gasket.**

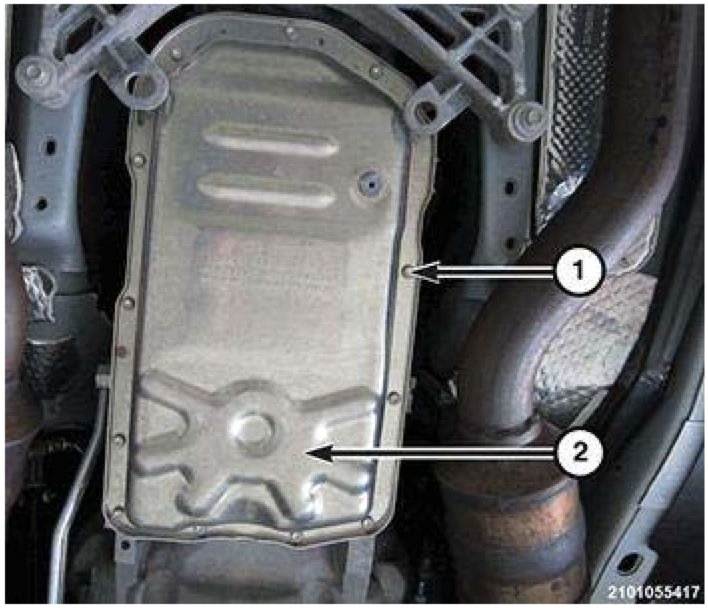

Fig. 241: Transmission Oil Pan & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the 13 oil pan retaining bolts (2).
4. Remove the oil pan (1) and gasket.

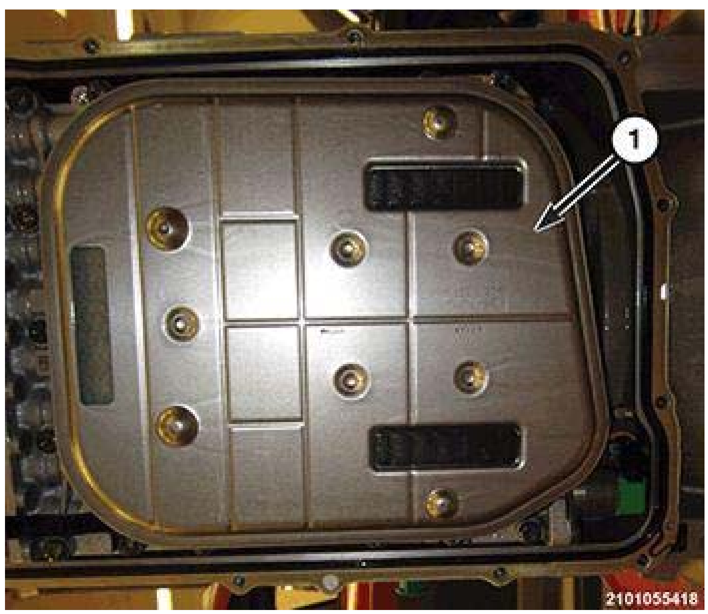

Fig. 242: Transmission Oil Filter
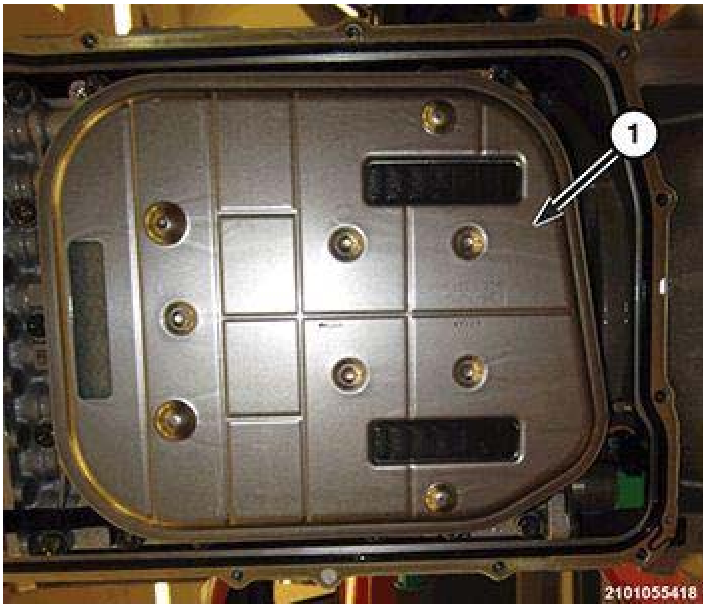
Courtesy of CHRYSLER GROUP, LLC

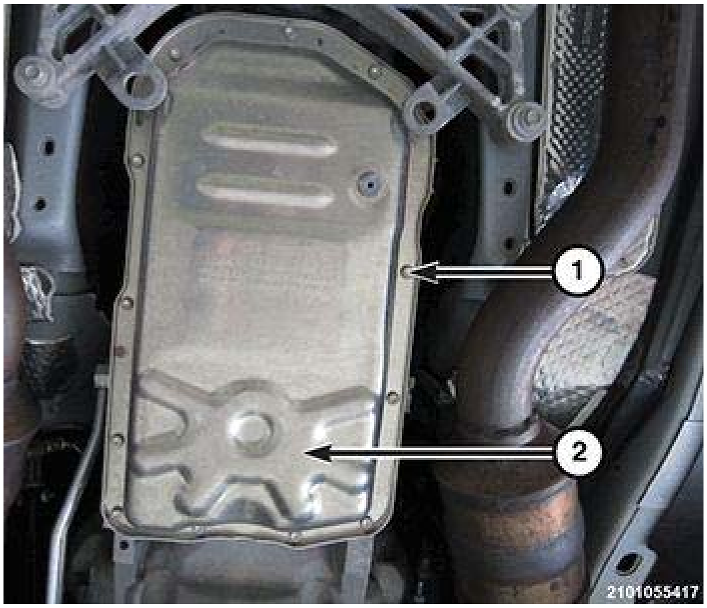
5. Remove the transmission oil filter (1).

INSTALLATION



[Fig. 243: Transmission Oil Filter]
Courtesy of CHRYSLER GROUP, LLC

1. Install the **NEW** transmission oil filter (1).



[Fig. 244: Transmission Oil Pan & Bolts]
Courtesy of CHRYSLER GROUP, LLC

2. Install the 13 oil pan retaining bolts and tighten to 10 N.m (89 in. lbs.) in a crisscross pattern.

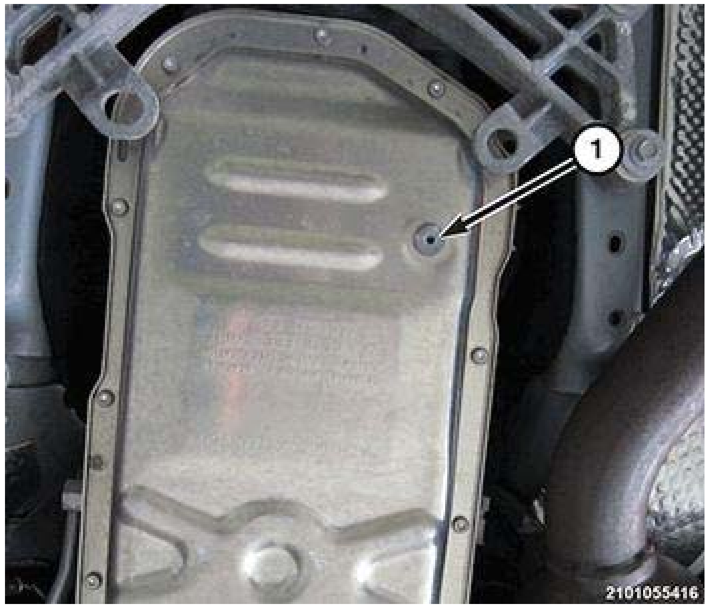


Fig. 245: Transmission Oil Pan Plug
Courtesy of CHRYSLER GROUP, LLC

3. Verify the transmission oil pan plug (1) is installed.
4. Inspect and adjust the fluid level. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

LEVER, MANUAL PARK RELEASE

REMOVAL

REMOVAL

1. Remove the shifter bezel storage bin liner.
2. Remove the Manual Park Release (MPR) lever bolts.

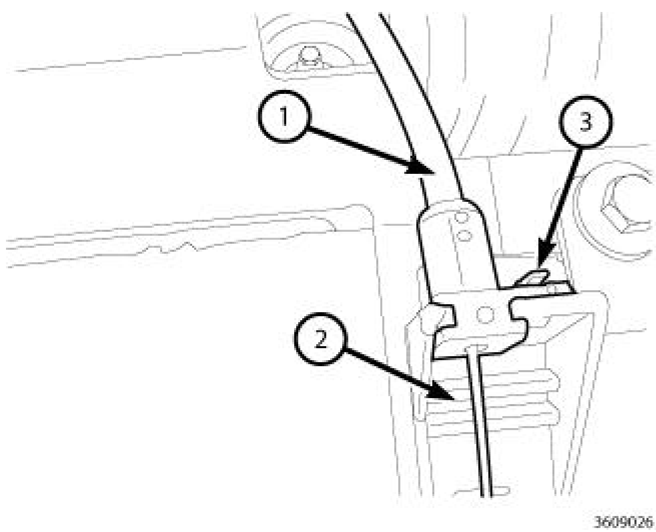

Fig. 246: Cable, Housing & Release Tab
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the MPR cable (1) from the housing (2), while holding the release tab (3) open.
4. Remove the MPR cable (1) from the MPR lever and remove the MPR lever from the vehicle.

INSTALLATION

INSTALLATION

1. Connect the Manual Park Release (MPR) cable to the MPR lever.
2. Install the MPR lever bolts and tighten to the proper **SPECIFICATIONS** .

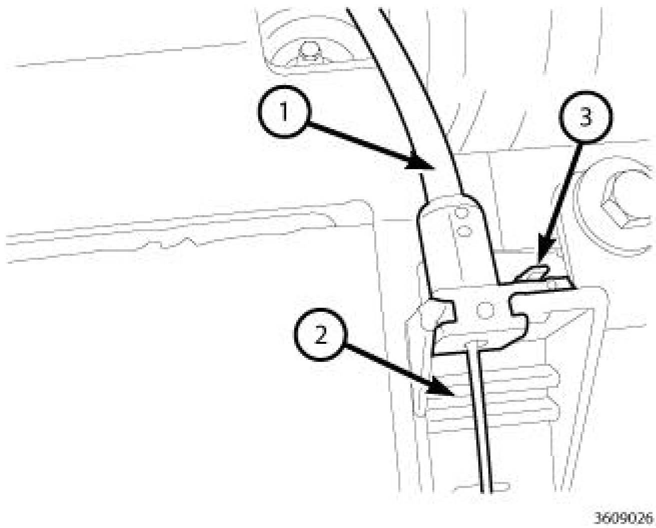

Fig. 247: Cable, Housing & Release Tab
Courtesy of CHRYSLER GROUP, LLC

3. Connect the MPR cable (1) to the housing (2) and make sure the locking tab (3) is locked.
4. Install the shifter bezel storage bin liner.

PUMP, TRANSMISSION OIL

DESCRIPTION

DESCRIPTION

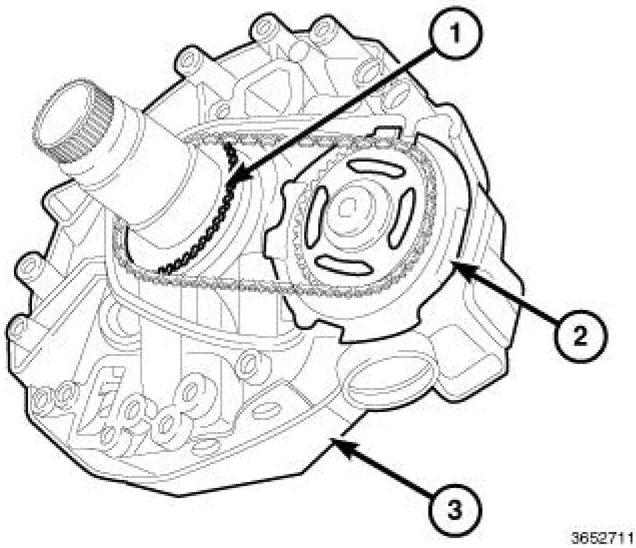

Fig. 248: Transmission Oil Pump, Chain And Sprocket & Oil Pump Housing
Courtesy of CHRYSLER GROUP, LLC

The transmission oil pump (2) is driven by a chain and sprocket (1). The oil pump is located just behind the torque converter, inside of the pump housing (3). The pump is a double-stroke vane pump. The pump has dual chambers, two inlet and two outlet ports. The pump provides necessary lubrication and cooling throughout all phases of transmission operation.

OPERATION

OPERATION

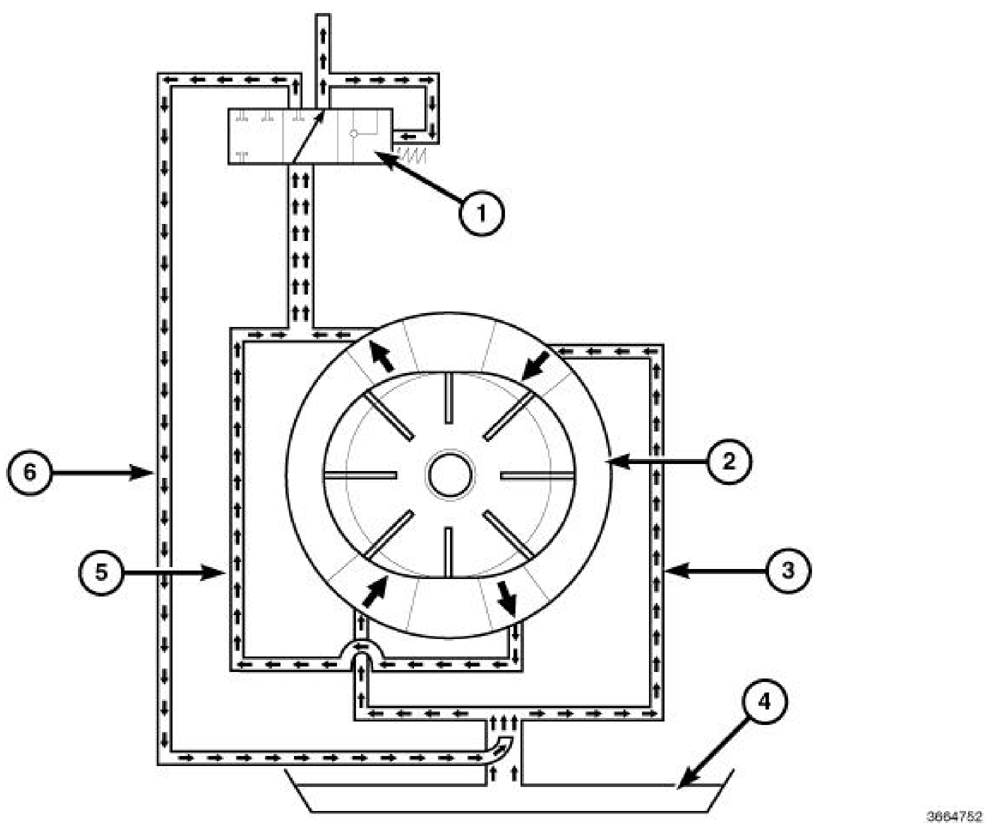

Fig. 249: Transmission Oil Pump Flow Diagram

Courtesy of CHRYSLER GROUP, LLC

1- SYSTEM PRESSURE VALVE	4 - SUMP
2 - PUMP	5 - PRESSURE PIPE
3 - INTAKE PIPE	6 - RETURN OF REDUNDANT OIL

The transmission oil pump is driven by a chain and sprocket. The oil pump has two intake ports and two exhaust ports. The pump draws fluid through a filter and pressurizes the fluid as the pump rotates. After the fluid is pressurized, it exits the pump through two exhaust ports that feed the system pressure valve. The system pressure valve maintains fluid pressure and allows excess pressure to return to the pump. This reduces cavitation and noise.

REMOVAL

REMOVAL

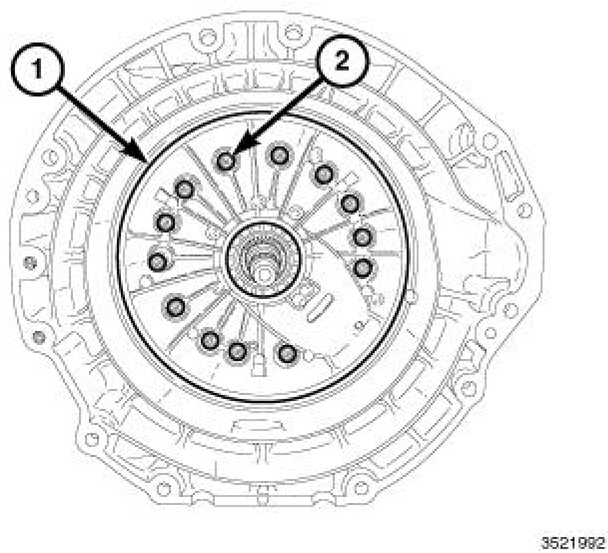

Fig. 250: Thirteen Oil Pump Housing Retaining Bolts
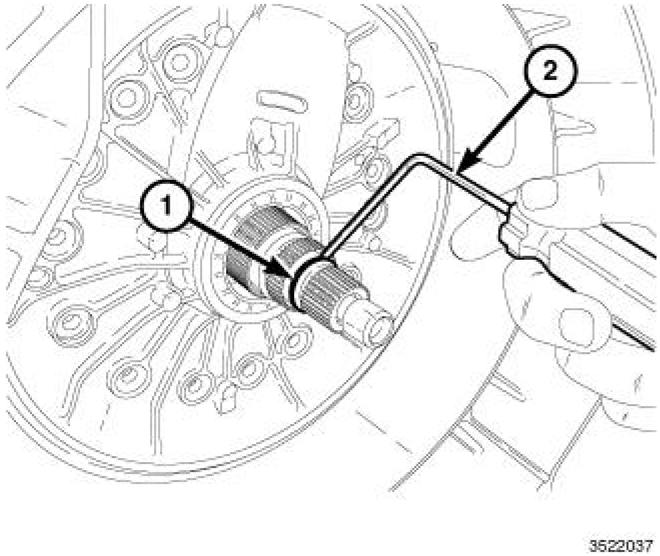
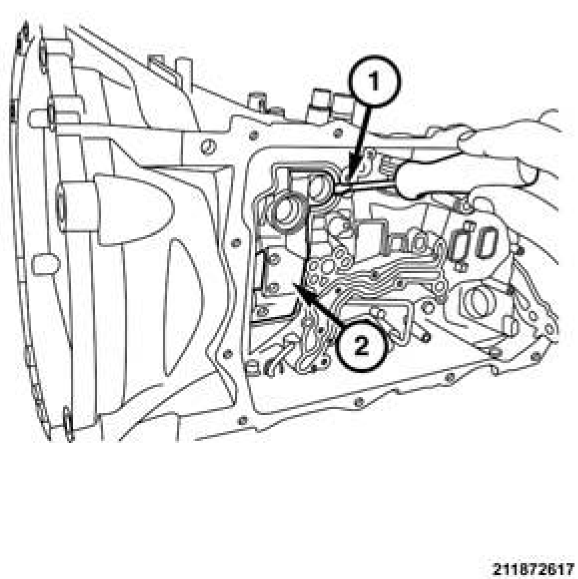
Courtesy of CHRYSLER GROUP, LLC

1. Remove the transmission. Refer to **REMOVAL**.
2. Remove the valve body. Refer to **VALVE BODY, REMOVAL**.
3. Remove the 13 transmission oil pump assembly to case bolts (2).



[Fig. 251: Input Shaft O-Ring & Small Pick](#)
Courtesy of CHRYSLER GROUP, LLC

4. Remove the input shaft O-ring (1) using a small pick (2) or equivalent.



[Fig. 252: Prying Oil Pump Housing Away From Case](#)
Courtesy of CHRYSLER GROUP, LLC

5. Carefully pry the transmission oil pump housing (1) away from the case (2) with a small flat blade screwdriver or equivalent through the case opening.
6. From the front of the transmission, remove the transmission oil pump housing.

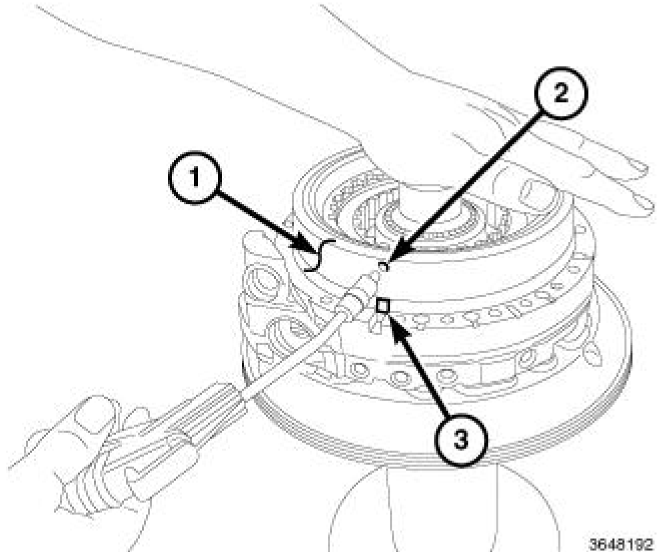


Fig. 253: B-Piston, Hole & B-Piston Alignment Tab
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Apply air pressure slowly, oil may spray when B-piston releases from the assembly.**

7. With one hand above B-piston (1), carefully apply air pressure into the hole directly above the B-piston alignment tab (3) to remove B-piston (2) from the assembly.

9. Install the belleville spring (1).

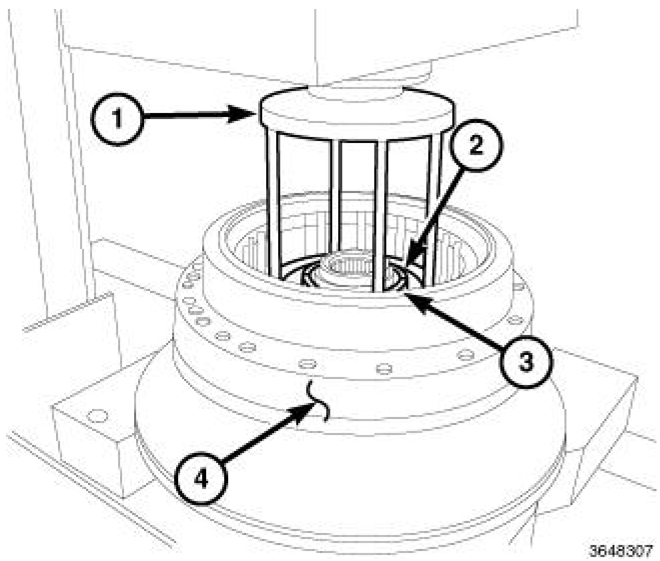

Fig. 278: Oil Pump Housing Assembly
Courtesy of CHRYSLER GROUP, LLC

10. Position the transmission oil pump housing assembly (4) in a suitable arbor press.
11. Using (special tool #8285, Compressor, Spring) (1), press on the fingers of the piston retaining ring to remove tension, and install the two halves of the split retainer ring (2).

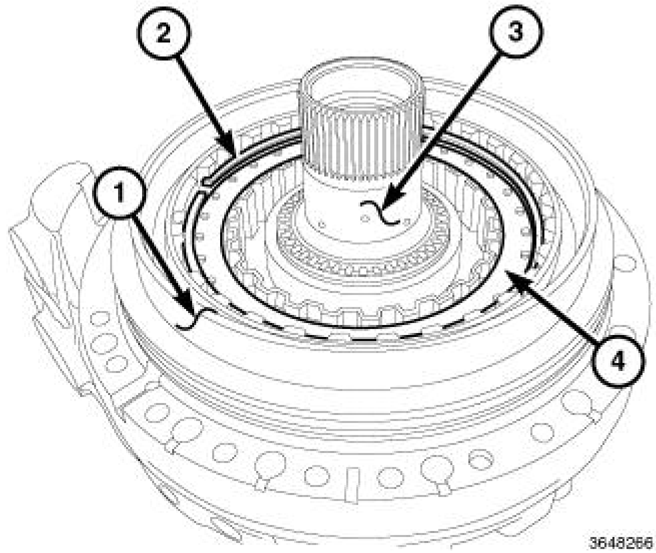

Fig. 279: Outer Ring, Snap Ring, Hub & Spacers
Courtesy of CHRYSLER GROUP, LLC

12. Install the hub (3).
13. Install the clutches and spacers (4).
14. Install the snap ring (2).
15. Install the outer ring (1) (below B-piston).

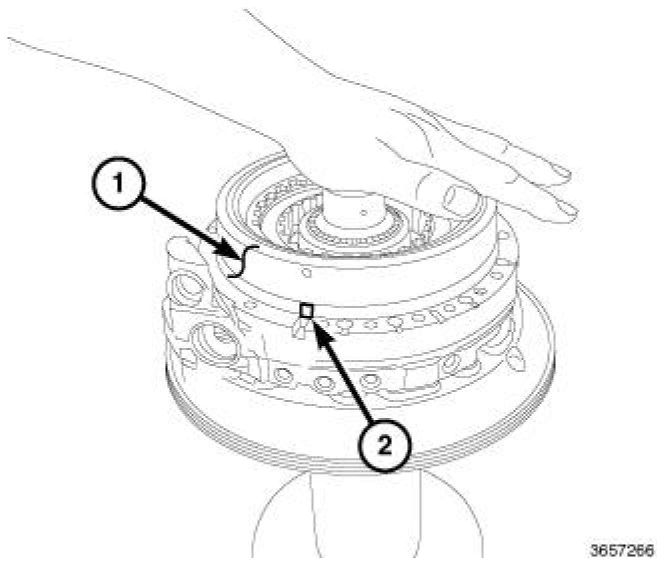

Fig. 280: B-Piston Alignment Tab & B-Piston
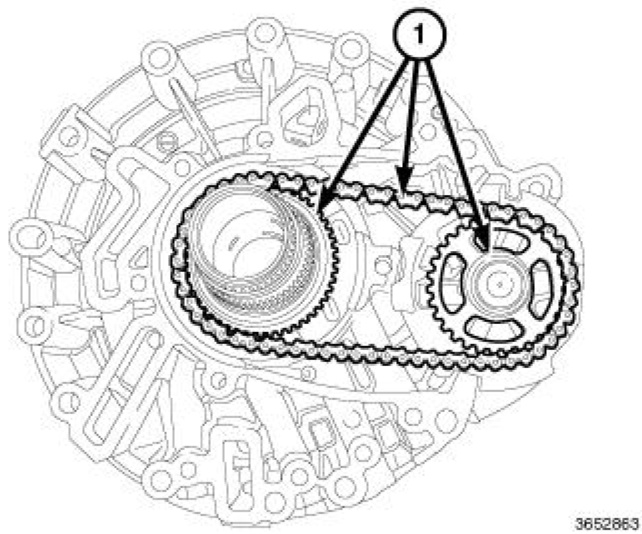
Courtesy of CHRYSLER GROUP, LLC

16. Position the B-piston alignment tab (2) above the notch and install B-piston (1) on the assembly.
17. Install the transmission oil pump. Refer to **PUMP, TRANSMISSION OIL, INSTALLATION**.

INSTALLATION

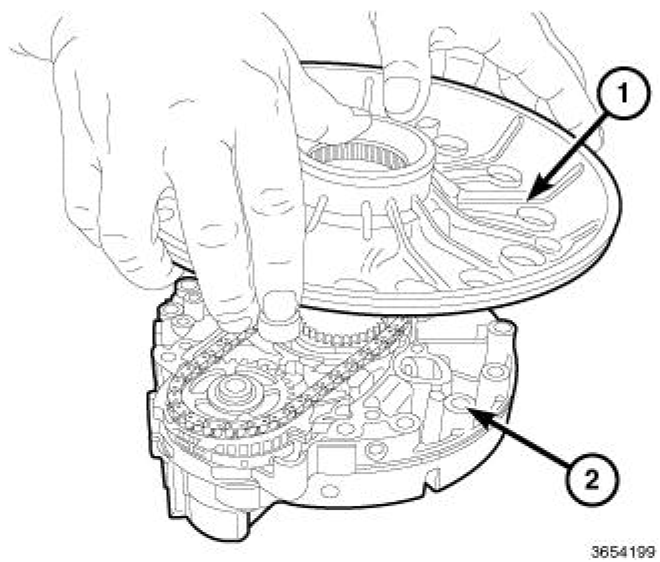
INSTALLATION

NOTE: **If the transmission oil pump was disassembled, replace all O-rings.**



[Fig. 281: Drive Sprocket, Chain And Pump Body]()
Courtesy of CHRYSLER GROUP, LLC

1. Install the drive sprocket, chain and pump body (1) as an assembly into the transmission oil pump housing.



[Fig. 282: Front Cover & Oil Pump Housing]()
Courtesy of CHRYSLER GROUP, LLC

2. Set the pump cover (1) onto the transmission oil pump housing (2).

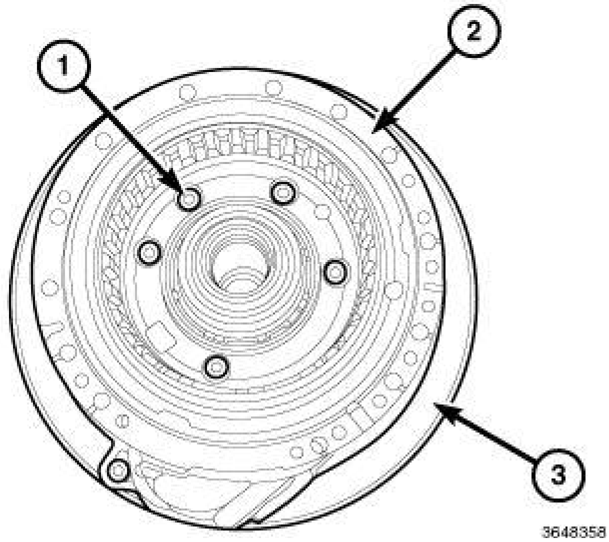


Fig. 283: Oil Pump Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: The transmission oil pump bolts under the A-clutch must be replaced.

3. Install the **NEW** six bolts (1) and tighten to 5 N.m (44 in. lbs.) plus 45Â°.

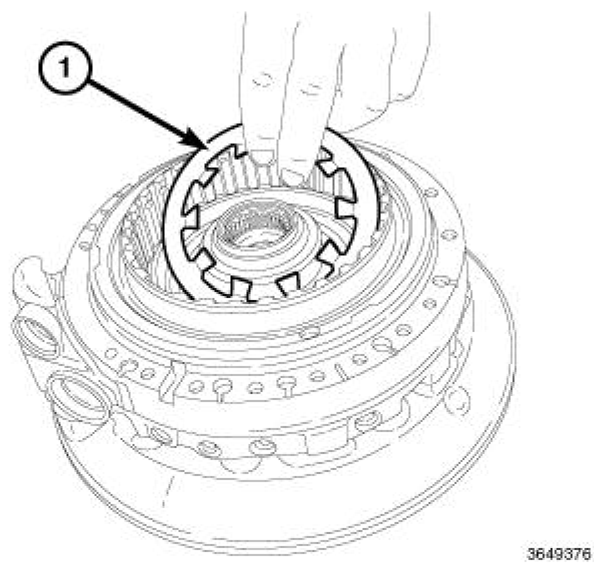

Fig. 284: Piston Retaining Ring And Piston
Courtesy of CHRYSLER GROUP, LLC

4. Install the piston plate and the piston retainer.

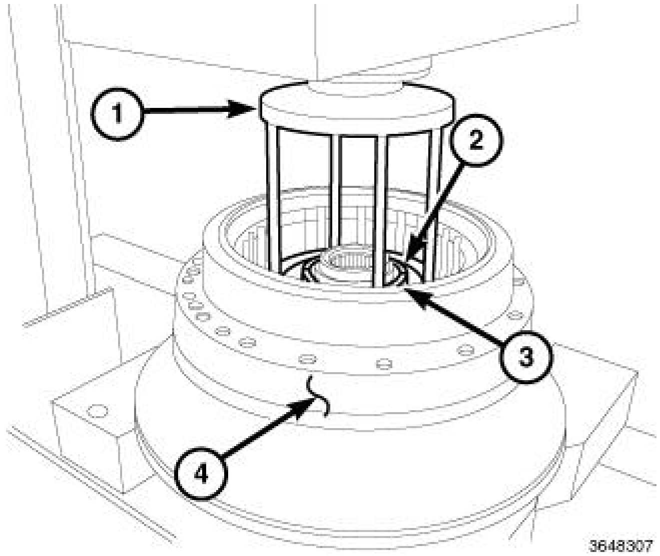

Fig. 285: Oil Pump Housing Assembly
Courtesy of CHRYSLER GROUP, LLC

5. Position the transmission oil pump housing assembly (4) in a suitable arbor press.
6. Using (special tool #8285, Compressor, Spring) (1), press on the fingers of the piston retainer and install the two halves of the retaining ring (2).

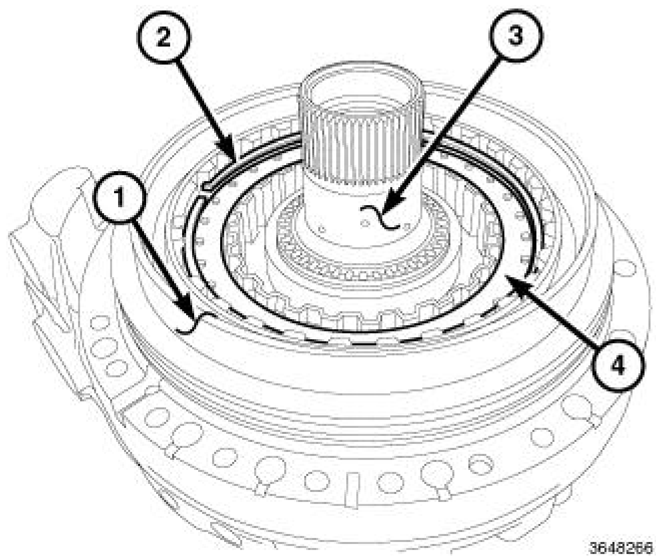

Fig. 286: Outer Ring, Snap Ring, Hub & Spacers
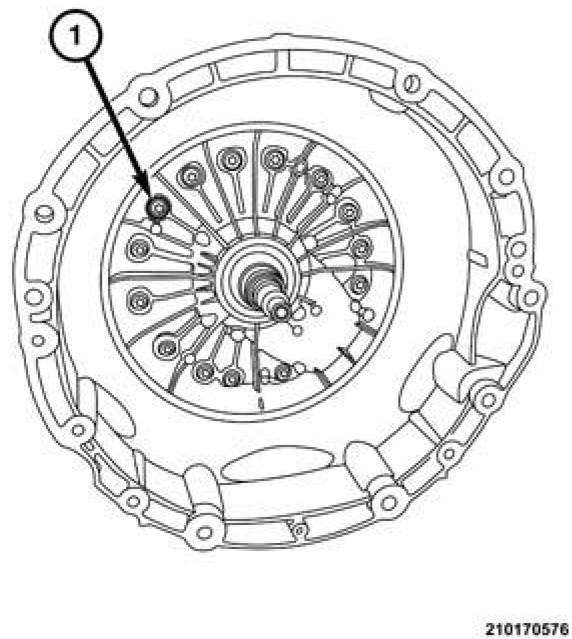
Courtesy of CHRYSLER GROUP, LLC

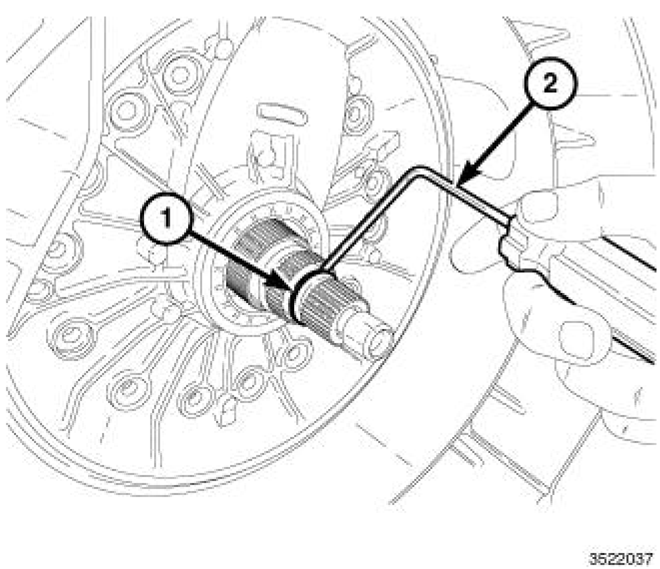
7. Install the hub (3).
8. Install the clutches and spacers (4).
9. Install the snap ring (2).
10. Install the outer ring (1) (inside B-piston).
11. Install the B-piston.



[Fig. 287: Oil Pump Assembly To Case Bolts]
Courtesy of CHRYSLER GROUP, LLC

NOTE: Firmly press the transmission oil pump in place hand before drawing it in with bolts.

12. Install the 14 **new** transmission oil pump cover retaining bolts (2) and tighten the oil pump cover as follows:
    a. In order to seat the transmission oil pump cover properly, pre tighten bolts one, seven and nine to 6 N.m (53 in. lb.).
    b. Working in a clockwise pattern, beginning with number one, tighten to 10 N.m (89 in. lb.).
    c. Working in a clockwise pattern, beginning with number one, tighten an additional 90Â°.



[Fig. 288: Input Shaft O-Ring & Small Pick]

Courtesy of CHRYSLER GROUP, LLC

13. Install the **new** input shaft O-ring (1).
14. Install the valve body. Refer to **VALVE BODY, INSTALLATION**.
15. Install the transmission. Refer to **INSTALLATION**.

SEAL, OUTPUT SHAFT

REMOVAL

OUTPUT SHAFT SEAL

CAUTION: Do not allow the propeller shaft to hang from the vehicle unsupported. Damage may occur to the joint, boot, and center bearing from over-angulation.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

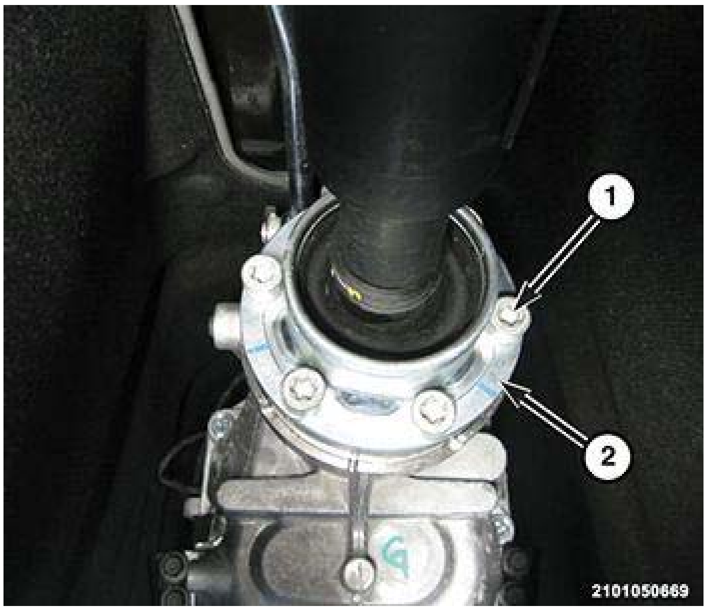


Fig. 289: Bolts And Washers & Transmission Flange
Courtesy of CHRYSLER GROUP, LLC

2. Remove the drive shaft bolts (1) and washers (2) to transmission output flange and position aside the drive shaft. Secure the drive shaft with a strap or equivalent.

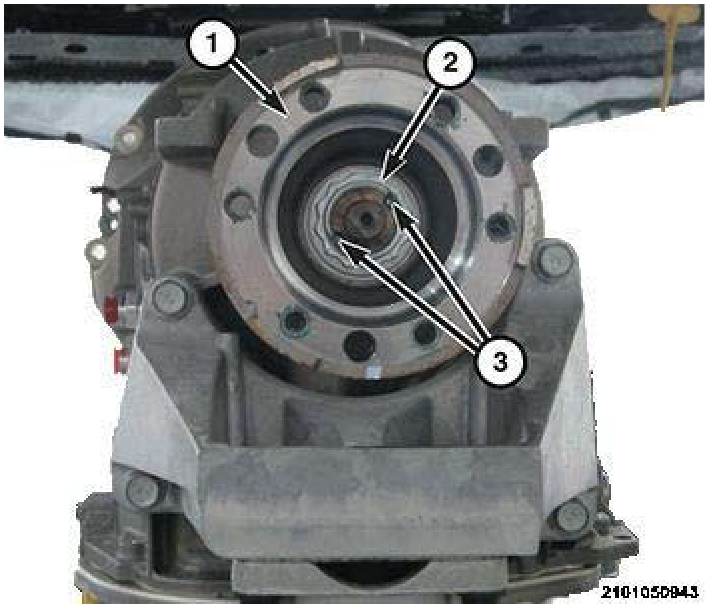

Fig. 290: Drive Shaft Flange, Nut & Staking Area
Courtesy of CHRYSLER GROUP, LLC

3. Using a suitable punch, remove the staking (3) from the transmission output flange nut (2).
4. Using (special tool #C-3281, Holder, Flange) (2) and a 34 mm 12 point socket, remove the transmission output flange nut (2).
5. Remove the transmission output flange (1) and transmission output shaft dust seal.
6. Remove the transmission output shaft seal with suitable screw and slide hammer.

INSTALLATION

OUTPUT SHAFT SEAL

CAUTION: The seal must be installed flush with the case. Driving the seal deeper could damage the seal causing a leak.

1. Position the new transmission output shaft seal over the transmission output shaft and against the transmission case.
2. Using (special tool #9677, Installer, Seal) install the transmission output shaft seal.
3. Verify that the transmission is in PARK,

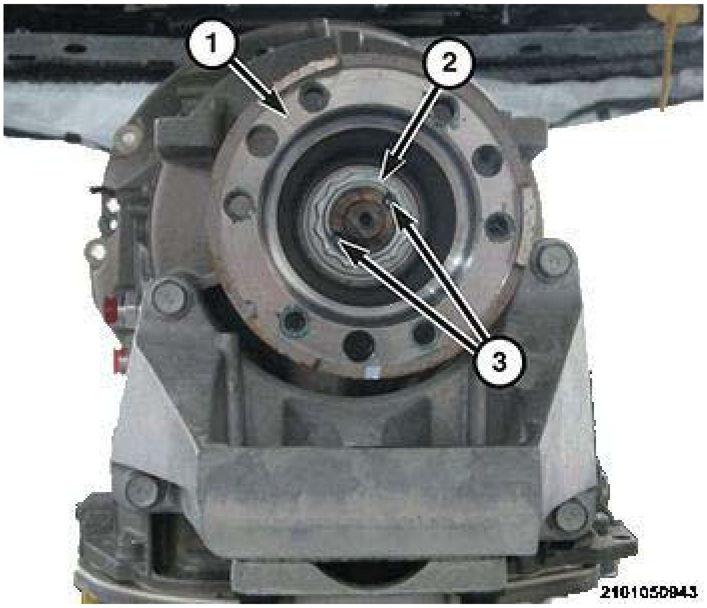

Fig. 291: Drive Shaft Flange, Nut & Staking Area
Courtesy of CHRYSLER GROUP, LLC

4. Install the transmission output shaft flange (1) onto the transmission output shaft and install a **NEW** transmission output flange nut (2). Tighten the transmission output flange nut, with a 34 mm 12 point socket, to the proper **SPECIFICATIONS** .
5. Stake (3) the transmission output flange nut.
6. Position the drive shaft in place on the transmission output flange.

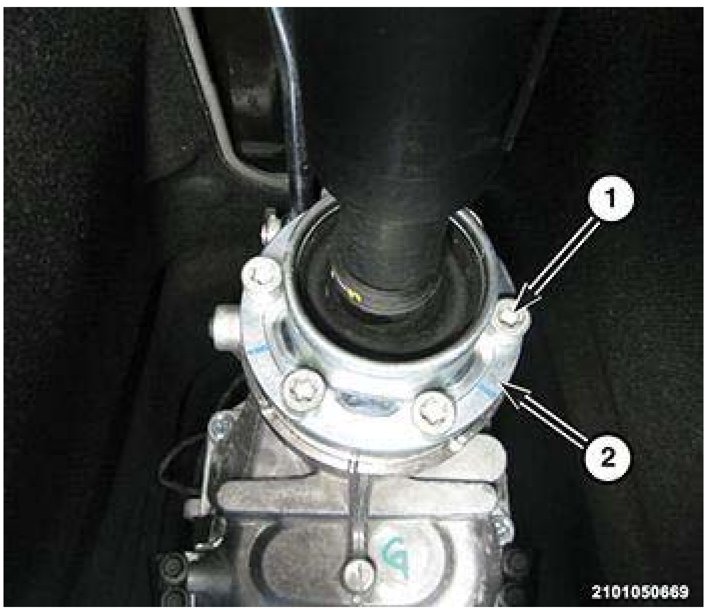

Fig. 292: Bolts And Washers & Transmission Flange
Courtesy of CHRYSLER GROUP, LLC

7. Install the drive shaft washers (2) and bolts (1) and tighten to the **SPECIFICATIONS** .
8. Check the transmission fluid level. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

SEAL, TORQUE CONVERTER HUB

REMOVAL

TORQUE CONVERTER HUB SEAL

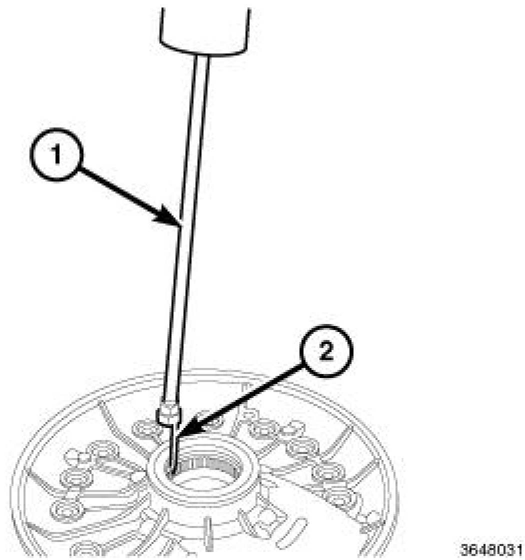

Fig. 293: Seal Remover & Slide Hammer
Courtesy of CHRYSLER GROUP, LLC

1. Remove the torque converter. Refer to **TORQUE CONVERTER, REMOVAL**.
2. Using (special tool #9667, Remover, Seal) and (special tool #C-3752, Slide Hammers) remove the torque converter hub seal.

INSTALLATION

TORQUE CONVERTER HUB SEAL

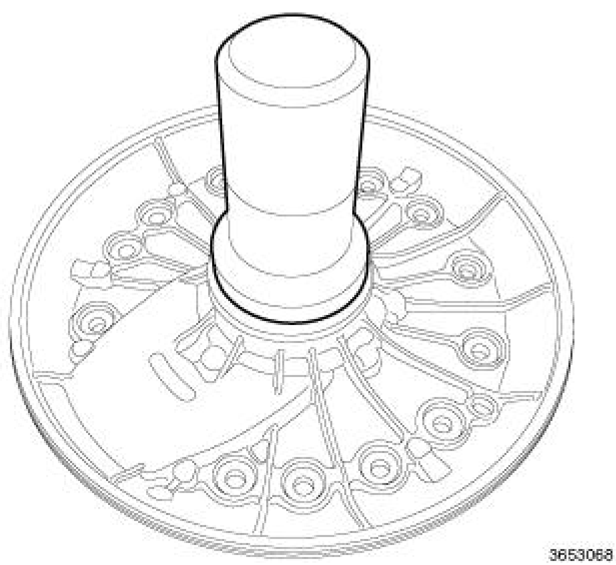

Fig. 294: Oil Pump Cover Oil Seal
Courtesy of CHRYSLER GROUP, LLC

1. Position the torque converter hub seal over the input shaft and against the transmission oil pump cover.
2. Using (special tool #10375, Installer, Oil Pump Cover Oil Seal) install a new torque converter hub seal.

3. Install the torque converter. Refer to **TORQUE CONVERTER, INSTALLATION**.

SHIFTER, TRANSMISSION

DESCRIPTION

FLOOR SHIFT

The Electronic Shifter (E-Shifter) is an electronic switch/module floor mounted device, using CAN messaging to communicate driver requests for transmission gear changes without a mechanical connection.

PADDLE SHIFT

Some vehicles may be equipped with optional paddle shift. For more information on paddle shift. Refer to **SWITCH, REMOTE RADIO, DESCRIPTION** .

OPERATION

FLOOR SHIFT

The E-Shifter:

- communicates with the Transmission Control Module (TCM) via a Controller Area Network (CAN).
- incorporates a solenoid that allows the lever to be locked for purposes of Brake Transmission Shift Interlock (BTSI) function.
- lever-lock function is controlled electronically by the TCM via CAN message, and mechanically by the release trigger on the knob.
- indicates the selected/non-selected gears provided via illumination of PRNDM+- characters on knob.
- lever-position feedback is provided via mechanical detents, which also keep the lever in the desired position.
- communicates driver requests for transmission gear changes without a mechanical connection.
- is comprised of an upper knob and a lower base, which can be serviced separately.
- on some models, may have steering wheel-mounted paddle shifters available. Refer to **SWITCH, REMOTE RADIO, DESCRIPTION** .

The Electronic Shifter (E-Shifter) offers (P, R, N, D, M) modes of function.

The M selection (manual mode) is engaged by moving the shift-lever sideways to M. Requests to up/down shift are achieved by moving the lever fore/aft once in the manual position.

PADDLE SHIFTERS

Some vehicles may be equipped with optional steering wheel paddle shifters.

The steering wheel paddle shifters may be enabled or disabled in the default drive mode. The vehicle will start in default mode unless it is in valet mode.

To enable the steering wheel paddle shifters, press the **ON** button on the touchscreen.

To disable the steering wheel paddle shifters, press the **OFF** button on the touchscreen.

Fig. 295: Paddle Shifter Enable/Disable Screen
Courtesy of CHRYSLER GROUP, LLC

For additional information, refer to **SWITCH, REMOTE RADIO, OPERATION** .

STANDARD PROCEDURE

MPR DISENGAGE

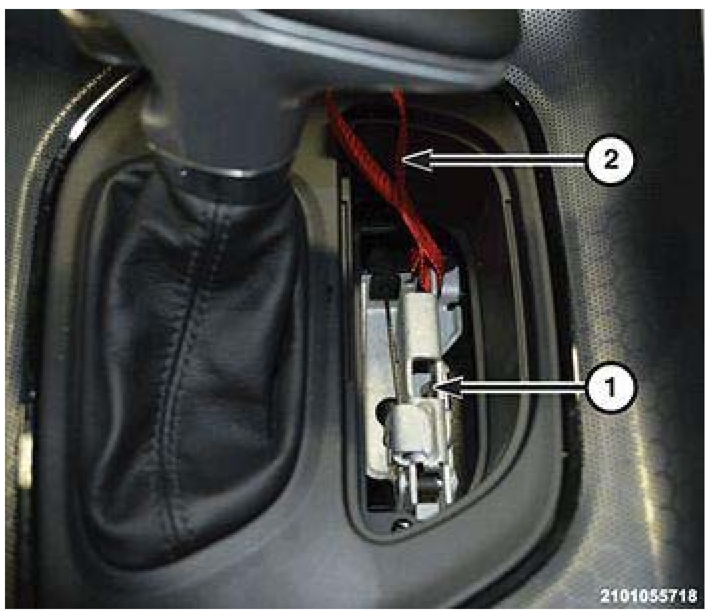
The Manual Park Release (MPR) lever is used for putting the transmission in neutral anytime the vehicle needs to be moved with the engine off in neutral. This is achieved by a cable attached to the transmission park pawl. When the cable is pulled, the transmission is put into neutral, and when the cable is released, the transmission is back into park.

WARNING: **Always secure your vehicle by fully applying the parking brake, before activating the Manual Park Release. Activating the Manual Park Release will allow your vehicle to roll away if it is not secured by the parking brake or by proper connection to a tow vehicle. Activating the Manual Park Release on an unsecured vehicle could lead to serious injury or death for those in or around the vehicle.**

NOTE: **Apply the parking brake.**

[Fig. 296: Manual Park Release Lever Access Panel]
Courtesy of CHRYSLER GROUP, LLC

1. Remove the Manual Park Release (MPR) lever access panel (1).



[Fig. 297: Locking Tab & Tether]
Courtesy of CHRYSLER GROUP, LLC

2. Release the locking tab (1) with a screw driver or equivalent and pull the tether (2).
3. While holding the locking tab (1) to the right, pull the tether (2) up and rearward, until it locks in place in the vertical position. The transmission is now out of park, and the vehicle can be moved.

MPR ENGAGE

Fig. 298: Releasing Locking Tab
Courtesy of CHRYSLER GROUP, LLC

1. Push the Manual Park Release (MPR) lever rearward, and use a small screwdriver or equivalent to release the locking tab (1).

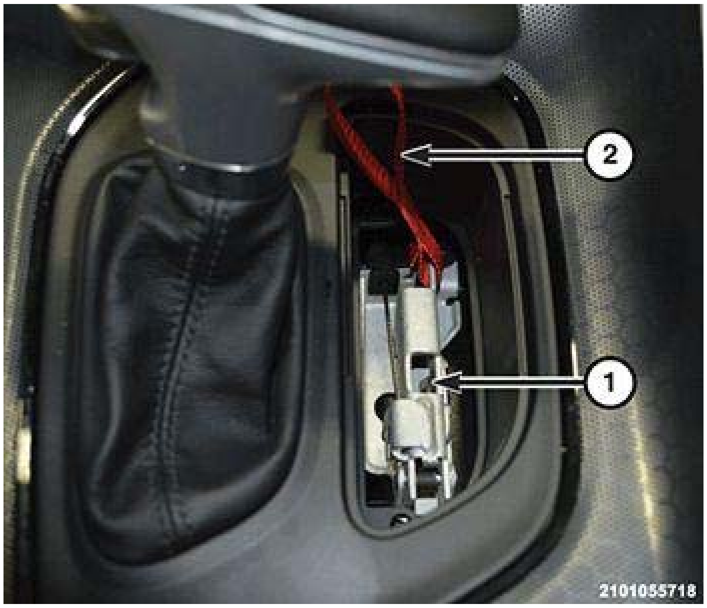


Fig. 299: Locking Tab & Tether
Courtesy of CHRYSLER GROUP, LLC

2. Allow the MPR lever to return to the engaged position.
3. Make sure that the locking tab (1) is in position, gently pull on the tether (2) to confirm the lever is locked.

[Fig. 300: Manual Park Release Lever Access Panel]
Courtesy of CHRYSLER GROUP, LLC

4. Install the MPR lever access panel.

REMOVAL

SHIFTER

WARNING: Always secure your vehicle by fully applying the parking brake, before activating the Manual Park Release. Activating the Manual Park Release will allow your vehicle to roll away if it is not secured by the parking brake or by proper connection to a tow vehicle. Activating the Manual Park Release on an unsecured vehicle could lead to serious injury or death for those in or around the vehicle.

1. Apply the parking brake.

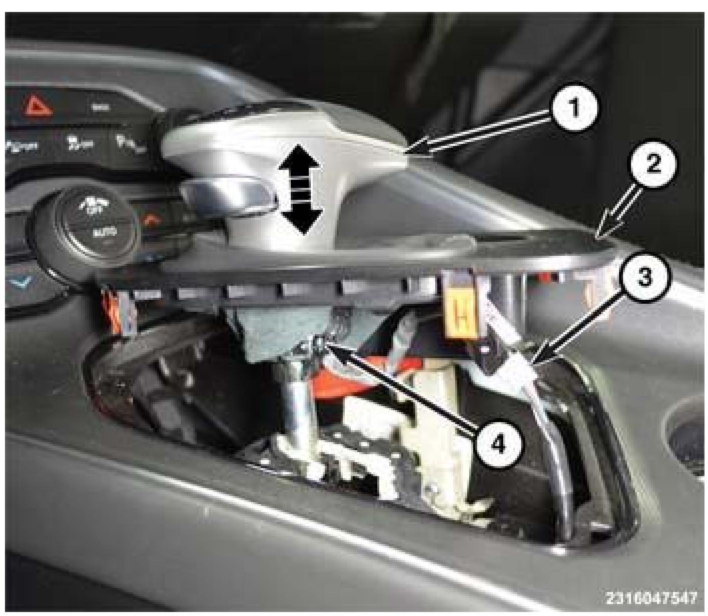

Fig. 301: Automatic Shifter
Courtesy of CHRYSLER GROUP, LLC

2. Using a trim stick or equivalent, carefully release the retaining clips and lift the shifter bezel (2).
3. Unplug the wire harness connector (3) between the knob and lower base.
4. Remove the shifter knob screw (4) and remove the shifter knob and shifter bezel (2).

Fig. 302: Removing/Install Console Bezel Panel
Courtesy of CHRYSLER GROUP, LLC

5. Using a trim stick or equivalent, starting at the rear of the console bezel panel, carefully release the retaining clip and lift the console bezel panel (1). Disconnect the wire harness connectors and remove the console bezel panel.

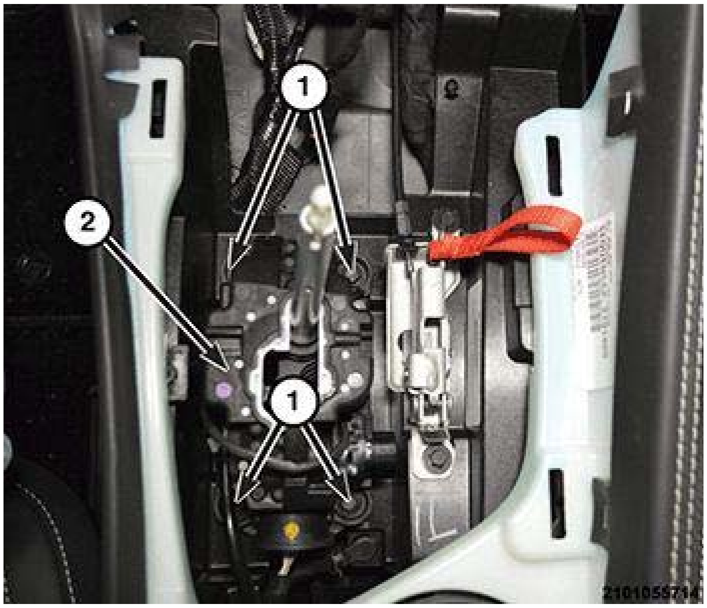

Fig. 303: Shifter Assembly & Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Remove the shifter bolts (1) and lift the shifter assembly (2) up enough to allow access to the shifter wire harness connector.

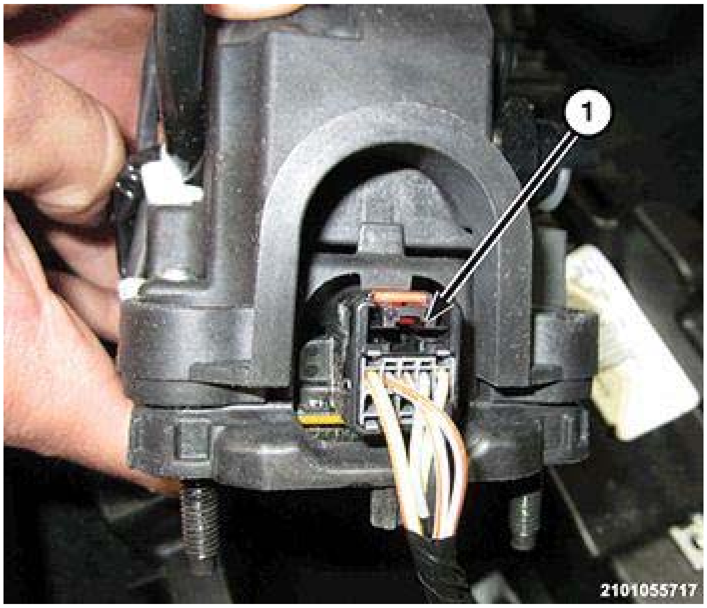

Fig. 304: Shifter Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

7. Disconnect the shifter wire harness connector (1).
8. Remove the shifter from the vehicle.

INSTALLATION

SHIFTER

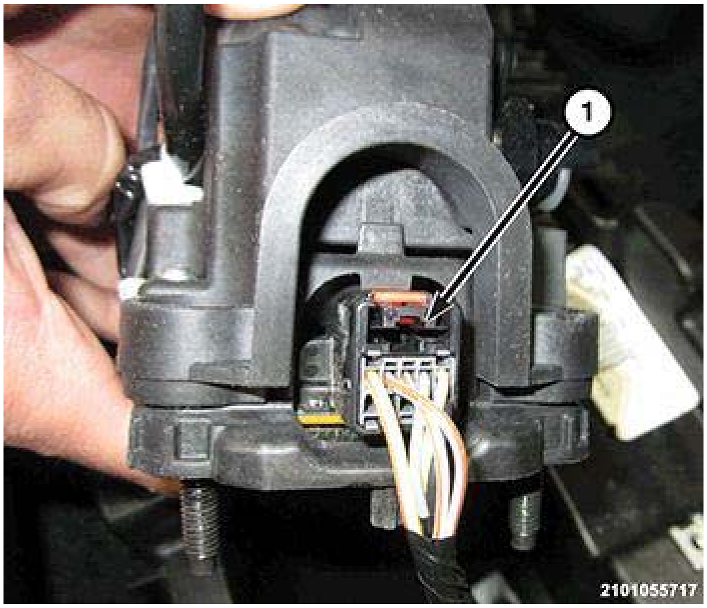

Fig. 305: Shifter Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Connect the wire harness connector (1) prior to installing the shifter to the vehicle.

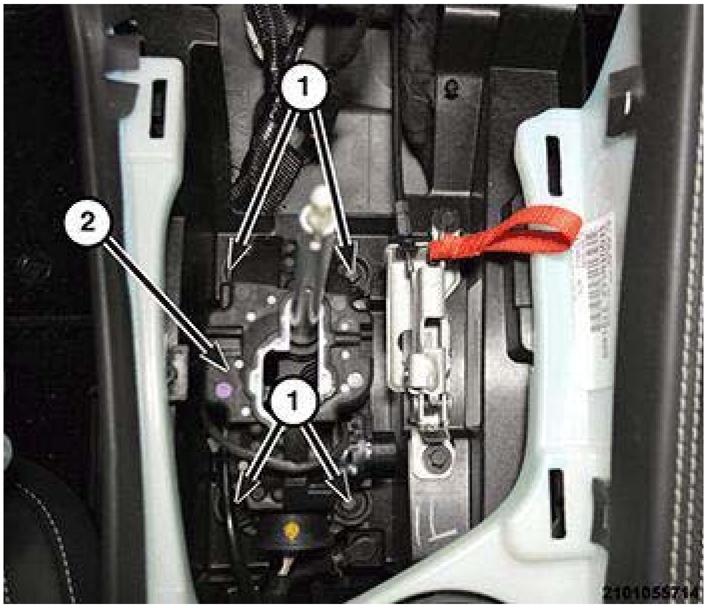

Fig. 306: Shifter Assembly & Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Install the shifter (2) and shifter bolts (1), tighten to the proper (**TORQUE SPECIFICATIONS**).

Fig. 307: Removing/Install Console Bezel Panel
Courtesy of CHRYSLER GROUP, LLC

3. Connect the wire harness connectors and install the console bezel panel (1).

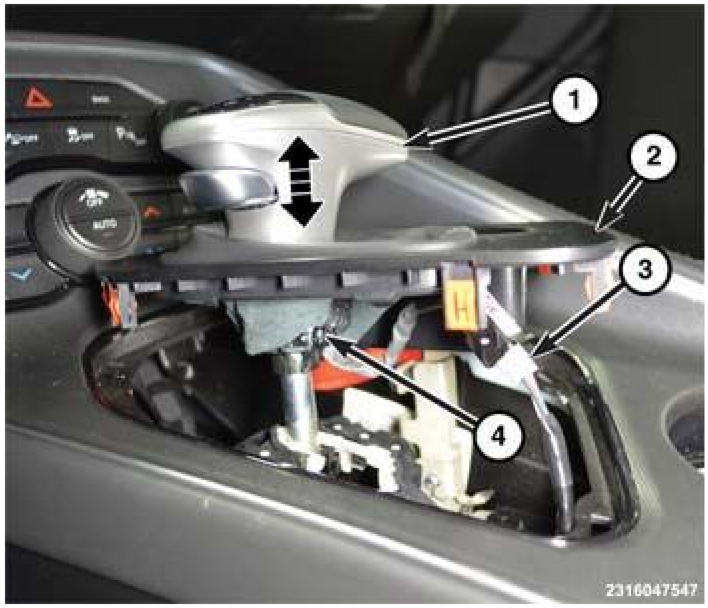

Fig. 308: Automatic Shifter
Courtesy of CHRYSLER GROUP, LLC

4. Install the shifter knob (1) and install the shifter knob screw (4). Tighten the screw securely.
5. Connect the wire harness connector (3).
6. Position the shifter bezel (2) in place and engage the retaining clips.

SOLENOID, TRANSMISSION

DESCRIPTION

DESCRIPTION

CAUTION: The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Failure to follow these instructions may result in damage to the TCM/TCMA.

The solenoids are integrated into the Transmission Control Module Assembly (TCMA) of the 8HP transmission and are not replaceable individually.

OPERATION

OPERATION

CAUTION: The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Failure to follow these instructions may result in damage to the TCM/TCMA.

The TCM will actuate the valves via solenoids based on the position of the shifter, transmission fluid temperature, engine operating conditions, traction conditions, and driver demands. During a shift, the TCM will actuate the solenoids to match the gear ranges to the optimal torque range of the engine based on the position of the accelerator pedal, shifter, and vehicle speed as determined by the PCM based on input from the Vehicle Speed Sensor (VSS) and ABS module.

SENSOR, SPEED

DESCRIPTION

DESCRIPTION

The OSS (1) is located at the back of the TCMA and reads output shaft speed from the P4 carrier (2).

TORQUE CONVERTER

DESCRIPTION

DESCRIPTION

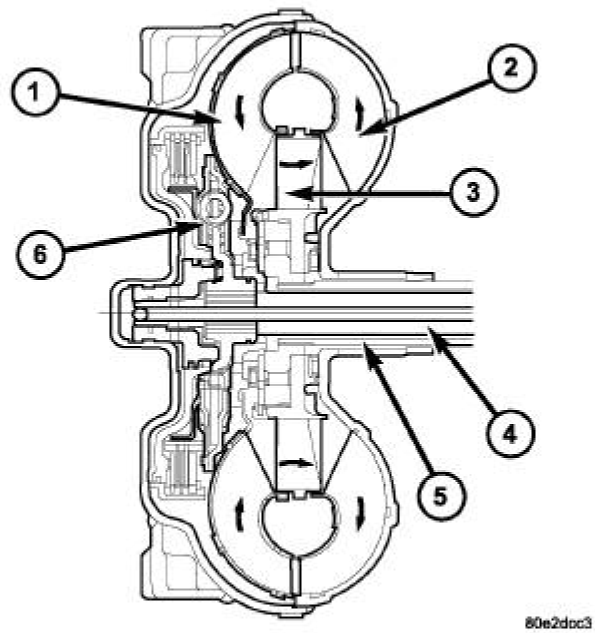

Fig. 313: Torque Converter
Courtesy of CHRYSLER GROUP, LLC

1 - TURBINE
2 - IMPELLER
3 - STATOR
4 - INPUT SHAFT
5 - STATOR SHAFT
6 - TURBINE DAMPER

CAUTION: The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid.

The torque converter is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine (1), a stator (3), an overrunning clutch, an impeller (2), and an electronically applied converter clutch. The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The converter clutch engages in third through fifth gears. The torque converter hub drives the transmission oil (fluid) pump.

A turbine damper (6) has been added for some applications to help improve vehicle noise, vibration, and harshness (NVH) characteristics.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

IMPELLER

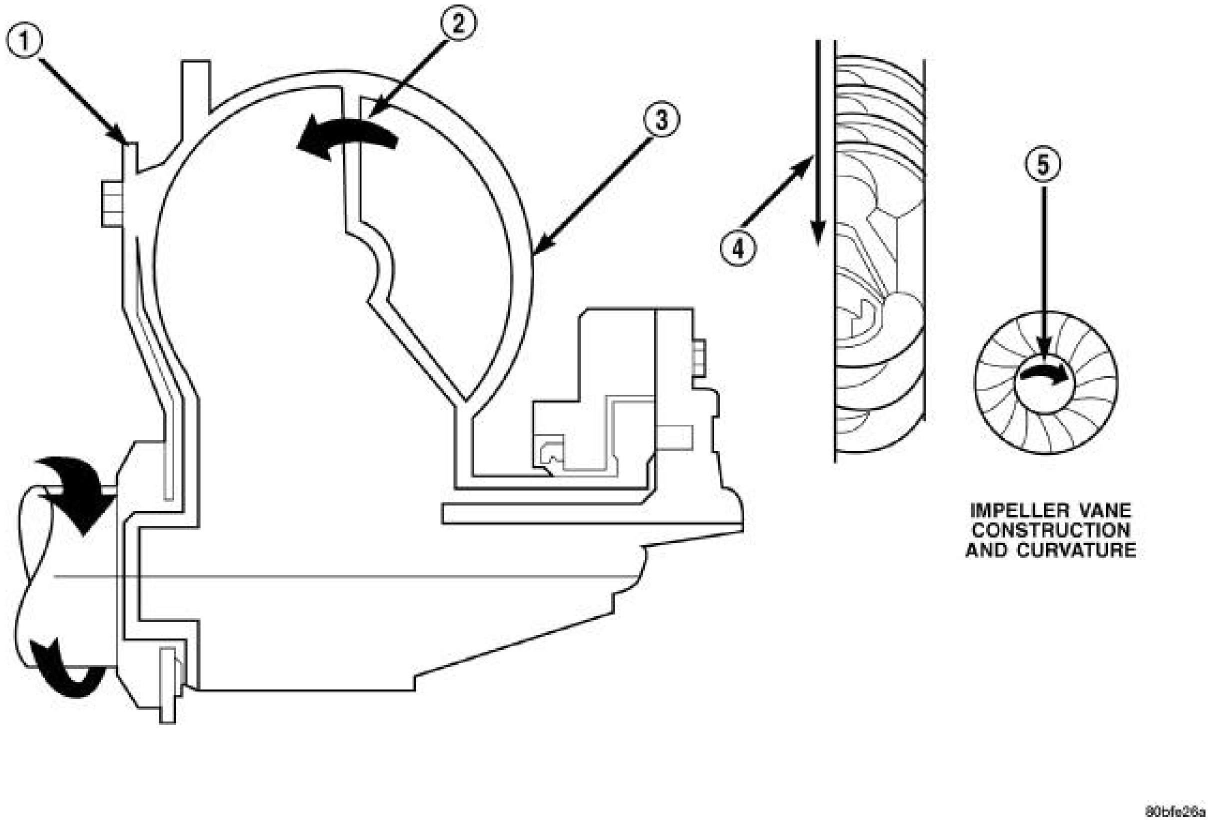

Fig. 314: Identifying Impeller
Courtesy of CHRYSLER GROUP, LLC

1 - ENGINE FLEXPLATE
2 - OIL FLOW FROM IMPELLER SECTION INTO TURBINE SECTION
3 - IMPELLER VANES AND COVER ARE INTEGRAL
4 - ENGINE ROTATION
5 - ENGINE ROTATION

The impeller (3) is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving members of the system.

TURBINE

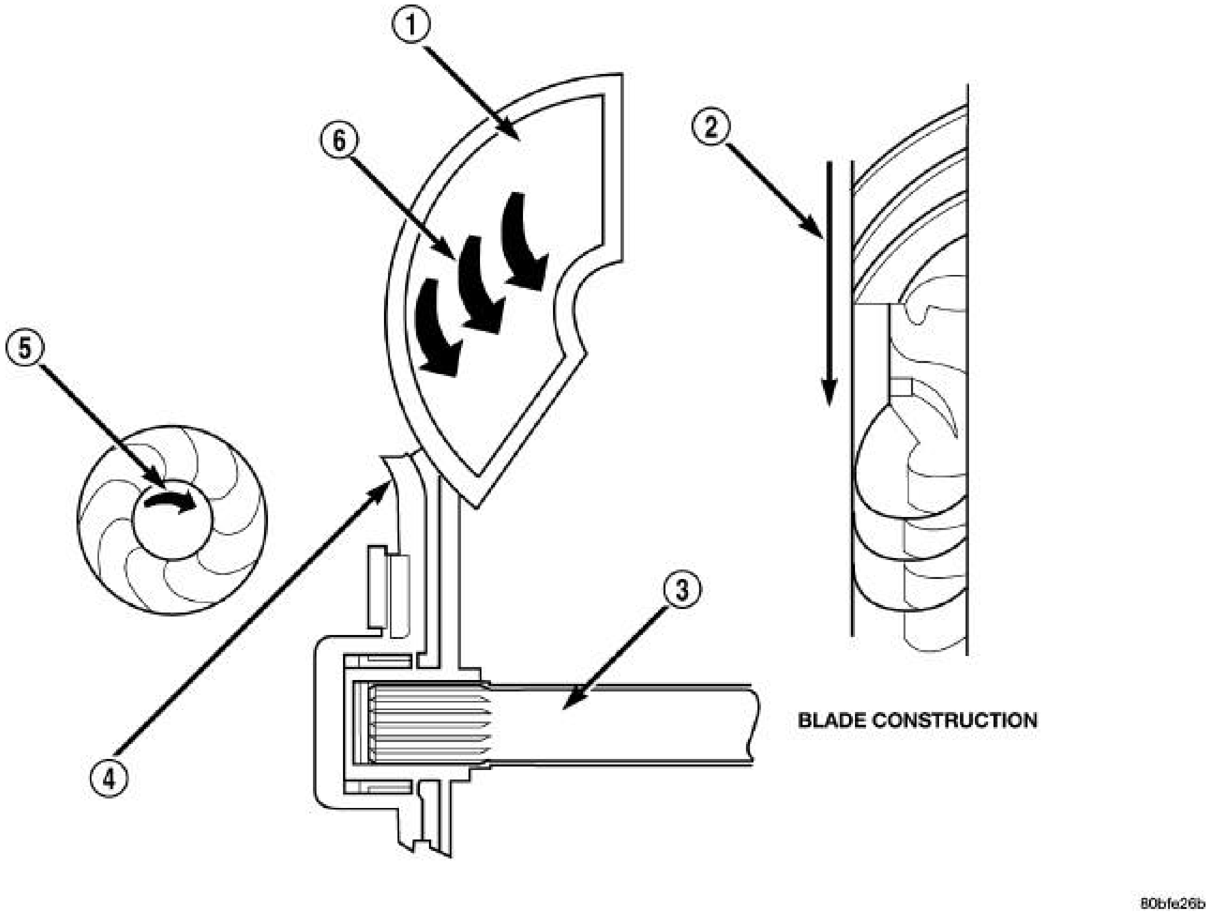

Fig. 315: Identifying Turbine
Courtesy of CHRYSLER GROUP, LLC

1 - TURBINE VANE
2 - ENGINE ROTATION
3 - INPUT SHAFT
4 - PORTION OF TORQUE CONVERTER COVER
5 - ENGINE ROTATION
6 - OIL FLOW WITHIN TURBINE SECTION

The turbine (1) is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

STATOR

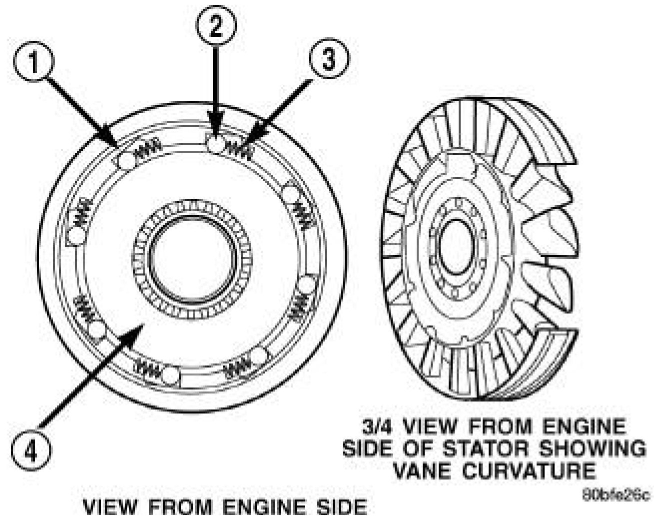

Fig. 316: Identifying Over-Running Clutch
Courtesy of CHRYSLER GROUP, LLC

1 - CAM (OUTER RACE)
2 - ROLLER
3 - SPRING
4 - INNER RACE

The stator assembly (1-4) is mounted on a stationary shaft which is an integral part of the oil pump.

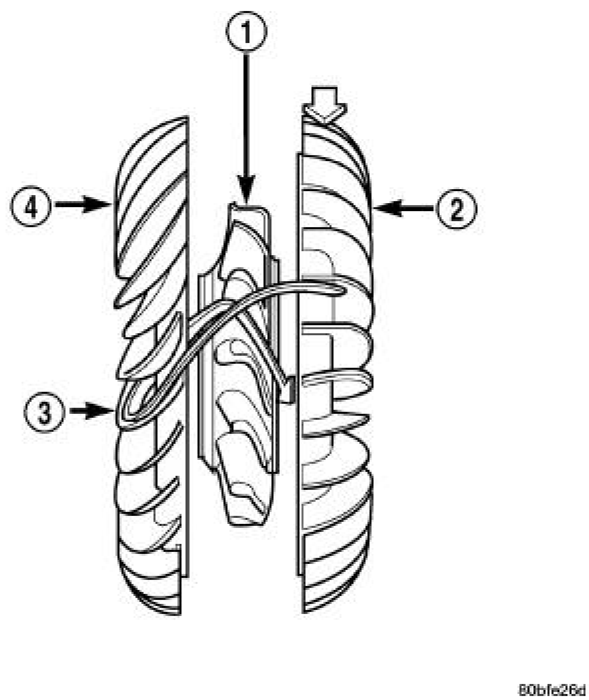

Fig. 317: Identifying Stator Components
Courtesy of CHRYSLER GROUP, LLC

1 - STATOR
2 - IMPELLER
3 - FLUID FLOW

4 - TURBINE

The stator (1) is located between the impeller (2) and turbine (4) within the torque converter case. The stator contains a freewheeling clutch, which allows the stator to rotate only in a clockwise direction. When the stator is locked against the freewheeling clutch, the torque multiplication feature of the torque converter is operational.

TORQUE CONVERTER CLUTCH (TCC)

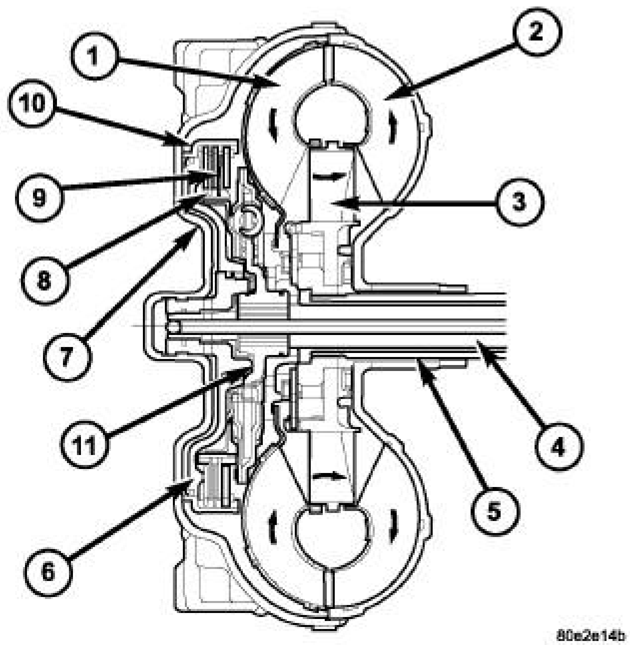

Fig. 318: Identifying Torque Converter Components
Courtesy of CHRYSLER GROUP, LLC

1 - TURBINE
2 - IMPELLER
3 - STATOR
4 - INPUT SHAFT
5 - STATOR SHAFT
6 - PISTON
7 - COVER SHELL
8 - INTERNALLY TOOTHED DISC CARRIER
9 - CLUTCH PLATE SET
10 - EXTERNALLY TOOTHED DISC CARRIER
11 - TURBINE DAMPER

The TCC (9) was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller and turbine were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston with friction material was added to the turbine assembly to provide this mechanical lock-up.

In order to reduce heat build-up in the transmission and buffer the powertrain against torsional vibrations, the TCM can duty cycle the torque converter lock-up solenoid to achieve a smooth application of the torque converter clutch. This function, referred to as Electronically Modulated Converter Clutch (EMCC) can occur at various times depending on the following variables:

- Shift lever position
- Current gear range
- Transmission fluid temperature
- Engine coolant temperature
- Input speed
- Throttle angle
- Engine speed

OPERATION

OPERATION

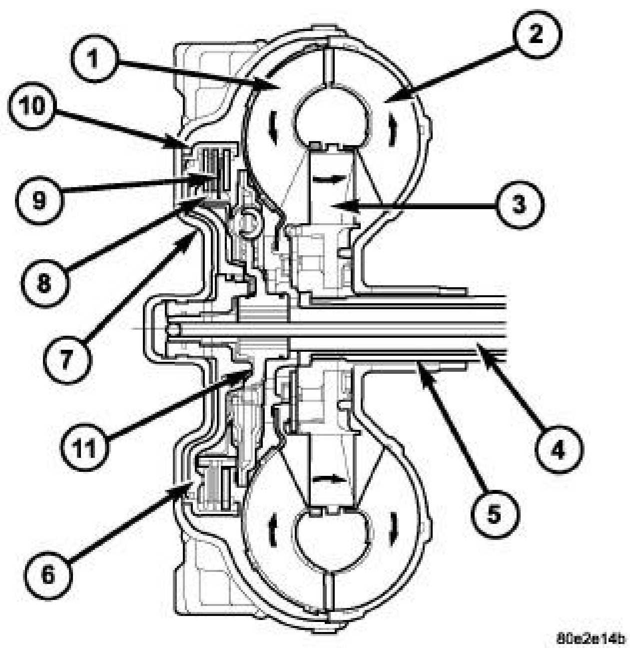

Fig. 319: Identifying Torque Converter Components
Courtesy of CHRYSLER GROUP, LLC

1 - TURBINE
2 - IMPELLER
3 - STATOR
4 - INPUT SHAFT
5 - STATOR SHAFT
6 - PISTON
7 - COVER SHELL
8 - INTERNALLY TOOTHED DISC CARRIER

9 - CLUTCH PLATE SET	
10 - EXTERNALLY TOOTHED DISC CARRIER	
11 - TURBINE DAMPER	

The torque converter housing has a unique shape to incorporate the torque converter clutch and flex plate connection. The torque converter uses the typical turbine, impeller and stator assemblies found in a standard torque converter assembly. The torque converter drives the pump through the splines on the inside of the hub. The torque converter uses a multi-disc torque converter clutch system that improves the durability and the holding pressure in the lock-up circuit. The torque converter incorporates a turbine dampening system. This system suppresses torsional vibrations from the engine to ensure optimal shift quality and reduce noise and vibration concerns.

TCC RELEASE When the TCC is open, the TCC piston is pushed to its default position by torque converter chamber pressure. The torque converter switch valve (SV-TC) provides pressure for torque converter operation which has been regulated by the converter pressure regulating valve (TC-V). After exiting the torque converter, fluid moves into the cooling and lubrication circuits. The converter pressure retention valve (TCH1-V) ensures the torque converter pressure is a minimum of 0.35 bar (5 psi) when the TCC is open.

TCC APPLY When the TCC solenoid is energized, fluid is directed to the torque converter switch valve (SV-TC) and TCC lockup valve (TCC-V). The TCC lockup valve directs fluid to the TCC and torque converter chamber. The torque converter switch valve directs fluid exiting the converter chamber to a secondary pressure retention valve (TCH2-V) which is calibrated to retain 1.0 bar (14.5 psi) of pressure in the converter. The torque converter switch valve also directs line pressure to the cooler and lubrication circuit.

TURBINE

When the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

STATOR

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft. Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counterclockwise direction. When this happens the over-running clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.0:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such as way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling

TORQUE CONVERTER CLUTCH (TCC)

In a standard torque converter, the impeller (2) and turbine are rotating at about the same speed and the stator (3) is freewheeling, providing no torque multiplication. By applying the turbines piston and friction material (9) a total converter engagement can be obtained. The result of this engagement is a direct 1:1 mechanical link

between the engine and the transmission.

HYDRO-MECHANICAL AND ELECTRICAL

The Torque Converter Clutch (TCC) is engaged and released by the Transmission Control Module Assembly (TCMA). The TCC can be engaged and controlled in any forward gear from 1 through 8. In addition, the 8HP transmission incorporates a neutral idle control (NIC) function. Instead of the engine continuing to drive the converter when the vehicle comes to rest, the converter is partially disconnected from the driveline so only a slight residual load remains. Decoupling of the torque converter during NIC is accomplished by allowing clutch B to slip.

REMOVAL

REMOVAL

1. Remove the transmission from the vehicle. Refer to **REMOVAL**.
2. Place a suitable drain pan under the torque converter housing end of the transmission.

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

3. Pull the torque converter forward until the center hub clears the oil pump seal.
4. Separate the torque converter from the transmission.

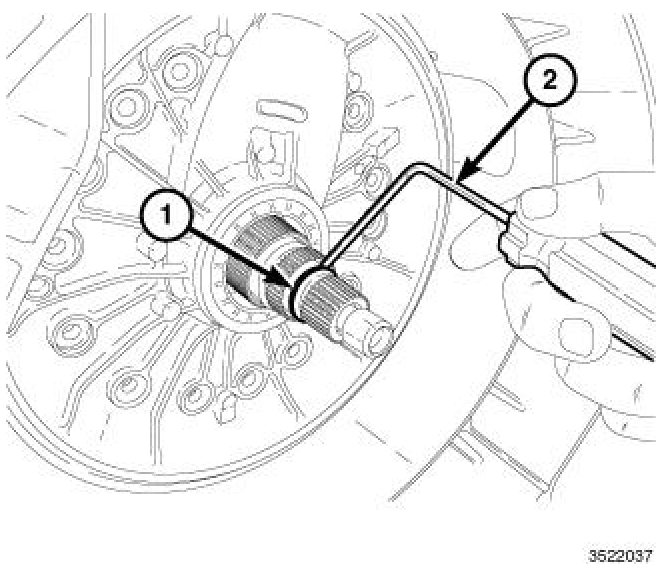

Fig. 320: Input Shaft O-Ring & Small Pick
Courtesy of CHRYSLER GROUP, LLC

5. Check the input shaft O-ring (1) for damage, replace if necessary.

INSTALLATION

INSTALLATION

NOTE: Check the torque converter hub for sharp edges, burrs, scratches, or nicks. Polish the hub with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.

1. Lubricate the oil pump seal lip with transmission fluid.

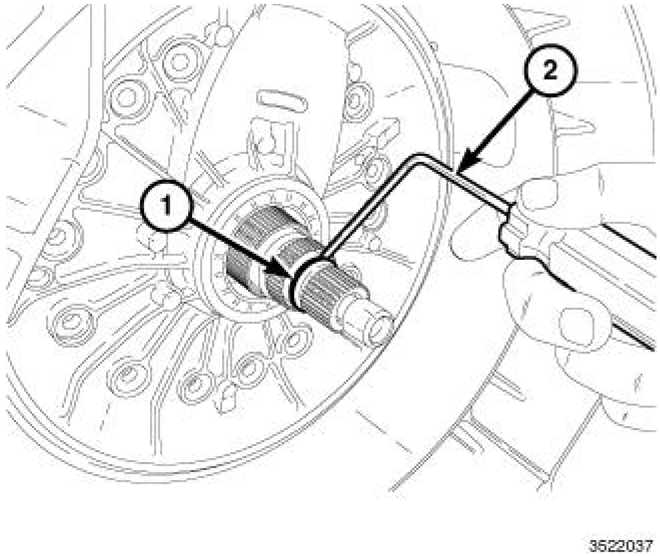

Fig. 321: Input Shaft O-Ring & Small Pick
Courtesy of CHRYSLER GROUP, LLC

2. Check the input shaft O-ring (1) for any damage. Replace if necessary.
3. Place the torque converter in position on the transmission.

CAUTION: Do not damage oil pump seal or converter hub while inserting torque converter into the front of the transmission.

4. Align the torque converter to the oil pump seal opening.
5. Insert the torque converter hub into the oil pump drive gear.
6. While pushing the torque converter inward, rotate the torque converter until the torque converter is fully seated into the oil pump drive gear.

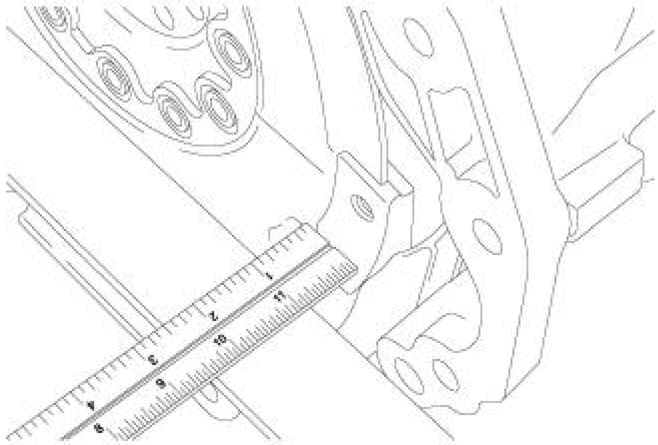

Fig. 322: Straightedge
Courtesy of CHRYSLER GROUP, LLC

7. Check the torque converter seating with a scale and straightedge. The surface of the torque converter lugs should be at least 19 mm (3/4 in.) to the rear of the straightedge when the torque converter is fully seated.
8. If necessary, temporarily secure the torque converter with a C-clamp attached to the torque converter housing.
9. Install the transmission. Refer to **INSTALLATION**.
10. Perform the TRANSMISSION FILL AFTER SERVICE procedure. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

VALVE BODY

DESCRIPTION

DESCRIPTION

CAUTION: The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Failure to follow these instructions may result in damage to the TCM/TCMA.

The valve body includes the Transmission Control Module (TCM), all solenoids and sensors, and can be referred to as the Transmission Control Module Assembly (TCMA). The TCM is attached to the valve body between the transmission case and the valve body. If any component of the valve body **including the TCM** sensors or solenoids need replaced, the complete TCMA (valve body) must be replaced. For replacement of the TCMA (valve body), refer to **VALVE BODY, REMOVAL**.

OPERATION

4 - Output Speed Sensor
5 - Park Position Sensor

CAUTION: The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Failure to follow these instructions may result in damage to the TCM/TCMA.

The valve body, which includes the Transmission Control Module (TCM), controls the delivery and pressure of transmission fluid. The TCM is integrated into the valve body. The TCM regulates the amount of hydraulic pressure used to engage the clutches and the Torque Converter Clutch (TCC), in addition to directing hydraulic pressure to engage or release any given clutch for any given required gear. The TCM will actuate the valves via solenoids based on the position of the shifter, transmission fluid temperature, engine operating conditions, traction conditions and driver demands. During a shift, the TCM will actuate the solenoids to match the gear ranges to the optimal torque range of the engine based on the position of the accelerator pedal, shifter and vehicle speed as determined by the Powertrain Control Module (PCM) based on input from the Vehicle Speed Sensor (VSS) and Anti-lock Brake System (ABS) module. Due to the complexity of the 8HP transmission control system, always refer to the appropriate transmission electrical/electronic Diagnostics & Testing article when attempting to diagnose transmission problems.

If the Transmission Control Module Assembly (TCMA) is replaced, it **must** be programmed and a drive learn needs to be performed before returning the vehicle to the customer. Refer to **STANDARD PROCEDURE** for programming and drive learn procedures .

REMOVAL

REMOVAL 8HP90

CAUTION: The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Failure to follow these instructions may result in damage to the TCM/TCMA.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Drain the transmission fluid into a clean container. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

DESCRIPTION

DESCRIPTION

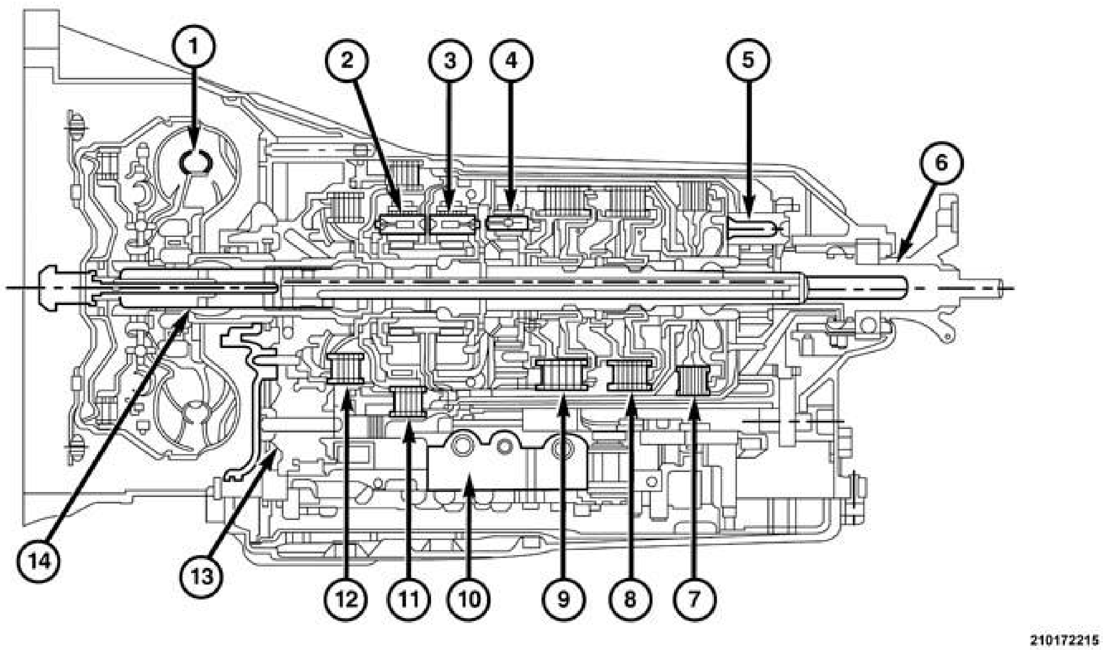

Fig. 1: 8HP45/845RE Automatic Transmission
Courtesy of CHRYSLER GROUP, LLC

CAUTION: A unique transmission fluid has been developed for this transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid, see FLUIDS, LUBRICANTS AND GENUINE PARTS located in owners manual.

The transmission case is a single-piece unit. The starter pocket, cooler line fittings, and manual park release lever are located on the driver's side of the case. The electrical connector and oil fill plug are located on the passenger side of the case. This transmission uses a flanged output shaft connection.

OPERATION

OPERATION

CAUTION: A unique transmission fluid has been developed for this transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid see, FLUIDS, LUBRICANTS AND GENUINE PARTS located in owners manual.

The 8HP45/845RE is an electronic eight-speed automatic transmission.

- The Transmission Control Module Assembly (TCMA), which is integrated into the valve body, provides fully synchronized clutch-to-clutch shifting through four planetary gear sets.
- The TCMA includes a mounting plate that holds the Transmission Control Module (TCM) and a molded wiring harness for connection to various transmission sensors and solenoids.
- The valve body assembly contains all the sensors and solenoids required for operation, completely inside the transmission. Eight speeds allow the engine to maintain its optimal RPM range, increasing fuel economy and performance.
- Transmission control is performed by the TCM based on hard-wired and CAN bus signals from sensors and modules.
- The TCM receives driveability data from the Powertrain Control Module (PCM) and other modules over the CAN-C bus.
- It also receives shift lever position information from the electronic shifter over a dedicated transmission CAN bus.
- The TCM processes this input data and controls operation of the torque converter clutch, park lock system, solenoid valves, and pressure regulating valve.
- The input and output speed sensors are Hall-effect sensors that measure shaft rotational speed.
- The input speed sensor is located at the top, near the center, of the of the TCMA and reads input shaft speed from the magnetic ring on the P2 carrier.
- The output speed sensor is located at the back of the TCMA and reads output shaft speed from the P4 carrier

FILTER SERVICE The 8HP45/845RE has a conventional fluid sump design, however, the filter is integrated into the oil pan resulting in a lower profile for improved vehicle packaging. The oil pan gasket is reusable providing it is not damaged during removal.

FLUID CHECK AND FILL A fluid fill tube and indicator are not provided. All work is performed under the vehicle while raised on a hoist. In the event of a transmission shift quality concern, a fluid leak, or in conjunction with a transmission repair, the transmission fluid level must be validated and topped off as necessary. The procedure involves the use of a scan tool to monitor transmission fluid temperature. Specific service procedures are necessary to check and fill the transmission with fluid. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

CLUTCHES

The 8HP45 transmission uses two multi-plate holding clutches (A and B) and three multi-plate driving (rotating) clutches (C, D, and E). Gear shifts from one - eight and eight - one are synchronous shifts, meaning one of the clutches must continue to transmit torque at lower pressure until the other clutch is able to accept the input torque.

Clutches A and B are holding clutches. Clutch A is applied by hydraulic pressure and released by a return spring, similar to the driving clutches. Clutch B operation is unique because it has fluid chambers on both sides of the apply piston, and therefore it is applied and released hydraulically. Regulation of fluid pressure on each side of the piston allows precise positioning of clutch B for apply, release, and controlled slip conditions.

Clutches C, D, and E operate in a similar manner. Regulated pressure is available at the clutch C shift solenoid and the clutch valve. When the shift solenoid is de-energized, fluid flows through the shift solenoid and applies pressure to the clutch valve. During the shift, pressure moves the clutch valve, which begins to apply the clutch.

Pressure from the holding valve regulates the opening of the clutch valve, softening the shift. Above a set threshold, the holding valve seats and allows the clutch valve to open completely.

EMERGENCY RUNNING FUNCTION - LIMP IN MODE

In the event of a complete transmission electrical failure (loss of power to the TCM), the transmission enters default limp-in mode. When the TCM loses power, all solenoids are de-energized. Maximum pressure locks the transmission in 6th gear, and a diagnostic trouble code (DTC) is stored in memory. If the vehicle is in a forward gear range when the fault occurs, the transmission defaults to 6th gear.

If the vehicle is in park, reverse, or neutral, or if the engine is turned off when the fault occurs, the transmission will remain in park because the park lock release system cannot release the parking pawl. No hydraulic pressure is supplied to the driving clutches. In this situation, the manual park release lever must be used to disengage the park pawl.

The limp-in function remains active until the DTC is rectified or the stored DTC is erased with the appropriate scan tool.

OIL PUMP OPERATION

The oil pump is located just behind the torque converter, between the pump housing and cover assemblies. The torque converter drives the pump assembly using a chain and sprockets. The oil pump is a double-stroke vane pump. The pump has dual chambers, two inlet and two outlet ports, allowing it to produce the fluid volume necessary for all operating conditions. The pump draws fluid through a filter and pressurizes the fluid as the pump rotates. After the fluid is pressurized, it exits the pump through two exhaust ports that feed the system pressure valve. The system pressure valve maintains fluid pressure and allows excess pressure to be returned to the pump. This reduces cavitation and noise. A slipping clutch can often be determined by comparing which internal units are applied in the various gear ranges. The SOLENOID APPLICATION chart provides a basis for analyzing road test results.

SOLENOID APPLICATION

1- A CLUTCH
2 - B CLUTCH
3 - P1 ANNULUS (PARTIAL CUTAWAY)
4 - P2 ANNULUS
5 - P3 SUN GEAR
6 - P3 CARRIER
7 - D CLUTCH DRUM (PARTIAL CUTAWAY)
8 - P4 ANNULUS DRUM (PARTIAL CUTAWAY)
9 - P4 ANNULUS (PARTIAL CUTAWAY)
10 - P4 SUN GEAR/D CLUTCH RETAINER (PARTIAL CUTAWAY)
11 - P4 CARRIER
12 - D CLUTCH
13 - C CLUTCH
14 - E CLUTCH
15 - P3 ANNULUS
16 - P2 CARRIER
17 - P1/P2 SUN GEAR
18 - P1 CARRIER
19 - INPUT SHAFT

Use this POWER FLOW COMPONENTS graphic and chart to identify the individual components of the specific gear powerflow explanations below:

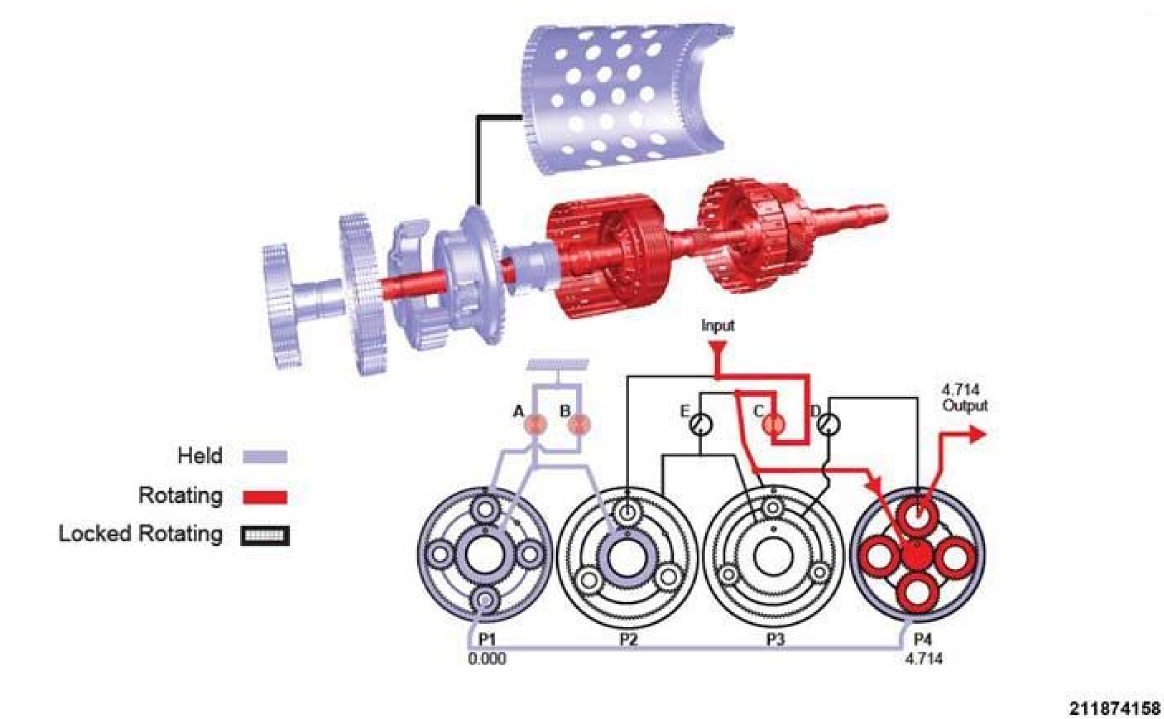

Fig. 3: Powerflow In First Gear
Courtesy of CHRYSLER GROUP, LLC

FIRST GEAR POWERFLOW

Clutch A (1) holds the P1/P2 sun gear (17) and clutch B (2) holds the P1 annulus (3). Because two members of the same gear set are held, the entire P1 gear set is stationary. The stationary P1 carrier (18) is connected to the P4 annulus (9), locking the annulus. The input shaft (19) drives the C clutch (13), and the C clutch (13) drives the P4 sun gear (10). The P4 sun gear (10) drives the P4 carrier (11), whose pinions walk around the held P4 annulus (9).

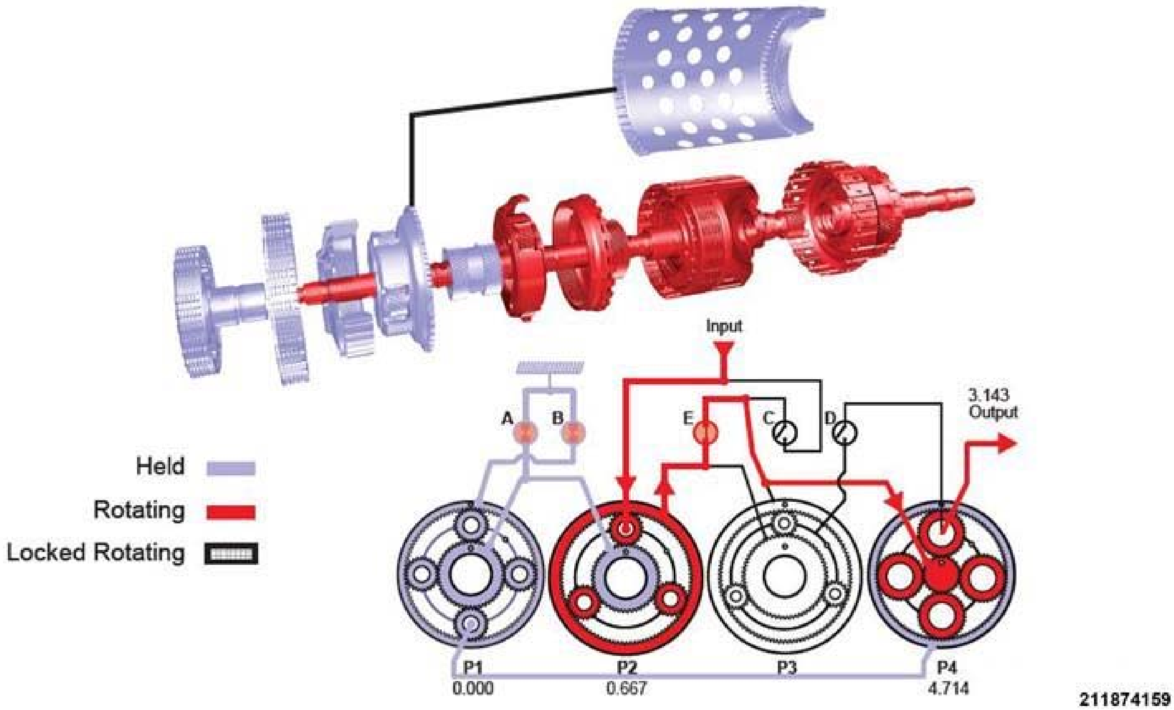

Fig. 4: Powerflow In Second Gear
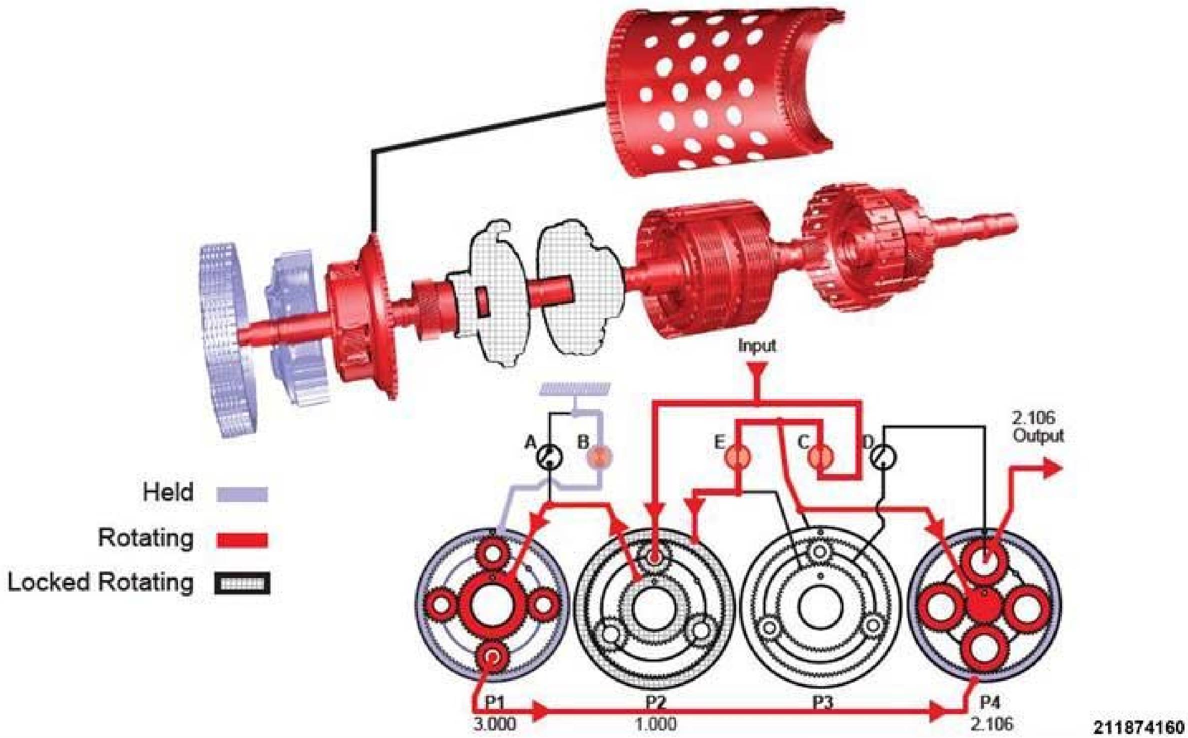
Courtesy of CHRYSLER GROUP, LLC

SECOND GEAR POWERFLOW

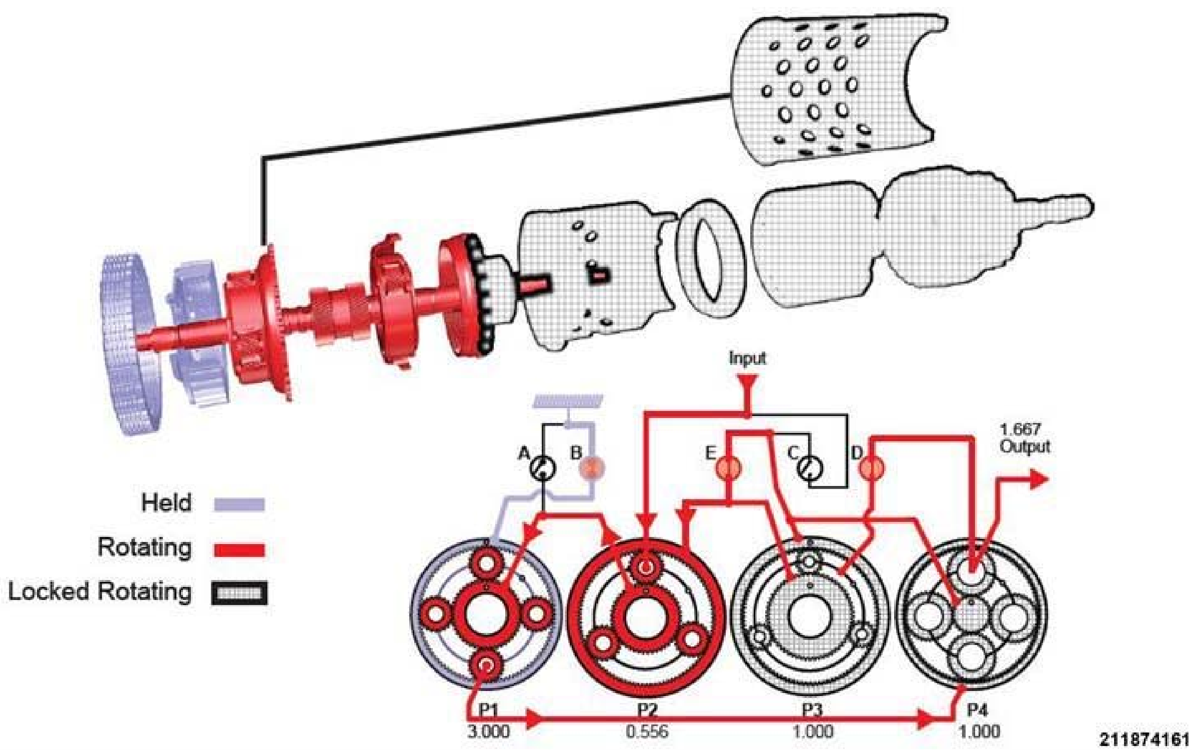
Clutch A (1) holds the P1/P2 sun gear (17) and clutch B (2) holds the P1 annulus (3). As with 1st gear, the entire P1 gear set is stationary. The stationary P1 carrier (18) is connected to the P4 annulus (9), locking the annulus. The input shaft (19) drives the P2 carrier (16). The P2 carrier (16) drives the P2 annulus (4). The P2 annulus (4) drives the E clutch (14) through the P3 sun gear (5) connection. The E clutch (14) then drives the P4 sun gear (10). The P4 sun gear (10) drives the P4 carrier (11), whose pinions walk around the held P4 annulus (9).



[**Fig. 5: Powerflow In Third Gear**]
Courtesy of CHRYSLER GROUP, LLC

THIRD GEAR POWERFLOW

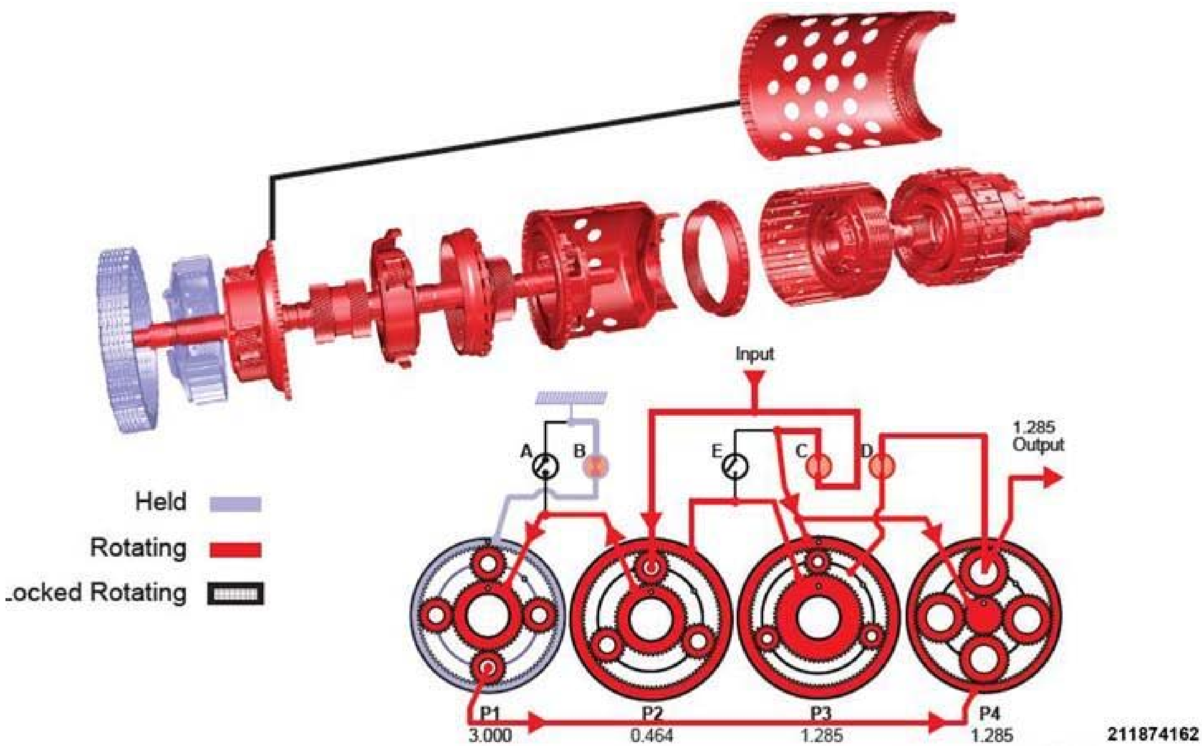
Clutch B (2) holds the P1 (3) annulus. The input shaft (19) drives the C clutch (12), which drives the P4 annulus (9). The C clutch (12) also drives the E clutch (14), which drives the P2 annulus (4). Because the P2 carrier (16) and the P2 annulus (4) are both driven at input shaft speed, the P2 gear set is locked at input shaft speed. The P1/P2 sun gear (17) drives the P1 carrier (18), and the P1 carrier drives the P4 annulus (9).



[Fig. 6: Powerflow In Fourth Gear](#)
Courtesy of CHRYSLER GROUP, LLC

FOURTH GEAR POWERFLOW

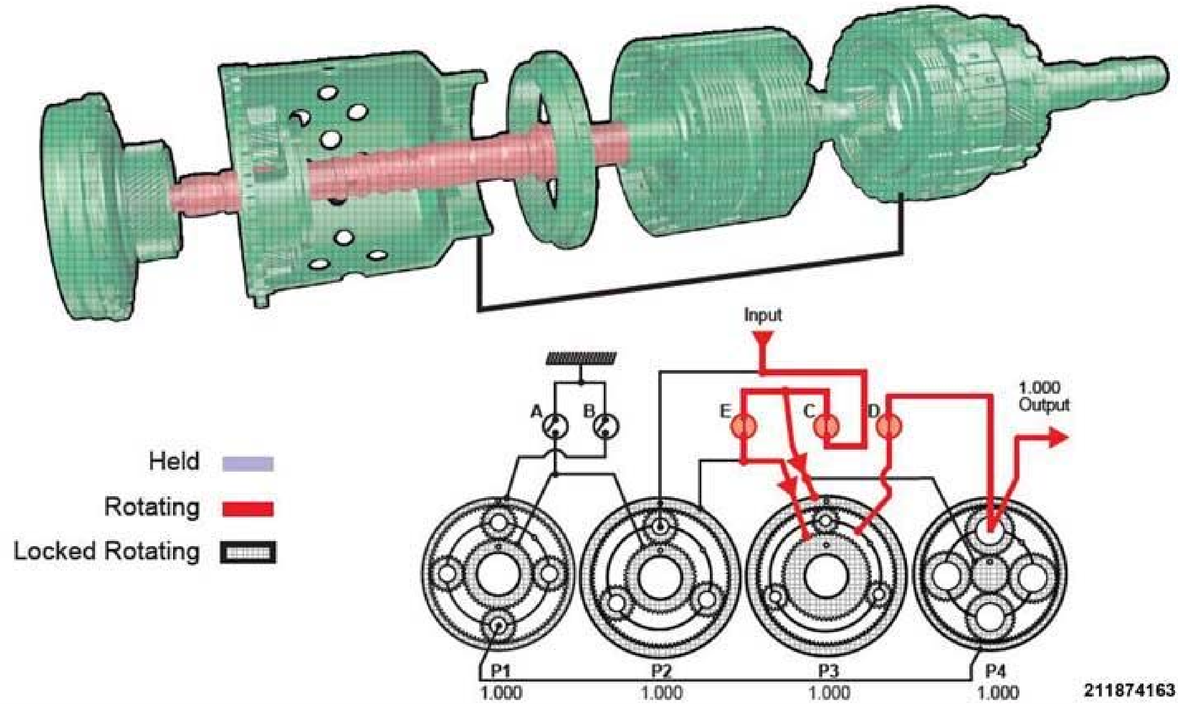
Clutch B (2) holds the P1 annulus (3). With the E (14) and D (12) clutches applied, all components of the P3 and P4 gear sets are locked together to rotate at the same speed. The input shaft (19) drives the P2 carrier (16) which drives the P1/P2 sun gear (17). The P1/P2 sun gear drives the P1 carrier (18). The P1 carrier drives the P4 gear set through the P4 annulus (9).



[Fig. 7: Powerflow In Fifth Gear](#)
Courtesy of CHRYSLER GROUP, LLC

FIFTH GEAR POWERFLOW

Clutch B (2) holds the P1 annulus (3). The input shaft (19) always drives the P2 carrier (16). Because the C clutch (13) is applied, the P3 annulus (15) and P4 sun gear (10) are also driven at input shaft speed. The D clutch (12) is applied to connect the P3 carrier (6) with the P4 carrier (11). The P2 carrier (16) drives the P1/P2 sun gear (17), which drives the P1 carrier (18). The P1 carrier walks around the held P1 annulus (3) and drives the P4 annulus (9). Gear reduction is achieved between the P4 sun gear (10) rotating at input shaft speed and the P4 annulus (9) rotating at a reduced speed.



[Fig. 8: Powerflow In Sixth Gear](#)
Courtesy of CHRYSLER GROUP, LLC

SIXTH GEAR POWERFLOW

Clutch C (13) drives the P3 annulus (15) at input shaft speed and E clutch (14) drives the P3 sun gear (5) at input shaft speed. Because two components of the same gear set are driven at the same speed, the entire gear set is locked in rotation. The D clutch (12) connects the P3 carrier (6) to the P4 carrier (11) and the output shaft.

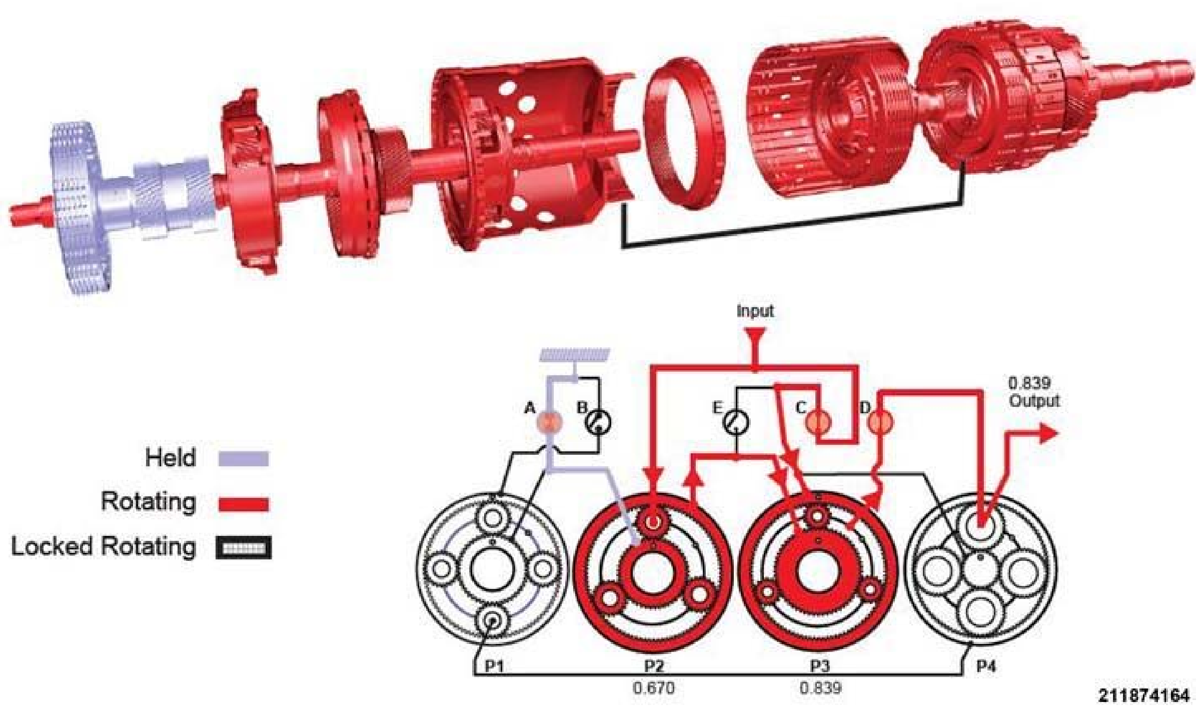


Fig. 9: Powerflow In Seventh Gear
Courtesy of CHRYSLER GROUP, LLC

SEVENTH GEAR POWERFLOW

Clutch A (1) holds the P1/P2 sun gear (17) stationary. The input shaft drives the P2 carrier which drives the P2 annulus, increasing the speed of the P3 sun gear (5) and creating overdrive. The C clutch (13) drives the P3 annulus (15) at input shaft speed. The P3 sun gear (5) spins at a faster speed than the P3 annulus (15) and the P3 carrier (6) is the output of the gear set. This results in a reduction that offsets the overdrive of the P2 gear set. The D clutch (12) connects the P3 carrier (6) to the P4 carrier (11) and the output shaft.

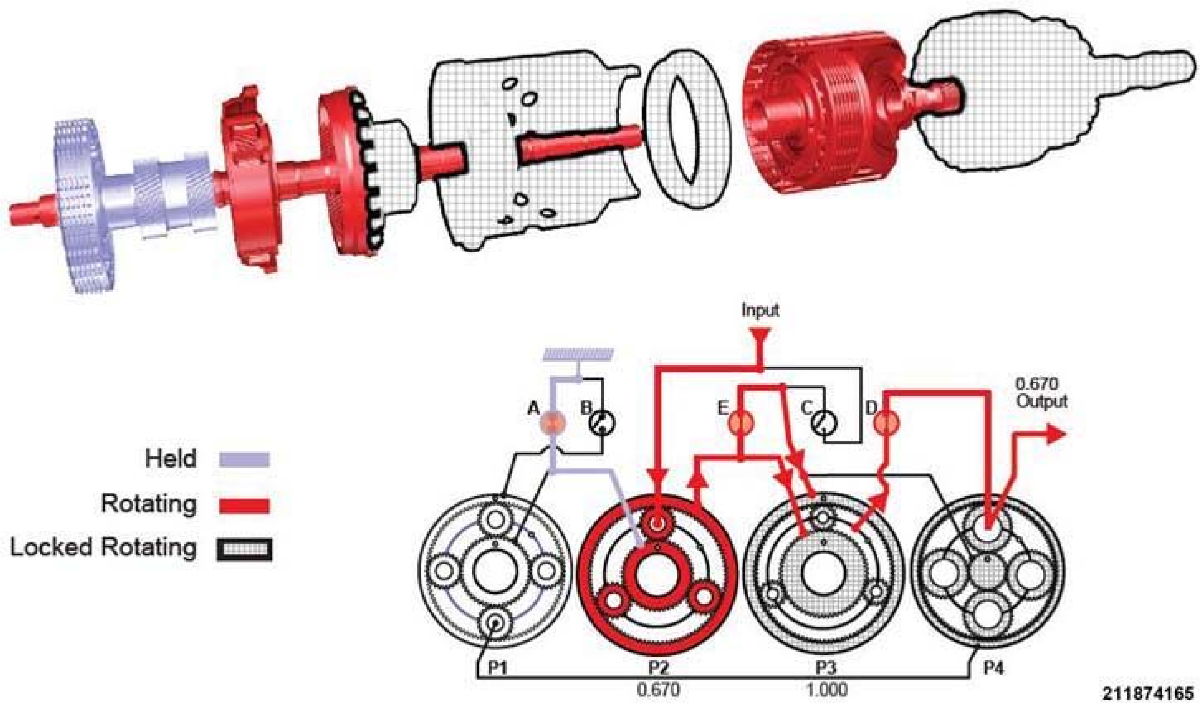

Fig. 10: Powerflow In Eighth Gear
Courtesy of CHRYSLER GROUP, LLC

EIGHTH GEAR POWERFLOW

Clutch A (1) holds the P1/P2 sun gear (17) stationary. As with 7th gear, the P2 gear set creates an overdrive ratio. However, the E clutch (14) is now applied, which locks together the P3 gear set and eliminates any torque multiplication from the P3 gear set. The overdrive created by P2 is transferred by the D clutch (7) to the output shaft.

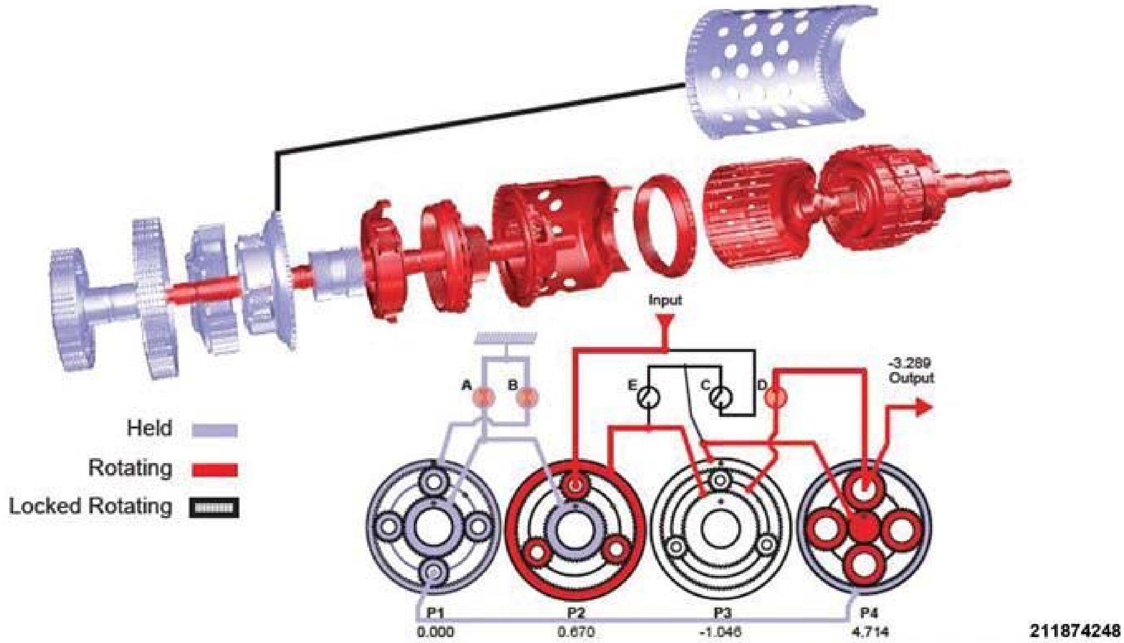

Fig. 11: Powerflow In Reverse Gear
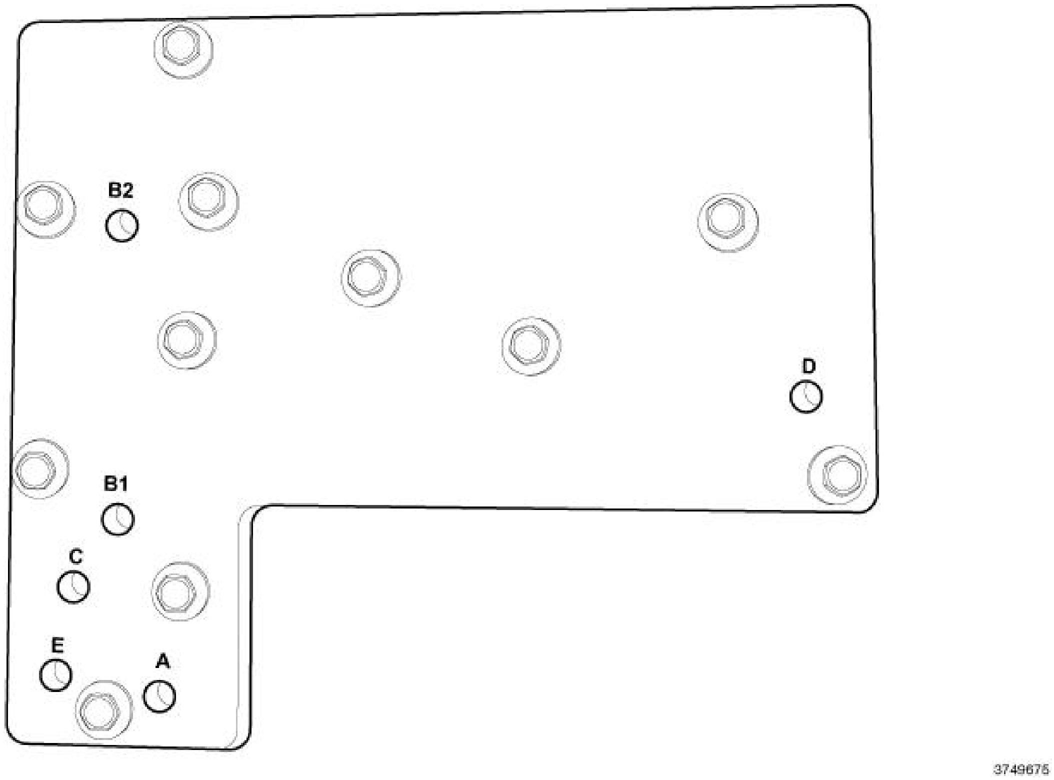
Courtesy of CHRYSLER GROUP, LLC

REVERSE GEAR POWERFLOW

Clutches A (1) and B (2) hold the P1 gear set to hold the P1/P2 sun gear (17). The input shaft drives the P2 carrier, which produces an overdrive ratio from the P2 gear set, driving the P3 sun gear (5) in engine direction. The P3 carrier (6) is connected to the output shaft by the D clutch (12). This holds the carrier, reversing the direction and multiplying torque. The P3 annulus (15) is connected to the P4 sun gear (10), which drives the P4 gear set opposite of engine direction and multiplies torque again.

DIAGNOSIS AND TESTING

CLUTCH AIR PRESSURE TESTS



[Fig. 12: Clutch Pressure Test Passages]
Courtesy of CHRYSLER GROUP, LLC

Inoperative clutches can be located using a series of tests by substituting air pressure for fluid pressure using (special tool #10383, Plate, Clutch Pressure Test).

The clutches may be tested by applying air pressure to their respective passages. The valve body must be removed. To make air pressure tests, proceed as follows:

NOTE: **The compressed air supply must be free of all dirt and moisture. Use a pressure of 5-8 bar (73-116 psi).**

Remove the valve body. For 8HP45/845RE, refer to **VALVE BODY, REMOVAL**. Install (special tool #10383, Plate, Clutch Pressure Test) and tighten bolts to 6 N.m (50 in. lbs.). When testing is finished, install valve body. For 8HP45/845RE, refer to **VALVE BODY, INSTALLATION**. Then refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

NOTE: **If any clutch does not appear to be functioning with the air, add some 8HP transmission fluid and try the test again. Some circuits will not operate without fluid.**

A CLUTCH

Apply air pressure to the feed hole located on the test plate marked **A** , listen for an audible thud. The piston should return to its starting position when the air pressure is removed.

B CLUTCH FUNCTION

Apply air pressure to the feed hole located on the test plate marked **B1** , listen for an audible thud. The piston should not return to its starting position when the air pressure is removed. If air pressure is applied to the B2 circuit, the B1 should return. An audible hiss may be heard when testing this clutch as the seal is designed to allow fluid/air to pass.

C CLUTCH

Apply air pressure to the feed hole located on the test plate marked **C** , listen for an audible thud. The piston should return to its starting position when the air pressure is removed.

D CLUTCH

Apply air pressure to the feed hole located on the test plate marked **D** , listen for an audible thud. The piston should return to its starting position when the air pressure is removed.

E CLUTCH

Apply air pressure to the feed hole located on the test plate marked **E** , listen for an audible thud. The piston should return to its starting position when the air pressure is removed.

DIAGNOSIS AND TESTING - AUTOMATIC TRANSMISSION - GENERAL CONDITIONS

CAUTION: Before attempting any repair on an automatic transmission, check for Diagnostic Trouble Codes with the appropriate scan tool.

CAUTION: A unique transmission fluid has been developed for this transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid, see FLUIDS, LUBRICANTS AND GENUINE PARTS located in owners manual.

Transmission malfunctions may be caused by these general conditions:

- Poor engine performance.
- Improper adjustments.
- Hydraulic malfunctions.
- Mechanical malfunctions.
- Electronic malfunctions.

Diagnosis of these problems should always begin by checking the easily accessible variables: fluid level, fluid condition, and transmission fault codes using the appropriate scan tool. Then perform a road test to determine if the problem has been corrected or if more diagnosis is necessary.

DIAGNOSIS AND TESTING - PRELIMINARY

CAUTION: A unique transmission fluid has been developed for this transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid, see FLUIDS, LUBRICANTS AND GENUINE PARTS located in owners manual.

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for disabled vehicles (will not back up or move forward).

VEHICLE IS DRIVEABLE

1. Check for transmission fault codes using the appropriate scan tool.
2. Road test and note how transmission upshifts, downshifts, and engages.
3. Check fluid level and condition.

VEHICLE IS DISABLED

1. Check for transmission fault codes using the appropriate scan tool.
2. Check for cracked, leaking cooler lines.
3. Check fluid level and condition.
4. With the transmission in the Park position, attempt to rotate drive shaft(s) to ensure transmission output shaft coupler/flange is secure.
5. Raise and support vehicle on safety stands, start engine with transmission in the Park position and allow to idle for several minutes, shift transmission into gear, and note following:
    a. If propeller shaft turns but wheels do not, problem is with differential or axle shafts.
    b. If propeller shaft does not turn and transmission is noisy, stop engine. Remove oil pan, and check for debris. If pan is clear, remove transmission and check for damaged driveplate, converter, oil pump, or input shaft.
6. Check the TCMA, Wiring, Valve body, and Solenoids (Utilize fault codes to diagnose if available).

DIAGNOSIS AND TESTING - ROAD TESTING

CAUTION: A unique transmission fluid has been developed for this transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid, see FLUIDS, LUBRICANTS AND GENUINE PARTS.

Before road testing, be sure the fluid level has been checked and adjusted if necessary. Verify that all diagnostic trouble codes have been resolved.

Observe engine performance during the road test. A poorly tuned engine will not allow accurate analysis of transmission operation.

Operate the transmission in all gear ranges. Check for shift variations and engine flare which indicates slippage. Note if shifts are harsh, spongy, delayed, early, or if part throttle downshifts are sensitive.

Slippage indicated by engine flare, usually means clutch, overrunning clutch, or line pressure problems.

A slipping clutch can often be determined by comparing which internal units are applied in the various gear ranges. The CLUTCH APPLICATION chart provides a basis for analyzing road test results.

STANDARD PROCEDURE

CLUTCH A MEASUREMENT

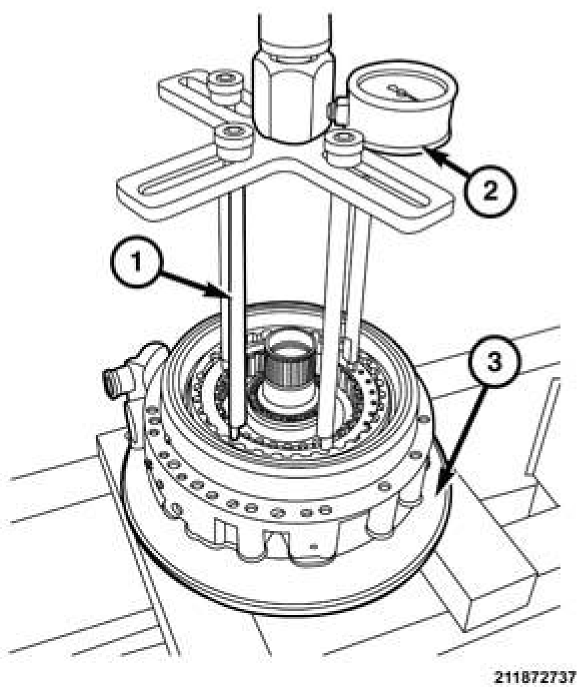

Fig. 13: Adapter & Pressing Tool
Courtesy of CHRYSLER GROUP, LLC

1. Using (special tool #10428, Adapter, Pressing Tool) (1) and (special tool #10429, Gauge, Force) (2) Place the clutch A/oil pump assembly in a suitable arbor press.
2. Apply 200 N (45 lbs.) of force to the clutch A backing plate to compress the wave plate.

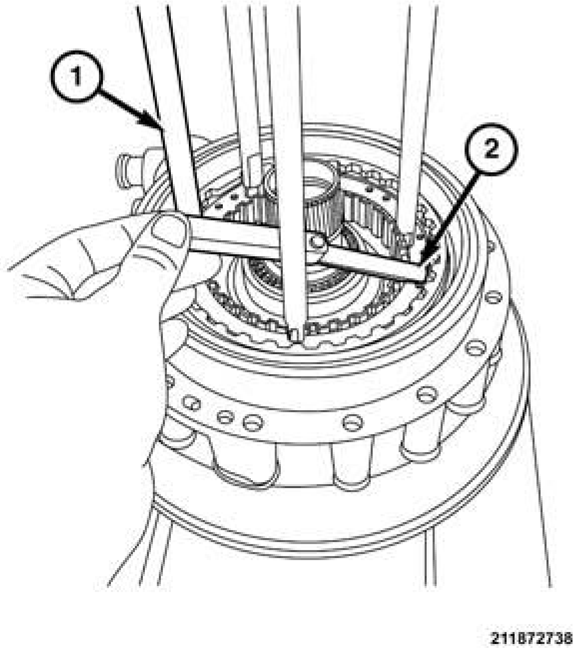

Fig. 14: Measuring Gap Between A-Clutch Backing Plate & Snap Ring
Courtesy of CHRYSLER GROUP, LLC

3. With a suitable feeler gauge (2) measure the gap between the clutch A backing plate and the snap ring.
4. Refer to the CLUTCH CLEARANCE TABLE for specs. If clearance is not within specification, a thinner or thicker selectable snap ring can be installed for proper clearance.

CLUTCH B MEASUREMENT

When the B-clutch is replaced, the proper selectable shim must be installed to achieve specified clearance.

Measurement: (special tool #8901A, Pressing Tool), (special tool #10429, Gauge, Force)

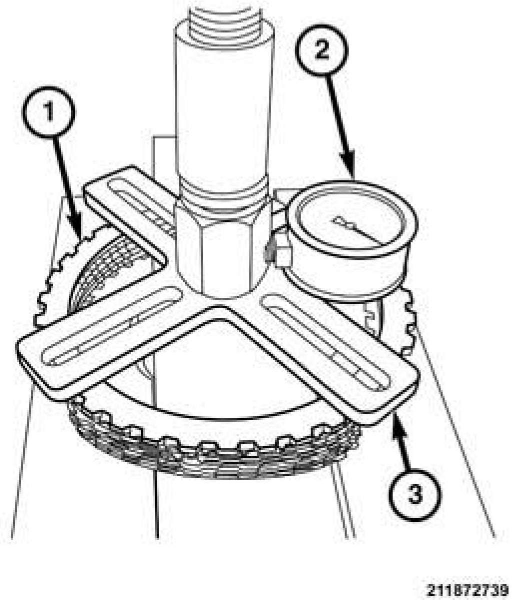

Fig. 15: Pressing Tool
Courtesy of CHRYSLER GROUP, LLC

1. Place the clutch B, with the wave plate on top, on a suitable arbor press.
2. Position tools (special tool #8901A, Pressing Tool) (3) (using just the cross bar) (3) and (special tool #10429, Gauge, Force) (2) on top of the B-clutch wave plate (1) and under the press ram.

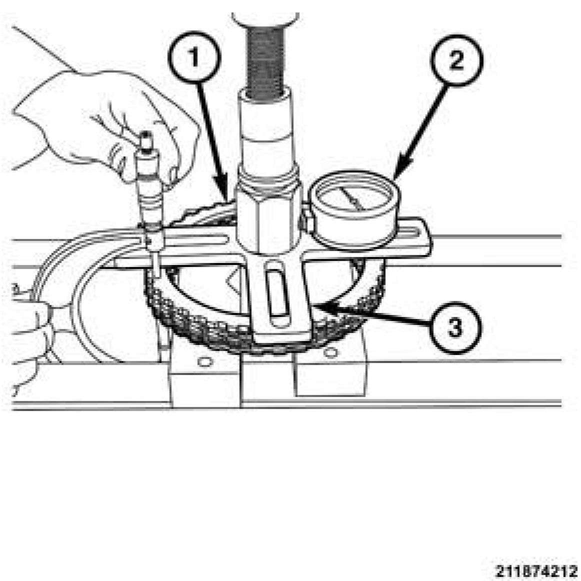

Fig. 16: Gauge, Pressing Tool & B-Clutch
Courtesy of CHRYSLER GROUP, LLC

3. Apply 500 N (112 lbs.) of downward force on clutch B to compress the wave plate.

4. Using a suitable micrometer, measure the thickness of the compressed clutch B (3). **Record the measurement as (A)** to calculate the clutch B clearance in order to determine the correct selectable shim thickness.

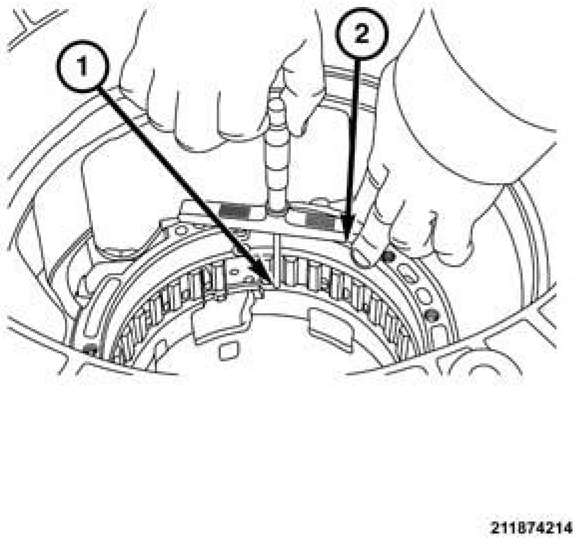

Fig. 17: Transmission Oil Pump & B-Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

5. With a suitable depth micrometer, place it at the mounting surface of the transmission oil pump (2) and measure to the base of the B-clutch retainer on the case (1). This measurement should be 61.05 mm. **Record the measurement as (B)** to calculate the clutch B clearance in order to determine the correct selectable shim thickness.

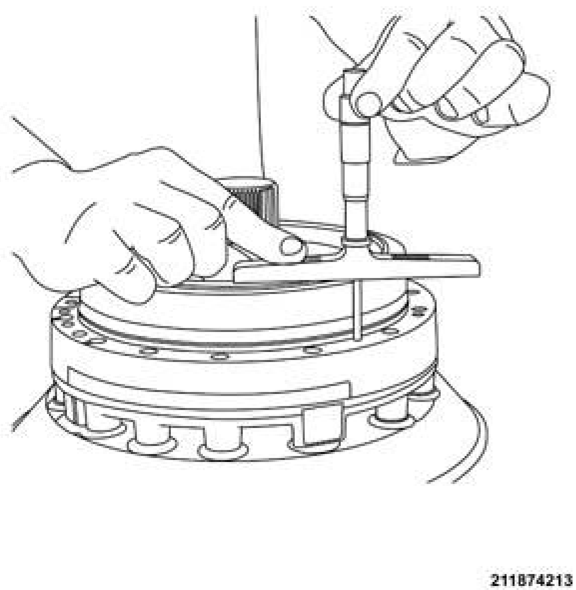

Fig. 18: Measuring B-Clutch Piston Using Depth Micrometer
Courtesy of CHRYSLER GROUP, LLC

6. Using a suitable depth micrometer, measure the clutch B piston.
7. Measure between the fluid pump sealing surface and the bottom of the straight edge. **Record the measurement as (C)** to calculate the clutch B clearance in order to determine the correct selectable shim thickness.

Calculation

Take the case depth (B) subtract (C) subtract (A) remainder is the clearance of the clutch B. If the clearance is not within specification a thinner or thicker reaction plate can be installed to achieve proper clearance.

CLUTCH C MEASUREMENT

1. Using (special tool #8901A, Pressing Tool) (2) and (special tool #10429, Gauge, Force) (1) place clutch C (3) in a suitable arbor press (with the backing plate facing up).
2. Apply 200 N (45 lbs.) of force to clutch C to compress the wave plate.
3. With a suitable feeler gauge, measure the gap between clutch C backing plate and clutch C retainer.
4. Refer to CLUTCH CLEARANCE TABLE for specs. If clearance is not within specification a thinner or thicker selectable backing plate can be installed to achieve proper clearance.

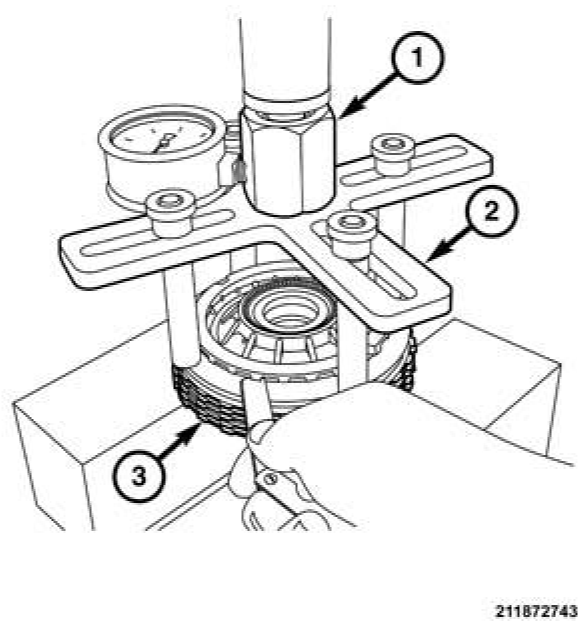

Fig. 19: Measuring Gap Between C-Clutch Backing Plate & C-Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

CLUTCH D MEASUREMENT

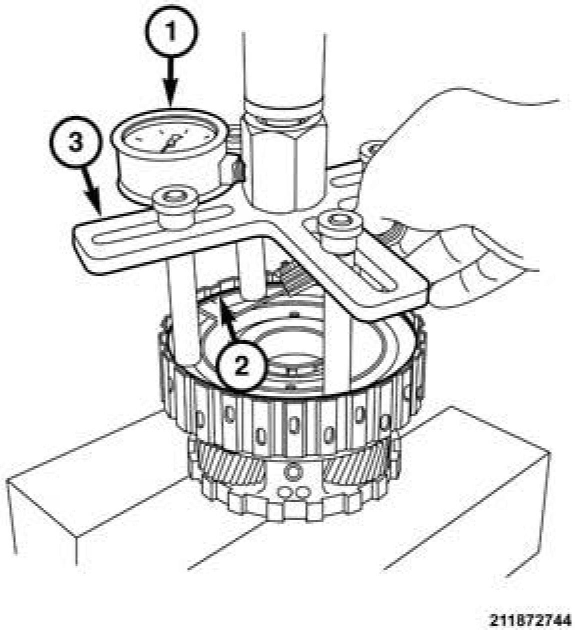

Fig. 20: Measuring Gap Between D-Clutch Backing Plate & D-Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

1. Using (special tool #8901A, Pressing Tool) (3) and (special tool #10429, Gauge, Force) (1) place clutch D in a suitable arbor press.
2. Apply 200 N (45 lbs.) of force to clutch D backing plate to compress the wave plate.
3. With a suitable feeler gauge (2), measure the gap between clutch D backing plate and clutch D retainer.
4. Refer to CLUTCH CLEARANCE TABLE for specs. If clearance is not within specification a thinner or thicker selectable snap ring can be Installed to achieve proper clearance.

CLUTCH E MEASUREMENT

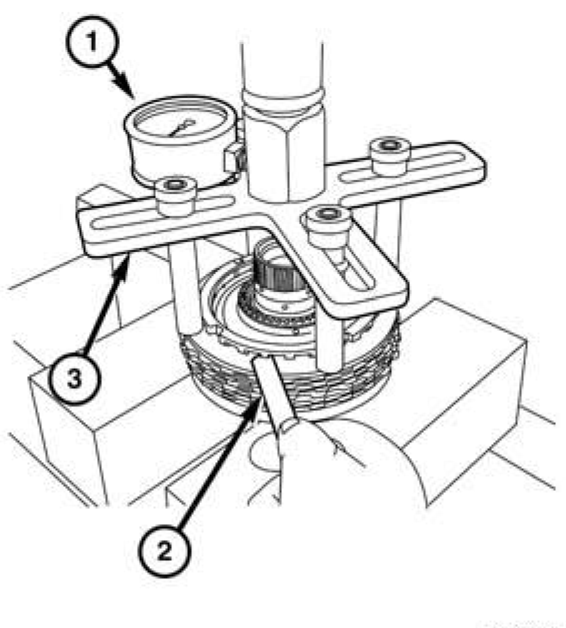

Fig. 21: Measuring Gap Between Backing Plate & Retainer Of E-Clutch
Courtesy of CHRYSLER GROUP, LLC

1. Place clutch E in a suitable arbor press.
2. Using (special tool #10429, Gauge, Force) (1) and (special tool #8901A, Pressing Tool) (3) apply 200 N (45 lbs.) to the backing plate of clutch E.
3. Using a set of feeler gauges (2), measure the gap between the backing plate and the retainer of clutch E.
4. Refer to the CLUTCH MEASUREMENTS TABLE for specifications. If clearance is not within specifications, a thinner or thicker selectable backing plate can be installed to achieve proper clearance.

7. Position aside the drive shaft (1) and support (2).
8. Remove the lower intermediate shaft. Refer to **SHAFT, INTERMEDIATE, LOWER, REMOVAL** .
9. Remove the starter. Refer to **STARTER, REMOVAL** .

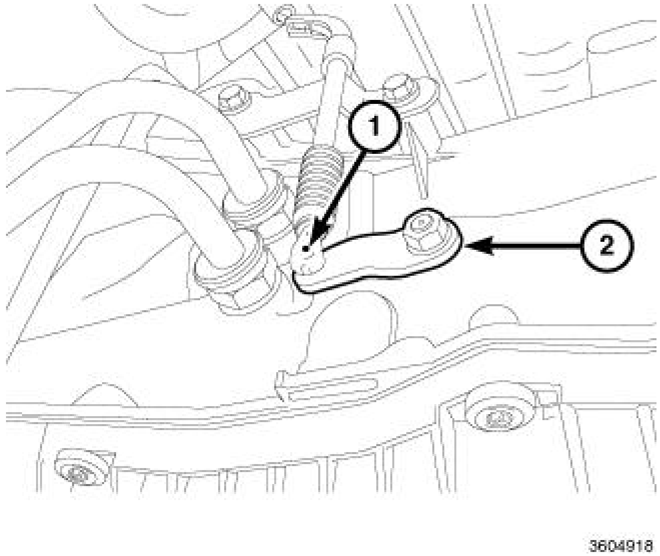

Fig. 27: Manual Park Release Cable & Lever
Courtesy of CHRYSLER GROUP, LLC

10. Disconnect the Manual Park Release (MPR) cable (1) from the MPR lever (2).

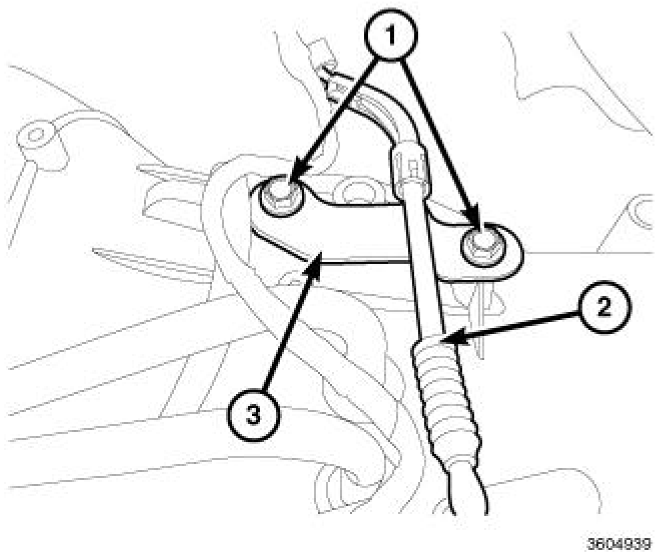

Fig. 28: Bolts, Manual Park Release Cable Bracket & Bracket/Cable
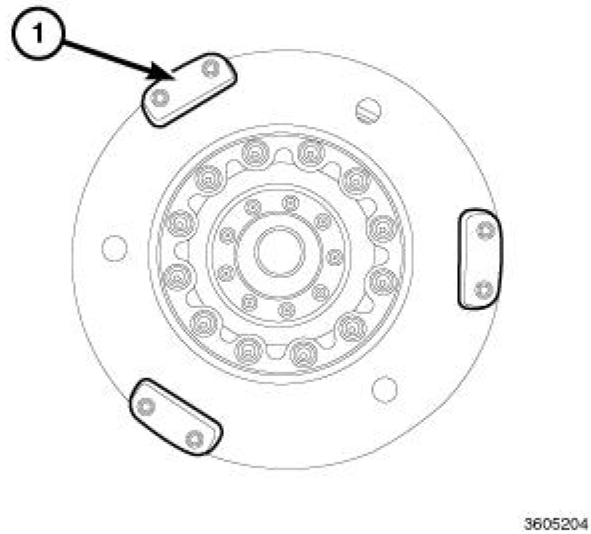
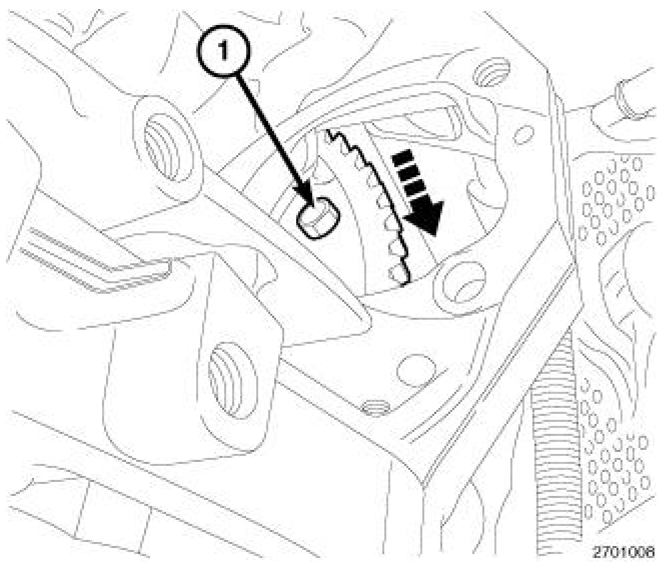
Courtesy of CHRYSLER GROUP, LLC

11. Remove the bolts (1) from the MPR cable bracket (3) and position the MPR bracket/cable (2, 3) aside.



[Fig. 29: Converter Attachment Bolts (3 Sets Of 2)](#)
Courtesy of CHRYSLER GROUP, LLC

12. The torque converter is attached with three sets of two bolts (1) 120Â° apart as shown in illustration.



[Fig. 30: Torque Converter Bolt](#)
Courtesy of CHRYSLER GROUP, LLC

13. Rotate the crankshaft in a clockwise direction for access, and through the starter opening, remove the six torque converter bolts (1).

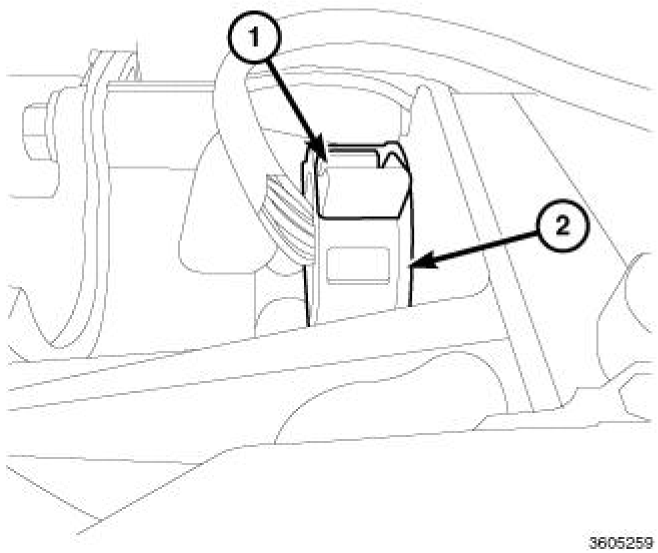


Fig. 31: Locking Mechanism Lock & Adapter Plug Connector
Courtesy of CHRYSLER GROUP, LLC

14. Turn the locking mechanism lock (1) of the transmission wire harness connector (2) counterclockwise to release the lock.

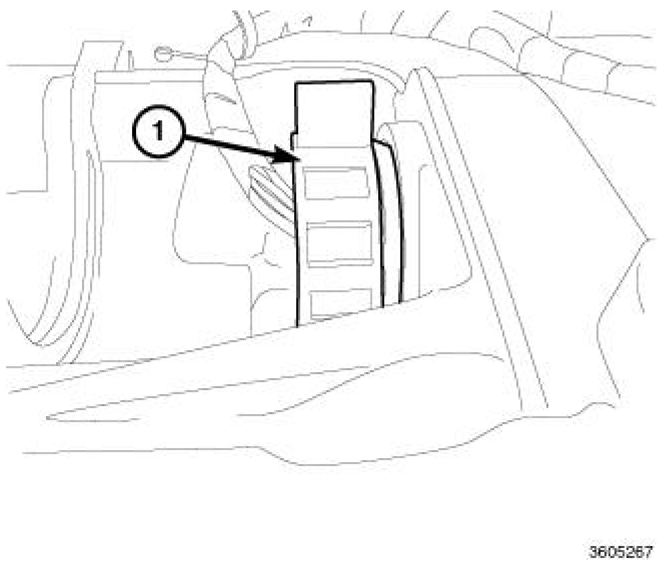

Fig. 32: Adapter Plug Connector
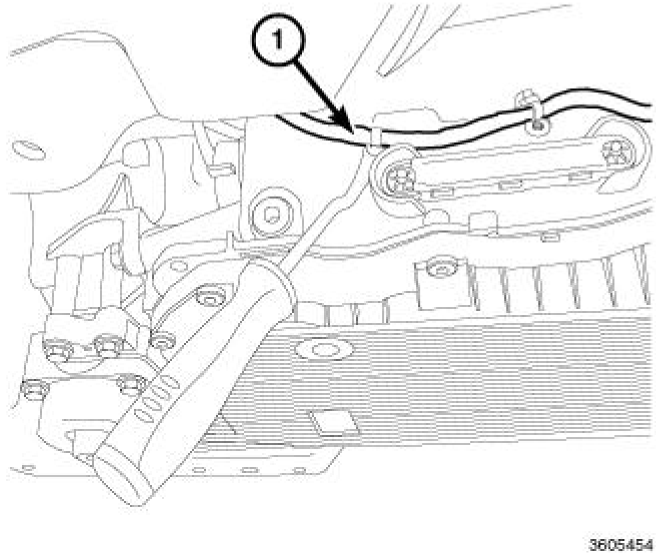
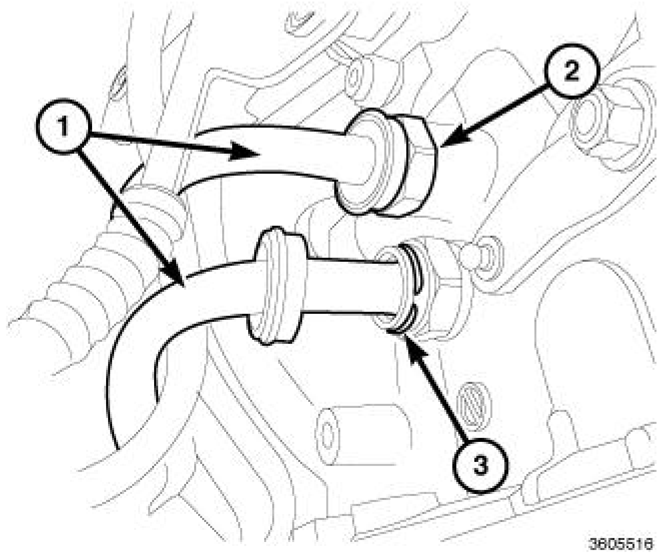
Courtesy of CHRYSLER GROUP, LLC

15. Remove the transmission wire harness connector (1).



[Fig. 33: Wiring Harness](#)
Courtesy of CHRYSLER GROUP, LLC

16. Disconnect the wiring harness (1) from the transmission.



[Fig. 34: Transmission Fluid Cooler Lines, Clips & Fittings](#)
Courtesy of CHRYSLER GROUP, LLC

17. Disconnect the transmission fluid cooler lines (1) at the fittings (2) by removing the clips (3). Refer to **TRANSMISSION, STANDARD PROCEDURE** .

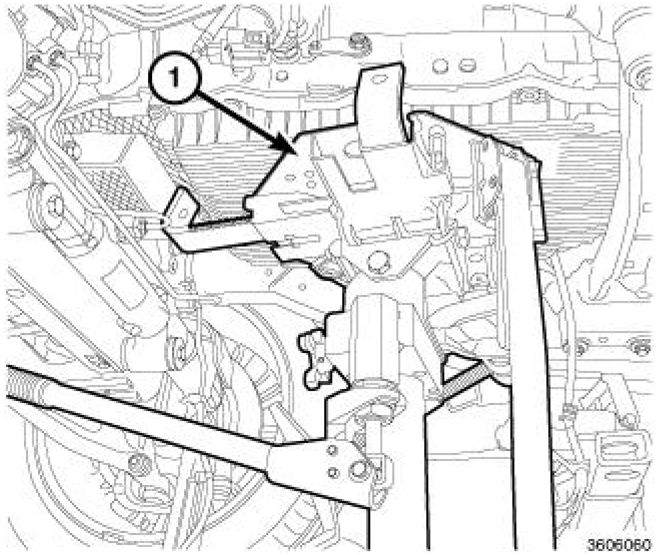


Fig. 35: Service Jack
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When supporting or lifting the transmission at the oil pan the weight of the transmission must be distributed evenly on the lifting fixture. Failure to do so could damage the oil pan and transmission.

18. Raise the transmission slightly with a transmission jack (1) to relieve load on the crossmember.

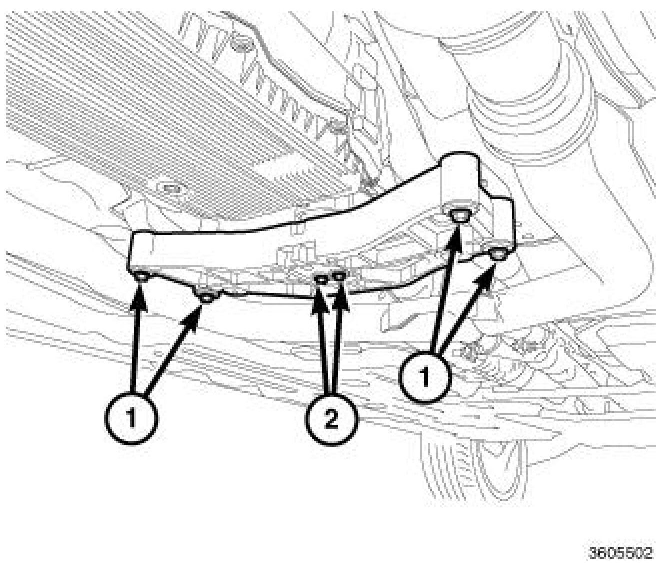

Fig. 36: Crossmember & Bolts
Courtesy of CHRYSLER GROUP, LLC

19. Remove the crossmember bolts (1), the transmission mount bolts (2) and remove the crossmember.

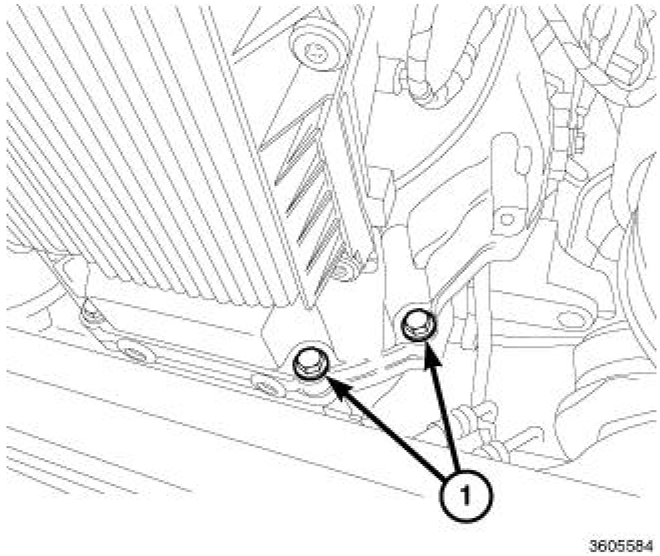

Fig. 37: Bell Housing Bolts (RH)
Courtesy of CHRYSLER GROUP, LLC

20. Remove the Right Hand (RH) transmission to engine bolts (1).

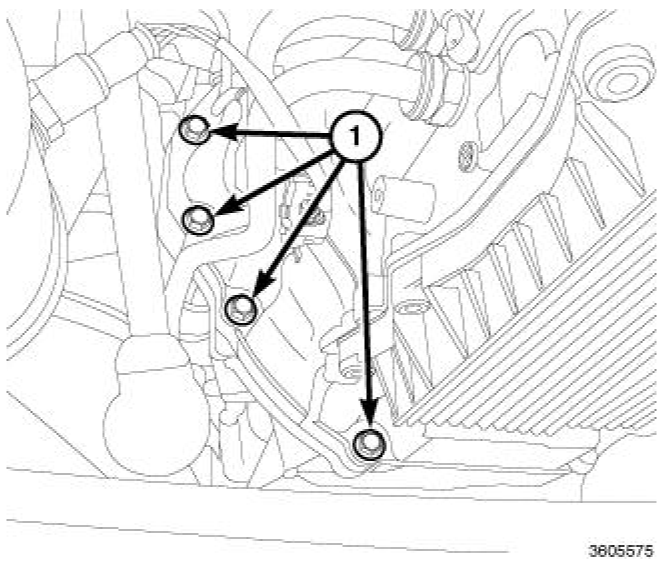

Fig. 38: Bell Housing Bolts (LH)
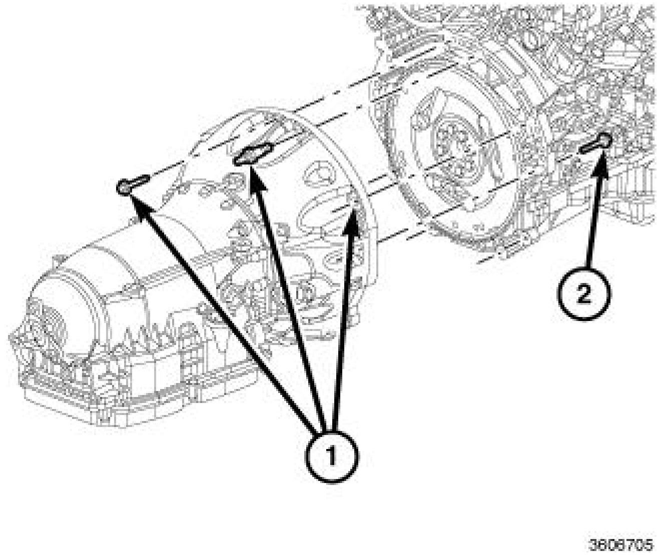
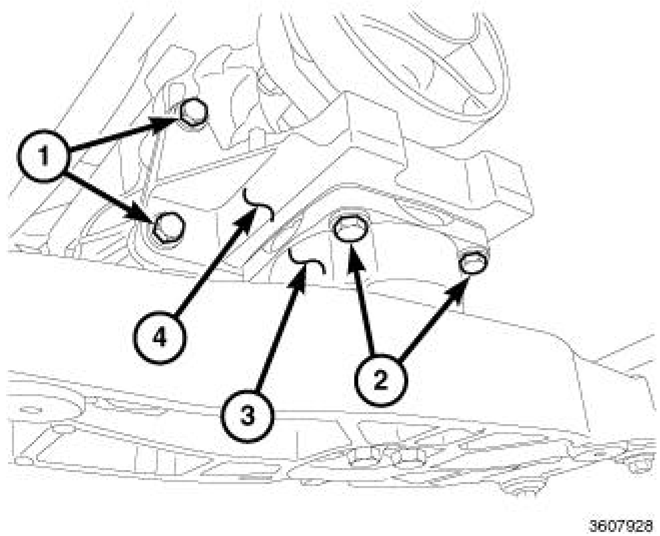
Courtesy of CHRYSLER GROUP, LLC

21. Remove the Left Hand (LH) transmission to engine bolts (1).



[Fig. 39: Upper Transmission To Engine Bolts]
Courtesy of CHRYSLER GROUP, LLC

22. Remove the remaining transmission to engine bolts (1, 2).
23. Hold the torque converter in place during transmission removal.
24. Lower the transmission and remove the transmission from the vehicle.



[Fig. 40: Transmission Mount Bolts & Transmission Mount]
Courtesy of CHRYSLER GROUP, LLC

25. Remove the four transmission mount bolts (2) and the transmission mount (3).
26. Remove the four adapter bracket bolts (1) and the adapter bracket (4).

DISASSEMBLY

DISASSEMBLY

CAUTION: The Transmission Control Module (TCM), or Transmission Control Module

Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Failure to follow these instructions may result in damage to the TCM/TCMA.

NOTE: **If the transmission is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the TCM Adaptation Procedure. Refer to MODULE, TRANSMISSION CONTROL, MODULE PROGRAMMING .**

NOTE: **Tag all clutch pack assemblies, as they are removed, for reassembly identification.**

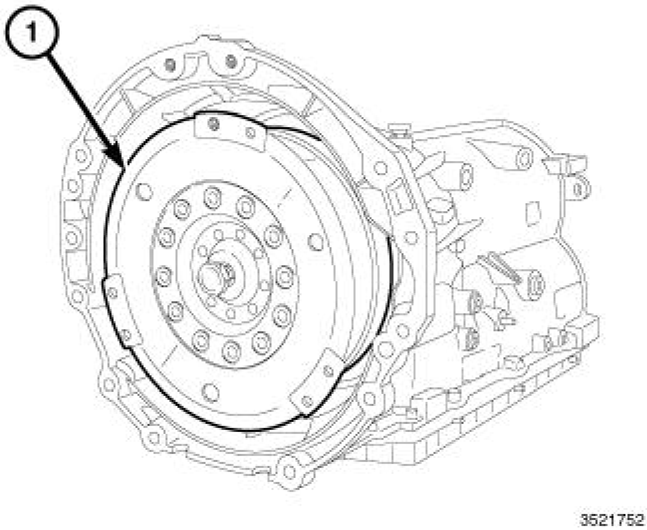


Fig. 41: Torque Converter
Courtesy of CHRYSLER GROUP, LLC

1. Remove the torque converter (1).

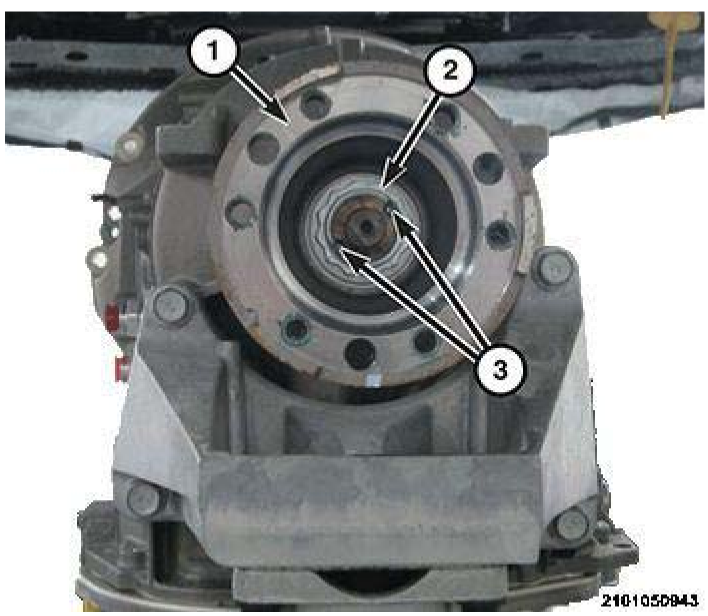

Fig. 42: Drive Shaft Flange, Nut & Staking Area

Courtesy of CHRYSLER GROUP, LLC

2. Using a suitable punch, remove the staking (3) from the drive shaft flange nut (2).

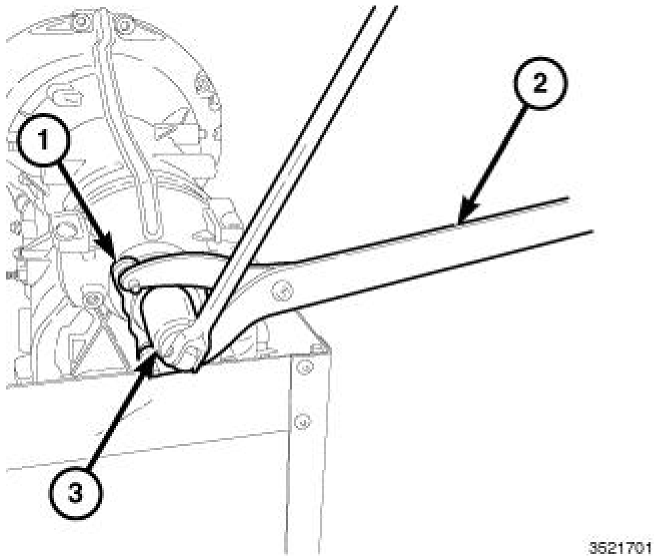

Fig. 43: Flange, Flange Holder & Socket
Courtesy of CHRYSLER GROUP, LLC

3. Loosen the nut about 1 thread using a 34 mm 12 point socket (3) and (special tool #C-3281, Holder, Flange) (2) to hold the flange (1).

NOTE:	**End play specification is between 0.11 - 0.42 mm (0.0043 - 0.0165 in.). If end play is outside this range, a different selectable end play shim must be used during assembly.**

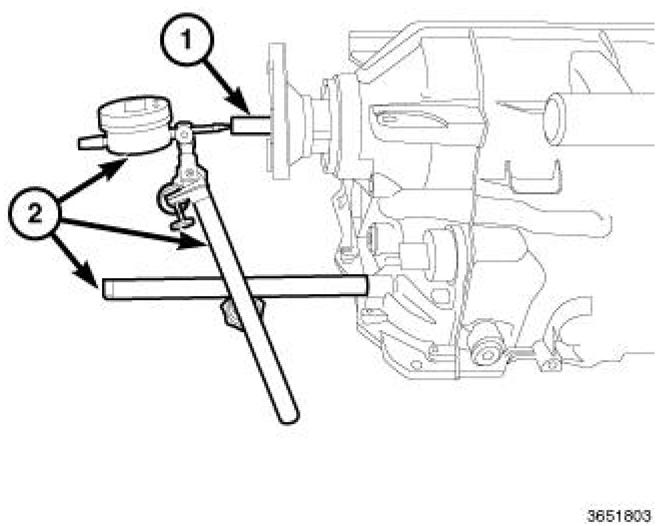

Fig. 44: Measuring End Play
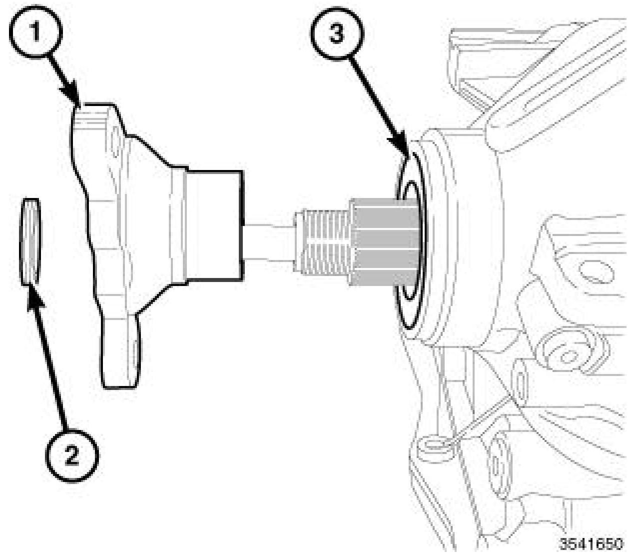
Courtesy of CHRYSLER GROUP, LLC

4. Measure the output shaft (1) end play as follows:
    a. Attach a dial indicator (2) and position the plunger against the end of the output shaft (1).

b. Zero the dial indicator (2).

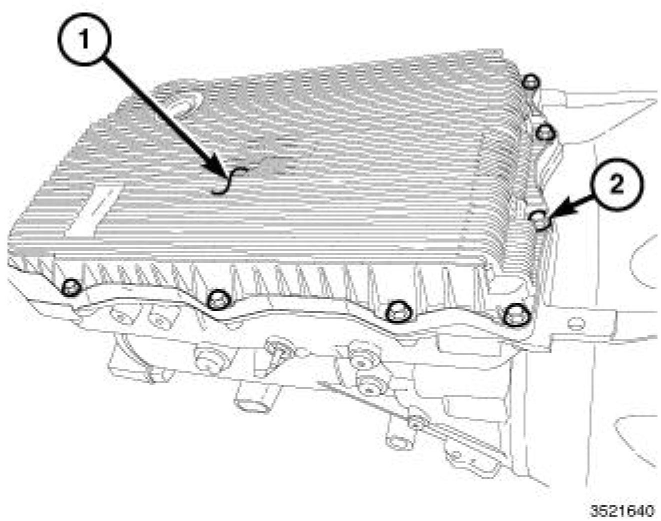
c. Move the output shaft (1) in and out, and record the maximum travel for assembly reference.



[Fig. 45: Propeller Shaft Flange, Rear Dust Seal & Rear Oil Seal]

Courtesy of CHRYSLER GROUP, LLC

5. Finish removing the drive shaft flange nut.
6. Remove the drive shaft flange (1).
7. Remove the transmission rear dust seal (2).
8. Remove the transmission rear oil seal (3) with a suitable slide hammer and screw.
9. Remove the transmission output shaft washer.



[Fig. 46: Thirteen Oil Pan Retaining Bolts]

Courtesy of CHRYSLER GROUP, LLC

10. Remove the thirteen oil pan retaining bolts (2).

NOTE: **Inspect the gasket for reuse. If the seal is cut or torn, replace the gasket.**

11. Carefully detach the oil pan (1) and gasket.

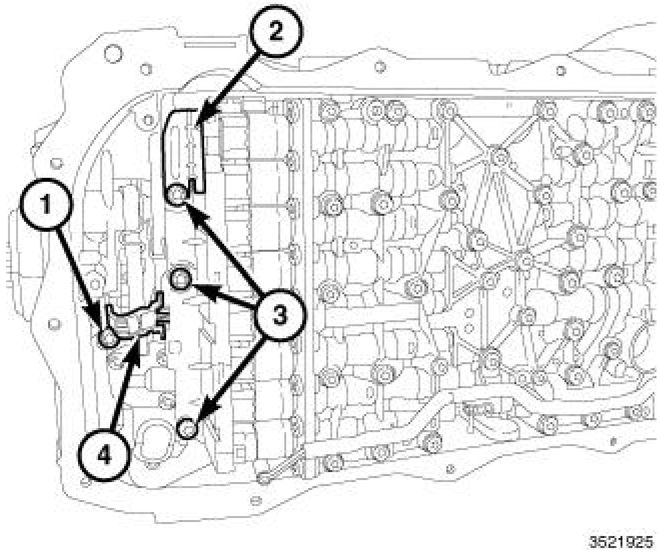


Fig. 47: Valve Body Assembly End Retainer Bolts
Courtesy of CHRYSLER GROUP, LLC

12. Remove the valve body assembly end retainer bolts (3).
13. Lift the electrical connector lock (2) to release the internal harness end from inside the transmission for valve body assembly removal.
14. Remove the sensor retaining bolt (1) and pull the sensor (4) loose from the case.

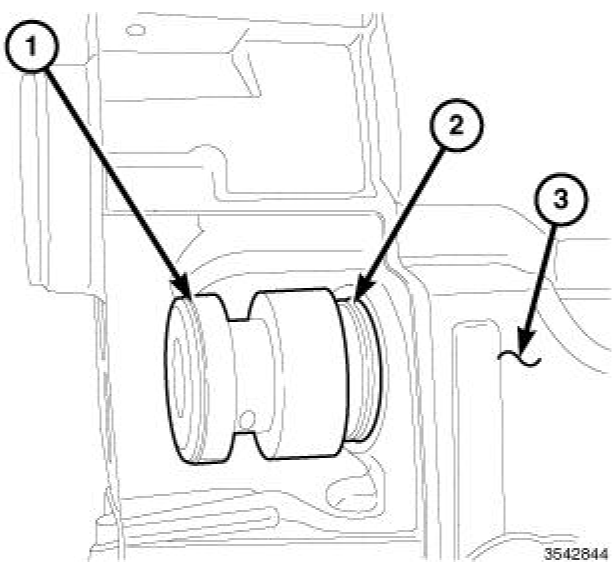

Fig. 48: Remover/Installer, Guide Sleeve, Electrical Harness Insulator & Transmission Case
Courtesy of CHRYSLER GROUP, LLC

15. Using (special tool #10377, Remover/Installer, Guide Sleeve) (1) carefully pull the electrical harness insulator (2) straight out from the transmission case (3).

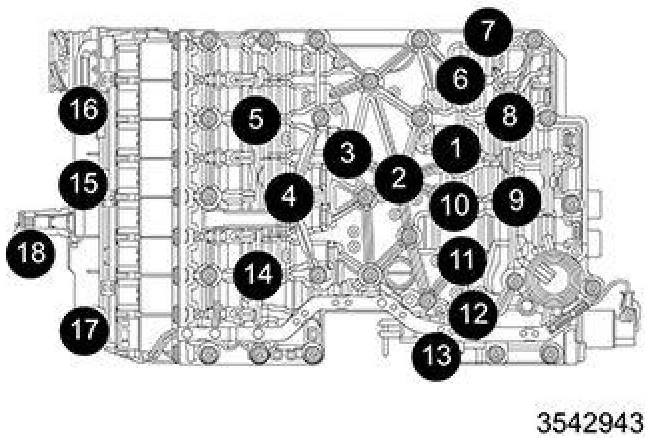

Fig. 49: Valve Body Bolts Loosening And Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

16. Remove the valve body assembly retaining bolts 1-14 (15-18 are already removed).
17. Carefully lift the valve body assembly from the transmission.

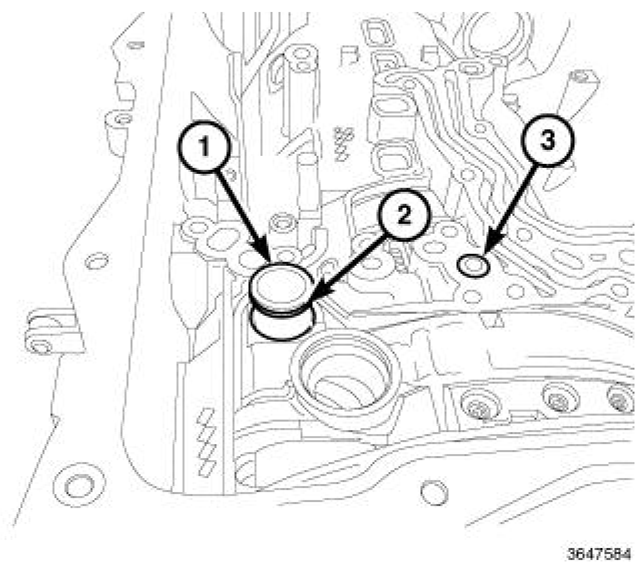

Fig. 50: Fluid Port, Two O-Rings, Compression Seal
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The fluid port (1) may be in the transmission or the valve body assembly.**

18. Pull the fluid port (1) from the transmission or valve body assembly.
19. Remove the two O-rings (2).
20. Remove the compression seal (3) from the transmission.

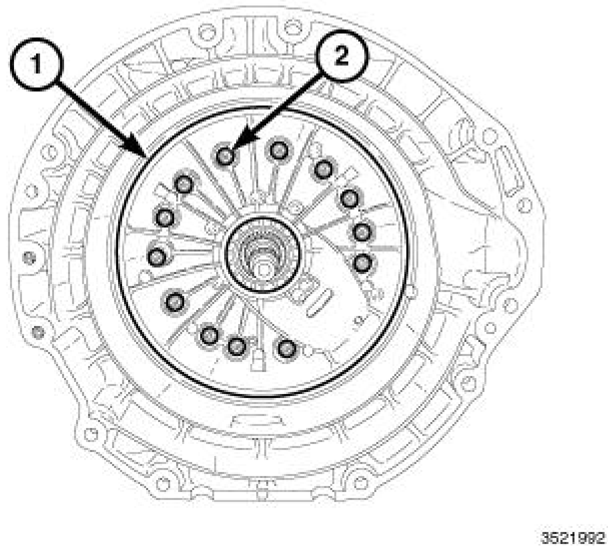

Fig. 51: Thirteen Oil Pump Housing Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

21. Remove the thirteen oil pump housing retaining bolts (2).

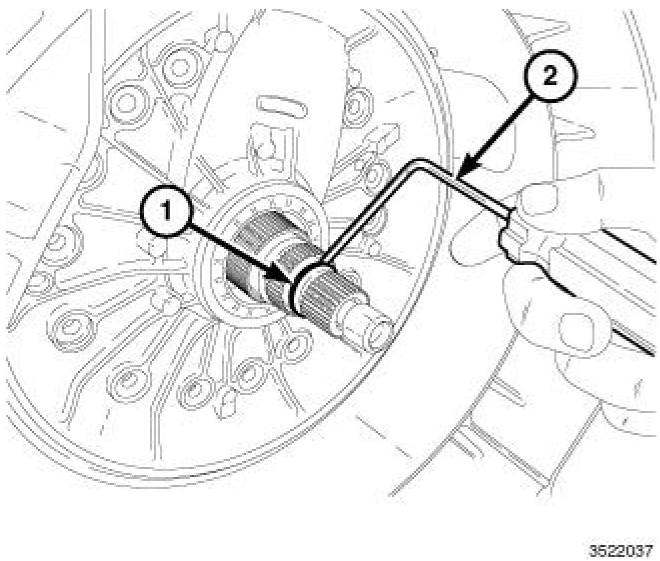

Fig. 52: Input Shaft O-Ring & Small Pick
Courtesy of CHRYSLER GROUP, LLC

22. Remove the input shaft O-ring (1) using a small pick (2) or equivalent.

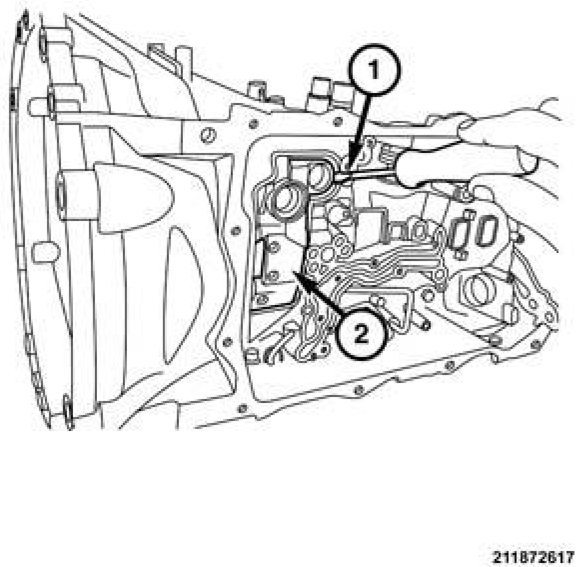

Fig. 53: Prying Oil Pump Housing Away From Case
Courtesy of CHRYSLER GROUP, LLC

23. Carefully pry the oil pump housing (1) away from the case (2) with a small flat blade screwdriver or equivalent through the case opening.
24. From the front of the transmission, remove the oil pump housing.

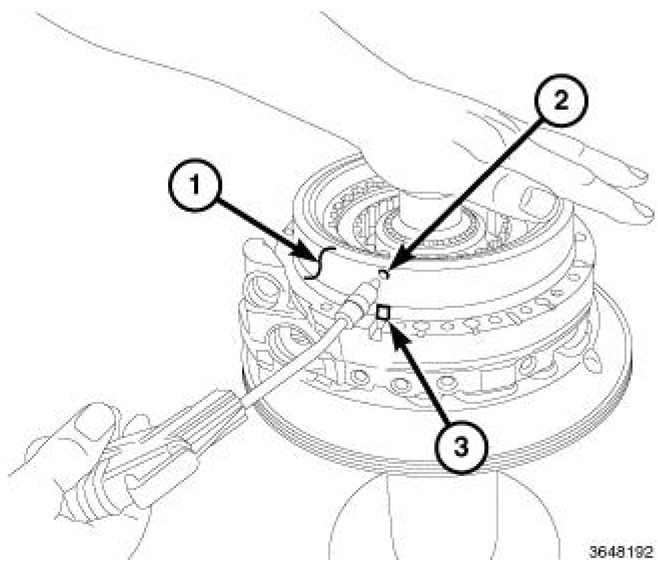

Fig. 54: B-Piston, Hole & B-Piston Alignment Tab
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Apply air pressure slowly because oil may spray when the B-piston releases from the assembly.**

25. With one hand above the B-piston (1), carefully apply air pressure into the hole (2) directly above the B-piston alignment tab (3) to remove the B-piston (1) from the assembly.

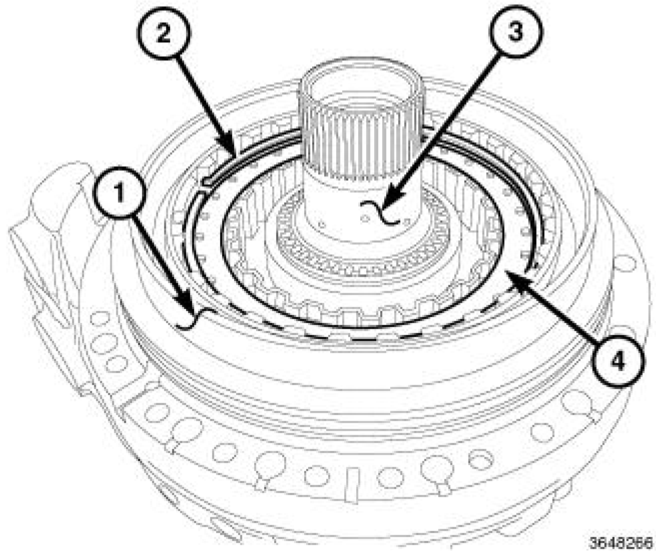

Fig. 55: Outer Ring, Snap Ring, Hub & Spacers
Courtesy of CHRYSLER GROUP, LLC

26. Remove the outer ring (1) (under B-piston).
27. Remove the snap ring (2).
28. Remove the clutches and spacers (4).
29. Remove the hub (3).

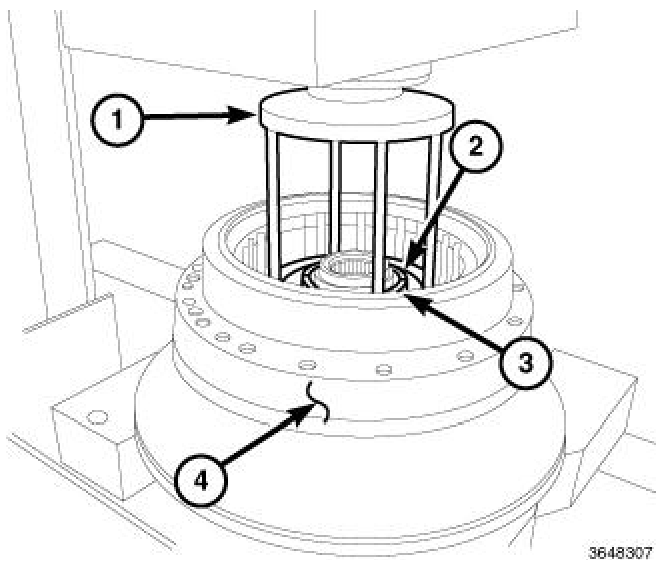

Fig. 56: Oil Pump Housing Assembly
Courtesy of CHRYSLER GROUP, LLC

30. Position the oil pump housing assembly (4) in a suitable arbor press.
31. Using (special tool #8285, Compressor, Spring) (1), press on the fingers of the piston retaining ring to remove tension, and remove the two halves of the split retainer ring (2, 3).

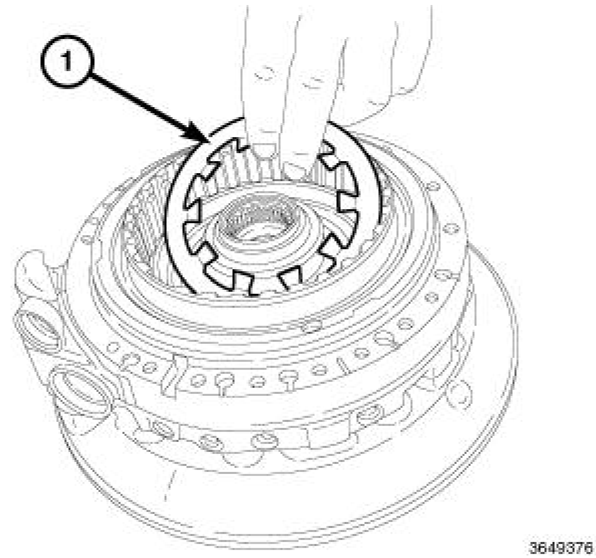

Fig. 57: Piston Retaining Ring And Piston
Courtesy of CHRYSLER GROUP, LLC

32. Remove the piston retaining ring and piston below it.

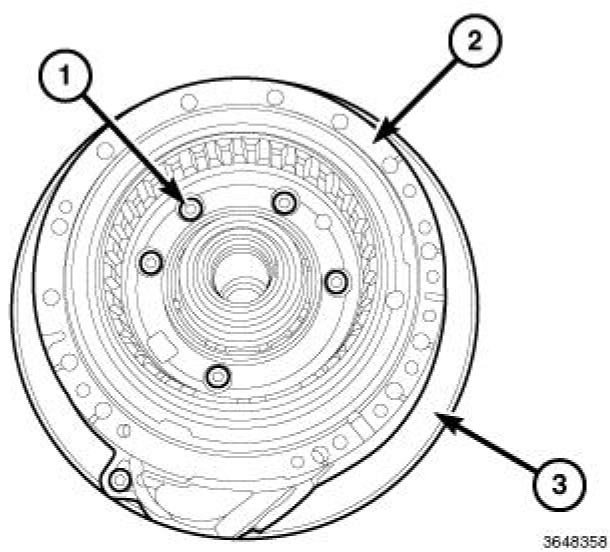

Fig. 58: Six Bolts, Oil Pump Housing & Oil Pump Cover
Courtesy of CHRYSLER GROUP, LLC

33. Remove the six bolts (1) and separate the oil pump housing (2) from the oil pump cover (3).

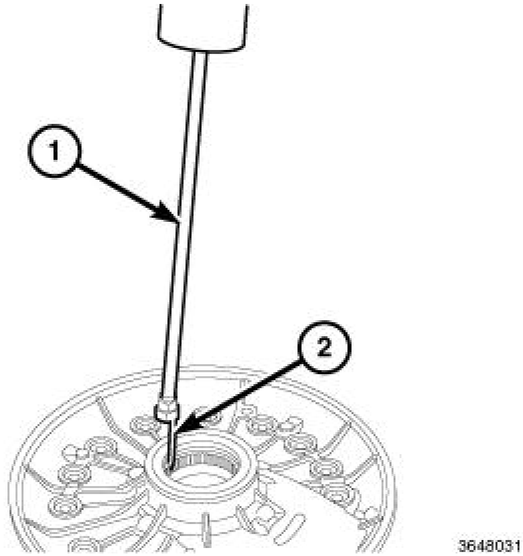

Fig. 59: Seal Remover & Slide Hammer
Courtesy of CHRYSLER GROUP, LLC

34. Using (special tool #9667, Remover, Seal) (2) and (special tool #C-3752, Slide Hammers) (1), remove the oil seal from the front pump cover.
35. Remove the outer lip seal from the front pump cover.

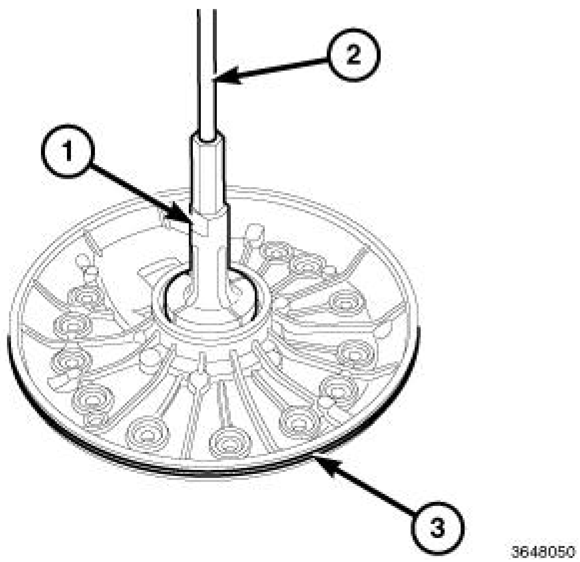

Fig. 60: Remover, Bearing Cup & Slide Hammers
Courtesy of CHRYSLER GROUP, LLC

36. Remove the snap ring.
37. Using (special tool #6787A, Remover, Bearing Cup) (1) and (special tool #C-3752, Slide Hammers) (2) remove the needle bearing from the front cover (3).
38. Remove the snap ring.
39. Using (special tool #9585, Remover, Bearing Cup) and (special tool #C-637, Slide Hammer, Universal) remove the needle bearing.

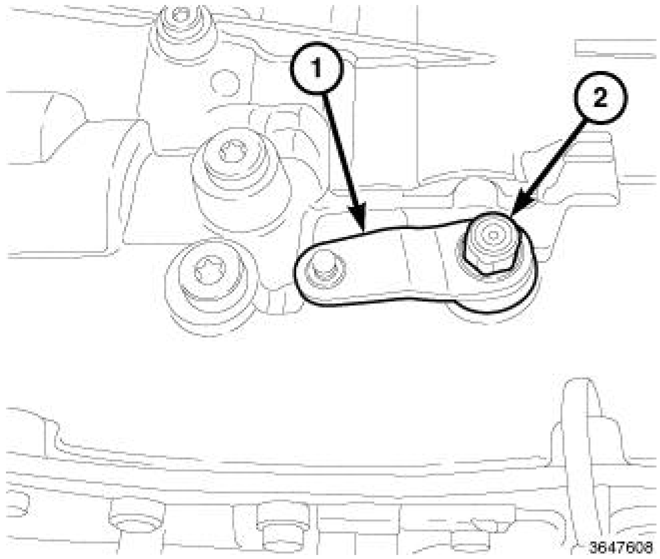

Fig. 61: Manual Park Release Lever Retaining Nut & Lever
Courtesy of CHRYSLER GROUP, LLC

40. Remove the Manual Park Release (MPR) lever retaining nut (2) and remove the lever (1).

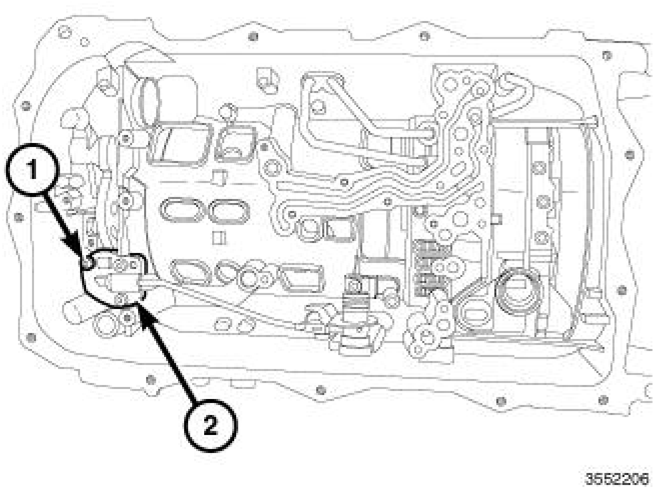

Fig. 62: Three Park Pawl Lock Rod Guide Plate Retaining Screws & Plate
Courtesy of CHRYSLER GROUP, LLC

41. Remove the three park pawl lock rod guide plate retaining screws (1) and remove the plate (2).

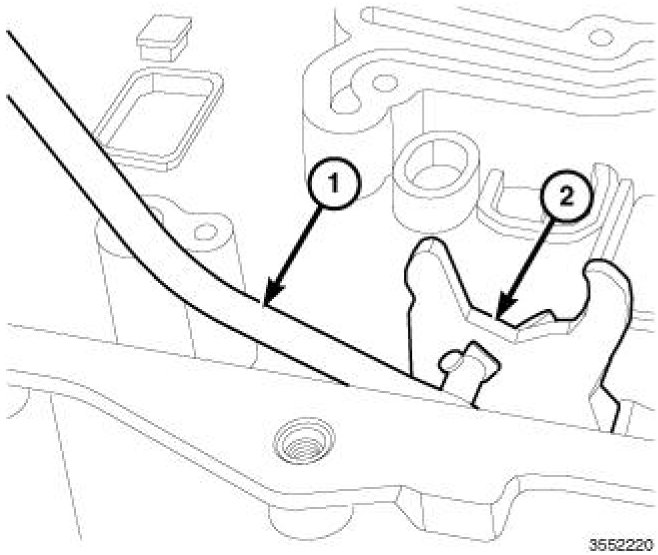

Fig. 63: Park Pawl Lock Rod & Fork
Courtesy of CHRYSLER GROUP, LLC

42. Remove the park pawl lock rod (1) from the fork (2).

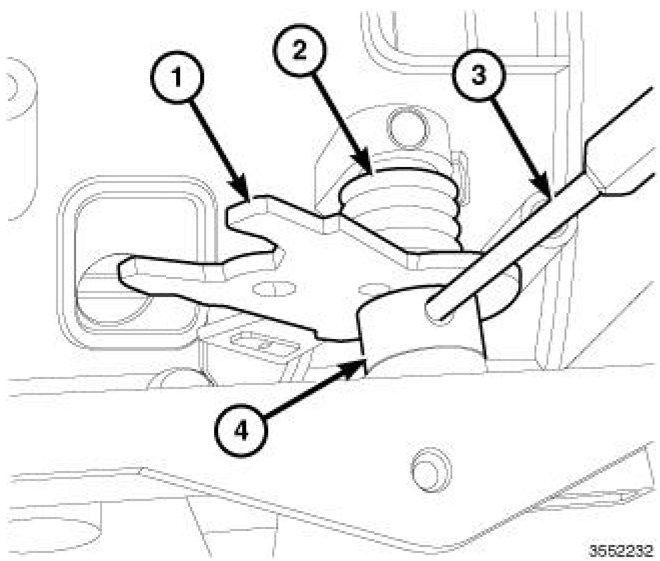

Fig. 64: Selector Shaft, Suitable Pin Punch, Spring & Fork
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Pay attention to the spring position for installation.**

43. Remove the roll pin from the MPR shaft (4) using a suitable pin punch (3).
44. Remove the shaft (4), spring (2) and fork (1) from the case.
45. Remove the MPR shaft seal using a small screwdriver or equivalent.

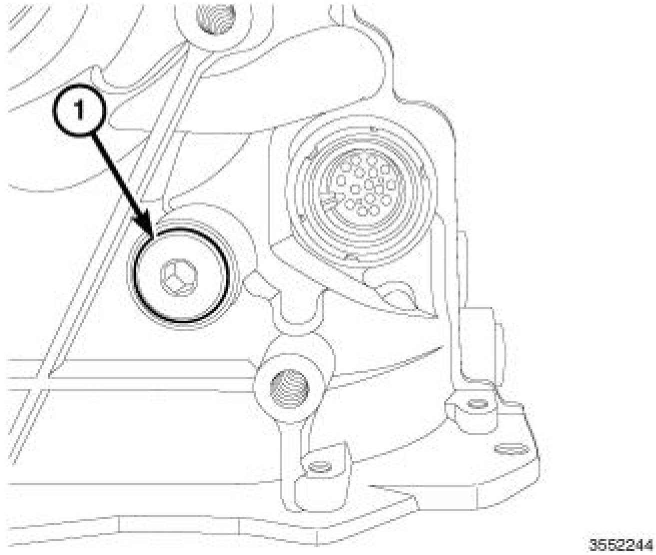

Fig. 65: Park Pawl Shaft Plug
Courtesy of CHRYSLER GROUP, LLC

46. Remove the park pawl shaft plug (1) from the rear of the case.

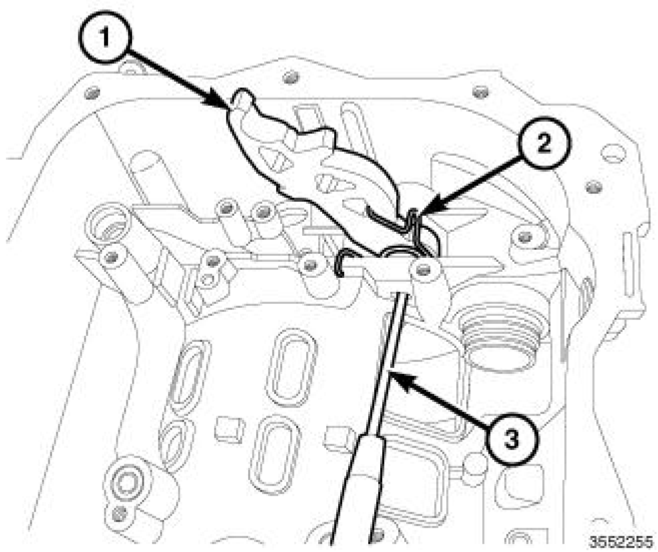

Fig. 66: Removing/Installing Park Pawl Shaft Using A Suitable Pin Punch, Park Pawl And Spring
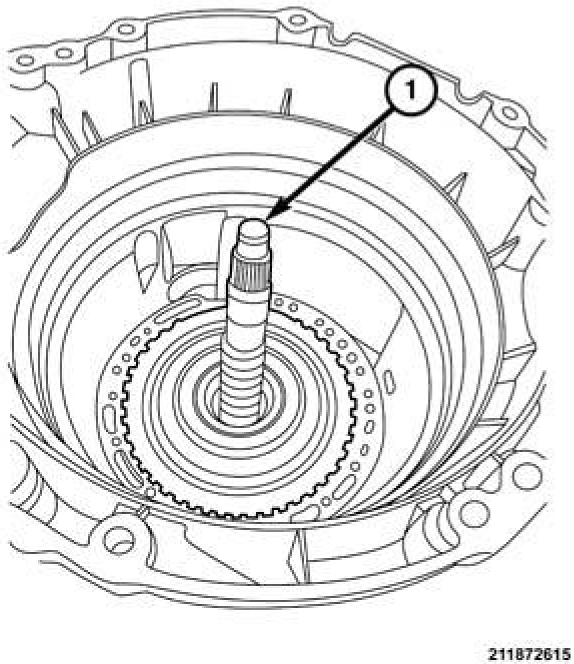
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Pay attention to the spring position for installation.**

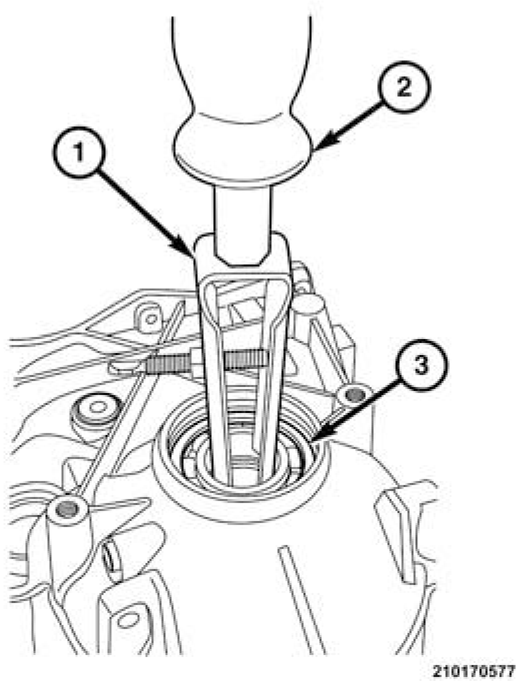
47. Remove the park pawl shaft using a suitable pin punch (3), remove the park pawl (1) and spring (2).



[Fig. 67: Input/Output Shaft & P4 Annulus Drum Assembly](#)
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The transmission must be in the upright position to remove the assembly to avoid damage to the drums.**

48. Remove the input/output shaft and P4 annulus drum assembly (1) from the case.



[Fig. 68: Removing Outer Ball Bearing Using Special Tools](#)
Courtesy of CHRYSLER GROUP, LLC

49. Remove the outer bearing snap ring, and the outer ball bearing (3) using (special tool #9664, Remover, Bearing Cup) (1) and (special tool #C-637, Slide Hammer, Universal) (2).

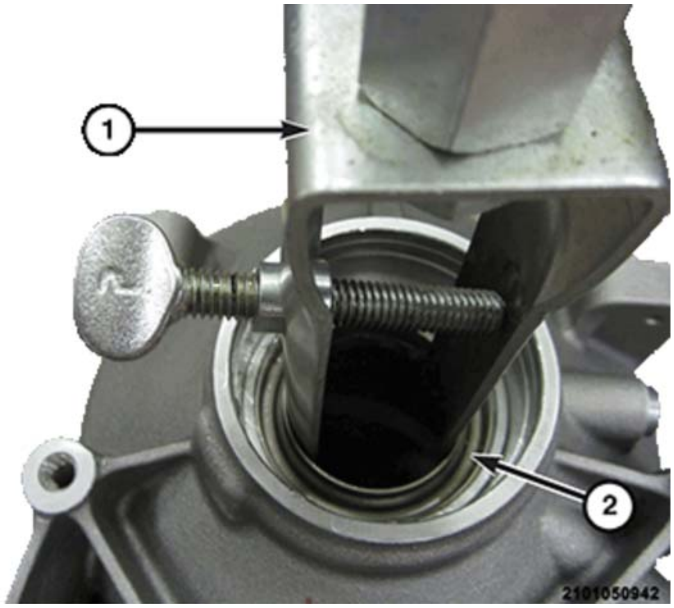


Fig. 69: Removing Oil Dam Using Special Tools
Courtesy of CHRYSLER GROUP, LLC

50. Remove the oil dam snap ring.
51. Using (special tool #9664, Remover, Bearing Cup) (1) and (special tool #C-637, Slide Hammer, Universal), remove the oil dam (2).

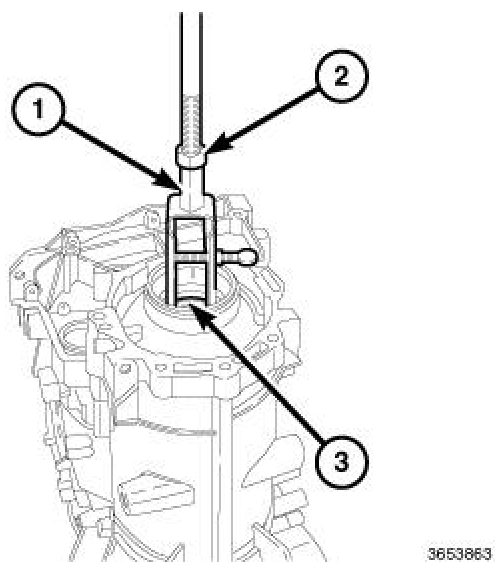

Fig. 70: Bearing Cup, Slide Hammer & Inner Needle Bearing
Courtesy of CHRYSLER GROUP, LLC

NOTE: **AWD shown in illustration, RWD similar.**

52. Remove the output shaft inner needle bearing snap ring.
53. Using (special tool #9664, Remover, Bearing Cup) (1) and (special tool #C-637, Slide Hammer,

Universal) (2), remove the inner needle bearing (3).

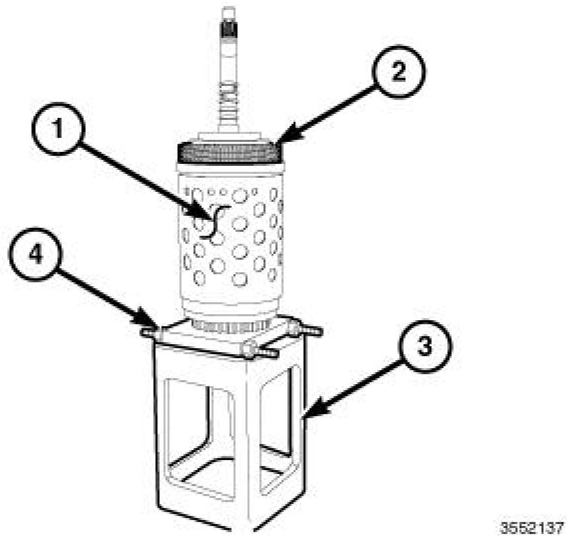

Fig. 71: P4 Annulus Drum Assembly, Press Fixture Assembly & Bearing/Gear Splitter
Courtesy of CHRYSLER GROUP, LLC

54. Position the input/output shaft and P4 annulus drum assembly (1) on (special tool #8925-3, Assembly, Press Fixture) (3) and (special tool #1130, Splitter, Bearing/Gear) (4).
55. Remove the clutch pack (2).

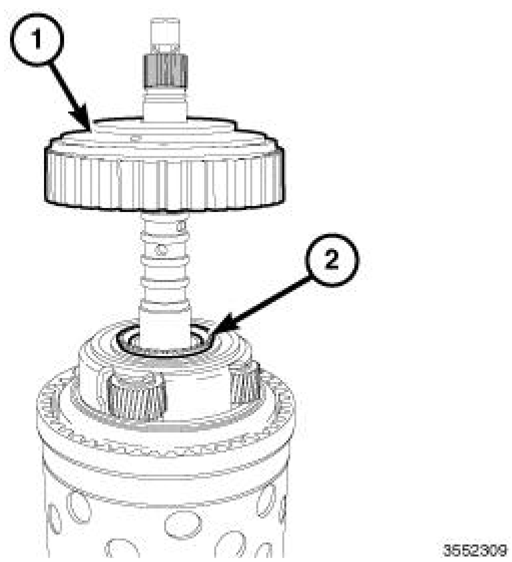

Fig. 72: P1 Annulus/B-Clutch Hub Assembly, Needle Bearing And Holding Plate
Courtesy of CHRYSLER GROUP, LLC

56. Remove the O-ring and 5 squared O-rings.
57. Remove the P1 annulus/B clutch hub assembly (1) from the P4 annulus drum.

NOTE: **The washer may stick to the bottom of the P1 annulus/B clutch hub assembly (1).**

58. Remove the selectable shim from the P1 annulus/B clutch hub.

59. Remove the needle bearing and holding plate (2) from the P1 planetary carrier.

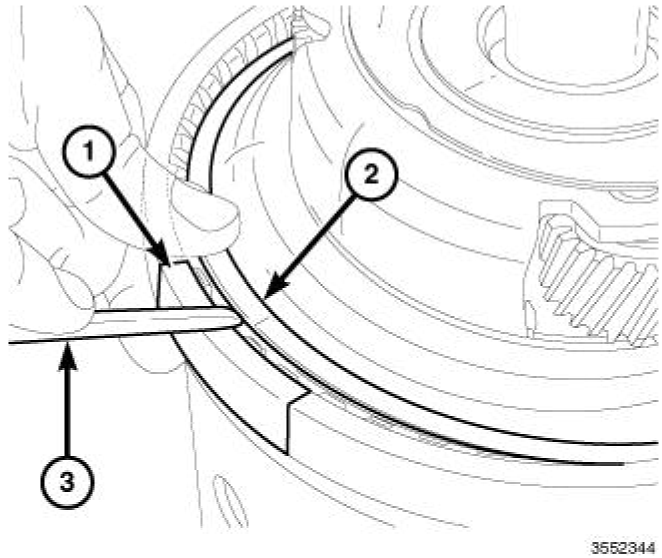

Fig. 73: Tool & Snap Ring
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The (special tool #10378, Rings, Support) are three pieces intended to be used in multiple locations around the drum.**

60. Position the (special tool #10378, Rings, Support) (1) on the P4 annulus drum assembly to protect the drum.

NOTE: **Pry the snap ring from the opposite side of the snap ring openings to release.**

NOTE: **When the snap ring is removed the internal clutch drum may drop slightly.**

61. Using a suitable tool (3), release the snap ring (2) by prying in and up from the opposite side of the snap ring openings.

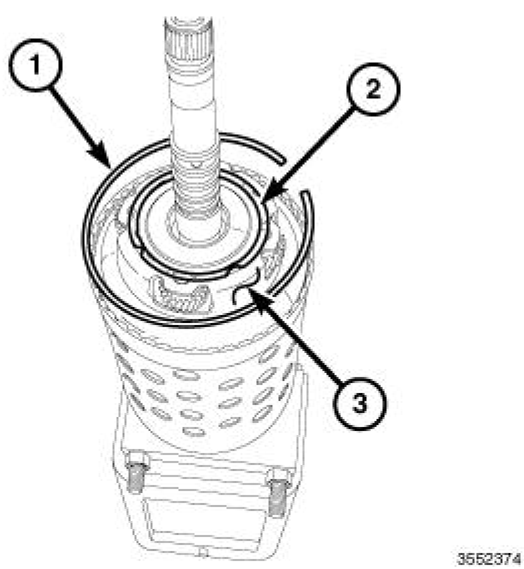

Fig. 74: Snap Ring & P1 Planetary Carrier
Courtesy of CHRYSLER GROUP, LLC

62. Remove the P1 planetary carrier (3).

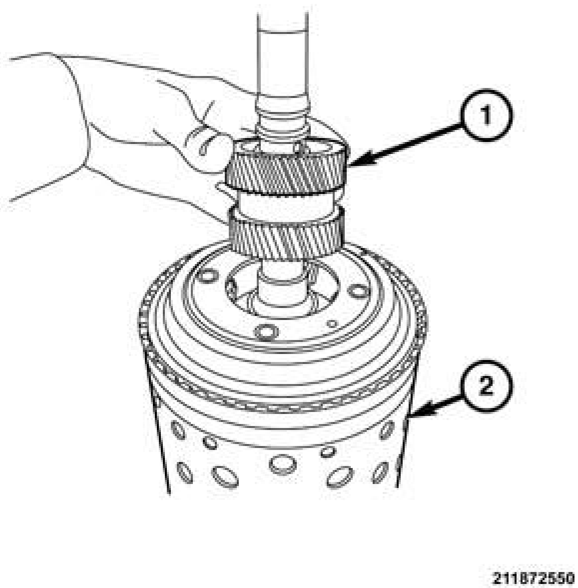

Fig. 75: P1/P2 Sun Gear & P1 Planetary Carrier
Courtesy of CHRYSLER GROUP, LLC

63. Remove P1/P2 (1) sun gear from the bottom of the P1 planetary carrier.

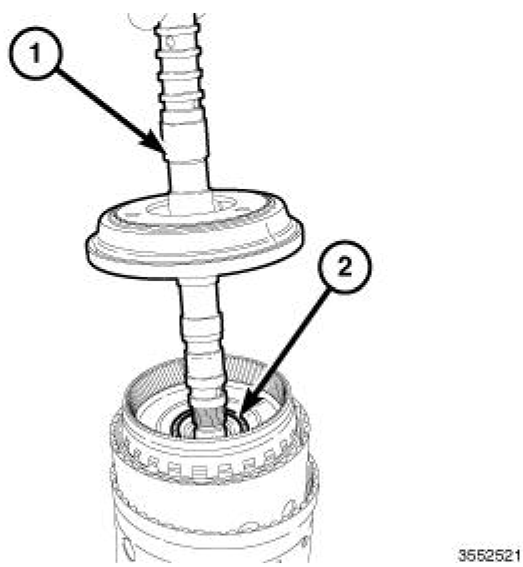

Fig. 76: P2 Planetary Carrier & Needle Bearing
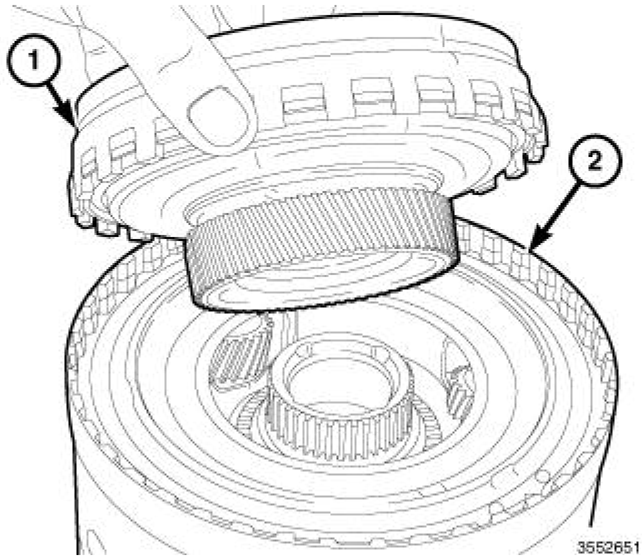
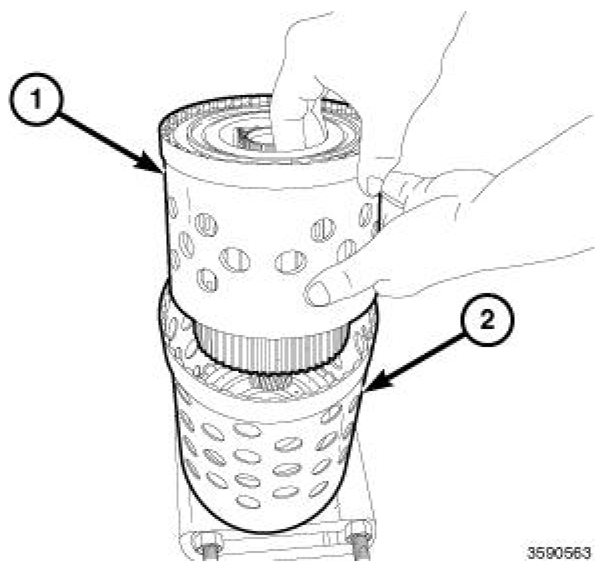
Courtesy of CHRYSLER GROUP, LLC

64. Remove the input shaft with P2 planetary carrier (1) from the drum assembly.
65. Remove the needle bearing (2) and washer.



[Fig. 77: P2 Annulus/P3 Sun Gear & Drum Assembly]
Courtesy of CHRYSLER GROUP, LLC

66. Remove the P2 annulus/P3 sun gear (1) from the drum assembly (2).



[Fig. 78: D-Clutch Drum & P4 Annulus Drum]
Courtesy of CHRYSLER GROUP, LLC

67. Remove the D clutch drum (1) from the P4 annulus drum (2).

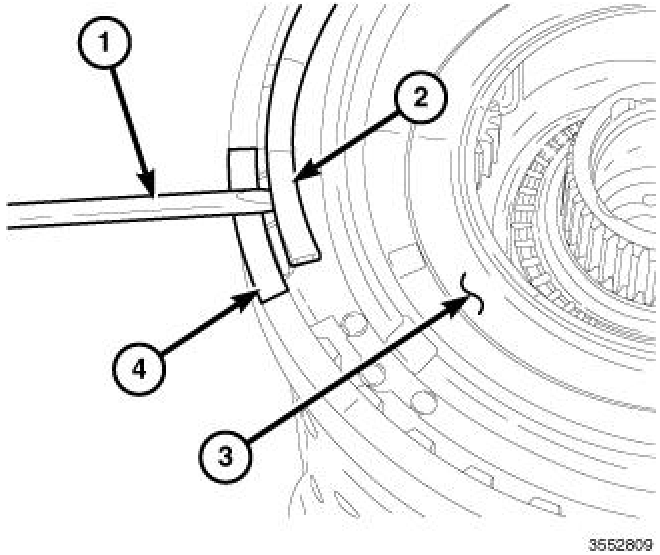


Fig. 79: Support Rings, Tool & P3 Planetary Carrier
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The (special tool #10378, Rings, Support) are three pieces intended to be used in multiple locations around the drum.**

68. Position the (special tool #10378, Rings, Support) (4) on the P4 annulus drum assembly to protect the drum.
69. Using a suitable tool (1), release and remove the snap ring (2).
70. Remove the P3 planetary carrier (3).
71. Remove the needle bearing from the planetary carrier.

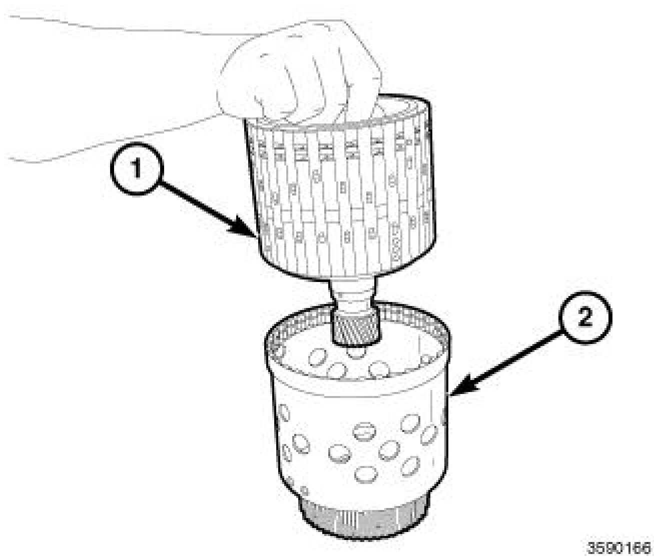

Fig. 80: P4 Sun Gear/C/E Clutch Retainer & D-Clutch Drum
Courtesy of CHRYSLER GROUP, LLC

72. Remove the P4 sun gear/C/E clutch retainer (1) from the D clutch drum (2).

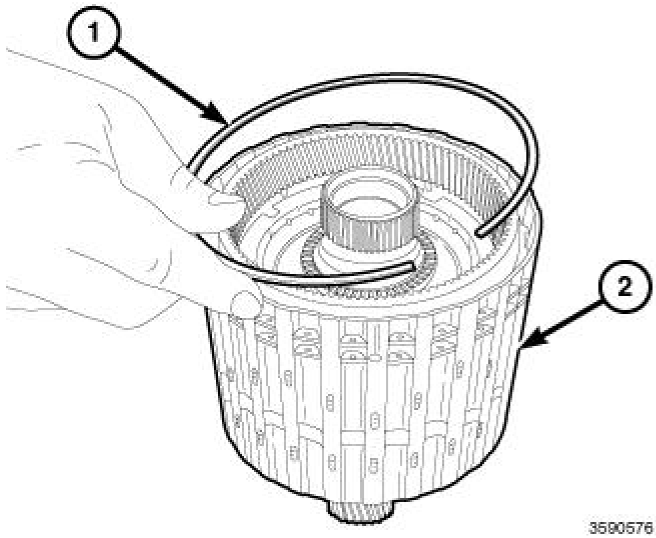

Fig. 81: Snap Ring & P4 Sun Gear/C/E Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

73. Remove the snap ring (1) from the P4 sun gear/C/E clutch retainer (2).

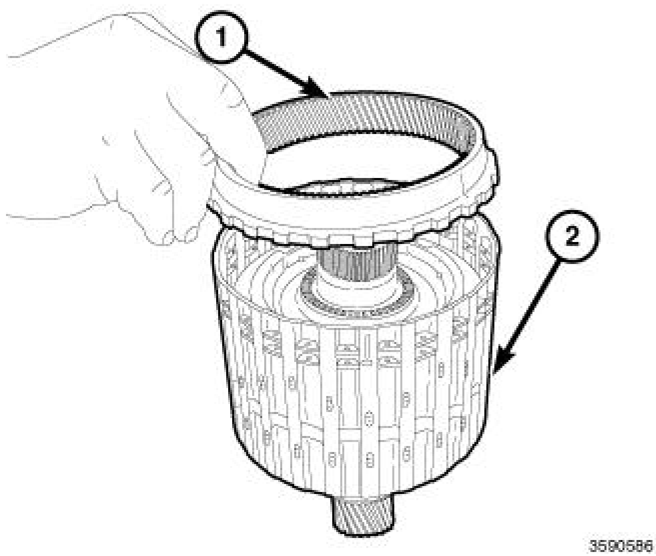

Fig. 82: P3 Annulus & P4 Sun Gear/C/E Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

74. Remove the P3 annulus (1) from the P4 sun gear/C/E clutch retainer (2).

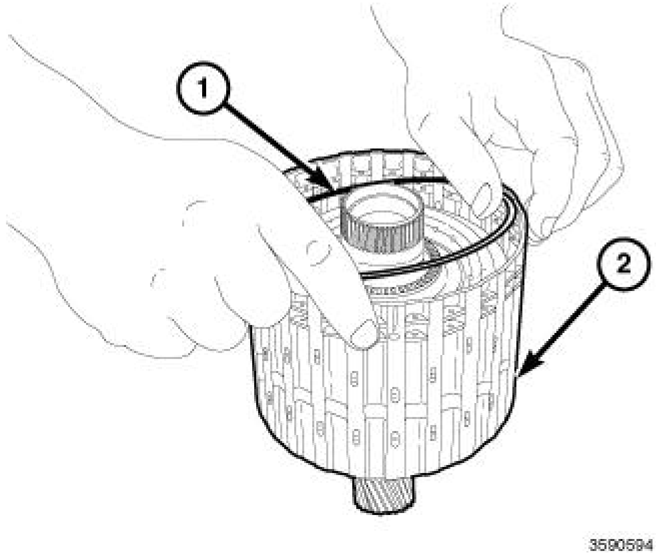

Fig. 83: Snap Ring & P4 Sun Gear/C/E Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

75. Remove the snap ring (1) from the P4 sun gear/C/E clutch retainer (2).

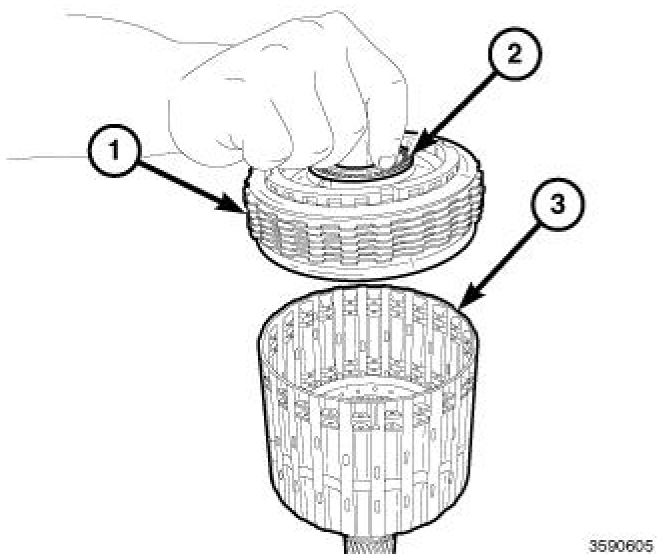

Fig. 84: E-Clutch & P4 Sun Gear/C/E Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

76. Remove the E clutch (1) from the P4 sun gear/C/E clutch retainer (3).
77. Remove the needle bearing (2) from the E clutch (1).

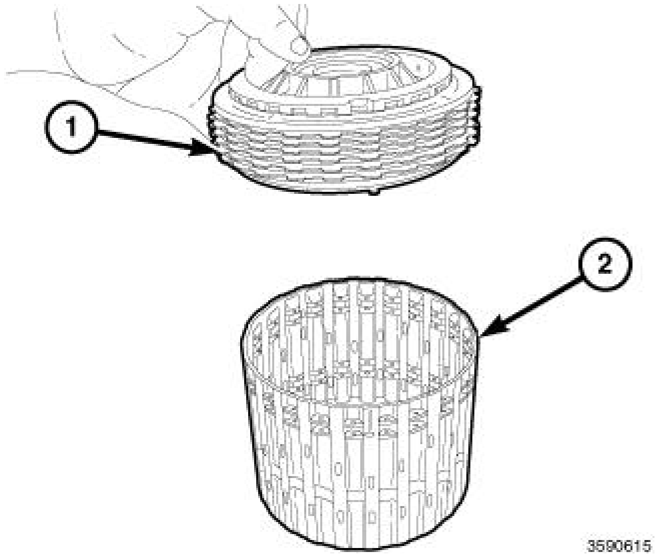

Fig. 85: C-Clutch & P4 Sun Gear/C/E Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

78. Remove the C clutch (1) from the P4 sun gear/C/E clutch retainer (2).
79. Remove the bearing from top and bottom of C clutch (1).

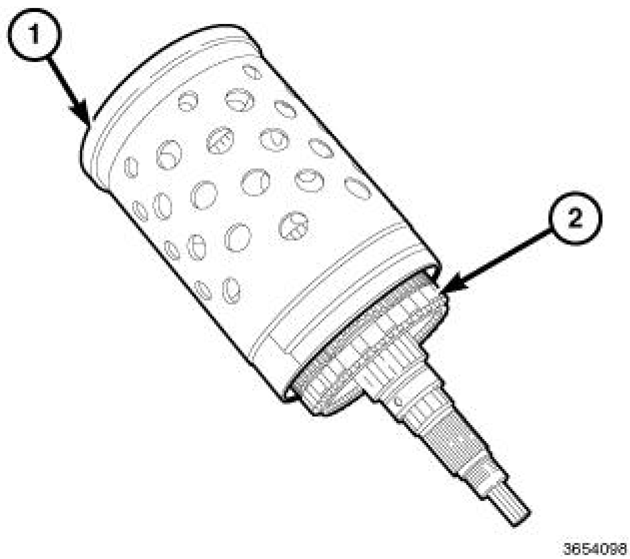

Fig. 86: P4 Planetary Carrier/Output Shaft & P4 Annulus Drum
Courtesy of CHRYSLER GROUP, LLC

80. Remove the P4 planetary carrier/output shaft (2) from the P4 annulus drum (1).

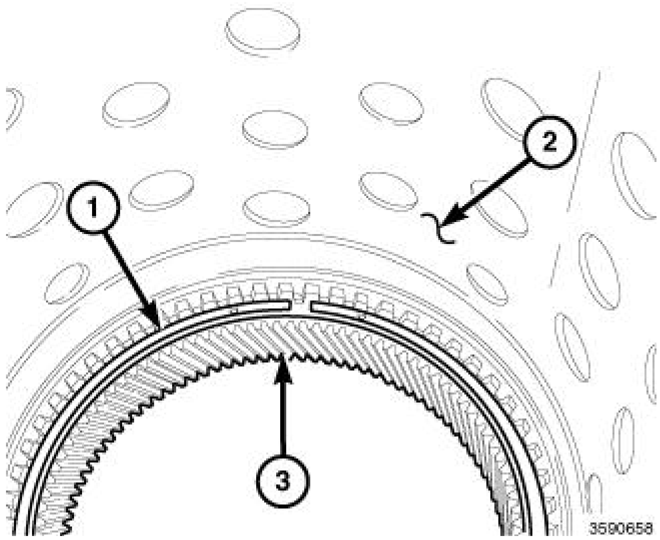

Fig. 87: Snap Ring & P4 Annulus Drum & P4 Annulus
Courtesy of CHRYSLER GROUP, LLC

81. Remove the snap ring (1) from the P4 annulus drum (2).
82. Remove the P4 annulus (3) from the P4 annulus drum (2).

CLEANING

CLEANING

CAUTION: **A unique transmission fluid has been developed for this transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid, see FLUIDS, LUBRICANTS AND GENUINE PARTS located in owners manual.**

The use of crocus cloth is permissible where necessary, providing it is used carefully. When used on shafts, or valves, use extreme care to avoid rounding off sharp edges. Sharp edges are vital as they prevent foreign matter from getting between the valve and valve bore.

Do not reuse oil seals, seal rings, or O-rings during overhaul. Replace these parts as a matter of course. Also do not reuse snap rings or E-clips that are bent or distorted. Replace these parts as well.

Lubricate transmission parts with the appropriate automatic transmission fluid only during overhaul and assembly.

NOTE: **Do not use shop towels or rags to dry the case (or any other transmission component) unless they are made from lint-free materials. Lint will stick to case surfaces and transmission components and circulate throughout the transmission after assembly. A sufficient quantity of lint can block fluid passages and interfere with valve body operation.**

Flush the case bores and fluid passages thoroughly with approved transmission fluid. Dry the case and all fluid passages with compressed air. Be sure that all fluid passages are clear.

INSPECTION

INSPECTION

Inspect the case for cracks, porous spots, worn bores, or damaged threads. Damaged threads can be repaired with HelicoilÂ® thread inserts. However, the case will have to be replaced if it exhibits any type of damage or wear.

ASSEMBLY

ASSEMBLY

CAUTION:	**A unique transmission fluid has been developed for this transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid, see FLUIDS, LUBRICANTS AND GENUINE PARTS located in owners manual.**
CAUTION:	**The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Failure to follow these instructions may result in damage to the TCM/TCMA.**
NOTE:	**If the transmission is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the TCM Adaptation Procedure. Refer to MODULE, TRANSMISSION CONTROL, MODULE PROGRAMMING .**

10. Install the snap ring (1) into the P4 sun gear/C/E clutch retainer (2).

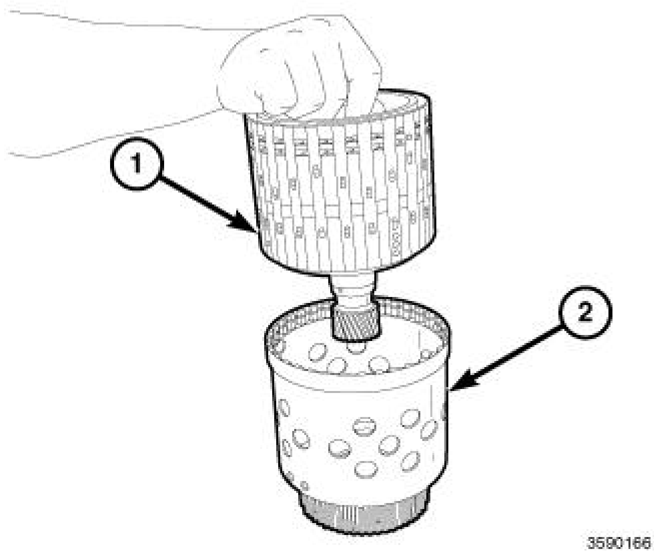

Fig. 95: P4 Sun Gear/C/E Clutch Retainer & D-Clutch Drum
Courtesy of CHRYSLER GROUP, LLC

11. Install the P4 sun gear/C/E clutch retainer (1) into the D clutch drum (2).

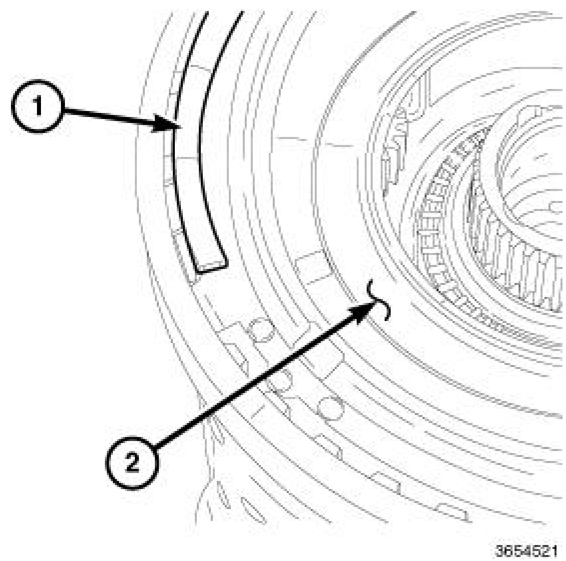

Fig. 96: P3 Planetary Carrier & Snap Ring
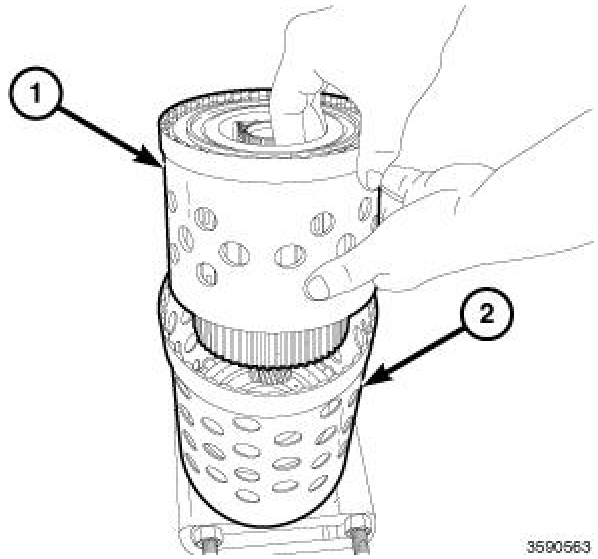
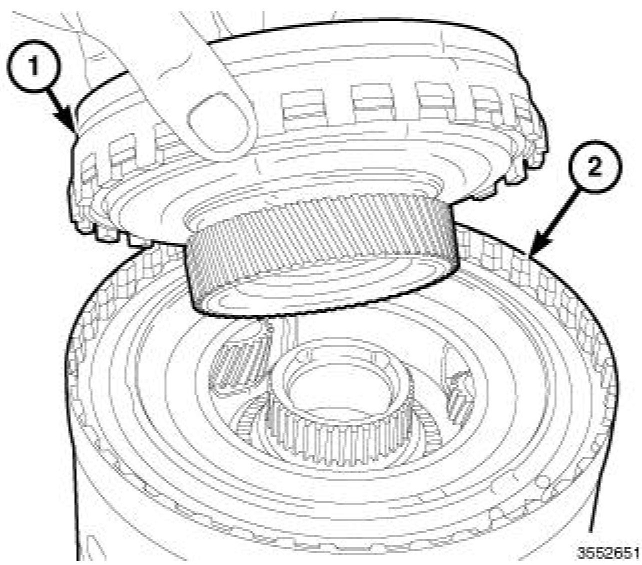
Courtesy of CHRYSLER GROUP, LLC

12. Install the needle bearing onto the planetary carrier.
13. Install the P3 planetary carrier (2) in the D clutch drum.
14. Install the snap ring (1).



[Fig. 97: D-Clutch Drum & P4 Annulus Drum]
Courtesy of CHRYSLER GROUP, LLC

15. Install the D clutch drum (1) into the P4 annulus drum (2).



[Fig. 98: P2 Annulus/P3 Sun Gear & Drum Assembly]
Courtesy of CHRYSLER GROUP, LLC

16. Install the P2 annulus\P3 sun gear (1) onto the drum assembly (2).

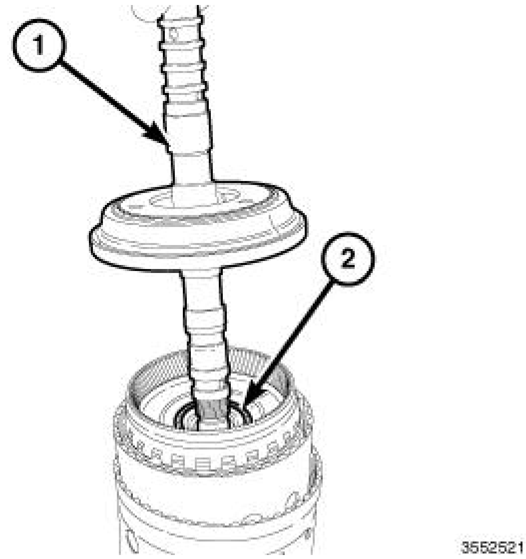


Fig. 99: P2 Planetary Carrier & Needle Bearing
Courtesy of CHRYSLER GROUP, LLC

17. Install the needle bearing (2) and washer.
18. Install the input shaft with P2 planetary carrier (1) into the drum assembly.

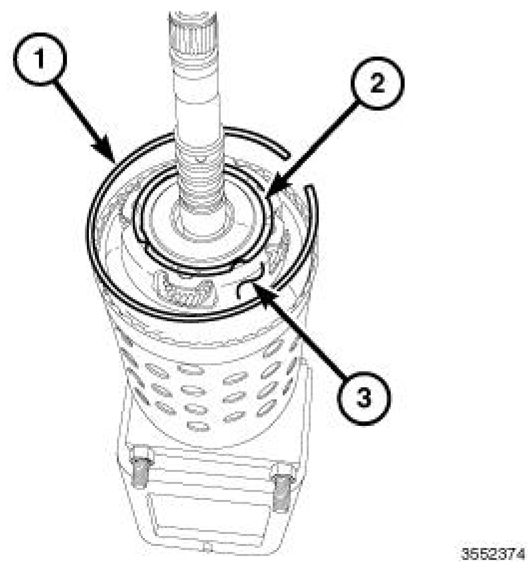

Fig. 100: Snap Ring & P1 Planetary Carrier
Courtesy of CHRYSLER GROUP, LLC

19. Install P1/P2 sun gear into the bottom of the P1 planetary carrier (3).
20. Install the P1 planetary carrier (3).
21. Install the snap ring (1).

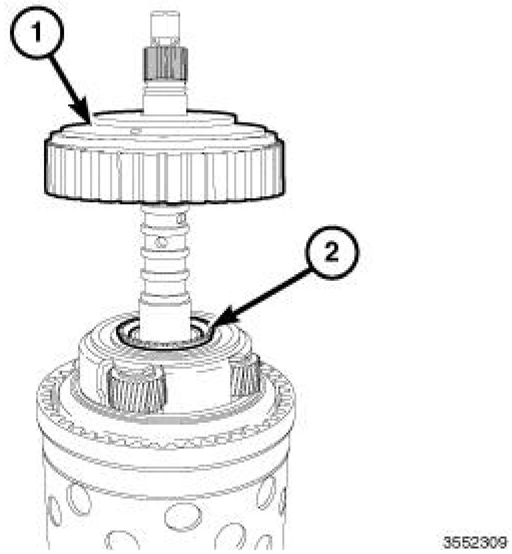

Fig. 101: P1 Annulus/B-Clutch Hub Assembly, Needle Bearing And Holding Plate
Courtesy of CHRYSLER GROUP, LLC

22. Install the needle bearing and holding plate (2) onto the P1 planetary carrier.
23. Install the selectable shim to the P1 annulus/B clutch hub.
24. Install the P1 annulus\B clutch hub assembly (1) onto the P4 annulus drum.
25. Install the O-ring and five squared O-rings.

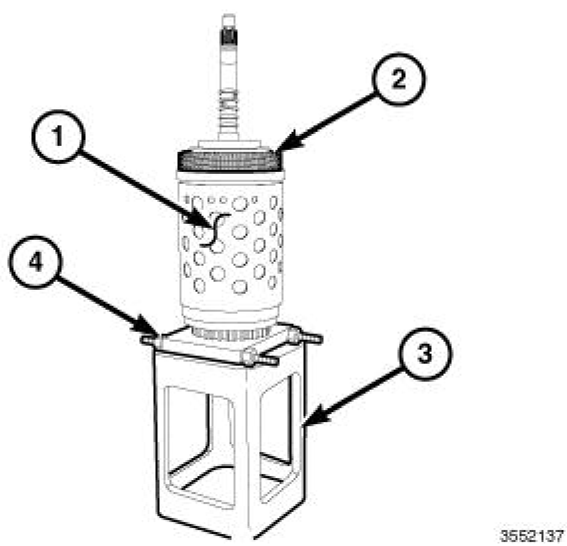

Fig. 102: P4 Annulus Drum Assembly, Press Fixture Assembly & Bearing/Gear Splitter
Courtesy of CHRYSLER GROUP, LLC

26. Install the clutch pack (2).

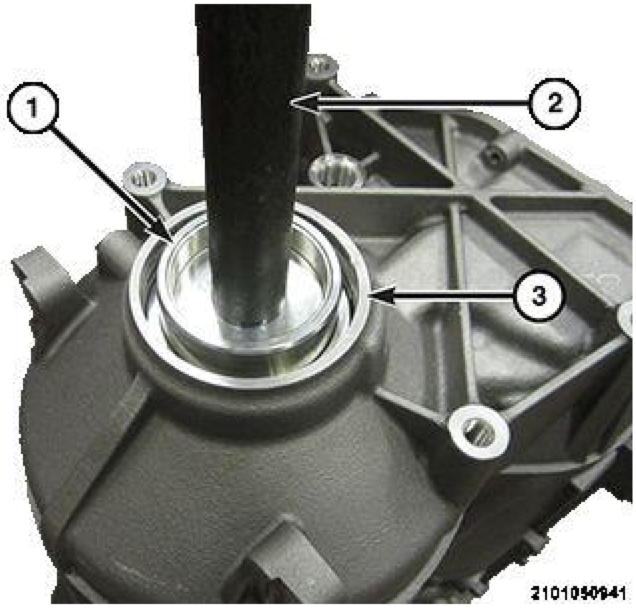

Fig. 103: Installing Output Shaft Inner Needle Bearing & Oil Dam
Courtesy of CHRYSLER GROUP, LLC

NOTE:	**The (special tool #10373A, Installer, Output Needle Bearing/Rear Oil Dam) (1) is a combination tool that is reversed to install the oil dam and output shaft inner needle bearing. For use to install the output shaft inner needle bearing, use the thick walled side of the tool against the bearing.**

27. Using (special tool #10373A, Installer, Output Needle Bearing/Rear Oil Dam) (1) and (special tool #C-4171, Driver Handle, Universal) (2), install the output shaft inner needle bearing.
28. Install the snap ring.

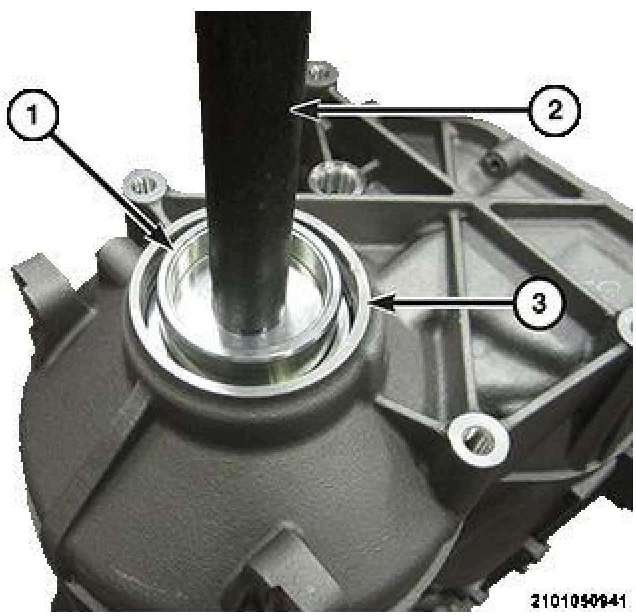

Fig. 104: Installing Output Shaft Inner Needle Bearing & Oil Dam
Courtesy of CHRYSLER GROUP, LLC

NOTE:	**The (special tool #10373A, Installer, Output Needle Bearing/Rear Oil Dam)**

(1) is a combination tool that is reversed to install the oil dam and output shaft inner needle bearing. For use to install the oil dam, use the thin walled side of the tool against the oil dam.

29. Using (special tool #10373A, Installer, Output Needle Bearing/Rear Oil Dam) (1) and (special tool #C-4171, Driver Handle, Universal) (2), install the oil dam.
30. Install the snap ring.

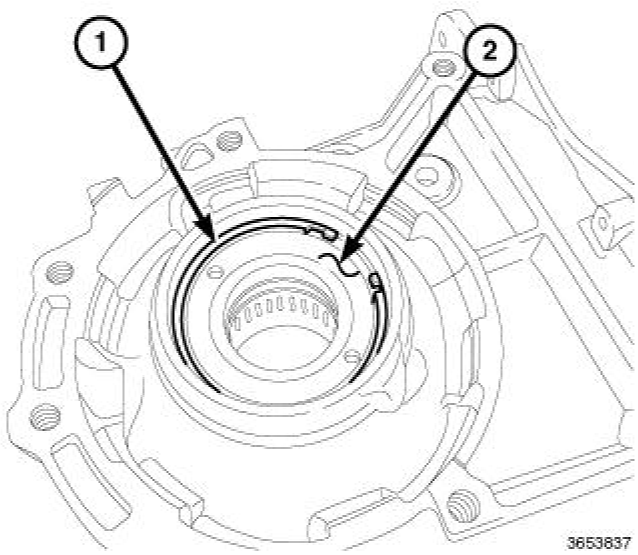

Fig. 105: Outer Bearing Snap Ring & Outer Needle Bearing
Courtesy of CHRYSLER GROUP, LLC

NOTE: **AWD shown in illustration, RWD similar.**

31. Install the ball bearing.
32. Install the snap ring (1).

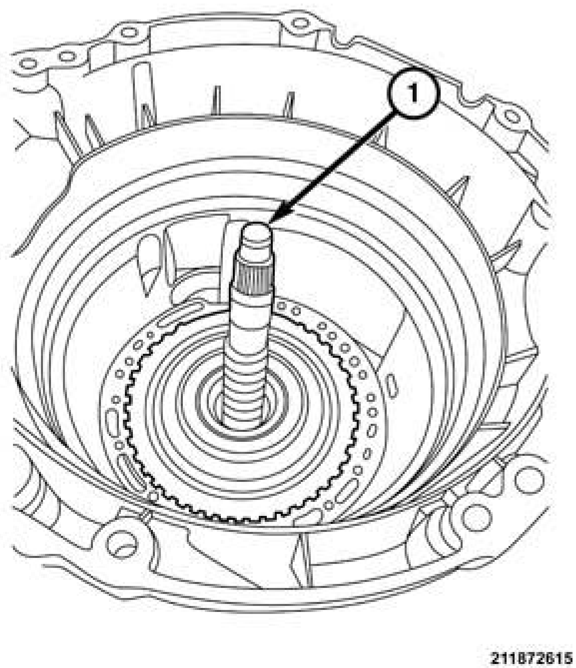

Fig. 106: Input/Output Shaft & P4 Annulus Drum Assembly
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The transmission must be in a upright position when the input/output shaft and the P4 annulus drum assembly (1) is installed.**

33. Install the input/output shaft and P4 annulus drum assembly (1) into the case.

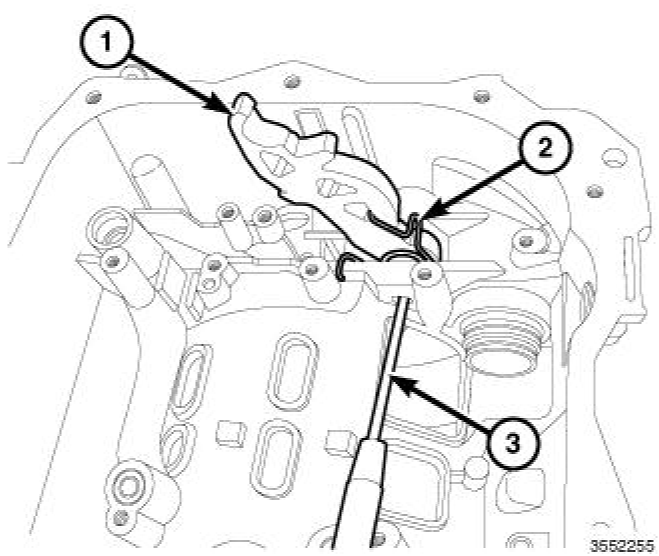

Fig. 107: Removing/Installing Park Pawl Shaft Using A Suitable Pin Punch, Park Pawl And Spring
Courtesy of CHRYSLER GROUP, LLC

34. From outside the transmission case, install the park pawl shaft and install the park pawl (1) and spring (2).

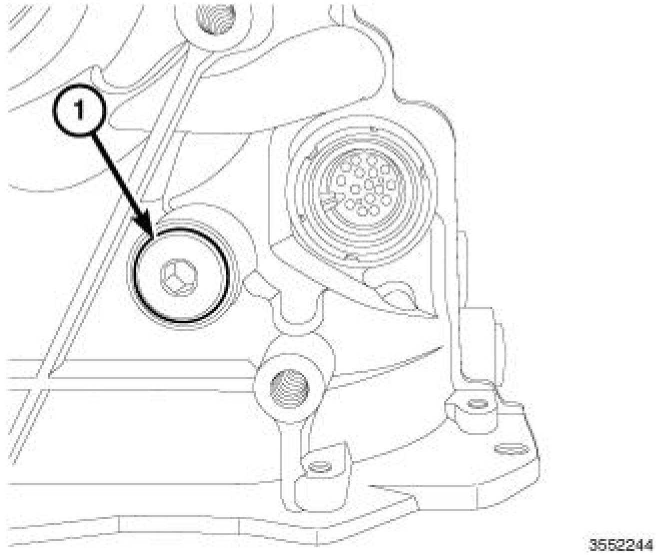

Fig. 108: Park Pawl Shaft Plug
Courtesy of CHRYSLER GROUP, LLC

35. Install the park pawl shaft plug (1) into the rear of the case and tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS**.

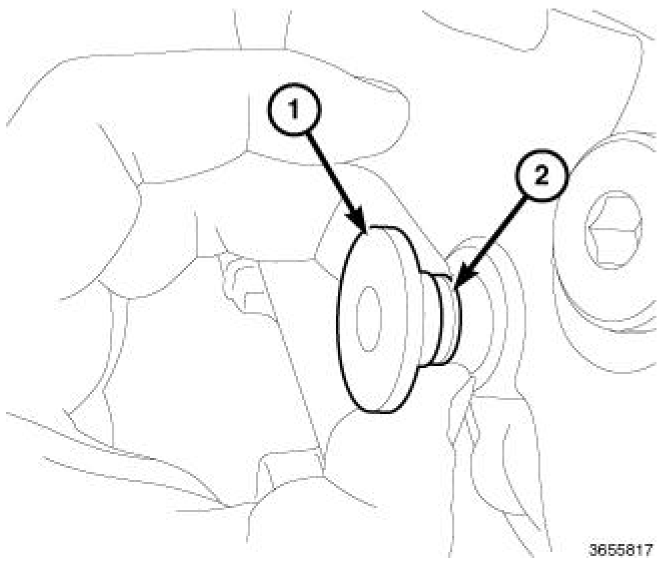

Fig. 109: Spacer & Selector Shaft Seal
Courtesy of CHRYSLER GROUP, LLC

36. Using (special tool #6936, Spacer) (1), install the Manual Park Release (MPR) shaft seal (2).

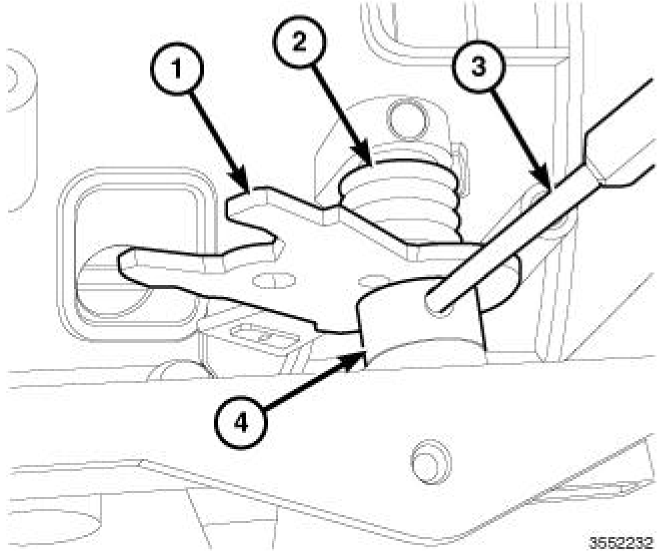

Fig. 110: Selector Shaft, Suitable Pin Punch, Spring & Fork
Courtesy of CHRYSLER GROUP, LLC

37. Install the shaft (4), spring (2), and fork (1) into the case.
38. Install the roll pin into the MPR shaft (4) using a suitable pin punch (3).

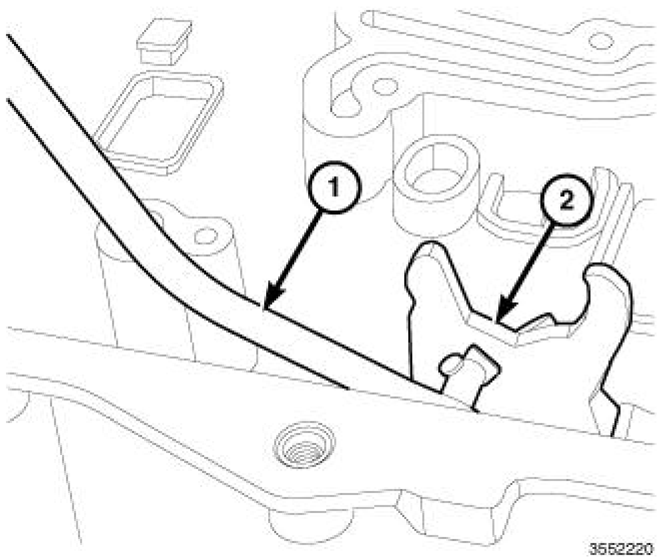

Fig. 111: Park Pawl Lock Rod & Fork
Courtesy of CHRYSLER GROUP, LLC

39. Install the park pawl lock rod (1) onto the fork (2).

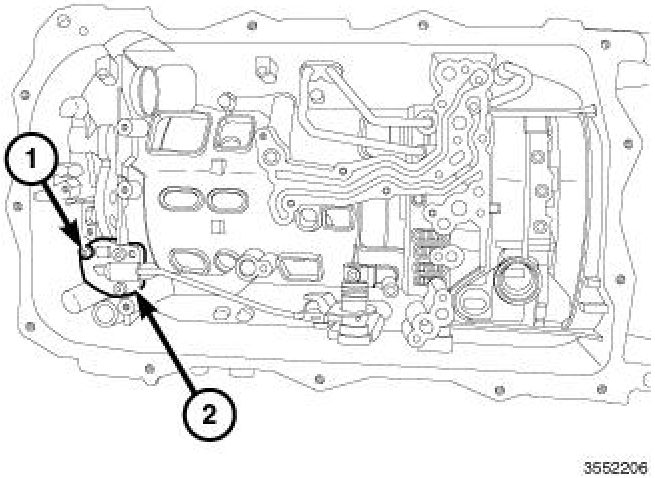

Fig. 112: Three Park Pawl Lock Rod Guide Plate Retaining Screws & Plate
Courtesy of CHRYSLER GROUP, LLC

40. Position the park pawl lock rod guide plate (2), install the three park pawl lock rod guide plate retaining screws (1) and tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS**.

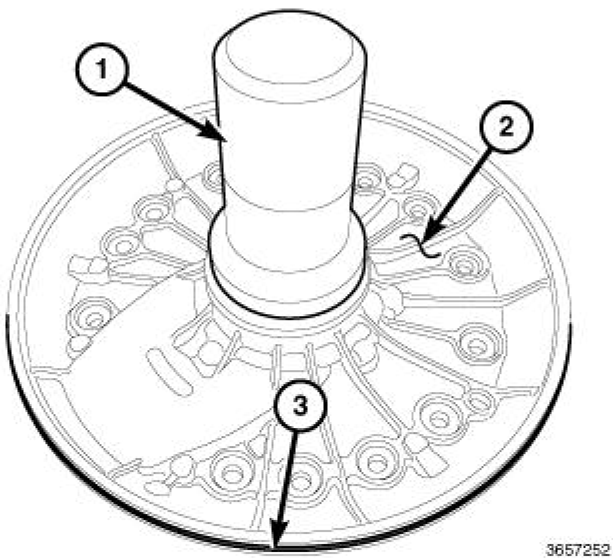

Fig. 113: Oil Pump Cover Lip Seal & Oil Pump Cover
Courtesy of CHRYSLER GROUP, LLC

41. Install the oil pump cover lip seal (3) on the oil pump cover (2).

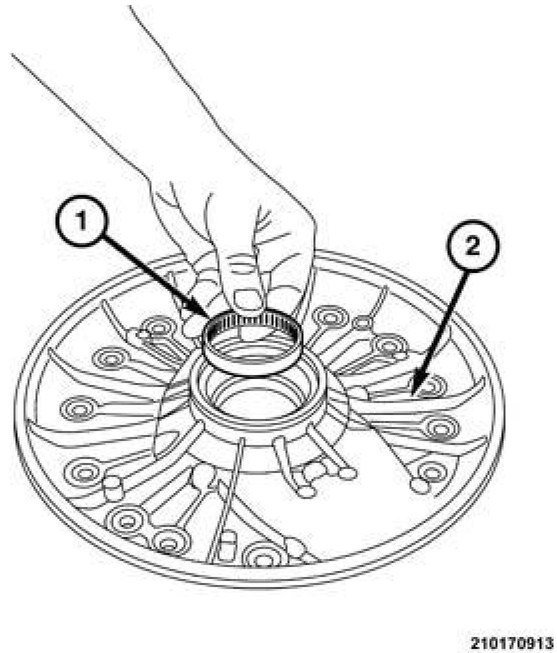

Fig. 114: Oil Pump Needle Bearing & Oil Pump Cover
Courtesy of CHRYSLER GROUP, LLC

42. If removed, install a **NEW** oil pump needle bearing using (special tool #10376, Installer, Input Shaft Needle Bearing) and (special tool #C-4171, Driver Handle, Universal).

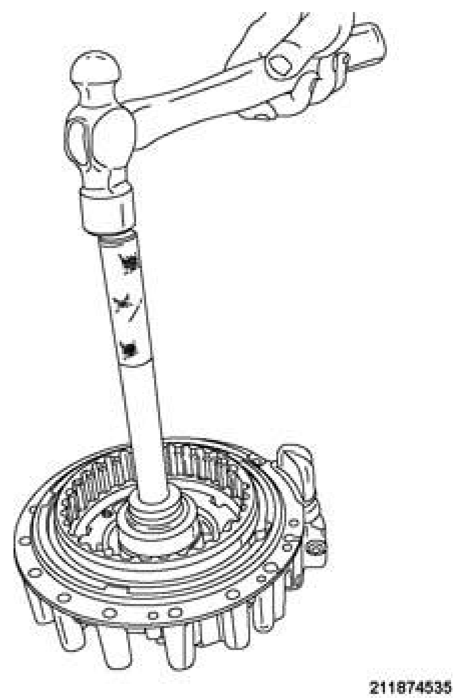

Fig. 115: Installing Oil Pump Housing Needle Bearing
Courtesy of CHRYSLER GROUP, LLC

43. If removed, install the inner oil pump needle bearing using (special tool #10382, Installer, Oil Pump Housing Needle Bearing)and (special tool #C-4171, Driver Handle, Universal)
44. Using (special tool #10375, Installer, Oil Pump Cover Oil Seal) (1), install the input shaft seal in the oil

pump cover (2).

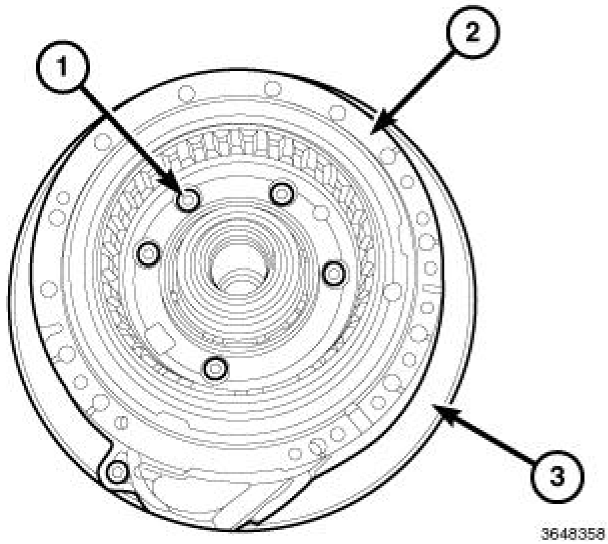

Fig. 116: Six Bolts, Oil Pump Housing & Oil Pump Cover
Courtesy of CHRYSLER GROUP, LLC

45. Position the oil pump housing (2) and oil pump cover (3) together.
46. Install the five bolts (1) and tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS**.

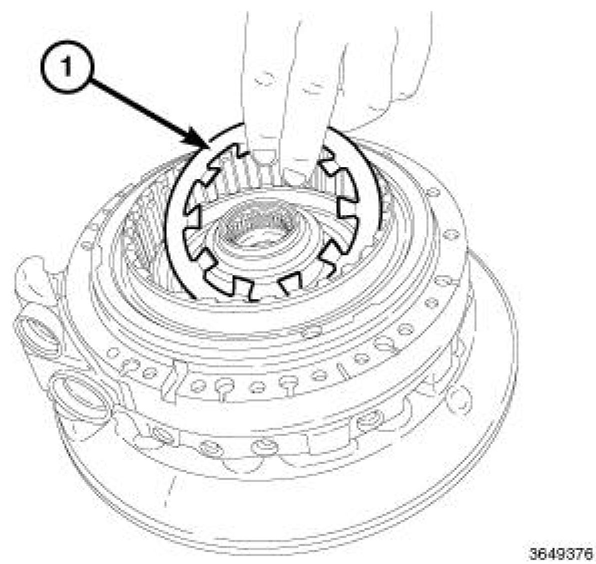

Fig. 117: Piston Retaining Ring And Piston
Courtesy of CHRYSLER GROUP, LLC

47. Insert the piston and the retaining ring (1) into the housing.

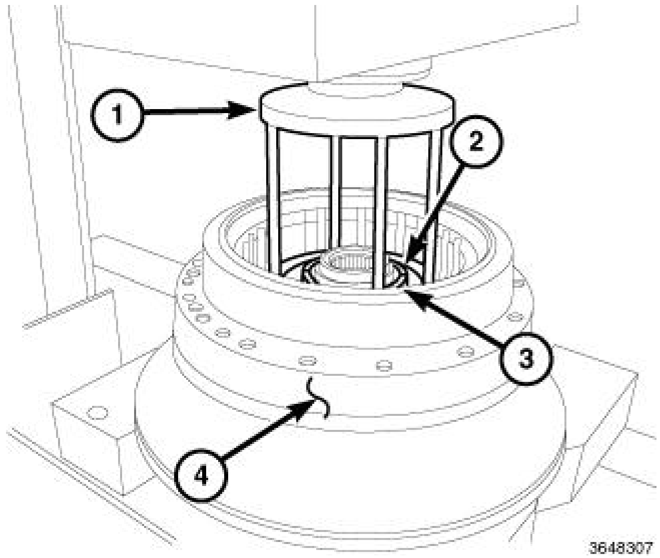

Fig. 118: Oil Pump Housing Assembly
Courtesy of CHRYSLER GROUP, LLC

48. Position the oil pump housing assembly (4) in a suitable arbor press.
49. Using (special tool #8285, Compressor, Spring) (1), press on the fingers of the piston retaining ring to remove tension, and install the two halves of the split retainer ring (2).

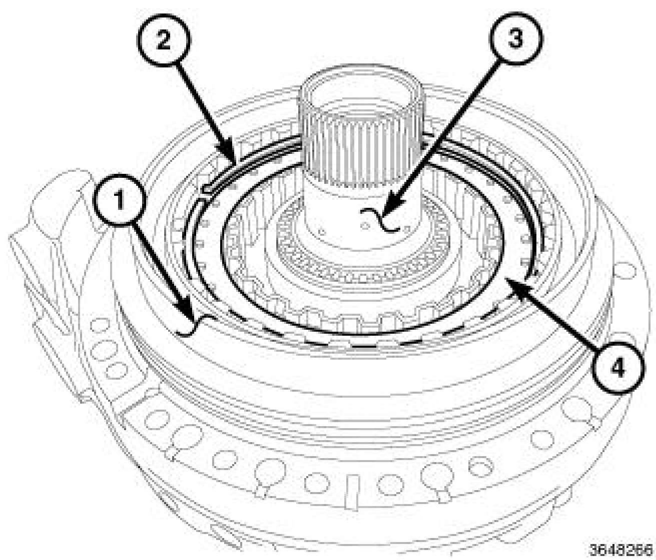

Fig. 119: Outer Ring, Snap Ring, Hub & Spacers
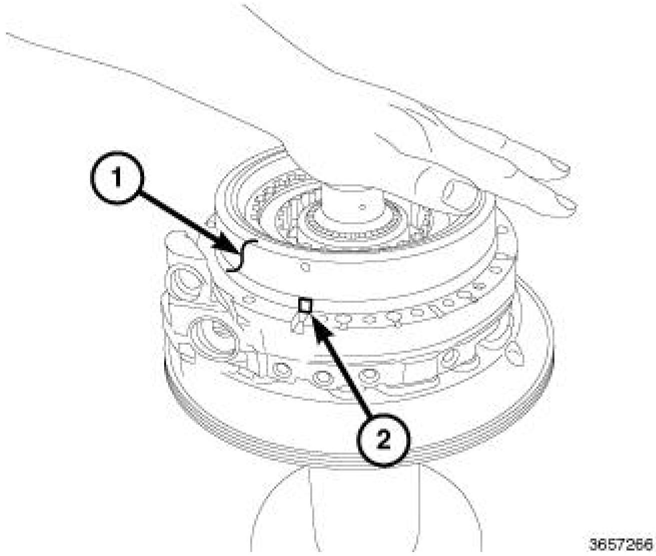
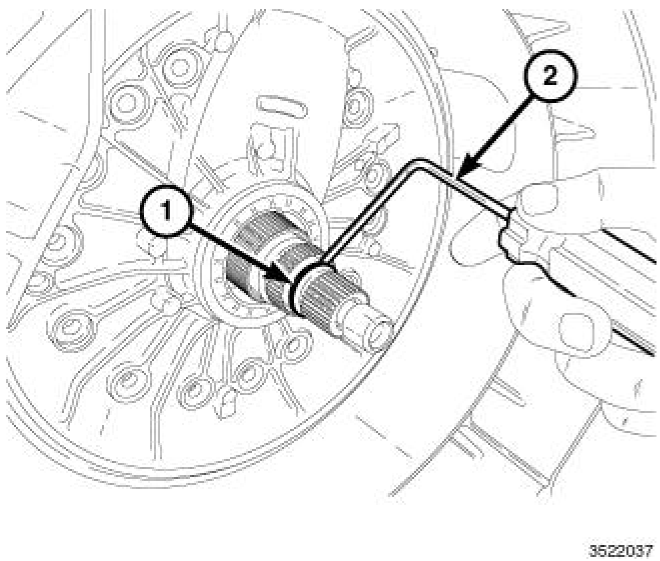
Courtesy of CHRYSLER GROUP, LLC

50. Install the hub (3).
51. Install the clutches and spacers (4).
52. Install the snap ring (2).
53. Install the outer ring (1) (below B-piston).



[Fig. 120: B-Piston Alignment Tab & B-Piston](#)
Courtesy of CHRYSLER GROUP, LLC

54. Position the B-piston alignment tab (2) above the notch and install B-piston (1) on the assembly.

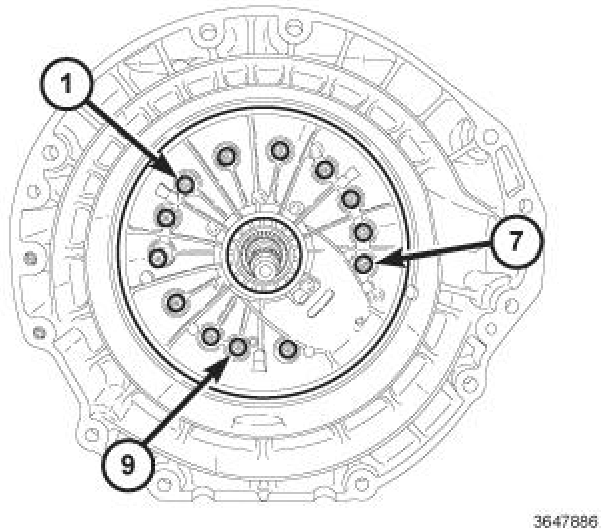


[Fig. 121: Input Shaft O-Ring & Small Pick](#)
Courtesy of CHRYSLER GROUP, LLC

55. Carefully position the oil pump housing assembly into the case, firmly press the oil pump into place before drawing it in with the bolts.

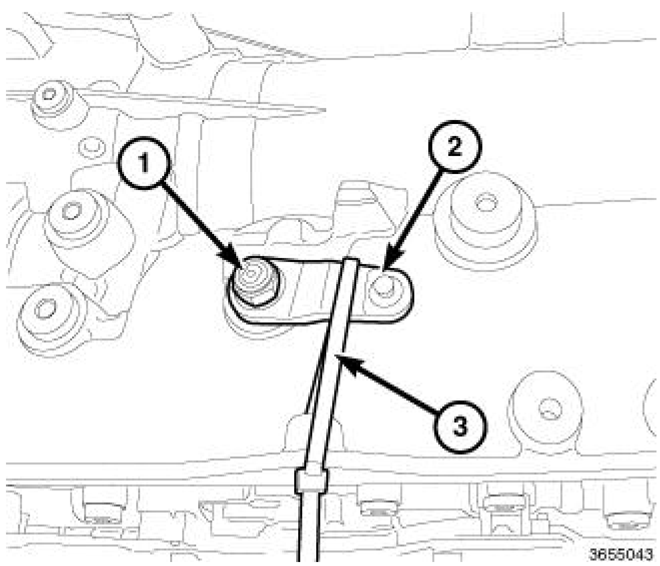
NOTE: **Check the transmission end play before installing the NEW oil pump bolts, in case adjustment is needed.**

56. Install the **NEW** input shaft O-ring.



[Fig. 122: Pre Tighten Bolts One, Seven And Nine](#)
Courtesy of CHRYSLER GROUP, LLC

57. Install the thirteen oil pump cover retaining bolts and tighten the oil pump cover as follows:
    a. In order to seat the oil pump cover properly, pre tighten bolts one, seven and nine to 6 N.m (53 in. lb.).
    b. Working in a clockwise pattern, beginning with number one, tighten to 10 N.m (89 in. lb.).
    c. Working in a clockwise pattern, beginning with number one, tighten an additional 90Â°.



[Fig. 123: Manual Park Release Lever, Nut & Tie Strap](#)
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The MPR lever (2) can be reversed to release tension and ease the installation of the valve body assembly.**

58. Temporarily install the MPR lever (2) to release tension on the shift fork as follows:
    a. Install the MPR lever (2) 180 degrees offset from its original position.
    b. Install the nut (1) and hand tighten.

c. Turn the MPR lever (2) and using a tie strap (3), secure the lever (2) into position so the park release fork is in the same position as it was before valve body assembly removal.

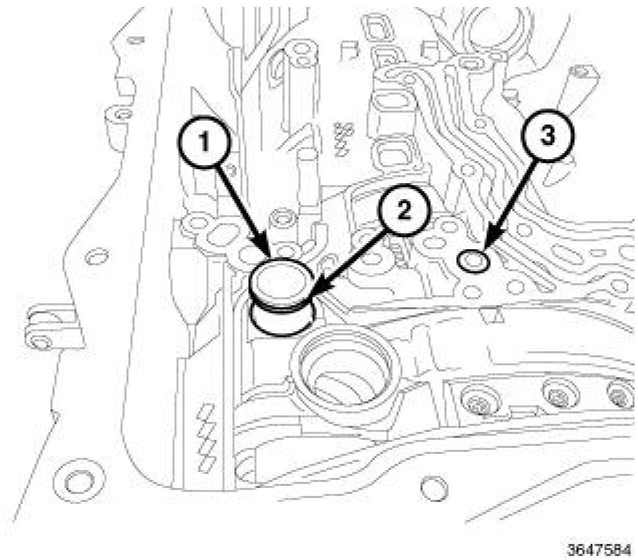


Fig. 124: Fluid Port, Two O-Rings, Compression Seal
Courtesy of CHRYSLER GROUP, LLC

59. Install a **NEW** compression seal (3) into the transmission case.
60. Install the fluid port (1) with **NEW** O-rings to the transmission case.

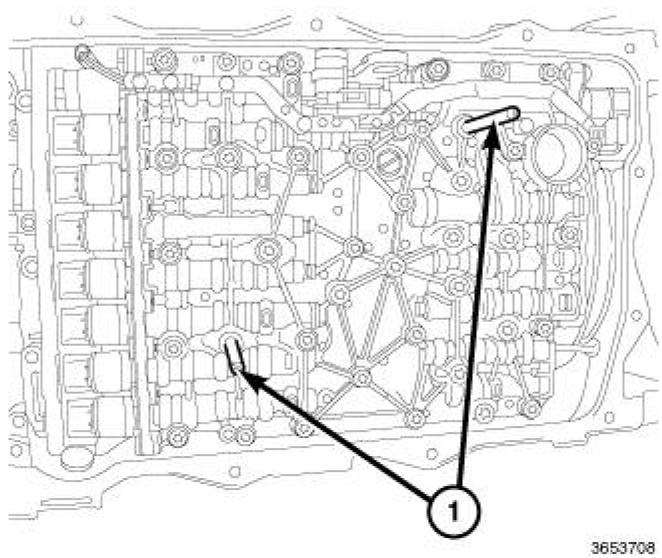

Fig. 125: Valve Body Alignment Pins
Courtesy of CHRYSLER GROUP, LLC

61. Install the (special tool #10379, Pins, Valve Body Alignment) (1) in the transmission case as guides for the valve body assembly.

NOTE: **Make sure the shift fork lines up properly.**

62. Using the valve body alignment pins (1) to guide, position the valve body assembly to the transmission.

NOTE: After several bolts have been hand tightened, remove the guide pins (1).

63. Install the fourteen valve body assembly retaining bolts and hand tighten.

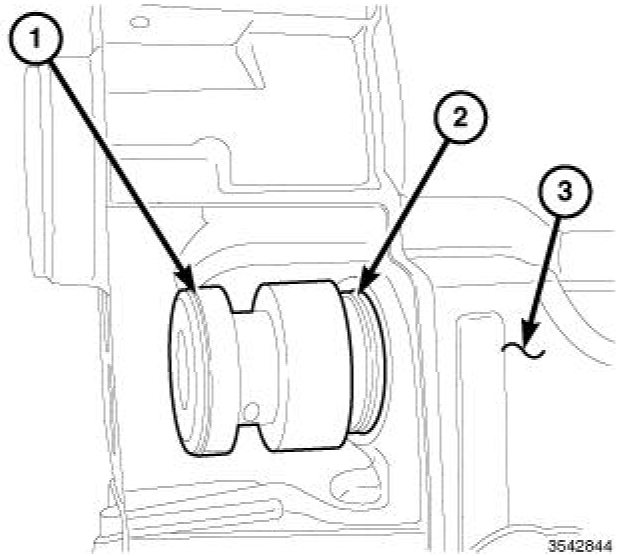

Fig. 126: Remover/Installer, Guide Sleeve, Electrical Harness Insulator & Transmission Case
Courtesy of CHRYSLER GROUP, LLC

64. Using (special tool #10377, Remover/Installer, Guide Sleeve) (1) carefully install the electrical harness insulator (2) into the transmission case (3).

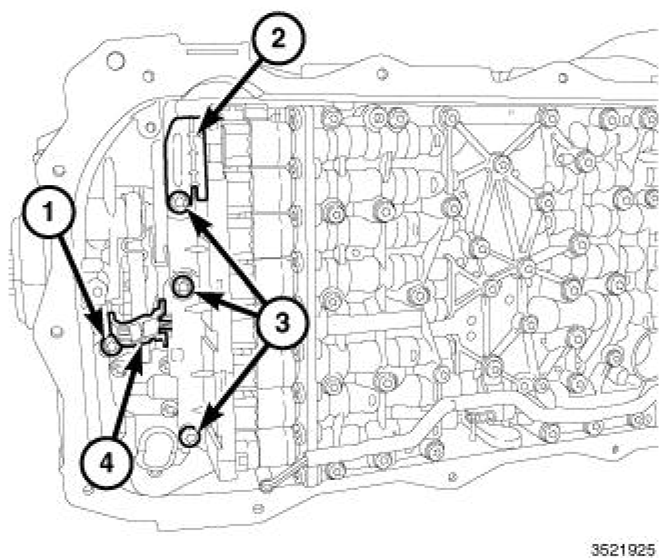

Fig. 127: Valve Body Assembly End Retainer Bolts
Courtesy of CHRYSLER GROUP, LLC

65. Install the sensor (4) and the sensor retaining bolt (1) and hand tighten.
66. Latch the electrical connector insulator lock (2) by pushing in.

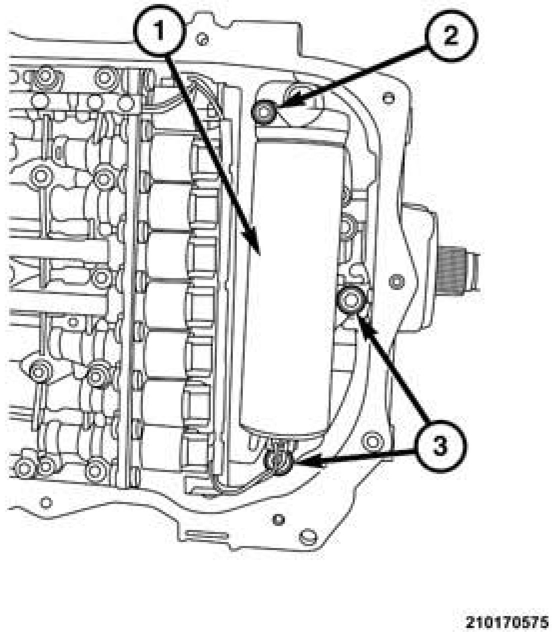

Fig. 128: Hydraulic Impulse Storage Unit & Bolts
Courtesy of CHRYSLER GROUP, LLC

67. If equipped, install the Hydraulic Impulse Storage Unit (H.I.S.).
68. Tighten the bolts (2 and 3) to the proper specification. Refer to **TORQUE SPECIFICATIONS**.
69. Install the valve body assembly end retainer bolts (3) and hand tighten.

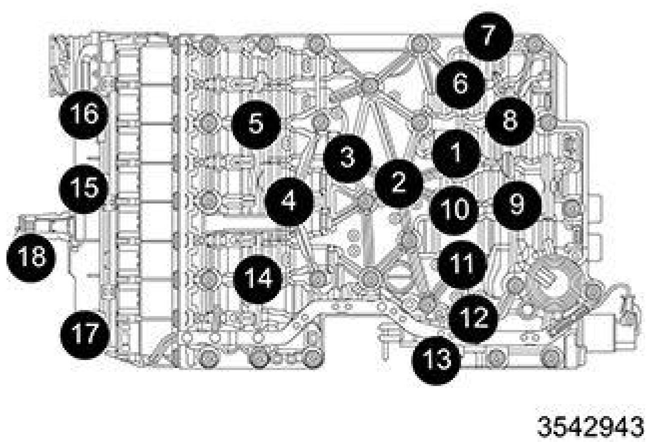

Fig. 129: Valve Body Bolts Loosening And Tightening Sequence
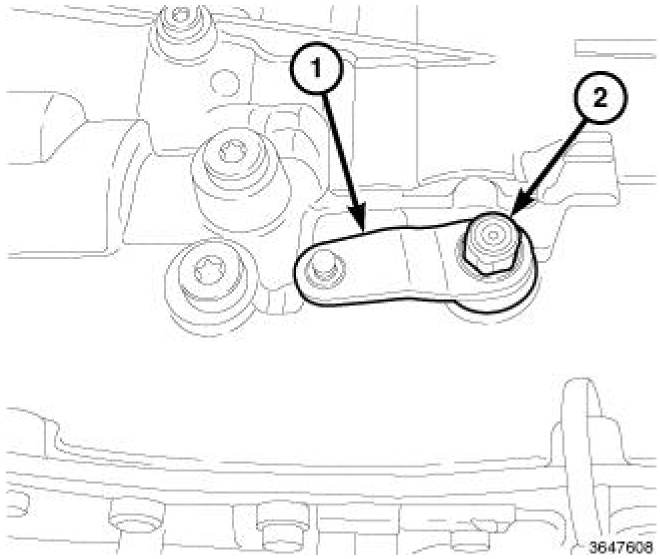
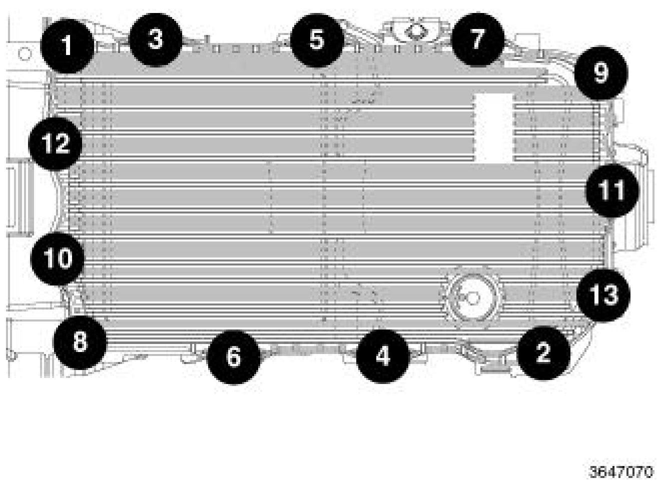
Courtesy of CHRYSLER GROUP, LLC

70. Tighten the valve body assembly retaining bolts 1-18 in the sequence shown in illustration to 6 N.m (53 in. lb.).



[Fig. 130: Manual Park Release Lever Retaining Nut & Lever](#)
Courtesy of CHRYSLER GROUP, LLC

71. Remove the tie strap and return the MPR lever (1) to the original position.
72. Install the nut (2) and tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS**.



[Fig. 131: Oil Pan Retaining Bolts Tightening Sequence](#)
Courtesy of CHRYSLER GROUP, LLC

73. Position the oil pan and gasket.
74. Install the thirteen oil pan retaining bolts and using the sequence shown in illustration and tighten to 10 N.m (89 in. lb.).
75. Install the transmission output shaft washer.

CAUTION: The seal must be installed flush with the case. Driving the seal deeper could damage the seal causing a leak.

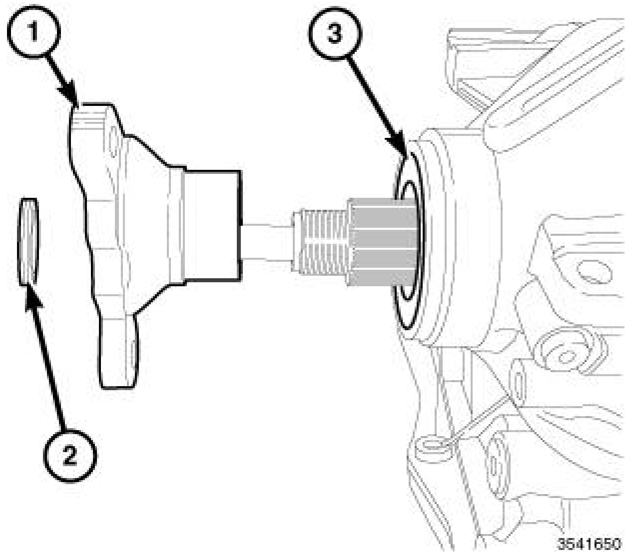


Fig. 132: Propeller Shaft Flange, Rear Dust Seal & Rear Oil Seal
Courtesy of CHRYSLER GROUP, LLC

76. Position the **NEW** output shaft seal (3) over the output shaft and against the transmission case.
77. Using (special tool #8481, Installer, Gear) install the output shaft seal.
78. Install the transmission rear dust seal (2).
79. Install the drive shaft flange (1).

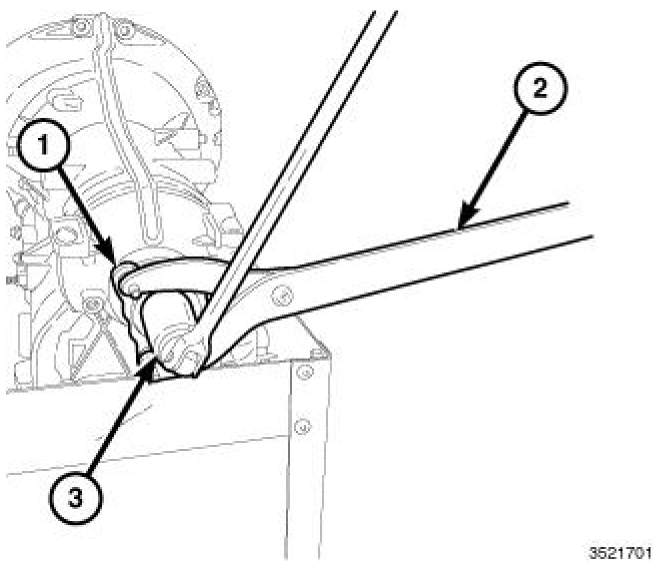

Fig. 133: Flange, Flange Holder & Socket
Courtesy of CHRYSLER GROUP, LLC

80. Install the **NEW** drive shaft flange nut and washer using a 34 mm 12 point socket (3) and (special tool #C-3281, Holder, Flange) (2) to hold the flange (1). Tighten to the proper specification. Refer to TORQUE SPECIFICATIONS.
81. Stake the nut.

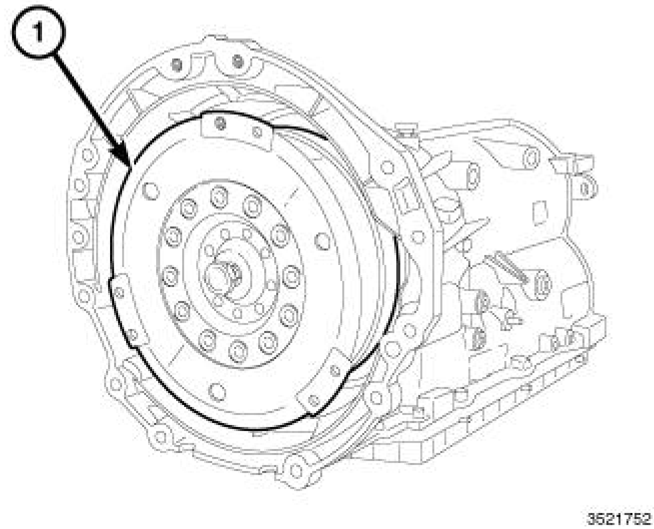

Fig. 134: Torque Converter
Courtesy of CHRYSLER GROUP, LLC

82. Install the torque converter (1). Refer to **TORQUE CONVERTER, INSTALLATION**.
83. Before installing the transmission in the vehicle, pre-fill the transmission as outlined in FILL TRANSMISSION AFTER SERVICE. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

INSTALLATION

INSTALLATION

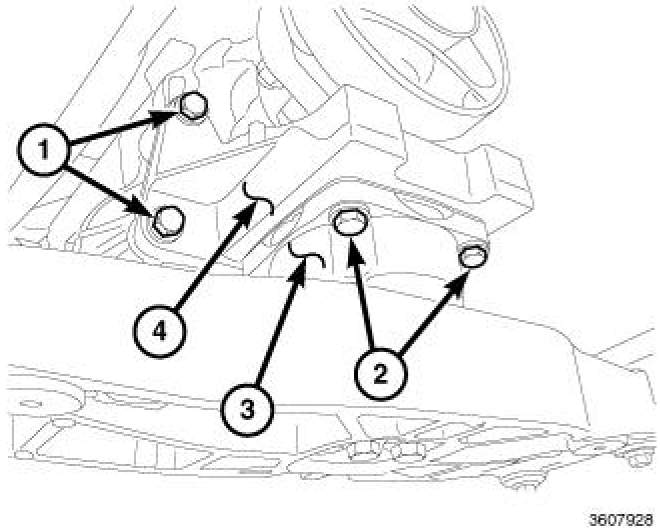
CAUTION: **When supporting or lifting the transmission at the oil pan the weight of the transmission must be distributed evenly on the lifting fixture. Failure to do so could damage the oil pan and transmission.**

NOTE: **Make sure that the transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.**

NOTE: **If the transmission is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the TRANSMISSION VERIFICATION TEST**

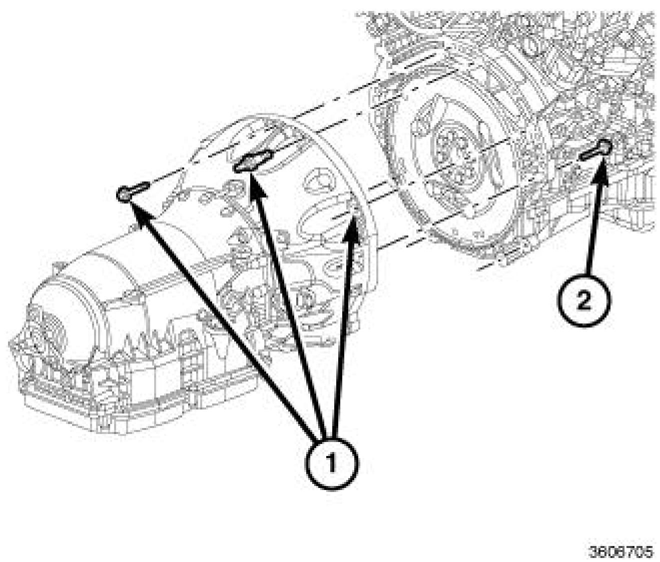
Refer to TRANSMISSION VERIFICATION TEST .

1. Install the torque converter. Refer to **TORQUE CONVERTER, INSTALLATION**.



[Fig. 135: Transmission Mount Bolts & Transmission Mount]
Courtesy of CHRYSLER GROUP, LLC

2. Position the adapter bracket (4) in place, install the adapter bracket bolts (1) and tighten to the proper specification. Refer to **SPECIFICATIONS**.
3. Position the transmission mount (3) in place, install the transmission mount bolts (2) and tighten to the proper specification. Refer to **SPECIFICATIONS**.



[Fig. 136: Upper Transmission To Engine Bolts]
Courtesy of CHRYSLER GROUP, LLC

NOTE: Hold torque converter in place during transmission installation.

4. Position the transmission to the vehicle.
5. Install the upper transmission to engine bolts (1, 2). Do not tighten at this time.

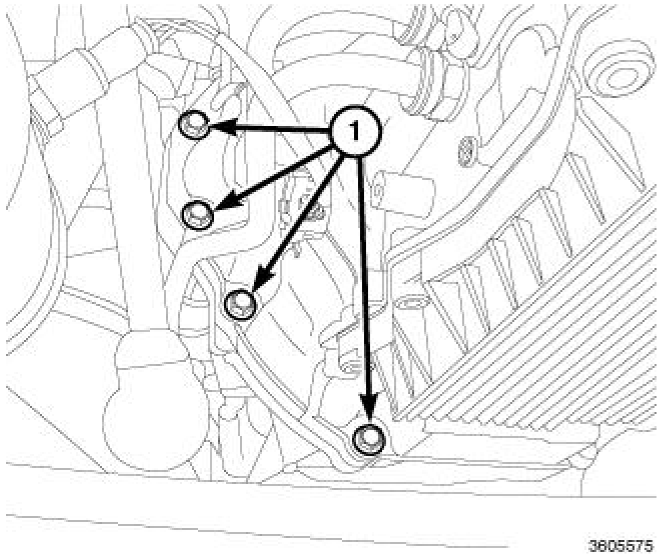


Fig. 137: Bell Housing Bolts (LH)
Courtesy of CHRYSLER GROUP, LLC

6. Install the Left Hand (LH) transmission to engine bolts (1). Do not tighten at this time.

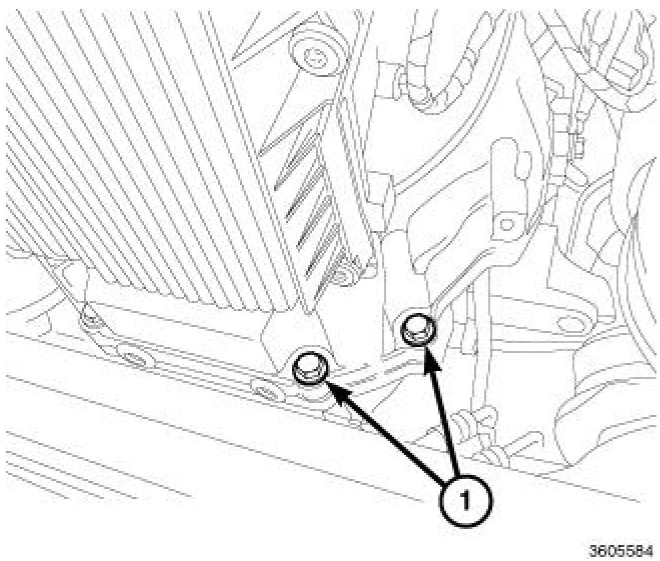

Fig. 138: Bell Housing Bolts (RH)
Courtesy of CHRYSLER GROUP, LLC

7. Install the Right Hand (RH) transmission to engine bolts (1). Tighten all the transmission to engine bolts to the proper specification. Refer to **SPECIFICATIONS**.

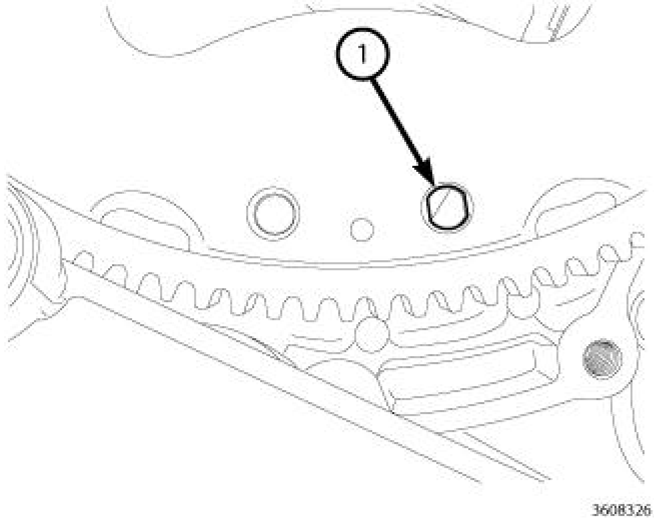

Fig. 139: Alignment Hole
Courtesy of CHRYSLER GROUP, LLC

8. Rotate crankshaft in clockwise direction to line up the alignment hole (1) in the flex plate, then start the first bolt.

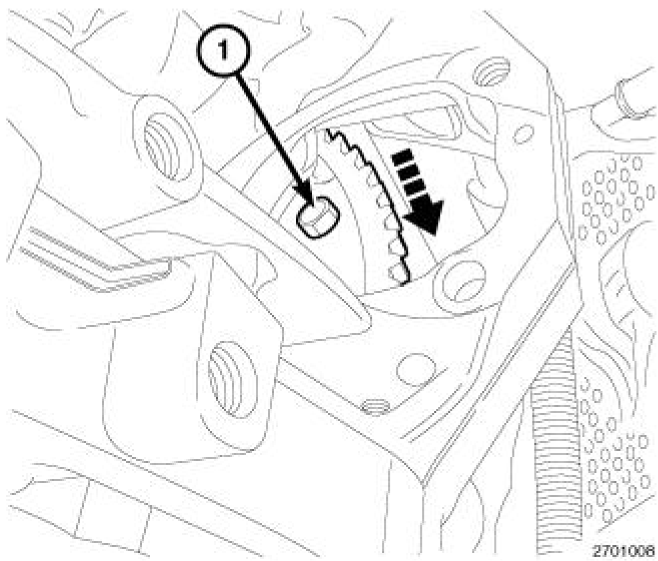

Fig. 140: Torque Converter Bolt
Courtesy of CHRYSLER GROUP, LLC

9. Rotate the crankshaft clockwise until the torque converter bolts (1) are accessible. There are three sets of two bolts 120Â° apart. Install the remaining torque converter bolts and tighten to the proper specification. Refer to **SPECIFICATIONS**.

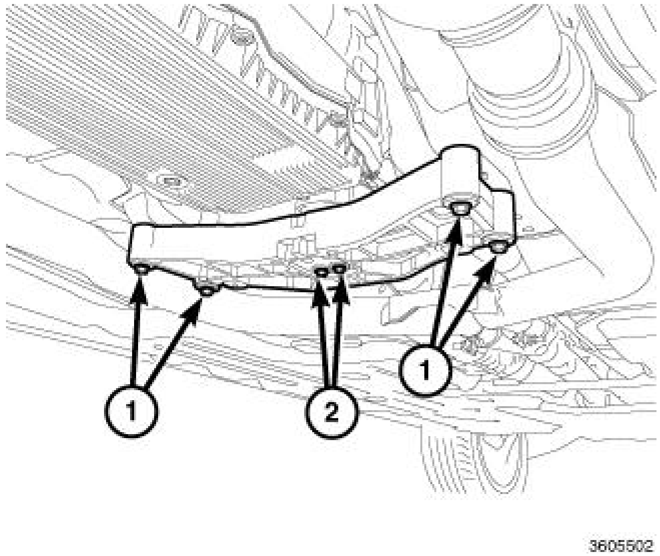

Fig. 141: Crossmember & Bolts
Courtesy of CHRYSLER GROUP, LLC

10. Position the crossmember in place and install the crossmember bolts (1) and tighten to the proper specification. Refer to **SPECIFICATIONS**.
11. Install the transmission mount bolts (2) and tighten to the proper specification. Refer to **SPECIFICATIONS**.

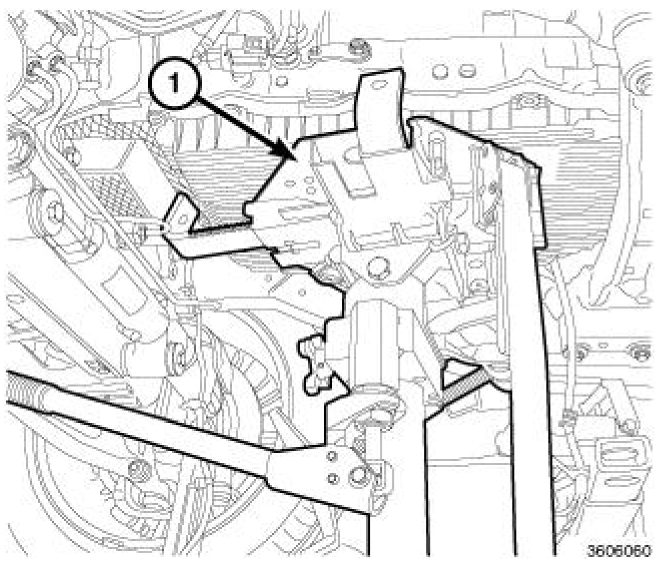

Fig. 142: Service Jack
Courtesy of CHRYSLER GROUP, LLC

12. Remove the transmission jack (1).

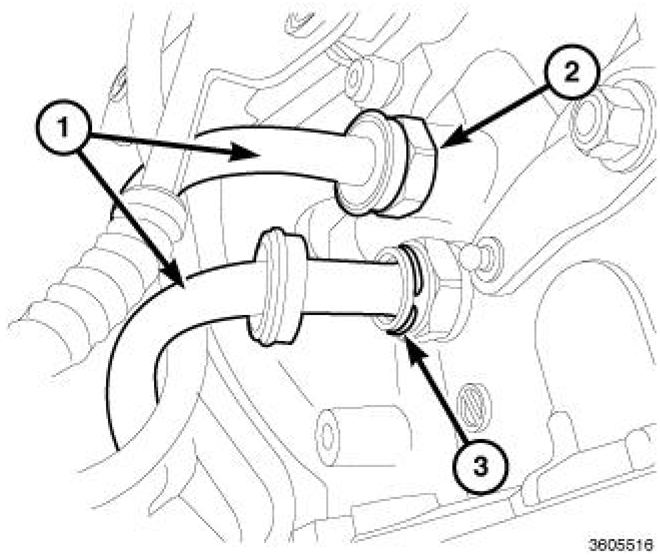

Fig. 143: Transmission Fluid Cooler Lines, Clips & Fittings
Courtesy of CHRYSLER GROUP, LLC

13. Connect transmission fluid cooler lines (1) to the transmission fittings (2) and install the clips (3).

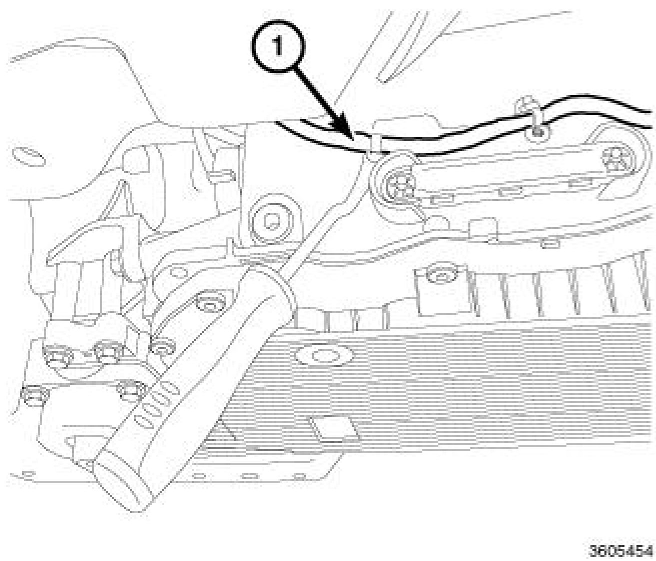

Fig. 144: Wiring Harness
Courtesy of CHRYSLER GROUP, LLC

14. Connect the wiring harness (1) push pins to the transmission.

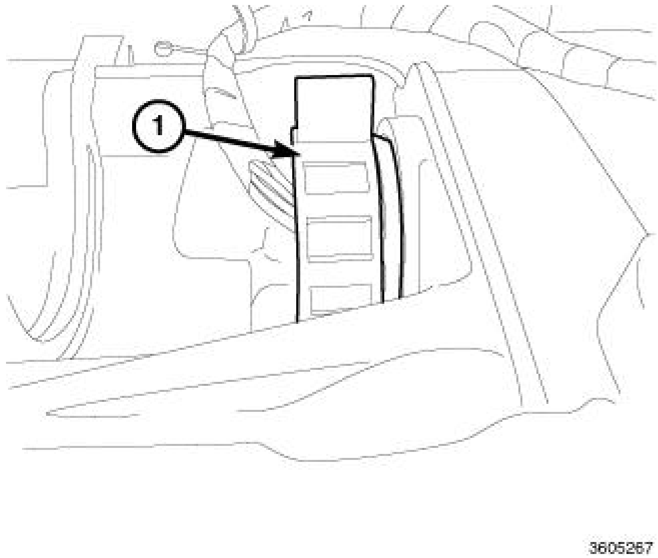

Fig. 145: Adapter Plug Connector
Courtesy of CHRYSLER GROUP, LLC

15. Connect the transmission wire harness connector (1) to the transmission.

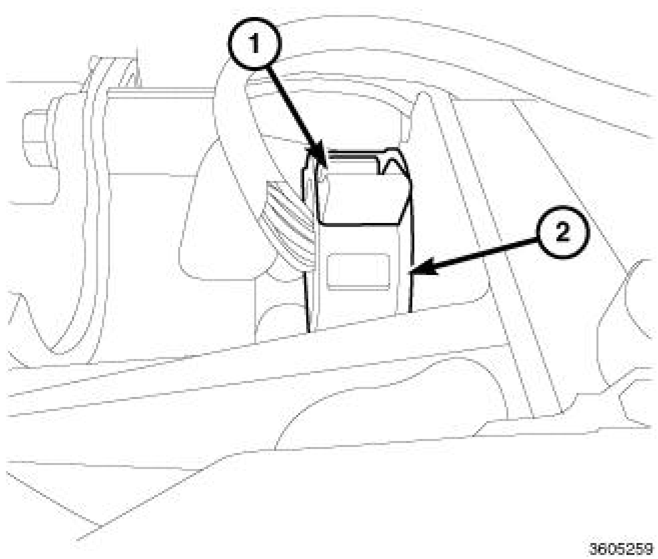

Fig. 146: Locking Mechanism Lock & Adapter Plug Connector
Courtesy of CHRYSLER GROUP, LLC

16. Turn the locking mechanism lock (1) of the transmission wire harness connector (2) clockwise to secure.

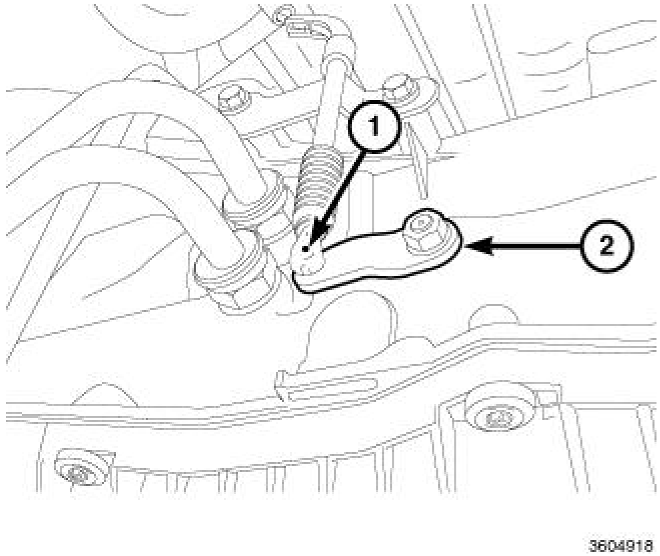

Fig. 147: Manual Park Release Cable & Lever
Courtesy of CHRYSLER GROUP, LLC

17. Connect the parking pawl release cable (1) to the lever (2).

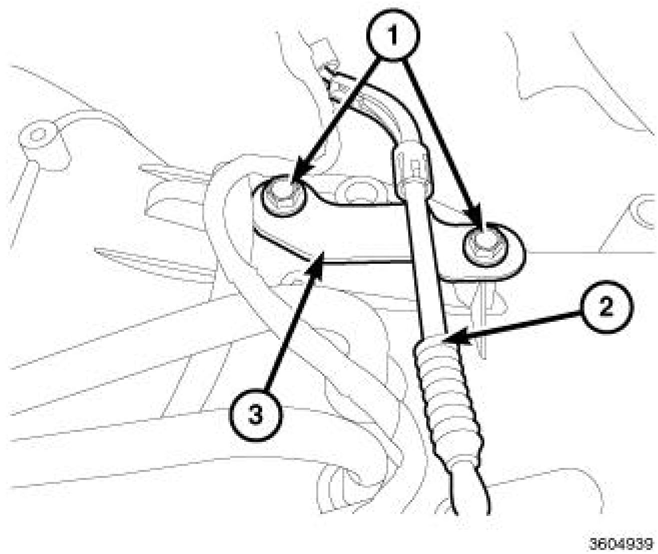

Fig. 148: Bolts, Manual Park Release Cable Bracket & Bracket/Cable
Courtesy of CHRYSLER GROUP, LLC

18. Position the manual park release cable bracket/cable (2, 3), install the bolts (1) and tighten to the proper specification. Refer to **SPECIFICATIONS**.
19. Install the starter. Refer to **STARTER, INSTALLATION** .
20. Install the drive shaft. Refer to **INSTALLATION** .
21. Install the exhaust. Refer to **RESONATOR, EXHAUST, INSTALLATION** .
22. Connect the right and left bank up stream oxygen sensors.
23. Connect the negative battery cable.
24. Perform the STANDARD PROCEDURE - TRANSMISSION FILL AFTER SERVICE. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

25. If the valve body is replaced, program the Transmission Control Module (TCM). Refer to **MODULE, TRANSMISSION CONTROL, MODULE PROGRAMMING** .
26. Perform the TRANSMISSION VERIFICATION TEST. Refer to **TRANSMISSION VERIFICATION TEST** .

	10376 - Installer, Input Shaft Needle Bearing (Originally Shipped In Kit Number(s) 10394A, 10394-UPD.)

CABLE, MANUAL PARK RELEASE

OPERATION

OPERATION

The 8HP utilizes a fully electronic shifter mechanism with no physical connections to the transmission such as shifter linkage or cables. Due to this design the park function of the transmission is performed using electronic inputs and hydraulic pressure to hold to parking pawl lever in the disengaged position while moving. Once in park this hydraulic pressure is reduced which allows the lever to engage the parking pawl which in turn keeps the vehicle from rolling forward or rearward.

Should the vehicle or any component of the E-Shifter lose power or communication the parking pawl will be engaged and the vehicle cannot be moved. To move the vehicle there is a manual park release mechanism that will allow first responders to disengage the parking pawl and allow the vehicle to be moved further facilitating vehicle recovery such as towing or moving the vehicle to allow jump starting.

REMOVAL

MANUAL PARK RELEASE CABLE

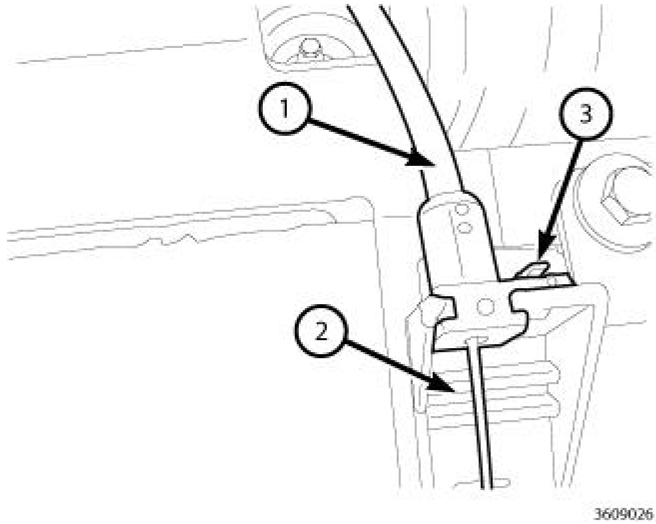

Fig. 149: Cable, Housing & Release Tab
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Apply the parking brake.
3. Remove the Manual Park Release (MPR) lever cover.
4. Disconnect the MPR cable (1) from the housing (2), while holding the release tab (3) open.
5. Disconnect the MPR cable from the lever.
6. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

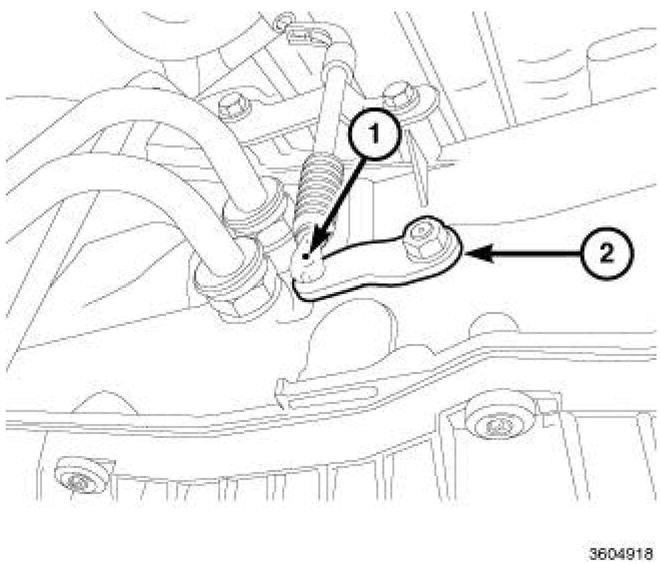

Fig. 150: Manual Park Release Cable & Lever
Courtesy of CHRYSLER GROUP, LLC

7. Disconnect the MPR cable (1) from the MPR lever (2).

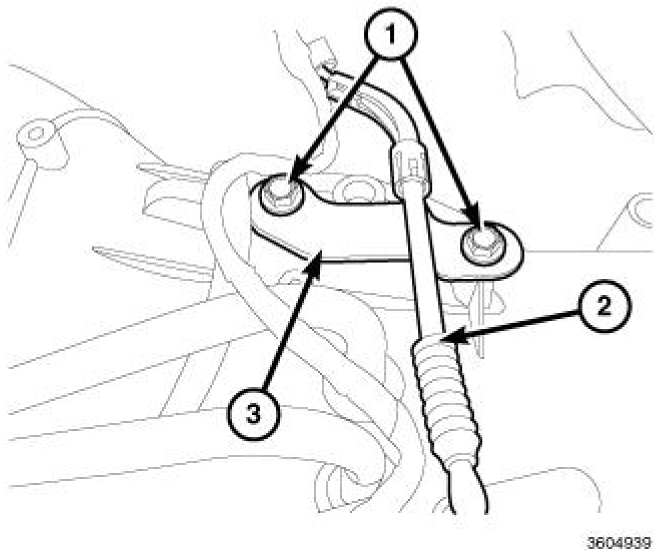

Fig. 151: Bolts, Manual Park Release Cable Bracket & Bracket/Cable
Courtesy of CHRYSLER GROUP, LLC

8. Remove the MPR cable bracket bolts (1) and remove the MPR cable (2) from the vehicle.

INSTALLATION

MANUAL PARK RELEASE CABLE

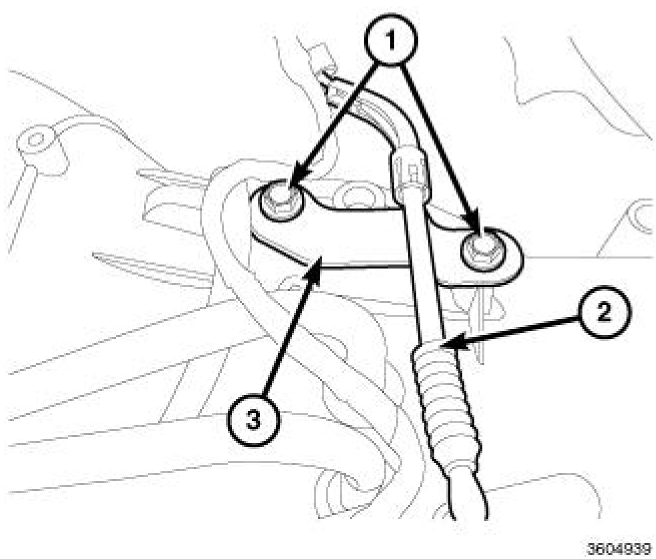

Fig. 152: Bolts, Manual Park Release Cable Bracket & Bracket/Cable
Courtesy of CHRYSLER GROUP, LLC

1. Install the Manual Park Release (MPR) cable (2) in the vehicle. Install the MPR cable bracket bolts (1) and tighten to the proper specification. Refer to SPECIFICATIONS.

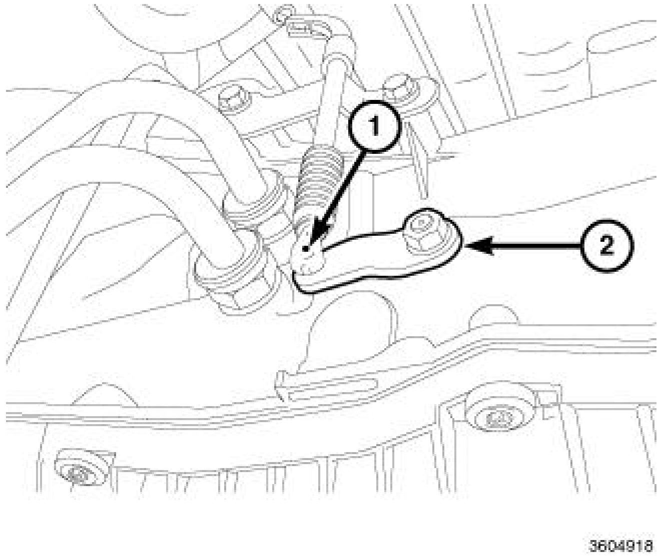

Fig. 153: Manual Park Release Cable & Lever
Courtesy of CHRYSLER GROUP, LLC

2. Connect the MPR cable (1) to the MPR lever (2).
3. Lower the vehicle.

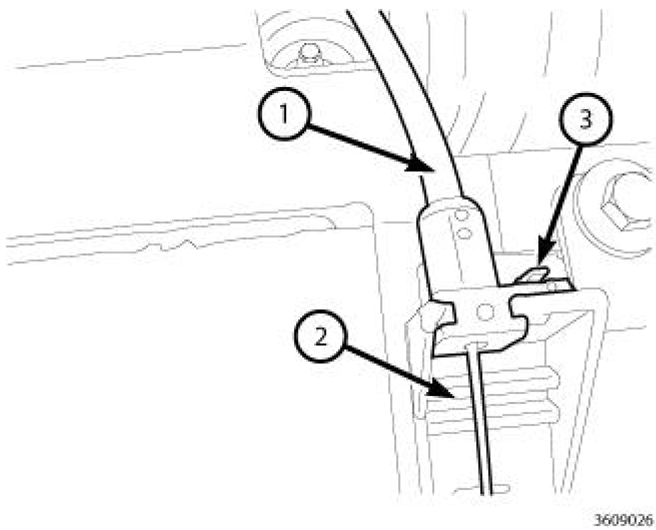

Fig. 154: Cable, Housing & Release Tab
Courtesy of CHRYSLER GROUP, LLC

4. Connect the MPR cable (2) to the MPR lever.
5. Connect the MPR cable (1) to the housing.
6. Install the MPR cover.
7. Connect the negative battery cable.

CLUTCH, A

DISASSEMBLY

CLUTCH A DISASSEMBLY

FLUID AND FILTER

DESCRIPTION

DESCRIPTION

FILTER SERVICE

The 8HP has a conventional fluid sump design, however, the filter is integrated into the oil pan resulting in a lower profile for improved vehicle packaging. The oil pan gasket is reusable providing it is not damaged during removal.

STANDARD PROCEDURE

STANDARD PROCEDURE - CHECK OIL LEVEL

To properly check and fill the transmission, perform the following procedure:

WARNING: **There is a risk of accident from vehicle moving when the engine is running. Secure vehicle to prevent it from moving. There is a risk of injury from contusions and burns if you insert your hands into the engine when it is running. Do not touch hot or rotating parts. Wear properly fitted work clothes.**

CAUTION: **A unique transmission fluid has been developed for this transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid, see FLUIDS, LUBRICANTS AND GENUINE PARTS located in owners manual.**

NOTE: **Oil dye is not required to find leaks in the 8HP transmission. The oil dye can cause shift quality issues and is not recommended. The 8HP fluid has illuminance that is visible under a black light.**

1. Raise and support the vehicle **on a level hoist** . Refer to **HOISTING, STANDARD PROCEDURE** .
2. Start the engine. The engine must continue to run for the entire test.
3. Using a scan tool or the vehicle information center, verify that the transmission fluid temperature is below 30Â°C (86Â°F).
4. Remove the transmission fill plug from the right rear of the transmission case.
5. Add transmission fluid until it trickles from the fill opening.
6. Install the transmission fill plug and tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS**.
7. Lower the vehicle for access to inside of the vehicle, leaving the tires at least 8 inches off the ground.
8. With the brakes applied, place the transmission in Reverse and hold for 5 seconds.
9. Place the transmission in Drive and hold for 5 seconds.
10. Release the brakes, slowly accelerate to 2nd gear and hold for 5 seconds.
11. Apply the brakes and place the transmission in Neutral.
12. Raise the engine speed to 2000 RPM for 5 seconds.
13. Return the engine to idle and place the transmission in Park.

NOTE: **A full transmission will have fluid at the fill hole with the transmission**

between 30Ā°C (86Ā°F) and 50Ā°C (122Ā°F). Do not over fill.

14. Remove the transmission fill plug and allow excess fluid to drain from fill hole or add fluid as necessary.
15. Install the transmission fill plug and tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS**.
16. Using a scan tool, clear any DTCs.

STANDARD PROCEDURE - TRANSMISSION FILL AFTER SERVICE

CAUTION: **A unique transmission fluid has been developed for this transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid, see FLUIDS, LUBRICANTS AND GENUINE PARTS located in owners manual.**

NOTE: **Tracer dye is not required to find leaks in the 8HP45 transmission.**

Tracer dye cannot be used in 8HP45 transmissions, poor shift quality will result.

The 8HP45 fluid has illuminance that is visible under a black light.

To Properly Fill The Transmission After An In Vehicle Service Or Overhaul, Perform The Following Procedure:

- If only the transmission cooler was replaced, add 0.7L (0.72 qt.) of transmission fluid.
- **If the transmission was overhauled (torque converter empty)** , prior to installing it in the vehicle, tip the transmission on its side, remove the oil fill plug on the right rear side of the case and install 9L (9.5 qts) of transmission fluid. Install the fill plug. After installing the transmission, perform the CHECK OIL LEVEL procedure. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
- **If an in vehicle service was performed** , raise the vehicle on a suitable hoist with the vehicle level in all planes. Refer to **HOISTING, STANDARD PROCEDURE** . With the engine off, remove the fill plug and fill until fluid starts flowing back out of the fill hole (approximately 4 quarts). Start the engine and with the transmission still **COLD** add fluid until fluid starts flowing back out of the fill hole. Install Fill Plug and then perform the CHECK OIL LEVEL procedure Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

STANDARD PROCEDURE - FLUID/FILTER SERVICE

NOTE: **Oil dye is not required to find leaks in the 8HP45 transmission. The oil dye can cause shift quality issues and is not recommended. The 8HP45 fluid has illuminance that is visible under a black light.**

NOTE: **The oil pan and filter are an integrated assembly that cannot be serviced separately.**

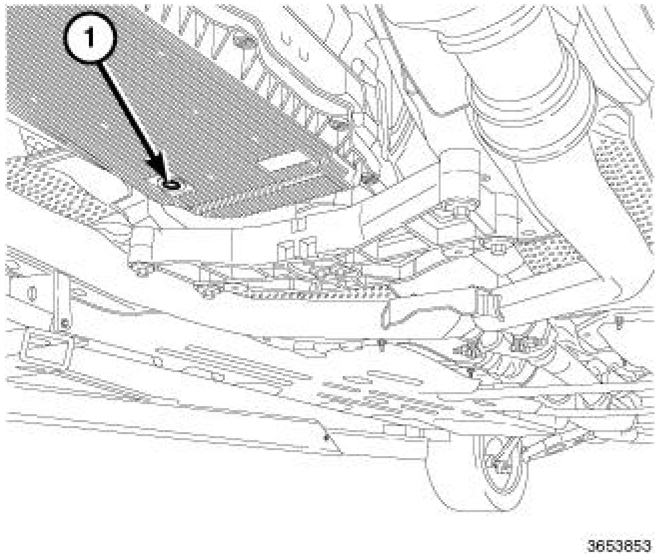

Fig. 240: Transmission Oil Pan Plug
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the transmission drain plug and allow the transmission to drain.

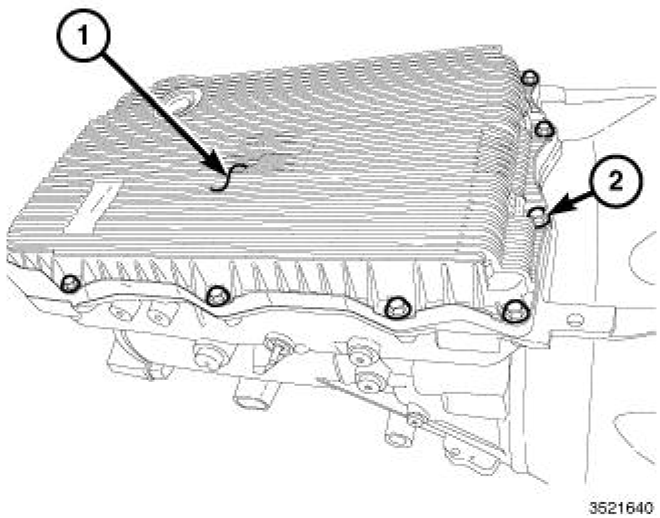

Fig. 241: Thirteen Oil Pan Retaining Bolts
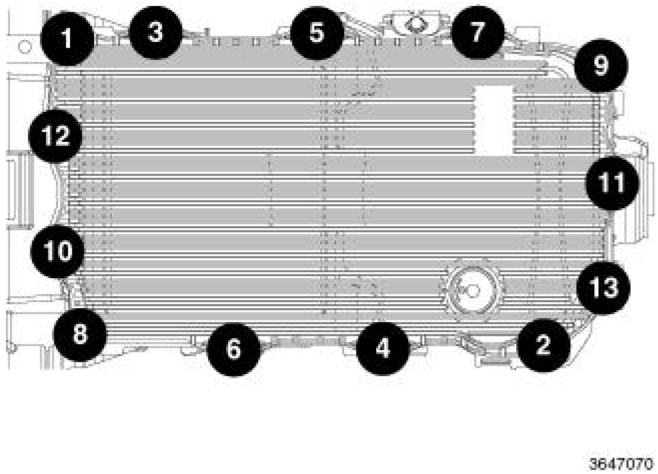
Courtesy of CHRYSLER GROUP, LLC

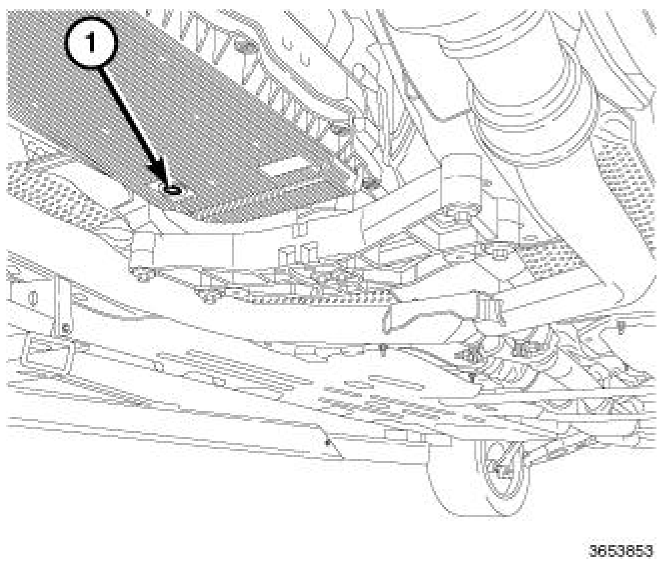
NOTE: Inspect the gasket for reuse. If the seal is cut or torn, replace the gasket.

3. Remove the 13 transmission oil pan bolts (2).
4. Remove the transmission oil pan (1) and gasket. If the transmission oil pan is being removed for contamination concerns discard the pan.
5. Install the **NEW** transmission oil pan (1) and gasket.



[Fig. 242: Oil Pan Retaining Bolts Tightening Sequence]
Courtesy of CHRYSLER GROUP, LLC

6. Install the 13 transmission oil pan bolts and tighten to 10 N.m (89 in. lbs.) using the sequence given.



[Fig. 243: Transmission Oil Pan Plug]
Courtesy of CHRYSLER GROUP, LLC

7. Inspect and adjust the fluid level. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
8. Lower the vehicle.

LEVER, MANUAL PARK RELEASE

REMOVAL

REMOVAL

1. Remove the shifter bezel storage bin liner.
2. Remove the Manual Park Release (MPR) lever bolts.

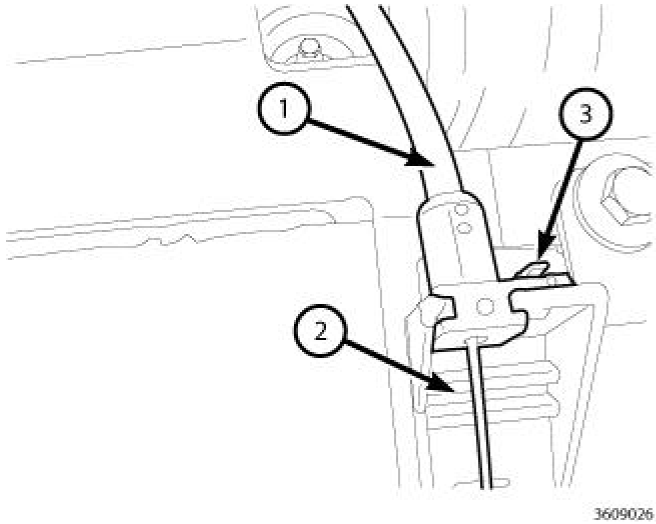


Fig. 244: Cable, Housing & Release Tab
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the MPR cable (1) from the housing (2), while holding the release tab (3) open.
4. Remove the MPR cable (1) from the MPR lever and remove the MPR lever from the vehicle.

INSTALLATION

INSTALLATION

1. Connect the Manual Park Release (MPR) cable to the MPR lever.
2. Install the MPR lever bolts and tighten to the proper specification. Refer to **SPECIFICATIONS**.

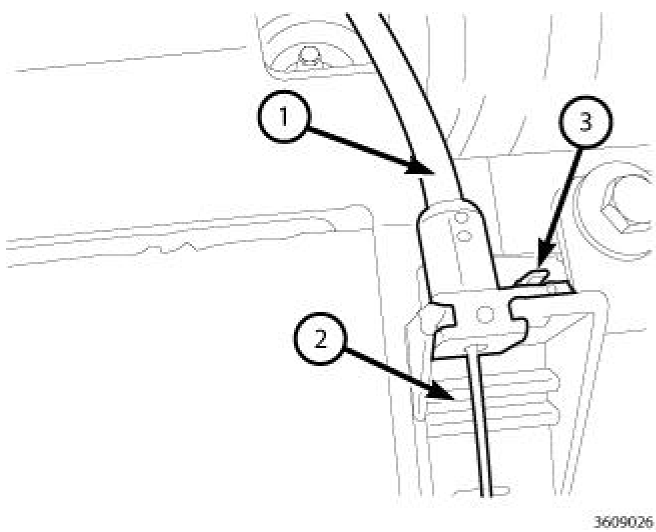

Fig. 245: Cable, Housing & Release Tab
Courtesy of CHRYSLER GROUP, LLC

3. Connect the MPR cable (1) to the housing (2) and make sure the locking tab (3) is locked.
4. Install the shifter bezel storage bin liner.

PUMP, TRANSMISSION OIL

DESCRIPTION

DESCRIPTION

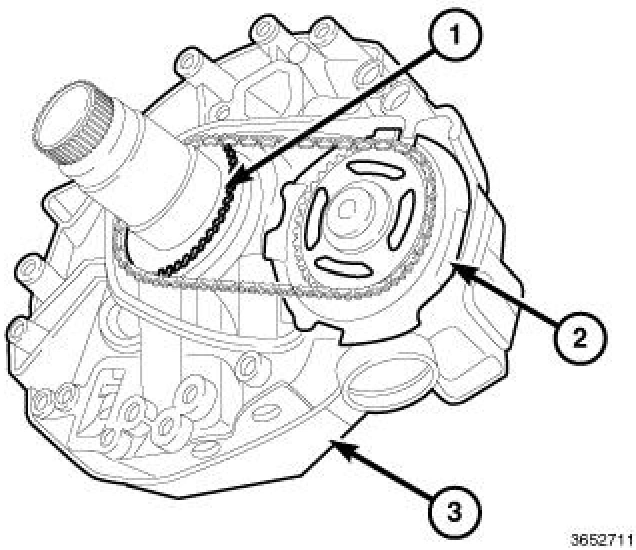

Fig. 246: Transmission Oil Pump, Chain And Sprocket & Oil Pump Housing
Courtesy of CHRYSLER GROUP, LLC

The transmission oil pump (2) is driven by a chain and sprocket (1). The oil pump is located just behind the torque converter, inside of the pump housing (3). The pump is a double-stroke vane pump. The pump has dual chambers, two inlet and two outlet ports. The pump provides necessary lubrication and cooling throughout all phases of transmission operation.

OPERATION

OPERATION

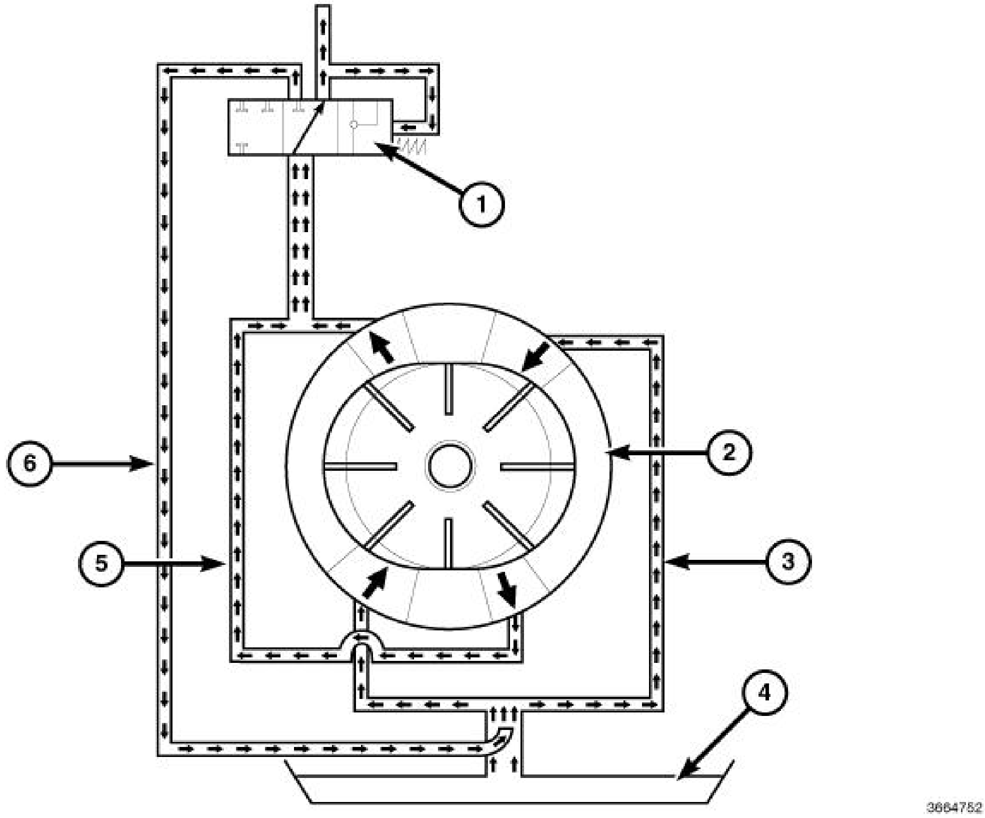

Fig. 247: Transmission Oil Pump Flow Diagram
Courtesy of CHRYSLER GROUP, LLC

1- SYSTEM PRESSURE VALVE	4 - SUMP
2 - PUMP	5 - PRESSURE PIPE
3 - INTAKE PIPE	6 - RETURN OF REDUNDANT OIL

The transmission oil pump is driven by a chain and sprocket. The oil pump has two intake ports and two exhaust ports. The pump draws fluid through a filter and pressurizes the fluid as the pump rotates. After the fluid is pressurized, it exits the pump through two exhaust ports that feed the system pressure valve. The system pressure valve maintains fluid pressure and allows excess pressure to return to the pump. This reduces cavitation and noise.

REMOVAL

TRANSMISSION OIL PUMP

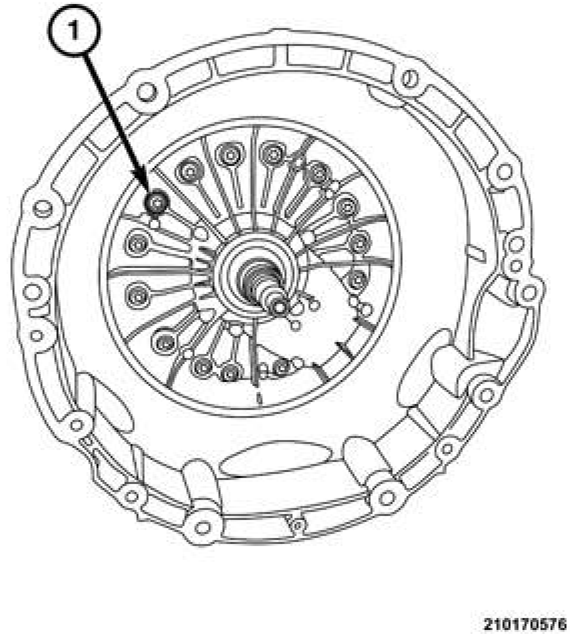

Fig. 248: Oil Pump Assembly To Case Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Remove the transmission. Refer to **REMOVAL**.
2. Remove the valve body. Refer to **VALVE BODY, REMOVAL**.
3. Remove the 13 oil pump assembly to case bolts (1).

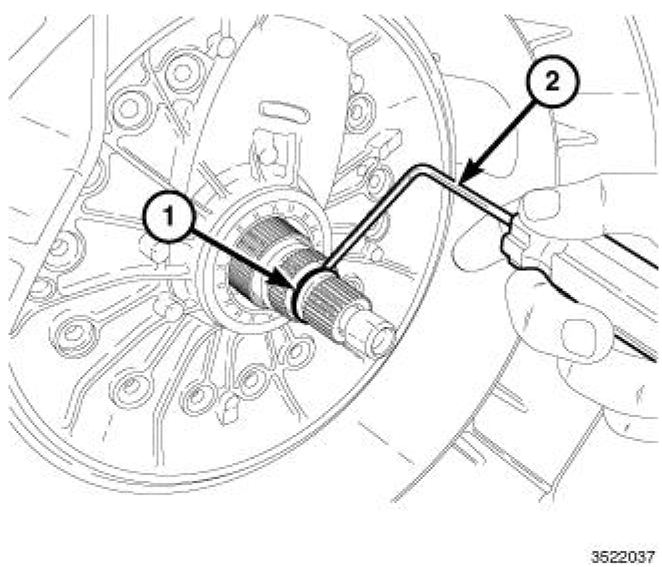

Fig. 249: Input Shaft O-Ring & Small Pick
Courtesy of CHRYSLER GROUP, LLC

4. Remove the input shaft O-ring (1) using a small pick (2) or equivalent and discard.

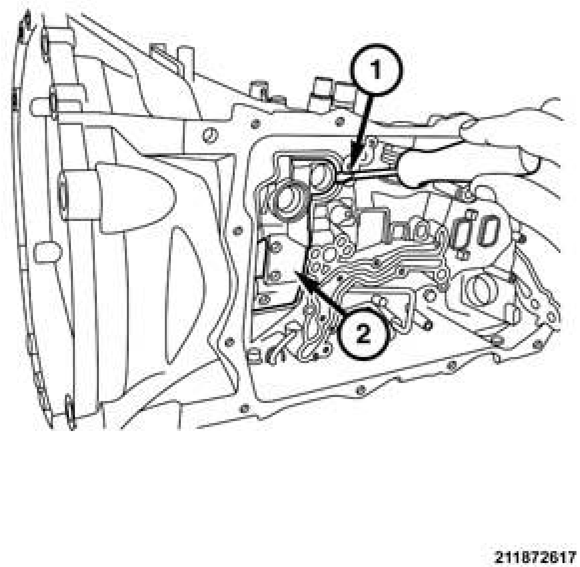

Fig. 250: Prying Oil Pump Housing Away From Case
Courtesy of CHRYSLER GROUP, LLC

5. Carefully pry the oil pump housing (1) away from the case (2) with a small flat blade screwdriver or equivalent through the case opening.
6. From the front of the transmission, remove the oil pump housing.

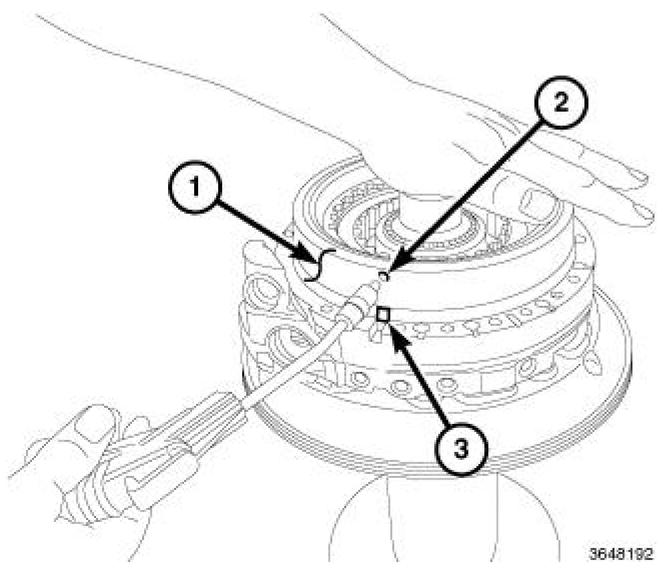

Fig. 251: B-Piston, Hole & B-Piston Alignment Tab
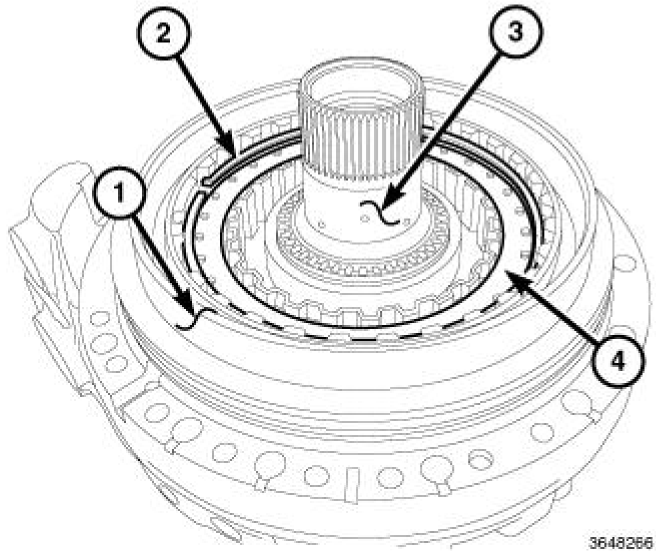
Courtesy of CHRYSLER GROUP, LLC

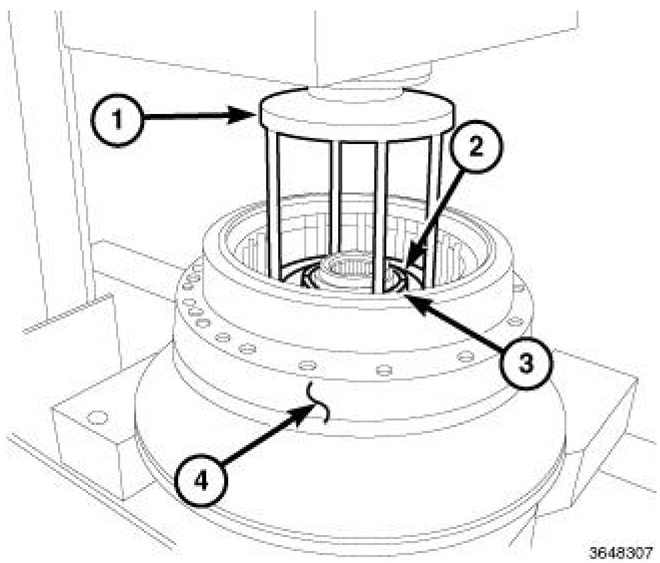
NOTE: **Apply air pressure slowly, oil may spray when B-piston releases from the assembly.**

7. With one hand above B-piston (1), carefully apply air pressure into the hole directly above the B-piston alignment tab (3) to remove B-piston (2) from the assembly.



[Fig. 252: Outer Ring, Snap Ring, Hub & Spacers](#)
Courtesy of CHRYSLER GROUP, LLC

8. Remove the outer ring (1) (inside B-piston).
9. Remove the snap ring (2).
10. Remove the clutches and spacers (4).
11. Remove the hub (3).



[Fig. 253: Oil Pump Housing Assembly](#)
Courtesy of CHRYSLER GROUP, LLC

12. Position the oil pump housing assembly (4) in a suitable press.
13. Using (special tool #8285, Compressor, Spring) (1), press on the fingers of the piston retainer to remove tension on the split retaining ring (2), and remove the two halves of the retaining ring (2).

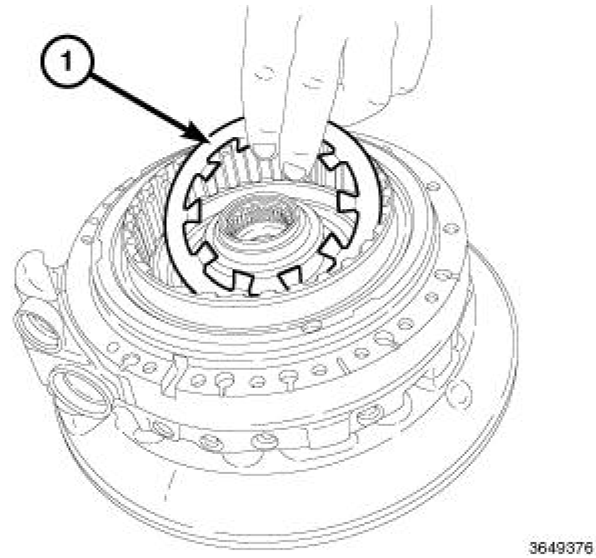


Fig. 254: Piston Retaining Ring And Piston
Courtesy of CHRYSLER GROUP, LLC

14. Remove the piston retainer and plate.

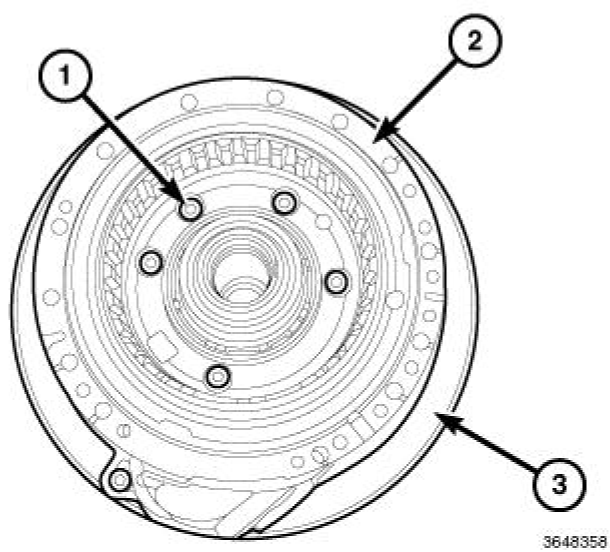

Fig. 255: Six Bolts, Oil Pump Housing & Oil Pump Cover

15. Remove the six bolts (1) and separate the oil pump housing (2) from the front oil pump cover (3).

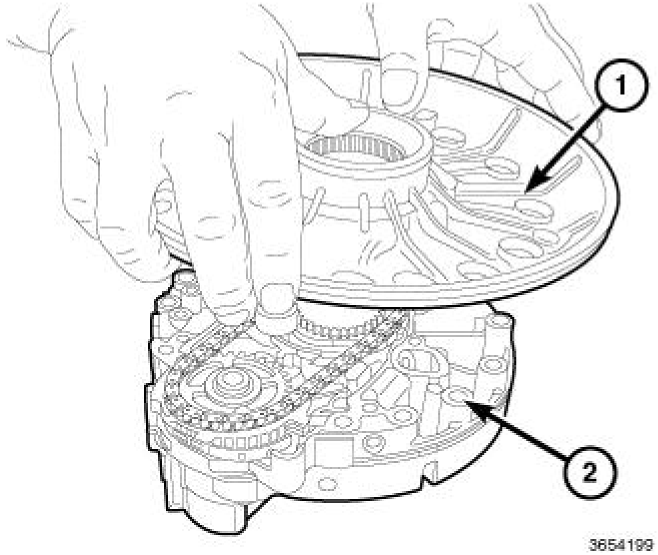

Fig. 256: Front Cover & Oil Pump Housing
Courtesy of CHRYSLER GROUP, LLC

16. Separate the front cover (1) from the oil pump housing (2).

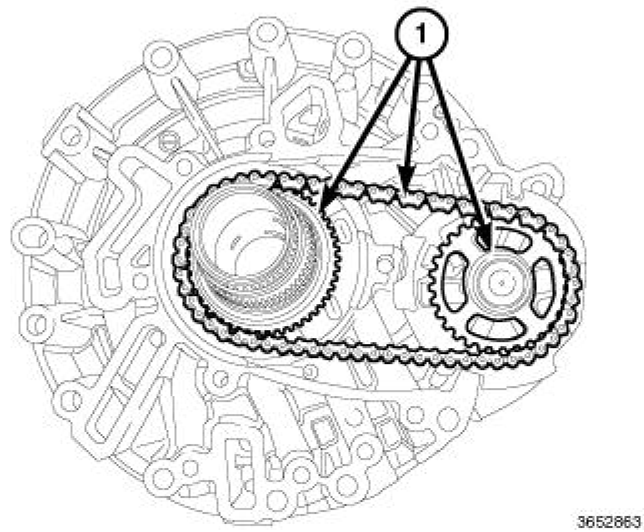

Fig. 257: Drive Sprocket, Chain And Pump Body
Courtesy of CHRYSLER GROUP, LLC

17. Remove the drive sprocket, chain and pump body (1) as an assembly.
18. Remove and discard all O-rings.

DISASSEMBLY

TRANSMISSION OIL PUMP

1. Remove the transmission oil pump. Refer to **PUMP, TRANSMISSION OIL, REMOVAL**.

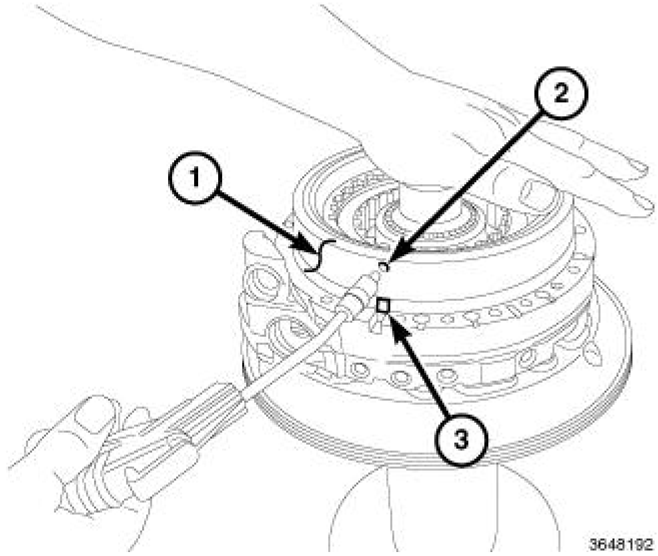

Fig. 258: B-Piston, Hole & B-Piston Alignment Tab
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Apply air pressure slowly, oil may spray when B-piston releases from the assembly.**

2. With one hand above B-piston (1), carefully apply air pressure into the hole directly above the B-piston alignment tab (3) to remove B-piston (2) from the assembly.

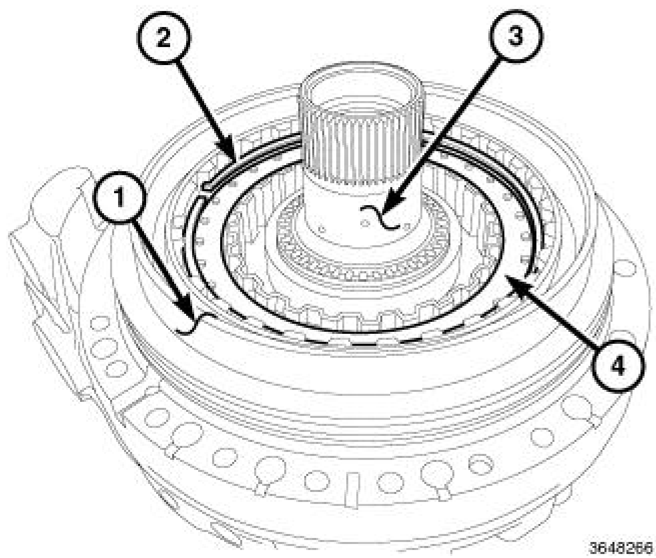

Fig. 259: Outer Ring, Snap Ring, Hub & Spacers
Courtesy of CHRYSLER GROUP, LLC

3. Remove the outer ring (1) (inside B-piston).
4. Remove the snap ring (2).
5. Remove the clutches and spacers (4).
6. Remove the hub (3).

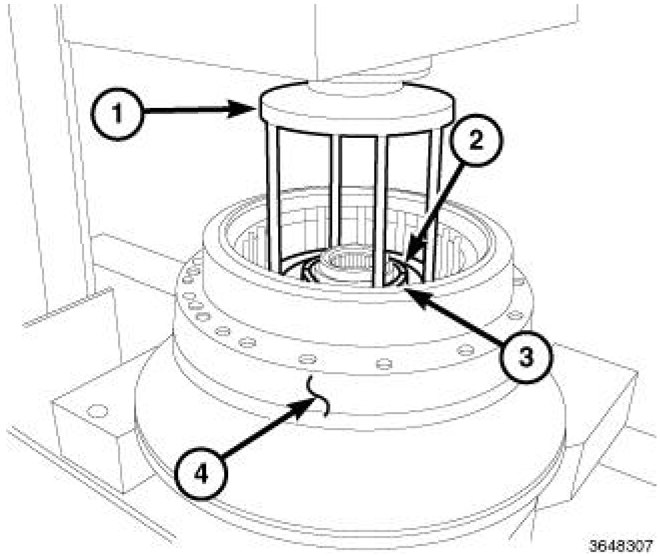

Fig. 260: Oil Pump Housing Assembly
Courtesy of CHRYSLER GROUP, LLC

7. Position the oil pump housing assembly (4) in a suitable press.
8. Using (special tool #8285, Compressor, Spring) (1), press on the fingers of the piston retainer to remove tension on the split retaining ring (2), and remove the two halves of the retaining ring (2).

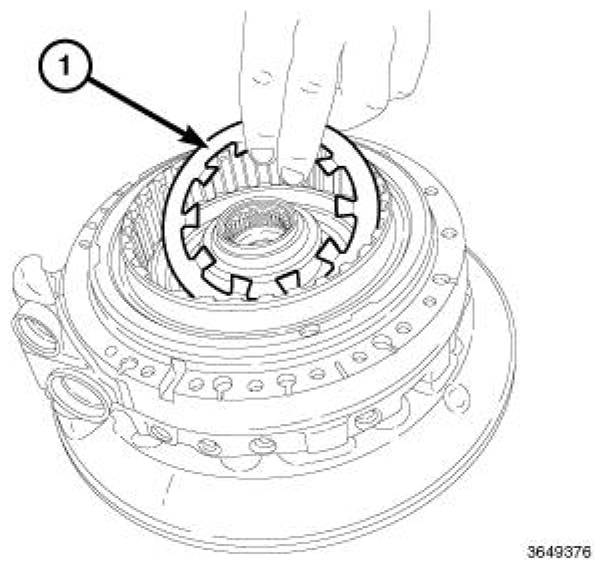

Fig. 261: Piston Retaining Ring And Piston
Courtesy of CHRYSLER GROUP, LLC

9. Remove the piston retainer and plate.

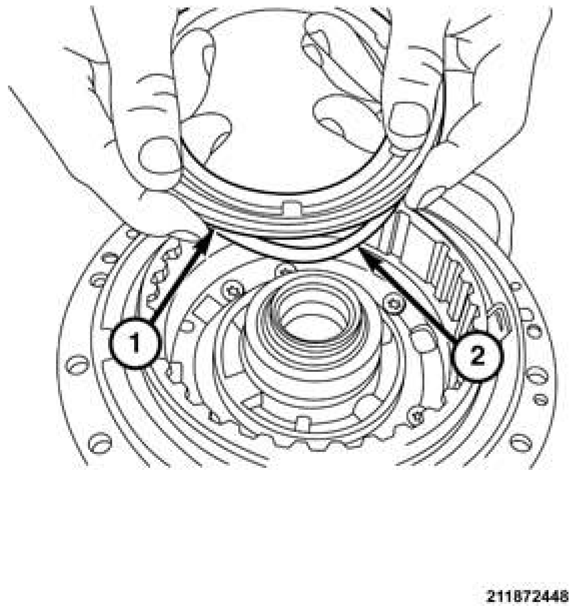

Fig. 262: A-Piston & Seal

14. Carefully pry up on the oil pump (1), separating it from the housing (2).

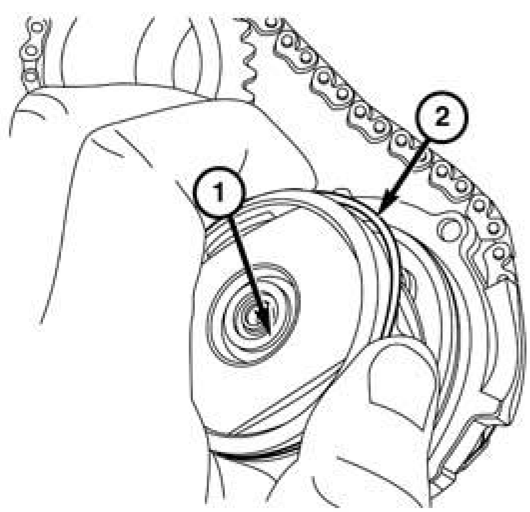

Fig. 267: Oil Pump Housing & O-Ring
Courtesy of CHRYSLER GROUP, LLC

15. Remove the oil pump O-ring (2).

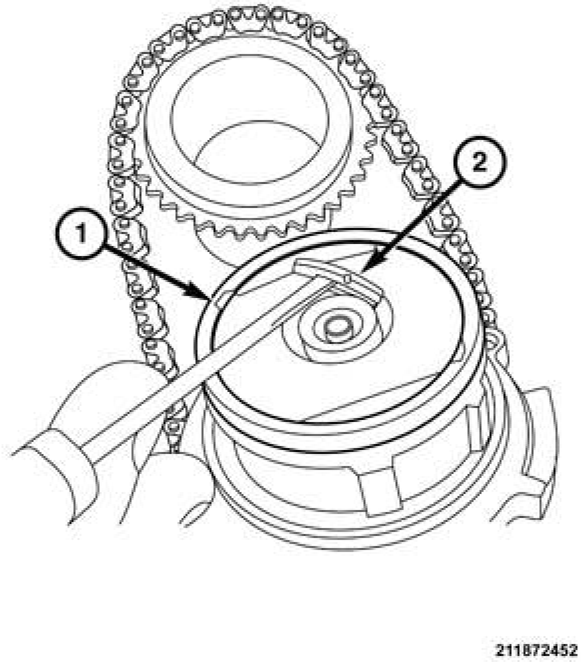

Fig. 268: Oil Pump Seal
Courtesy of CHRYSLER GROUP, LLC

16. Remove the oil pump seal (2).

ASSEMBLY

TRANSMISSION OIL PUMP

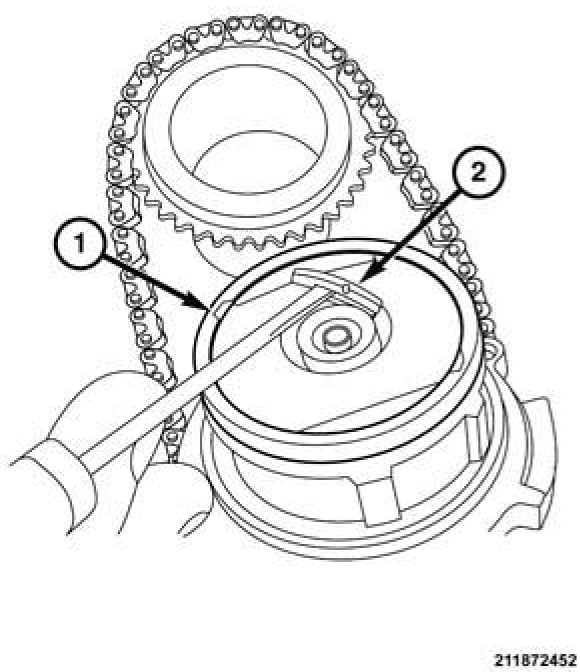

Fig. 269: Oil Pump Seal
Courtesy of CHRYSLER GROUP, LLC

1. Install the transmission oil pump seal (2).

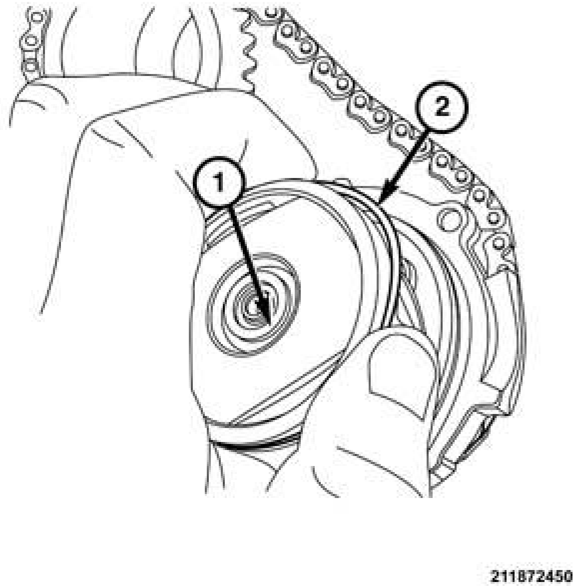

Fig. 270: Oil Pump Housing & O-Ring
Courtesy of CHRYSLER GROUP, LLC

2. Install the transmission oil pump O-ring (2).
3. Carefully seat the transmission oil pump into the housing, make sure the pump is seated properly.

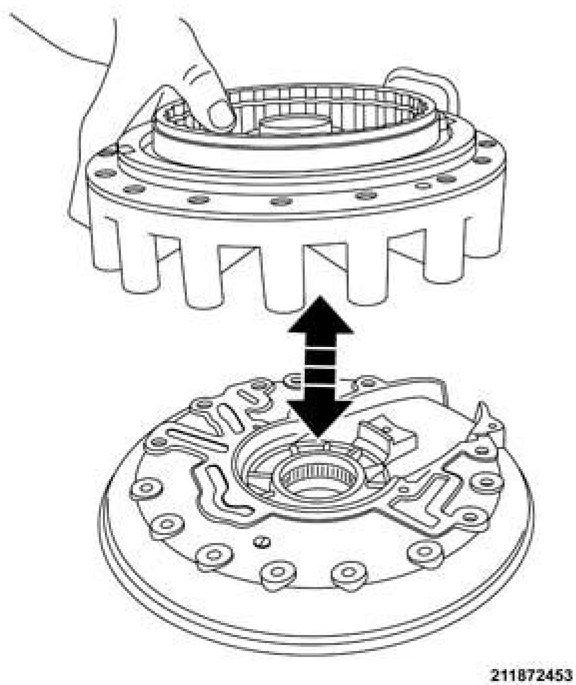

Fig. 271: Two Halves Of Oil Pump
Courtesy of CHRYSLER GROUP, LLC

4. Install the two transmission oil pump housing halves together.

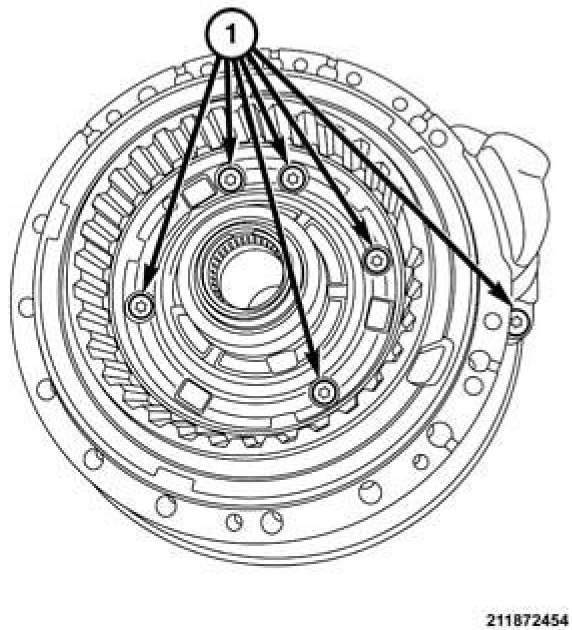

Fig. 272: Oil Pump TorxĀ® Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Install six **NEW** transmission oil pump housing TorxĀ® bolts (1).
6. Tighten the bolts to 5 N.m (44 in. lbs). plus 45Ā°.

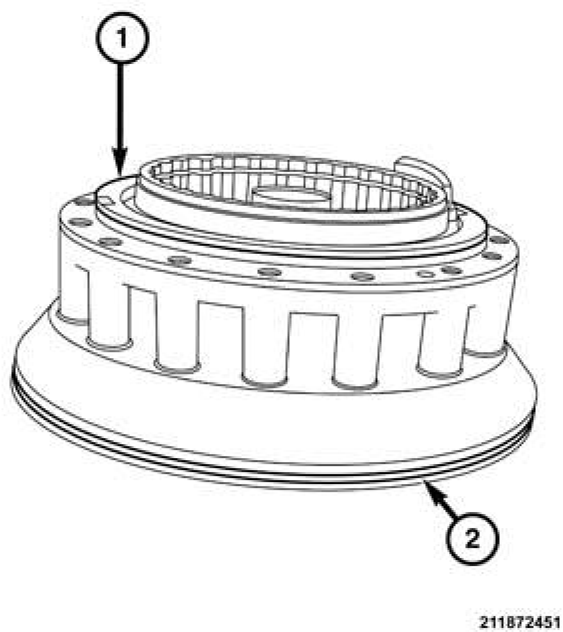

Fig. 273: Inner & Outer Oil Pump O-Rings
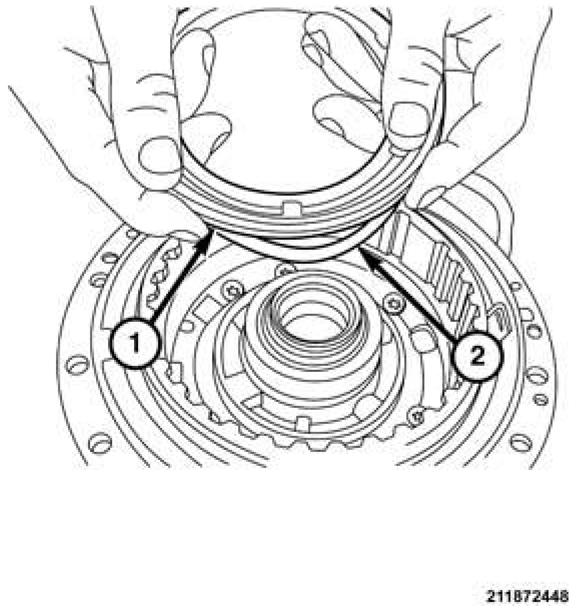
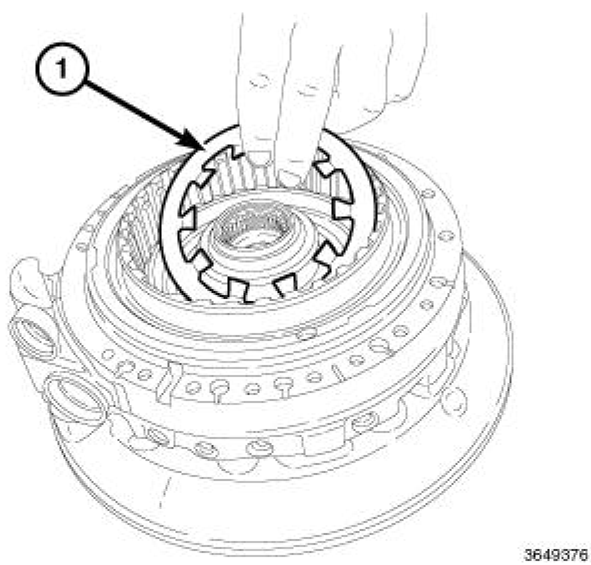
Courtesy of CHRYSLER GROUP, LLC

7. Replace the inner and outer transmission oil pump housing O-rings (1).



[Fig. 274: A-Piston & Seal](#)
Courtesy of CHRYSLER GROUP, LLC

8. Replace the A- piston seal (2) and install the A-piston (1).



[Fig. 275: Piston Retaining Ring And Piston](#)
Courtesy of CHRYSLER GROUP, LLC

9. Install the Belleville spring (1).

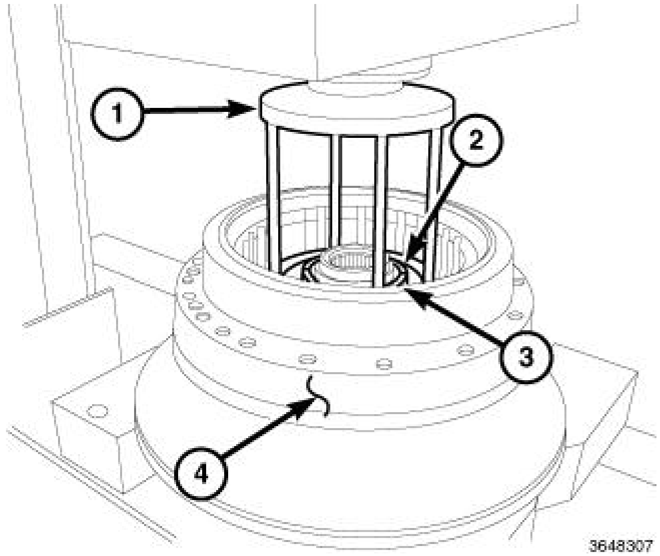


Fig. 276: Oil Pump Housing Assembly
Courtesy of CHRYSLER GROUP, LLC

10. Position the transmission oil pump housing assembly (4) in a suitable arbor press.
11. Using (special tool #8285, Compressor, Spring) (1), press on the fingers of the piston retaining ring to remove tension, and install the two halves of the split retainer ring (2).

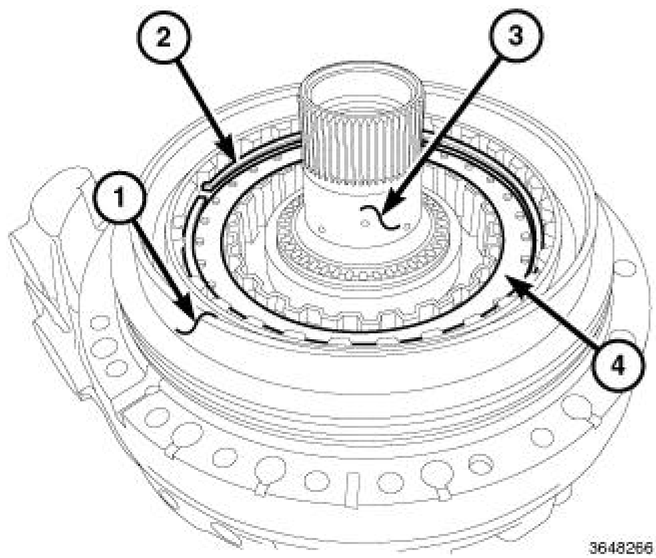

Fig. 277: Outer Ring, Snap Ring, Hub & Spacers
Courtesy of CHRYSLER GROUP, LLC

12. Install the hub (3).
13. Install the clutches and spacers (4).
14. Install the snap ring (2).
15. Install the outer ring (1) (below B-piston).

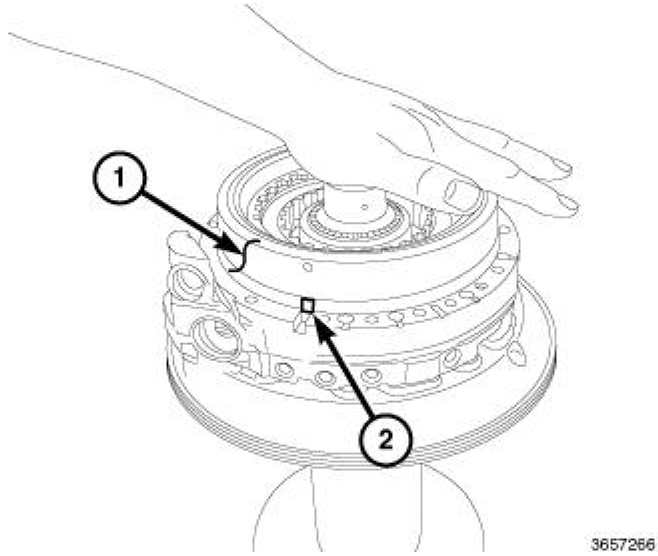

Fig. 278: B-Piston Alignment Tab & B-Piston
Courtesy of CHRYSLER GROUP, LLC

16. Position the B-piston alignment tab (2) above the notch and install B-piston (1) on the assembly.
17. Install the transmission oil pump. Refer to **PUMP, TRANSMISSION OIL, INSTALLATION**.

INSTALLATION

TRANSMISSION OIL PUMP

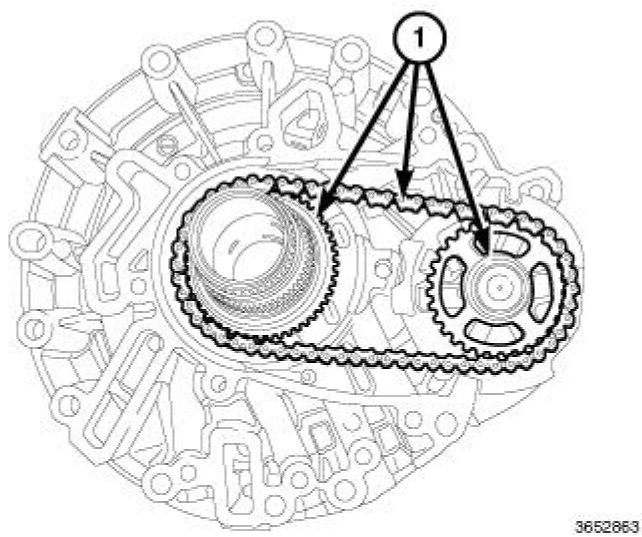

Fig. 279: Drive Sprocket, Chain And Pump Body
Courtesy of CHRYSLER GROUP, LLC

1. Install the drive sprocket, chain and pump body (1) as an assembly into the oil pump housing.

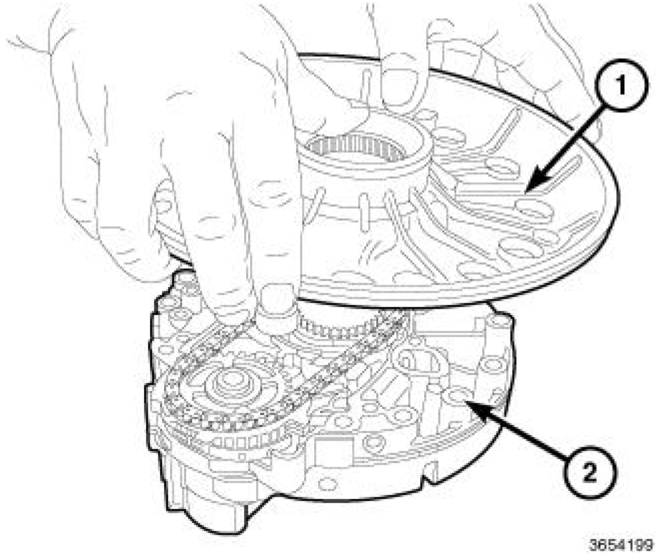

Fig. 280: Front Cover & Oil Pump Housing
Courtesy of CHRYSLER GROUP, LLC

2. Set the transmission oil pump cover (1) onto the transmission oil pump housing (2), install the five transmission oil pump housing to cover bolts and tighten to 5 N.m (44 in. lbs.) plus 45Ā°.

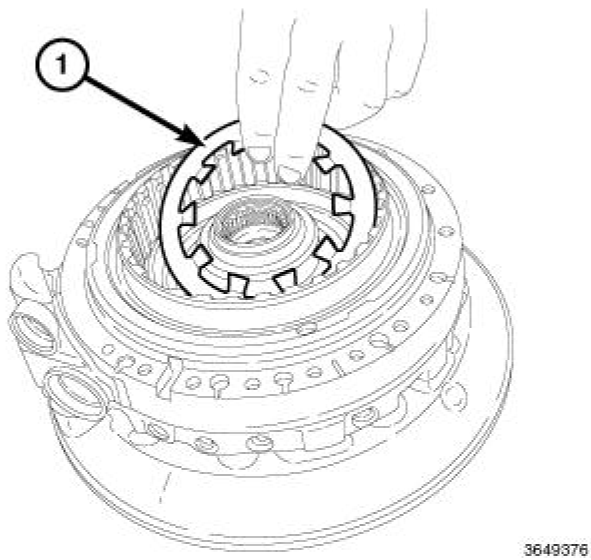

Fig. 281: Piston Retaining Ring And Piston
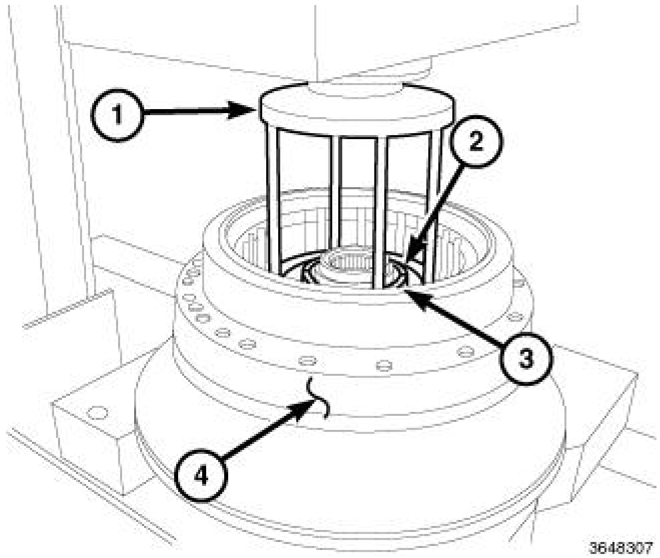
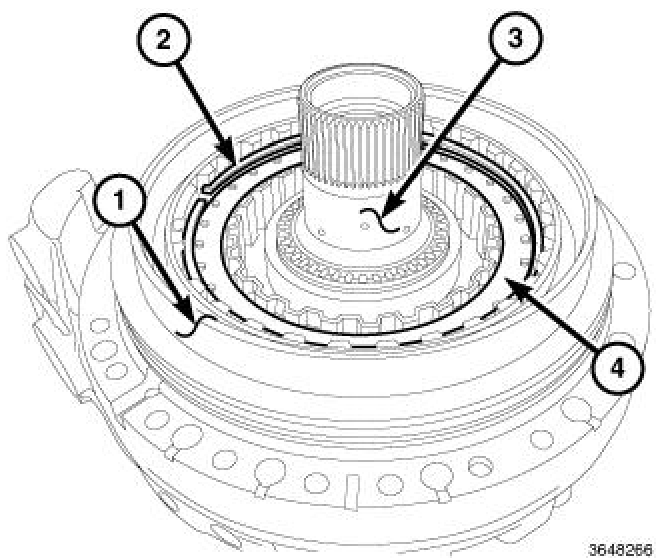
Courtesy of CHRYSLER GROUP, LLC

3. Install the piston plate and the piston retainer.



[Fig. 282: Oil Pump Housing Assembly]
Courtesy of CHRYSLER GROUP, LLC

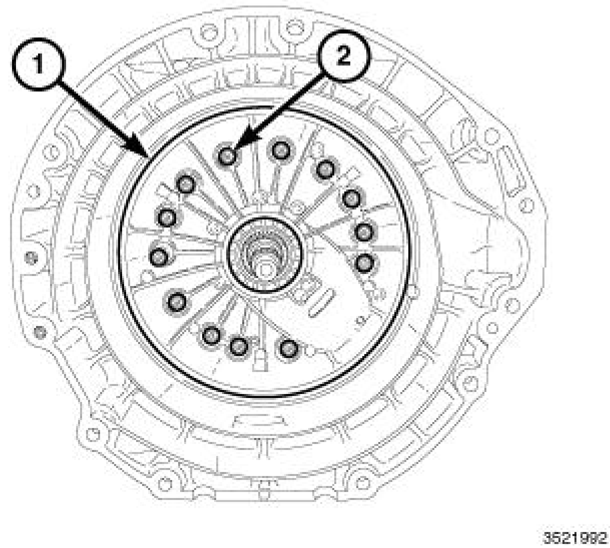
4. Position the transmission oil pump housing assembly (4) in a suitable arbor press.
5. Using (special tool #8285, Compressor, Spring) (1), press on the fingers of the piston retainer and install the two halves of the retaining ring (2).



[Fig. 283: Outer Ring, Snap Ring, Hub & Spacers]
Courtesy of CHRYSLER GROUP, LLC

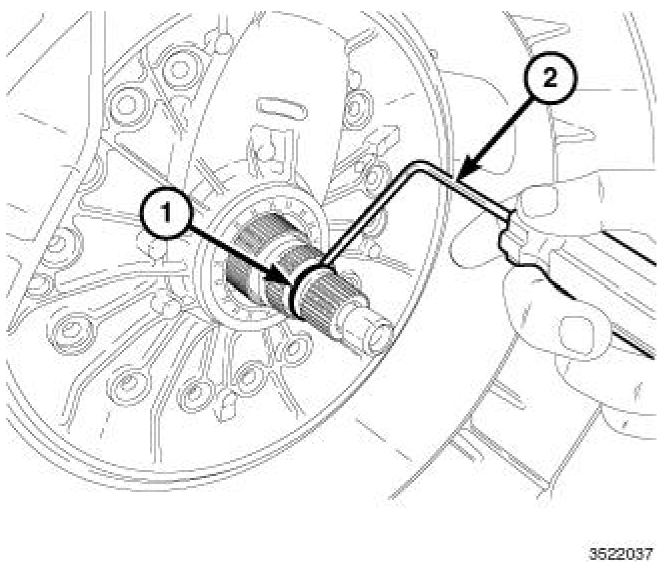
6. Install the hub (3).
7. Install the clutches and spacers (4).
8. Install the snap ring (2).
9. Install the outer ring (1) (inside B-piston).
10. Install the B-piston.

NOTE: **Firmly press the transmission oil pump in place by hand before drawing it in with bolts.**



[Fig. 284: Thirteen Oil Pump Housing Retaining Bolts]
Courtesy of CHRYSLER GROUP, LLC

11. Install the 13 **NEW** transmission oil pump housing cover bolts (2) and tighten the transmission oil pump cover as follows:
    a. In order to seat the transmission oil pump housing cover properly, pre-tighten bolts one, seven and nine to 6 N.m (53 in. lb.).
    b. Working in a clockwise pattern, beginning with number one, tighten to 10 N.m (89 in. lb.).
    c. Working in a clockwise pattern, beginning with number one, tighten an additional 90Â°.



[Fig. 285: Input Shaft O-Ring & Small Pick]
Courtesy of CHRYSLER GROUP, LLC

12. Install the **NEW** input shaft O-ring (1).
13. Install the valve body. Refer to **VALVE BODY, INSTALLATION**.
14. Install the transmission. Refer to **INSTALLATION**.

SEAL, OUTPUT SHAFT

REMOVAL

OUTPUT SHAFT SEAL

CAUTION: Do not allow the propeller shaft to hang from the vehicle unsupported. Damage may occur to the joint, boot, and center bearing from over-angulation.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

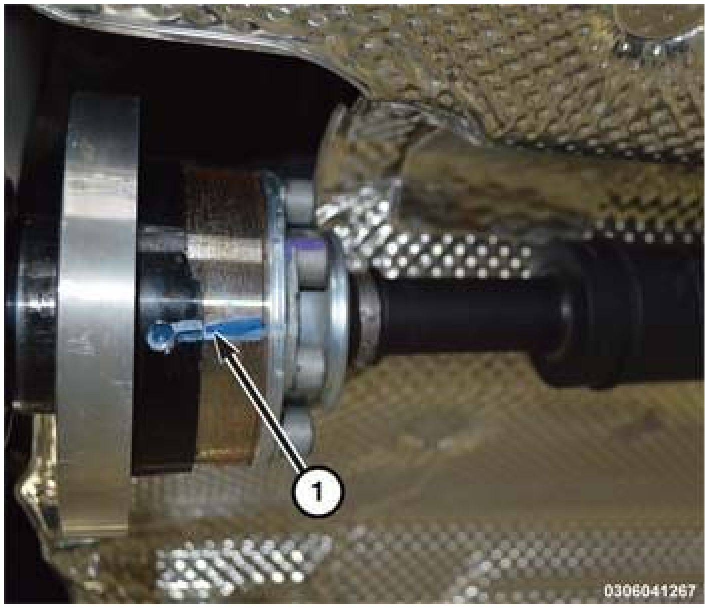


Fig. 286: Alignment Index Marks
Courtesy of CHRYSLER GROUP, LLC

2. Apply alignment index mark (1) to the transmission flange.

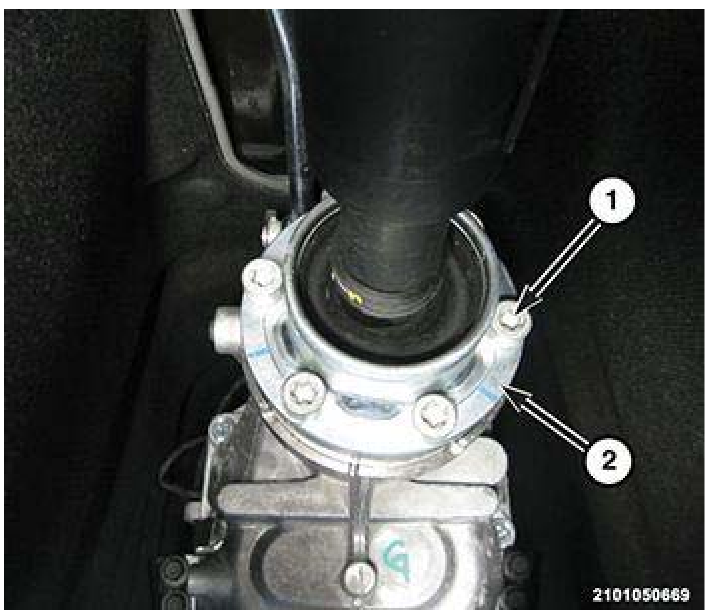

Fig. 287: Bolts And Washers & Transmission Flange
Courtesy of CHRYSLER GROUP, LLC

3. Remove the drive shaft bolts to transmission flange and position aside the drive shaft. Secure the drive shaft with a strap or equivalent.

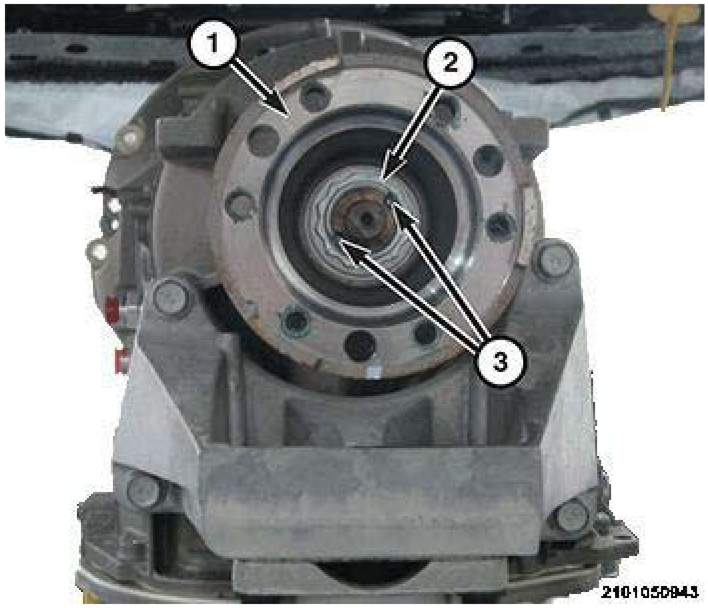

Fig. 288: Drive Shaft Flange, Nut & Staking Area
Courtesy of CHRYSLER GROUP, LLC

4. Using a suitable punch, remove the staking (3) from the drive shaft nut (2).
5. Remove the drive shaft flange nut (2) using a 34 mm 12 point socket (3) and (special tool #C-3281, Holder, Flange) (2) to hold the flange (1).
6. Remove the flange and flange dust seal.
7. Remove the output shaft seal with suitable screw and slide hammer.

INSTALLATION

OUTPUT SHAFT SEAL

CAUTION: The seal must be installed flush with the case. Driving the seal deeper could damage the seal causing a leak.

1. Position the new output shaft seal over the output shaft and against the transmission case.
2. Using (special tool #9677, Installer, Seal) install the output shaft seal.
3. Verify that the transmission is in PARK in order to prepare for the installation of the output shaft nut.

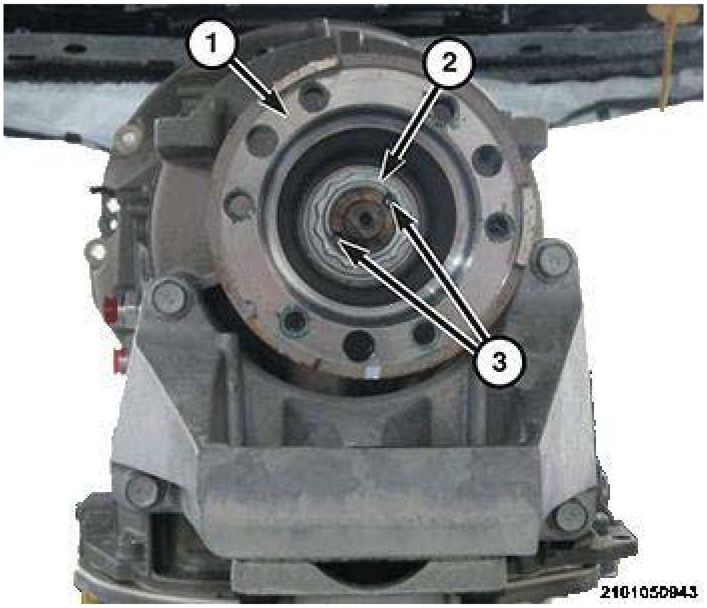

Fig. 289: Drive Shaft Flange, Nut & Staking Area
Courtesy of CHRYSLER GROUP, LLC

4. Install the drive shaft flange (1) onto the output shaft and install a **NEW** flange nut (2). Tighten the nut, with a 34 mm 12 point socket, to the proper specification. Refer to **TORQUE SPECIFICATIONS**.
5. Stake (3) the nut.
6. Install the drive shaft. Refer to **INSTALLATION** .
7. Perform the CHECK OIL LEVEL procedure. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

SEAL, TORQUE CONVERTER HUB

REMOVAL

TORQUE CONVERTER HUB SEAL

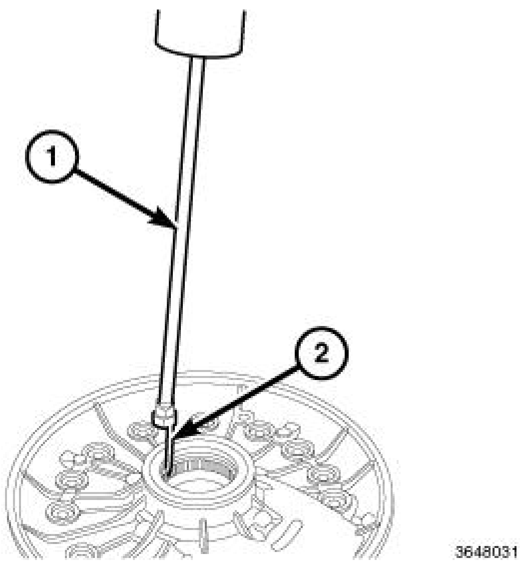

Fig. 290: Seal Remover & Slide Hammer

Courtesy of CHRYSLER GROUP, LLC

1. Remove the torque converter. Refer to **TORQUE CONVERTER, REMOVAL**.
2. Using (special tool #9667, Remover, Seal) and (special tool #C-3752, Slide Hammers) remove the torque converter hub seal.

INSTALLATION

TORQUE CONVERTER HUB SEAL

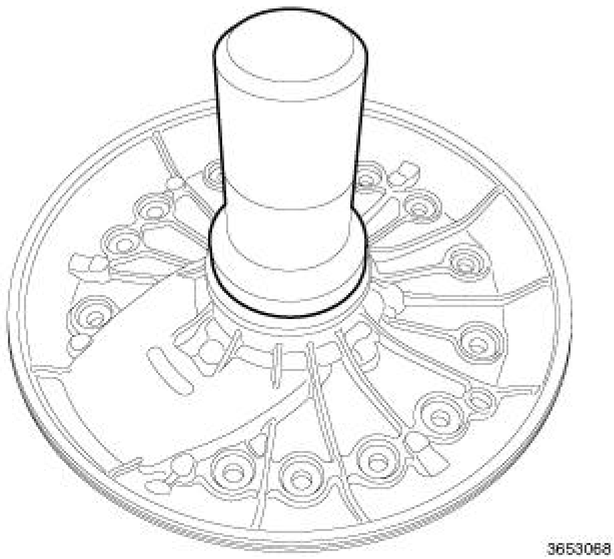

Fig. 291: Oil Pump Cover Oil Seal
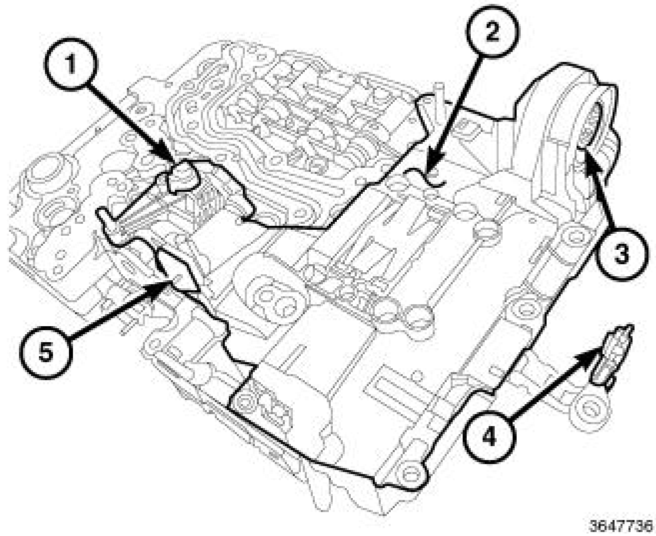
Courtesy of CHRYSLER GROUP, LLC

1. Position the torque converter hub seal over the input shaft and against the transmission oil pump cover.
2. Using (special tool #10375, Installer, Oil Pump Cover Oil Seal) install a new torque converter hub seal.
3. Install the torque converter. Refer to **TORQUE CONVERTER, INSTALLATION**.

SENSOR, SPEED

DESCRIPTION

DESCRIPTION



[Fig. 292: Input Speed Sensor, Output Speed Sensor, TCM (Includes Transmission Temperature Sensor) & Park Position Sensor]
Courtesy of CHRYSLER GROUP, LLC

1 - Input Speed Sensor
2 - TCM (Includes Transmission Temperature Sensor)
3 - External Wire Harness Connector
4 - Output Speed Sensor
5 - Park Position Sensor

CAUTION: The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Failure to follow these instructions may result in damage to the TCM/TCMA.

The input speed sensor (1) and the output speed sensor (4) are integrated components of the TCMA and not serviced individually.

OPERATION

OPERATION

CAUTION: The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Failure to follow these instructions may result in damage to the TCM/TCMA.

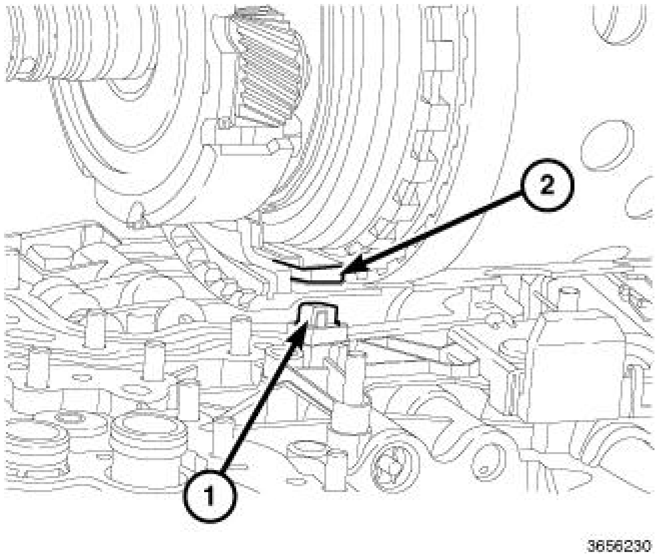


Fig. 293: ISS & Magnetic Ring
Courtesy of CHRYSLER GROUP, LLC

The input speed sensor (ISS) and output speed sensor (OSS) are Hall-effect sensors that measure shaft rotational speed. The ISS (1) is located at the front of the TCMA and reads input shaft speed from the magnetic ring (2) on the P2 carrier.

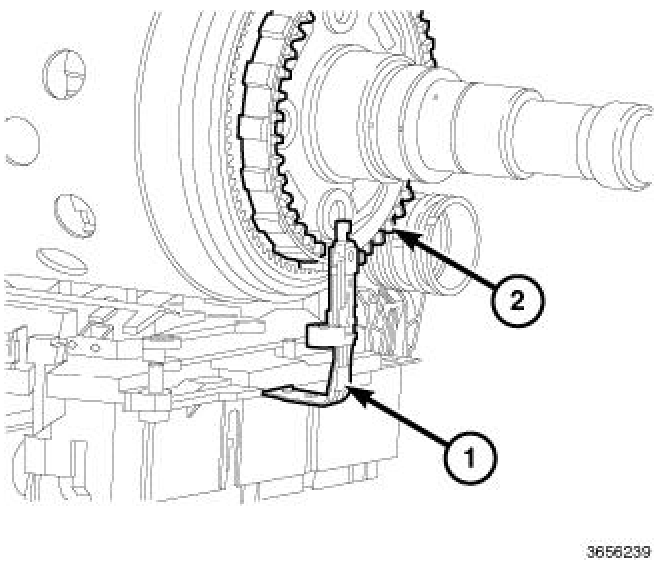

Fig. 294: OSS & P4 Carrier
Courtesy of CHRYSLER GROUP, LLC

The OSS (1) is located at the back of the TCMA and reads output shaft speed from the P4 carrier (2).

SHIFTER, TRANSMISSION

DESCRIPTION

FLOOR SHIFT

The Electronic Shifter (E-Shifter) is an electronic switch/module floor mounted device, using CAN messaging to communicate driver requests for transmission gear changes without a mechanical connection.

PADDLE SHIFT

Some vehicles may be equipped with optional paddle shift. For more information on paddle shift. Refer to **SWITCH, REMOTE RADIO, DESCRIPTION** .

OPERATION

FLOOR SHIFT

The E-Shifter:

- communicates with the Transmission Control Module (TCM) via a Controller Area Network (CAN).
- incorporates a solenoid that allows the lever to be locked for purposes of Brake Transmission Shift Interlock (BTSI) function.
- lever-lock function is controlled electronically by the TCM via CAN message, and mechanically by the release trigger on the knob.
- indicates the selected/non-selected gears provided via illumination of PRNDM+- characters on knob.
- lever-position feedback is provided via mechanical detents, which also keep the lever in the desired position.
- communicates driver requests for transmission gear changes without a mechanical connection.
- is comprised of an upper knob and a lower base, which can be serviced separately.
- on some models, may have steering wheel-mounted paddle shifters available. Refer to **SWITCH, REMOTE RADIO, DESCRIPTION** .

The Electronic Shifter (E-Shifter) offers (P, R, N, D, M) modes of function.

The M selection (manual mode) is engaged by moving the shift-lever sideways to M. Requests to up/down shift are achieved by moving the lever fore/aft once in the manual position.

PADDLE SHIFT

Some vehicles may be equipped with optional steering wheel paddle shifters.

The steering wheel paddle shifters may be enabled or disabled in the default drive mode. The vehicle will start in default mode unless it is in valet mode.

To enable the steering wheel paddle shifters, press the **ON** button on the touchscreen.

To disable the steering wheel paddle shifters, press the **OFF** button on the touchscreen.

Fig. 295: Paddle Shifter Enable/Disable Screen
Courtesy of CHRYSLER GROUP, LLC

For additional information, refer to **SWITCH, REMOTE RADIO, OPERATION** .

STANDARD PROCEDURES

MANUAL PARK RELEASE DISENGAGE

The Manual Park Release (MPR) lever is used for putting the transmission in neutral anytime the vehicle needs to be moved with the engine off in neutral. This is achieved by a cable attached to the transmission park pawl. When the cable is pulled, the transmission is put into neutral, and when the cable is released, the transmission is back into park.

WARNING: **Always secure your vehicle by fully applying the parking brake, before activating the Manual Park Release. Activating the Manual Park Release will allow your vehicle to roll away if it is not secured by the parking brake or by proper connection to a tow vehicle. Activating the Manual Park Release on an unsecured vehicle could lead to serious injury or death for those in or around the vehicle.**

NOTE: **Apply the parking brake.**

Fig. 296: Manual Park Release Lever Access Panel
Courtesy of CHRYSLER GROUP, LLC

1. Remove the Manual Park Release (MPR) lever access panel (1).

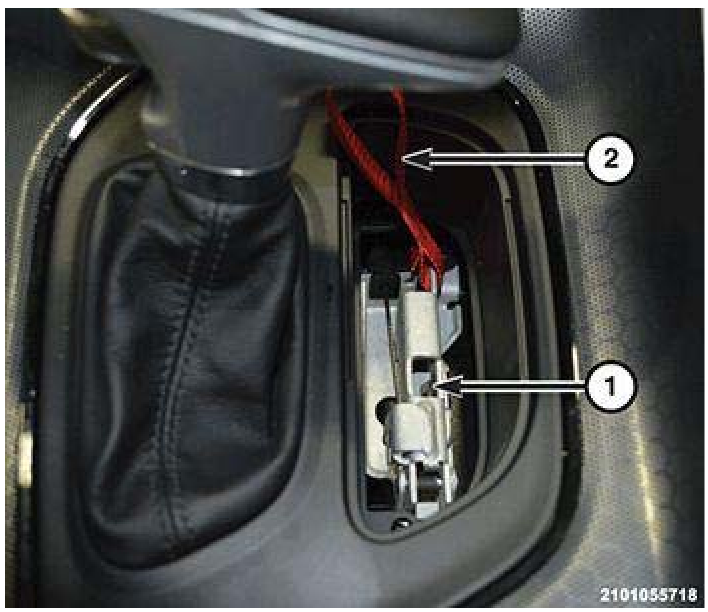

Fig. 297: Locking Tab & Tether
Courtesy of CHRYSLER GROUP, LLC

2. Release the locking tab (1) with a screw driver or equivalent and pull the tether (2).
3. While holding the locking tab (1) to the right, pull the tether (2) up and rearward, until it locks in place in the vertical position. The transmission is now out of park, and the vehicle can be moved.

MANUAL PARK RELEASE ENGAGE

Fig. 298: Releasing Locking Tab
Courtesy of CHRYSLER GROUP, LLC

1. Push the Manual Park Release (MPR) lever rearward, and use a small screwdriver or equivalent to release the locking tab (1).

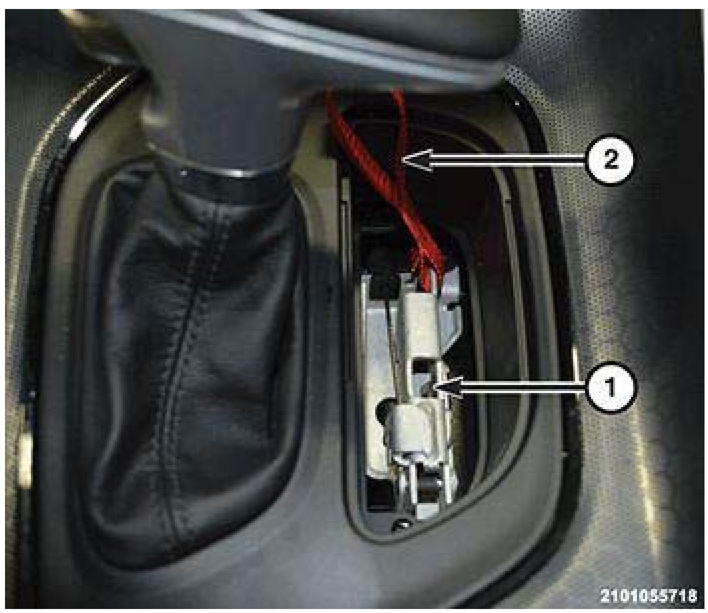

Fig. 299: Locking Tab & Tether
Courtesy of CHRYSLER GROUP, LLC

2. Allow the MPR lever to return to the engaged position.
3. Make sure that the locking tab (1) is in position, gently pull on the tether (2) to confirm the lever is locked.

Fig. 300: Manual Park Release Lever Access Panel
Courtesy of CHRYSLER GROUP, LLC

4. Install the MPR lever access panel.

REMOVAL

SHIFTER

WARNING: **Always secure your vehicle by fully applying the parking brake, before activating the Manual Park Release. Activating the Manual Park Release will allow your vehicle to roll away if it is not secured by the parking brake or by proper connection to a tow vehicle. Activating the Manual Park Release on an unsecured vehicle could lead to serious injury or death for those in or around the vehicle.**

1. Apply the parking brake.

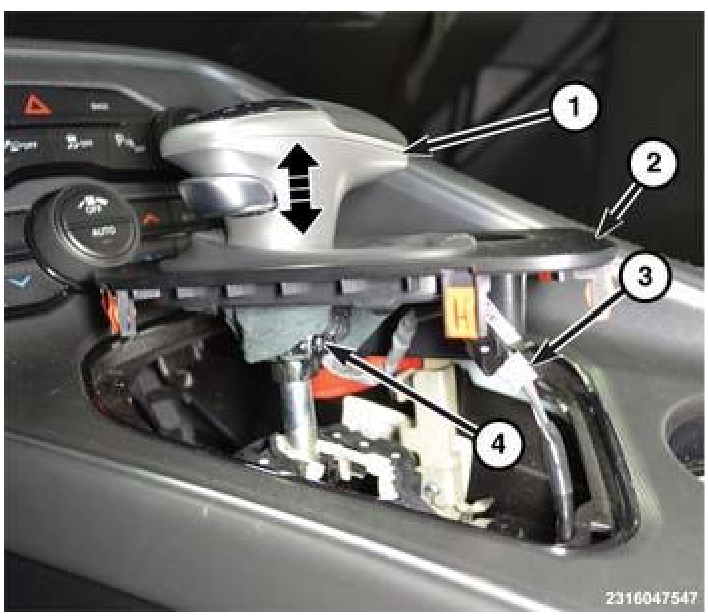

Fig. 301: Automatic Shifter
Courtesy of CHRYSLER GROUP, LLC

2. Using a trim stick or equivalent, carefully release the retaining clips and lift the shifter bezel (2).
3. Unplug the wire harness connector (3) from the shifter bezel.
4. Remove the shifter knob screw (4) and remove the shifter knob (1) and shifter bezel (2).

Fig. 302: Removing/Install Console Bezel Panel
Courtesy of CHRYSLER GROUP, LLC

5. Using a trim stick or equivalent, starting at the rear of the console bezel panel, carefully release the retaining clip and lift the console bezel panel (1).

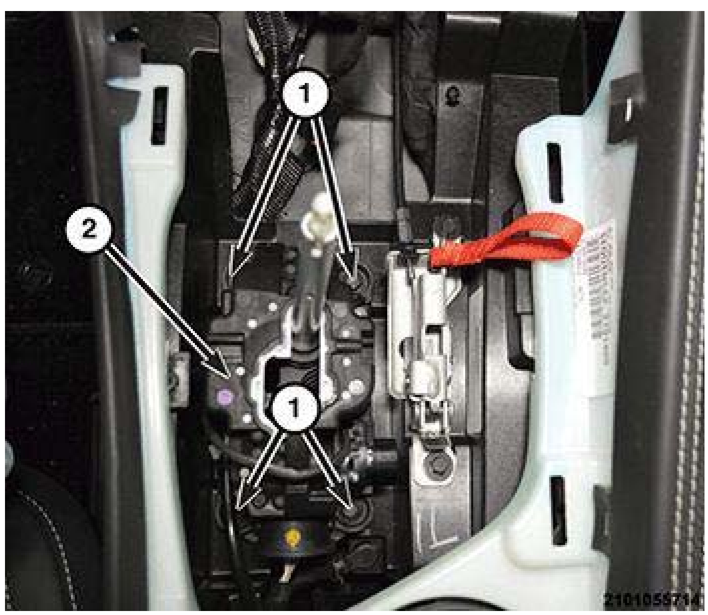

Fig. 303: Shifter Assembly & Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Disconnect the wire harness connectors and remove the console bezel panel.
7. Remove the shifter bolts (1) and lift the shifter assembly (2) up enough to allow access to the Electronic Shift Module (ESM) wire harness connector.

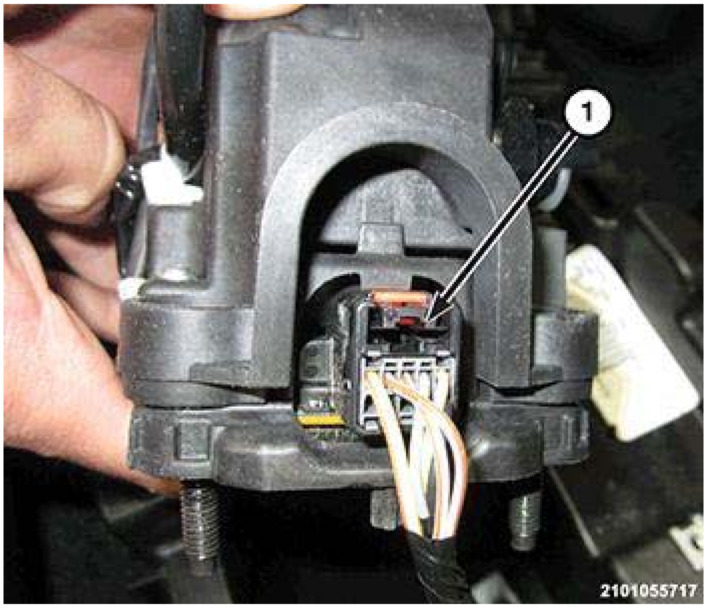

Fig. 304: Shifter Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

8. Disconnect the ESM wire harness connector (1).
9. Remove the shifter assembly from the vehicle.

INSTALLATION

SHIFTER

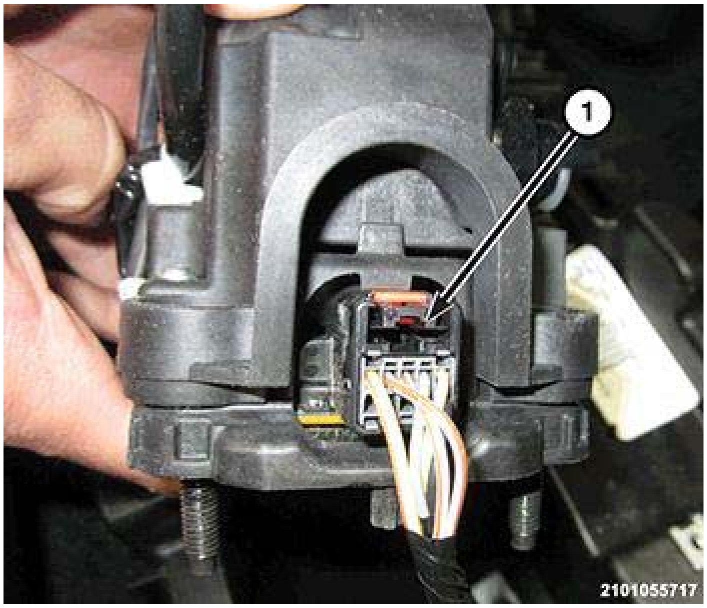

Fig. 305: Shifter Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Connect the Electronic Shift Module (ESM) wire harness connector (1).

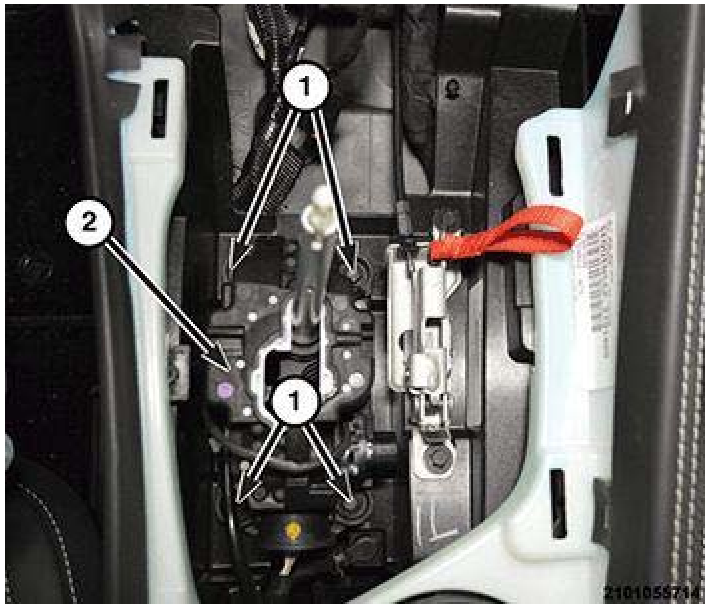

Fig. 306: Shifter Assembly & Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Install the ESM (2) and shifter bolts (1) and tighten to the proper torque specifications.

Fig. 307: Removing/Install Console Bezel Panel
Courtesy of CHRYSLER GROUP, LLC

3. Connect the wire harness connectors and install the console bezel panel (1).

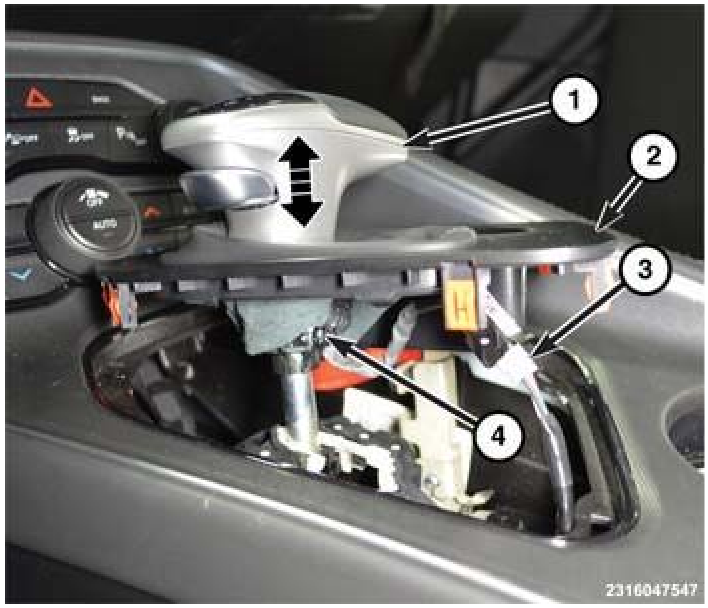

Fig. 308: Automatic Shifter
Courtesy of CHRYSLER GROUP, LLC

4. Position the shifter bezel (2) in place and engage the retaining clips.
5. Install the shifter knob (1) and install the shifter knob screw (4). Tighten the screw securely.
6. Connect the wire harness connector (3).

SOLENOID, TRANSMISSION

10 - Park Release Mechanical Valve

CAUTION: The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Failure to follow these instructions may result in damage to the TCM/TCMA.

The solenoids are integrated into the Transmission Control Module Assembly (TCMA) of the 8HP transmission and are not replaceable individually.

OPERATION

OPERATION

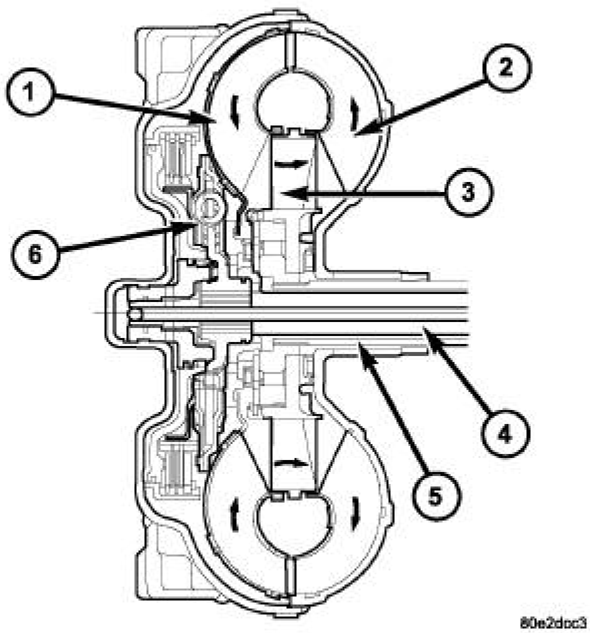
CAUTION: The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Failure to follow these instructions may result in damage to the TCM/TCMA.

The TCM will actuate the valves via solenoids based on the position of the shifter, transmission fluid temperature, engine operating conditions, traction conditions, and driver demands. During a shift, the TCM will actuate the solenoids to match the gear ranges to the optimal torque range of the engine based on the position of the accelerator pedal, shifter, and vehicle speed as determined by the PCM based on input from the Vehicle Speed Sensor (VSS) and ABS module.

TORQUE CONVERTER

DESCRIPTION

DESCRIPTION



[Fig. 310: Torque Converter]
Courtesy of CHRYSLER GROUP, LLC

1 - TURBINE
2 - IMPELLER
3 - STATOR
4 - INPUT SHAFT
5 - STATOR SHAFT
6 - TURBINE DAMPER

CAUTION: The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid.

The torque converter is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine (1), a stator (3), an overrunning clutch, an impeller (2), and an electronically applied converter clutch. The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The converter clutch engages in third through fifth gears. The torque converter hub drives the transmission oil (fluid) pump.

A turbine damper (6) has been added for some applications to help improve vehicle noise, vibration, and harshness (NVH) characteristics.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

IMPELLER

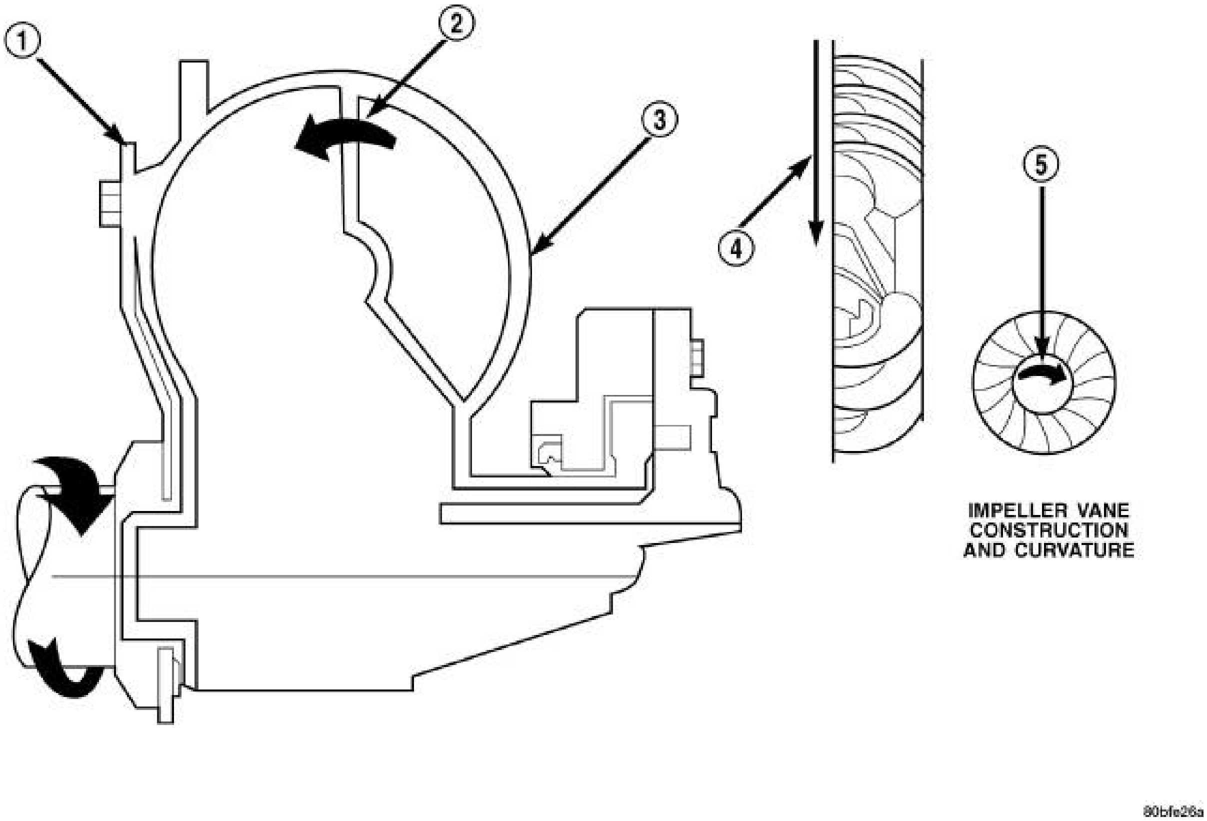


Fig. 311: Identifying Impeller
Courtesy of CHRYSLER GROUP, LLC

1 - ENGINE FLEXPLATE
2 - OIL FLOW FROM IMPELLER SECTION INTO TURBINE SECTION
3 - IMPELLER VANES AND COVER ARE INTEGRAL
4 - ENGINE ROTATION
5 - ENGINE ROTATION

The impeller (3) is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving members of the system.

TURBINE

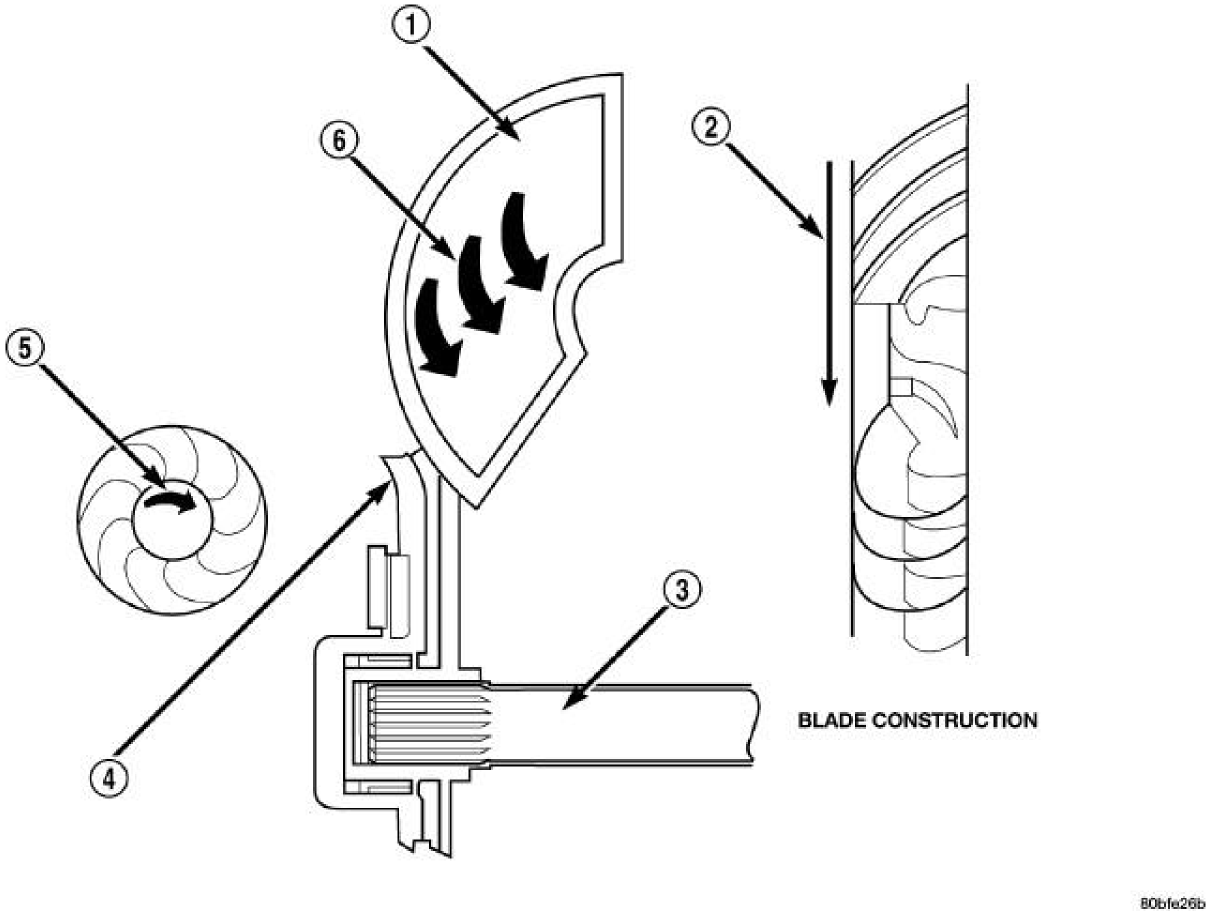

Fig. 312: Identifying Turbine

1 - TURBINE VANE
2 - ENGINE ROTATION
3 - INPUT SHAFT
4 - PORTION OF TORQUE CONVERTER COVER
5 - ENGINE ROTATION
6 - OIL FLOW WITHIN TURBINE SECTION

The turbine (1) is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

STATOR

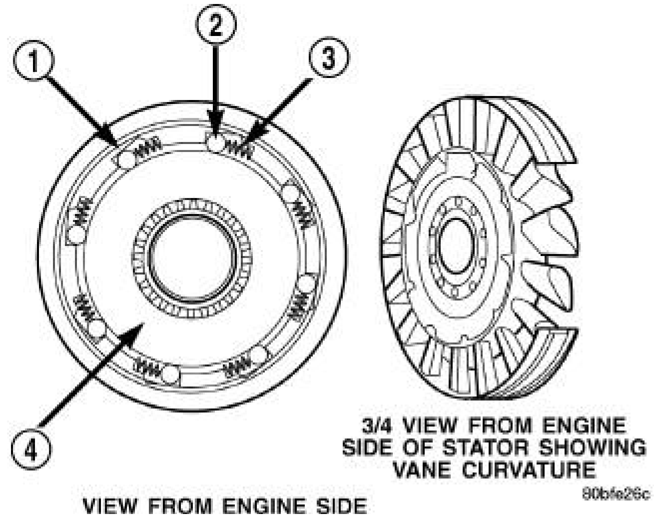

Fig. 313: Stator Components
Courtesy of CHRYSLER GROUP, LLC

1 - CAM (OUTER RACE)
2 - ROLLER
3 - SPRING
4 - INNER RACE

The stator assembly (1-4) is mounted on a stationary shaft which is an integral part of the oil pump.

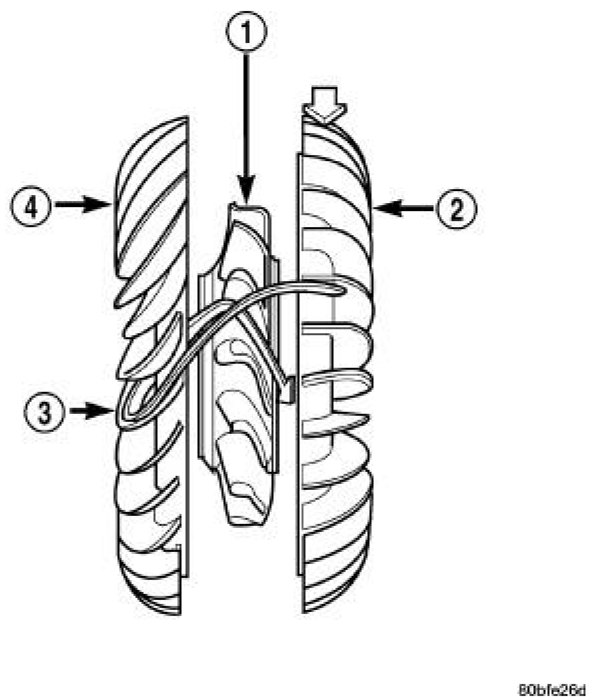

Fig. 314: Stator, Impeller, Fluid Flow & Turbine
Courtesy of CHRYSLER GROUP, LLC

1 - STATOR
2 - IMPELLER
3 - FLUID FLOW

4 - TURBINE

The stator (1) is located between the impeller (2) and turbine (4) within the torque converter case. The stator contains a freewheeling clutch, which allows the stator to rotate only in a clockwise direction. When the stator is locked against the freewheeling clutch, the torque multiplication feature of the torque converter is operational.

TORQUE CONVERTER CLUTCH (TCC)

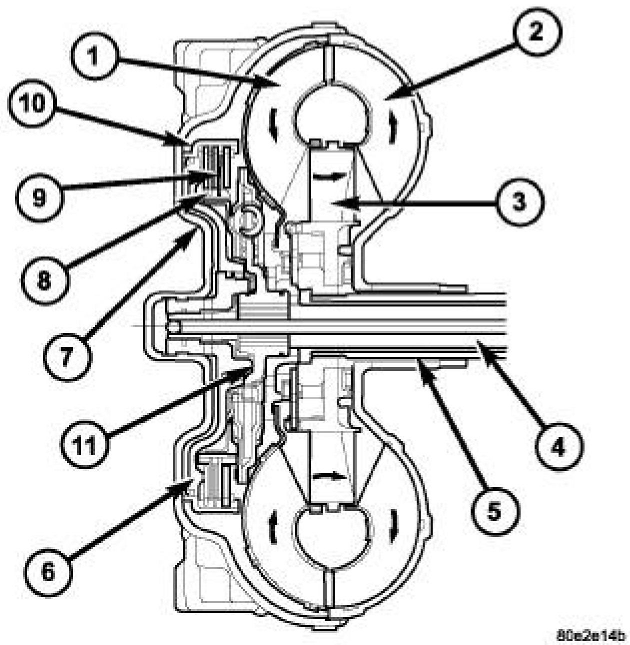

Fig. 315: Identifying Torque Converter Components

2 - IMPELLER
3 - STATOR
4 - INPUT SHAFT
5 - STATOR SHAFT
6 - PISTON
7 - COVER SHELL
8 - INTERNALLY TOOTHED DISC CARRIER
9 - CLUTCH PLATE SET
10 - EXTERNALLY TOOTHED DISC CARRIER
11 - TURBINE DAMPER

The TCC (9) was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller and turbine were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston with friction material was added to the turbine assembly to provide this mechanical lock-up.

In order to reduce heat build-up in the transmission and buffer the powertrain against torsional vibrations, the TCM can duty cycle the torque converter lock-up solenoid to achieve a smooth application of the torque converter clutch. This function, referred to as Electronically Modulated Converter Clutch (EMCC) can occur at various times depending on the following variables:

- Shift lever position
- Current gear range
- Transmission fluid temperature
- Engine coolant temperature
- Input speed
- Throttle angle
- Engine speed

OPERATION

OPERATION

8 - INTERNALLY TOOTHED DISC CARRIER

9 - CLUTCH PLATE SET
10 - EXTERNALLY TOOTHED DISC CARRIER
11 - TURBINE DAMPER

The torque converter housing has a unique shape to incorporate the torque converter clutch and flex plate connection. The torque converter uses the typical turbine, impeller and stator assemblies found in a standard torque converter assembly. The torque converter drives the pump through the splines on the inside of the hub. The torque converter uses a multi-disc torque converter clutch system that improves the durability and the holding pressure in the lock-up circuit. The torque converter incorporates a turbine dampening system. This system suppresses torsional vibrations from the engine to ensure optimal shift quality and reduce noise and vibration concerns.

TCC RELEASE When the TCC is open, the TCC piston is pushed to its default position by torque converter chamber pressure. The torque converter switch valve (SV-TC) provides pressure for torque converter operation which has been regulated by the converter pressure regulating valve (TC-V). After exiting the torque converter, fluid moves into the cooling and lubrication circuits. The converter pressure retention valve (TCH1-V) ensures the torque converter pressure is a minimum of 0.35 bar (5 psi) when the TCC is open.

TCC APPLY When the TCC solenoid is energized, fluid is directed to the torque converter switch valve (SV-TC) and TCC lockup valve (TCC-V). The TCC lockup valve directs fluid to the TCC and torque converter chamber. The torque converter switch valve directs fluid exiting the converter chamber to a secondary pressure retention valve (TCH2-V) which is calibrated to retain 1.0 bar (14.5 psi) of pressure in the converter. The torque converter switch valve also directs line pressure to the cooler and lubrication circuit.

TURBINE

When the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

STATOR

Torque multiplication is achieved by locking the stator's overrunning clutch to its shaft. Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counterclockwise direction. When this happens the overrunning clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.0:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such as way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling

TORQUE CONVERTER CLUTCH (TCC)

In a standard torque converter, the impeller (2) and turbine are rotating at about the same speed and the stator (3) is freewheeling, providing no torque multiplication. By applying the turbines piston and friction material (9) a total converter engagement can be obtained. The result of this engagement is a direct 1:1 mechanical link

between the engine and the transmission.

HYDRO-MECHANICAL AND ELECTRICAL

The Torque Converter Clutch (TCC) is engaged and released by the Transmission Control Module Assembly (TCMA). The TCC can be engaged and controlled in any forward gear from 1 through 8. In addition, the 8HP transmission incorporates a neutral idle control (NIC) function. Instead of the engine continuing to drive the converter when the vehicle comes to rest, the converter is partially disconnected from the driveline so only a slight residual load remains. Decoupling of the torque converter during NIC is accomplished by allowing clutch B to slip.

REMOVAL

TORQUE CONVERTER

1. Remove the transmission from the vehicle. Refer to **REMOVAL**.
2. Place a suitable drain pan under the torque converter housing end of the transmission.

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

3. Pull the torque converter forward until the center hub clears the oil pump seal.
4. Separate the torque converter from the transmission.

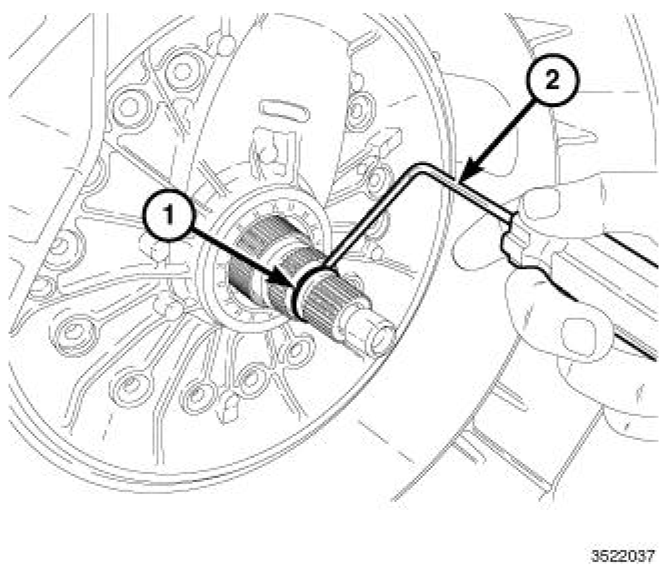

Fig. 317: Input Shaft O-Ring & Small Pick
Courtesy of CHRYSLER GROUP, LLC

5. Check the input shaft O-ring (1) for damage, replace if necessary.

INSTALLATION

TORQUE CONVERTER

NOTE: **Check the torque converter hub for sharp edges, burrs, scratches, or nicks. Polish the hub with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.**

1. Lubricate the oil pump seal lip with transmission fluid.

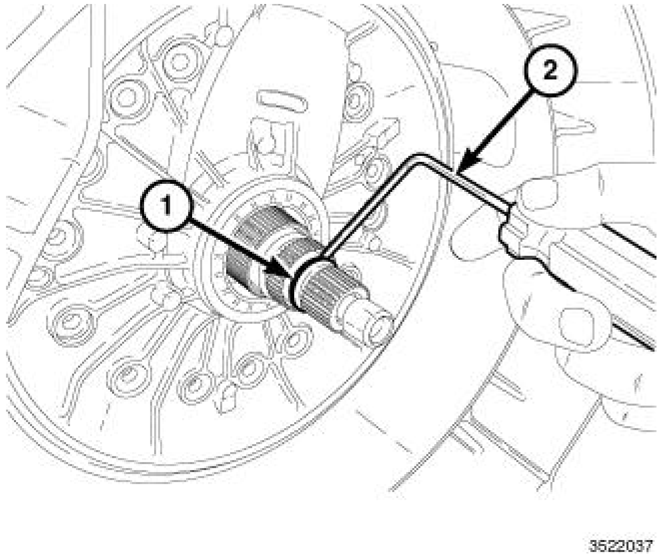

Fig. 318: Input Shaft O-Ring & Small Pick
Courtesy of CHRYSLER GROUP, LLC

2. Check the input shaft O-ring (1) for any damage. Replace if necessary.
3. Place the torque converter in position on the transmission.

CAUTION: **Do not damage oil pump seal or converter hub while inserting torque converter into the front of the transmission.**

4. Align the torque converter to the oil pump seal opening.
5. Insert the torque converter hub into the oil pump drive gear.
6. While pushing the torque converter inward, rotate the torque converter until the torque converter is fully seated into the oil pump drive gear.

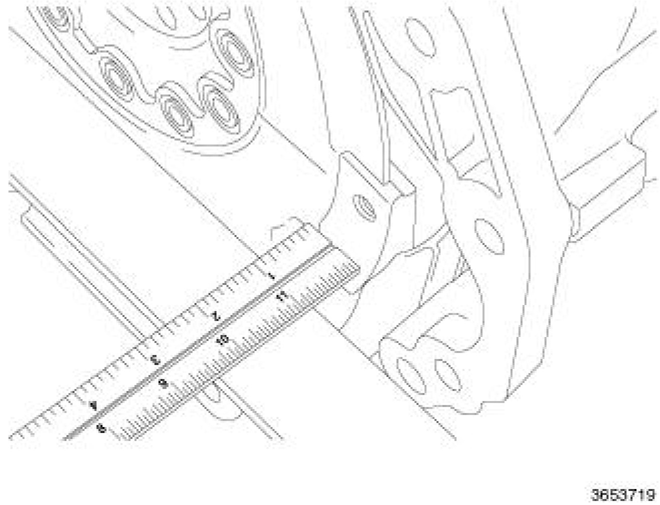

Fig. 319: Checking Torque Converter Seating
Courtesy of CHRYSLER GROUP, LLC

7. Check the torque converter seating with a scale and straightedge. The surface of the torque converter lugs should be at least 19 mm (3/4 in.) to the rear of the straightedge when the torque converter is fully seated.
8. If necessary, temporarily secure the torque converter with a C-clamp attached to the torque converter housing.
9. Install the transmission in the vehicle. Refer to **INSTALLATION**.
10. Perform the TRANSMISSION FILL AFTER SERVICE procedure. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

VALVE BODY

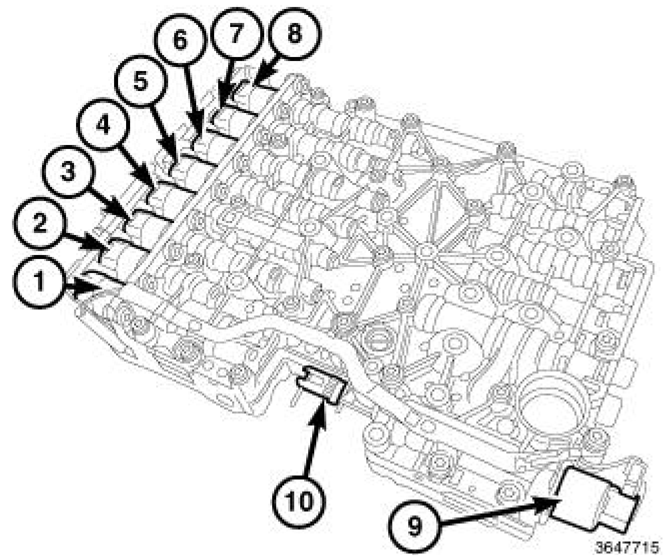
DESCRIPTION

DESCRIPTION

CAUTION: The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Failure to follow these instructions may result in damage to the TCM/TCMA.

The valve body includes the Transmission Control Module (TCM), all solenoids and sensors, and can be referred to as the Transmission Control Module Assembly (TCMA). The TCM is attached to the valve body between the transmission case and the valve body. If any component of the valve body **including the TCM** sensors or solenoids need replaced, the complete TCMA (valve body) must be replaced. For replacement of the TCMA (valve body). Refer to **VALVE BODY, REMOVAL**. Components of the valve body and TCM are as follows:

VALVE BODY



[Fig. 320: Solenoid A D E C & Park Release Mechanical Valve]

2 - TCM (Includes Transmission Temperature Sensor)
3 - External Wire Harness Connector
4 - Output Speed Sensor
5 - Park Position Sensor

CAUTION: The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Failure to follow these instructions may result in damage to the TCM/TCMA.

The valve body, which includes the Transmission Control Module (TCM), controls the delivery and pressure of transmission fluid. The TCM is integrated into the valve body. The TCM regulates the amount of hydraulic pressure used to engage the clutches and the Torque Converter Clutch (TCC), in addition to directing hydraulic pressure to engage or release any given clutch for any given required gear. The TCM will actuate the valves via solenoids based on the position of the shifter, transmission fluid temperature, engine operating conditions, traction conditions and driver demands. During a shift, the TCM will actuate the solenoids to match the gear ranges to the optimal torque range of the engine based on the position of the accelerator pedal, shifter and vehicle speed as determined by the PCM based on input from the Vehicle Speed Sensor (VSS) and ABS module. Due to the complexity of the 8HP45 transmission control system, always refer to the appropriate Transmission Electrical Diagnostics article when attempting to diagnose transmission problems.

If the Transmission Control Module Assembly (TCMA) is replaced, it **must** be programmed and a drive learn needs to be performed before returning the vehicle to the customer. For programming and drive learn procedures, refer to **TRANSMISSION CONTROL MODULE (TCM) ADAPTATION - 8HP45/845RE /8HP70/8HP90** .

REMOVAL

VALVE BODY

CAUTION: The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Failure to follow these instructions may result in damage to the TCM/TCMA.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Drain the transmission fluid into a clean container. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

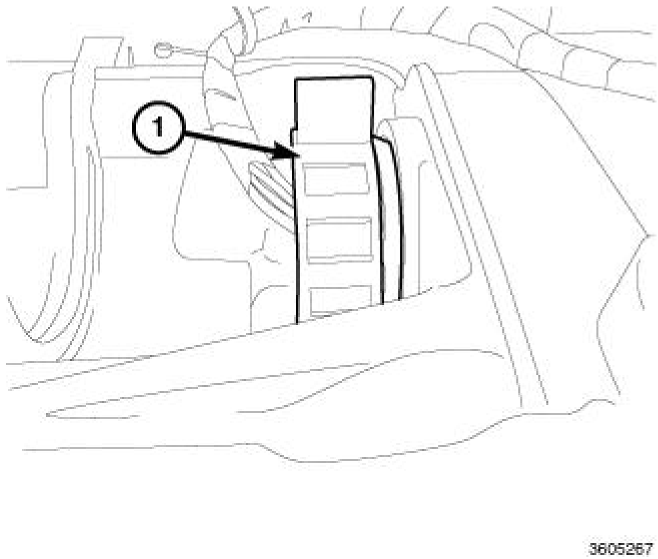

Fig. 324: Adapter Plug Connector
Courtesy of CHRYSLER GROUP, LLC

3. Turn the locking mechanism lock (1) of the transmission harness connector counterclockwise and disconnect the connector from the transmission.

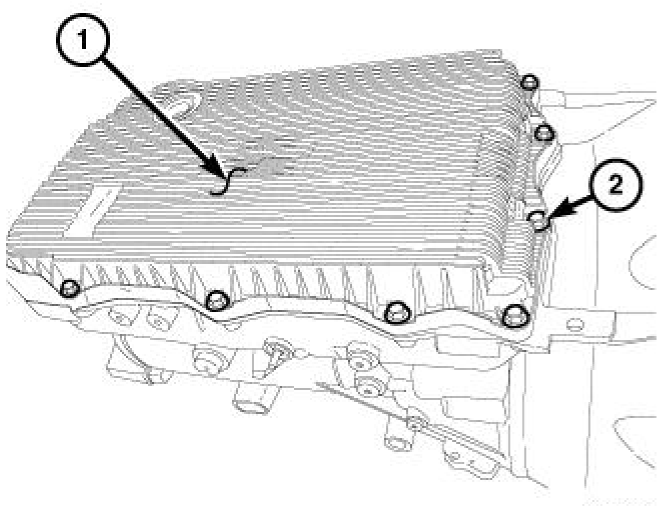

Fig. 325: Thirteen Oil Pan Retaining Bolts

Courtesy of CHRYSLER GROUP, LLC

NOTE: **Inspect the gasket for reuse. If the seal is cut or torn, replace the gasket.**

4. Remove the thirteen transmission oil pan bolts (2).
5. Carefully detach the transmission oil pan (1) and gasket.

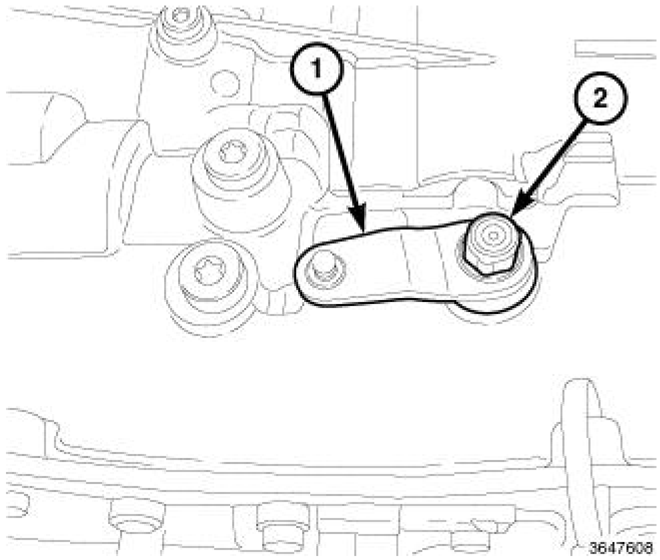

Fig. 326: Manual Park Release Lever Retaining Nut & Lever
Courtesy of CHRYSLER GROUP, LLC

6. Remove the Manual Park Release (MPR) lever retaining nut (2) and remove the lever (1).
7. Reinstall the MPR lever 180 degrees offset. Using a tie strap, secure the lever into position so the park release fork remains in the same position for installation of the valve body assembly.

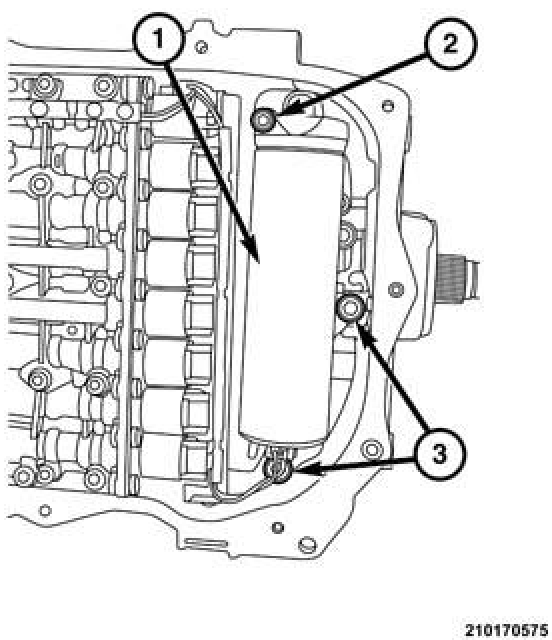

Fig. 327: Hydraulic Impulse Storage Unit & Bolts

Courtesy of CHRYSLER GROUP, LLC

8. If equipped, disconnect the Hydraulic Impulse Oil Storage (HIS) connector.
9. If equipped, remove three HIS bolts (2 and 3) and the accumulator (1).

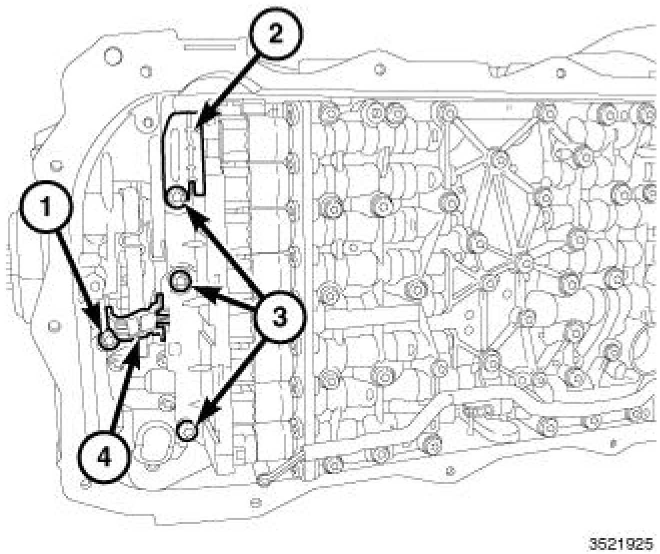

Fig. 328: Valve Body Assembly End Retainer Bolts
Courtesy of CHRYSLER GROUP, LLC

10. Remove the valve body assembly end retainer bolts (3).
11. Lift the electrical connector lock (2) to release the internal harness end from inside the transmission for valve body assembly removal.
12. Remove the Output Shaft Speed (OSS) sensor retaining bolt (1) and pull the OSS sensor (4) loose from the case.

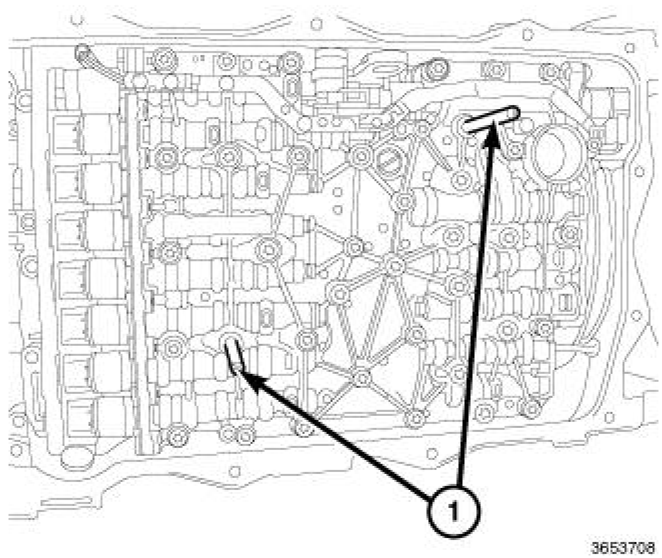
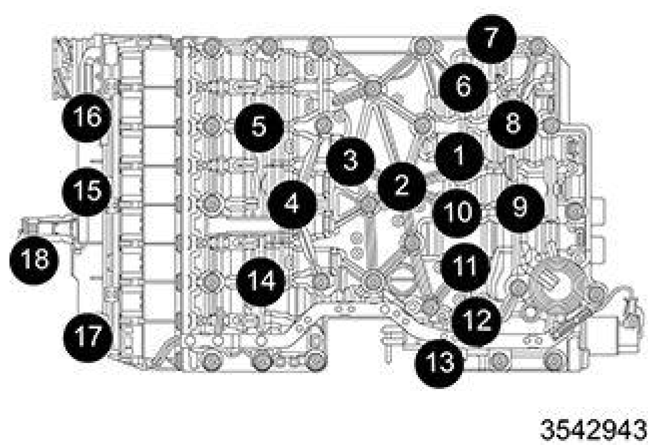
13. Using (special tool #10377, Remover/Installer, Guide Sleeve) (1) carefully pull the electrical harness insulator (2) straight out from the transmission case (3).



[Fig. 330: Valve Body Alignment Pins](#)
Courtesy of CHRYSLER GROUP, LLC

14. Remove two bolts and hand install (special tool #10379, Pins, Valve Body Alignment) (1).
15. Use an appropriate tool on one of the alignment pins to assist in holding the valve body in position while removing the remaining fasteners.



[Fig. 331: Valve Body Bolts Loosening And Tightening Sequence](#)
Courtesy of CHRYSLER GROUP, LLC

16. Remove remaining valve body bolts.
17. Carefully lower the valve body assembly from the transmission.

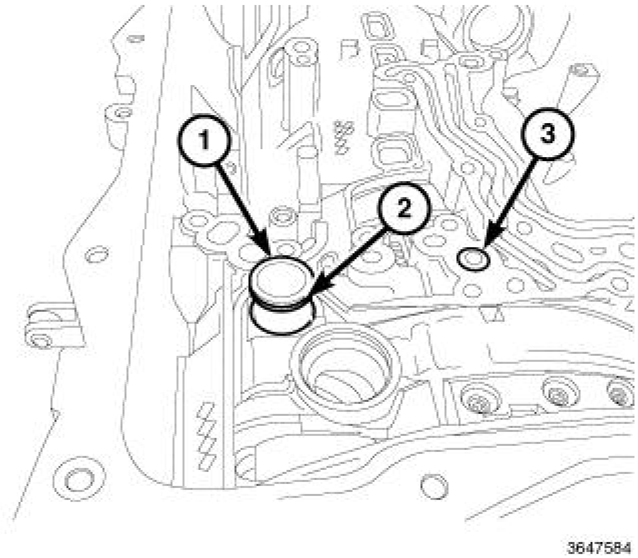


Fig. 332: Fluid Port, Two O-Rings, Compression Seal
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The fluid port may remain in the valve body upon removal, remove and discard the O-rings.**

18. Remove the fluid transfer port (1) from the transmission.
19. Remove and discard the O-ring (2) and seal (3).

INSTALLATION

VALVE BODY

CAUTION: **The Transmission Control Module (TCM), or Transmission Control Module Assembly (TCMA) is extremely sensitive to Electrostatic Discharge (ESD). Always use a ground strap and follow the ESD guidelines in ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES. Failure to follow these instructions may result in damage to the TCM/TCMA.**

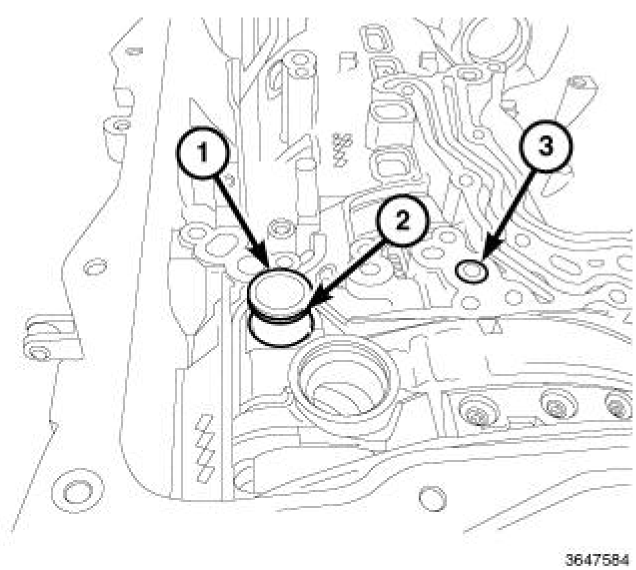

Fig. 333: Fluid Port, Two O-Rings, Compression Seal
Courtesy of CHRYSLER GROUP, LLC

1. Install the fluid port (1) with **NEW** O-rings (2) and seal (3) on the valve body.

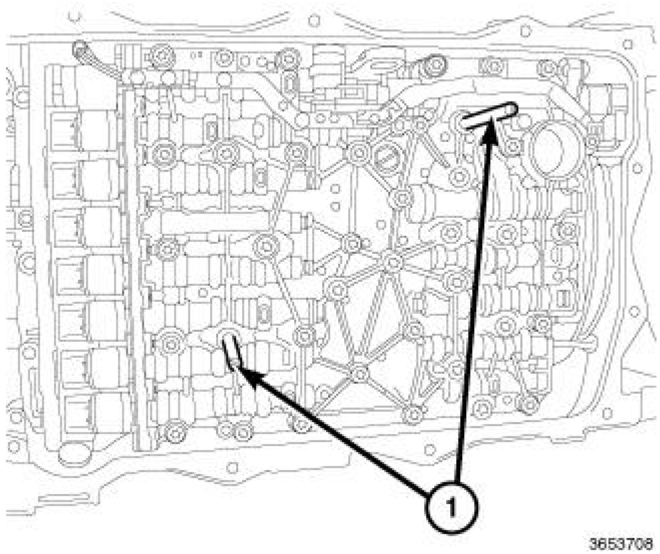

Fig. 334: Valve Body Alignment Pins
Courtesy of CHRYSLER GROUP, LLC

2. Install the valve body assembly on the transmission using the previously installed (special tool #10379, Pins, Valve Body Alignment) (1) as a guide.
3. Use an appropriate tool on one of the alignment pins to assist in holding the valve body in position while installing the valve body bolts.

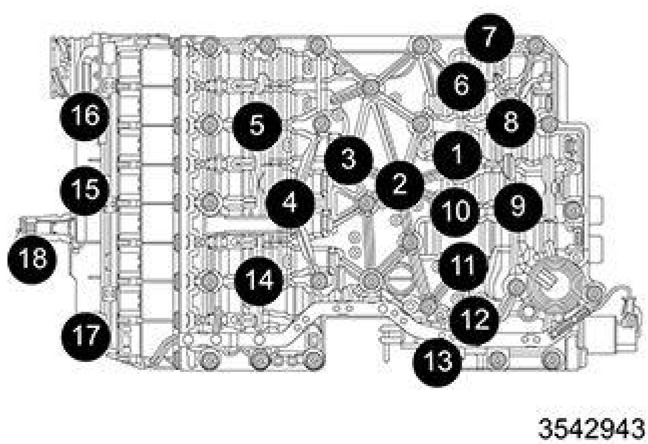

Fig. 335: Valve Body Bolts Loosening And Tightening Sequence
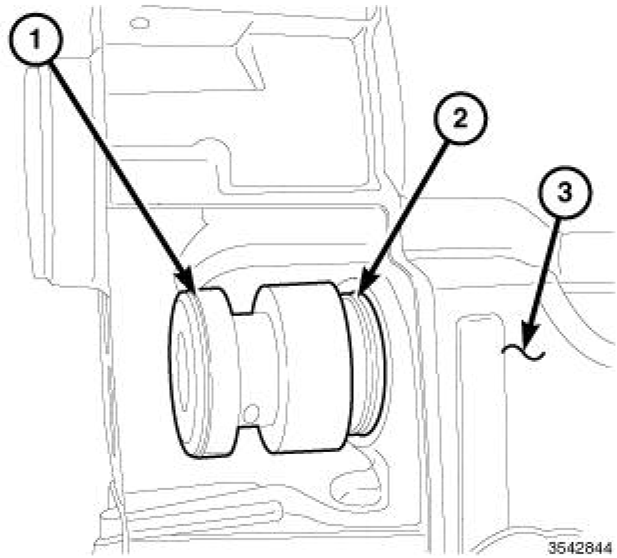
Courtesy of CHRYSLER GROUP, LLC

4. Install the valve body bolts not including 16-18 and hand tighten.
5. Remove the pins and install the remaining bolts.



[Fig. 336: Remover/Installer, Guide Sleeve, Electrical Harness Insulator & Transmission Case]

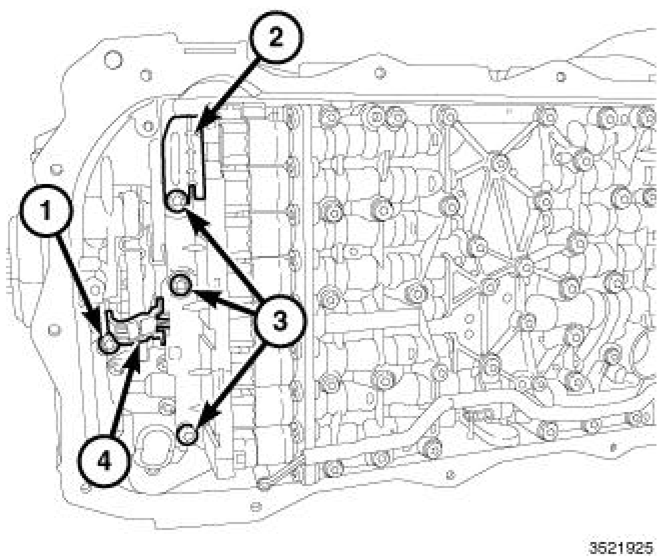
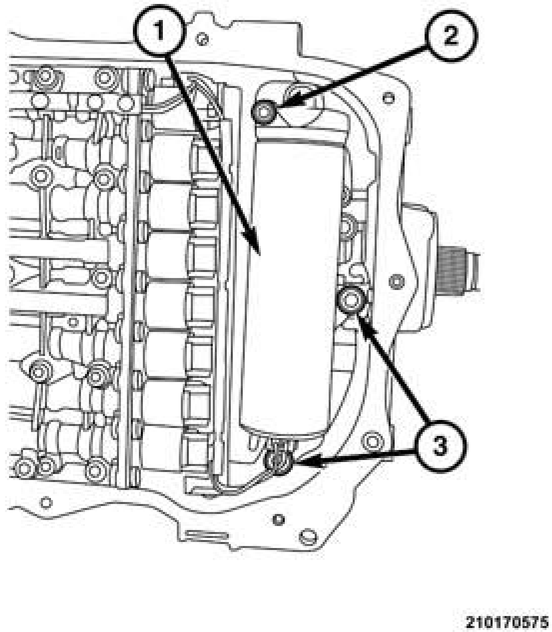
6. Using (special tool #10377, Remover/Installer, Guide Sleeve) (1) carefully install the electrical harness insulator (2) to the transmission case (3).



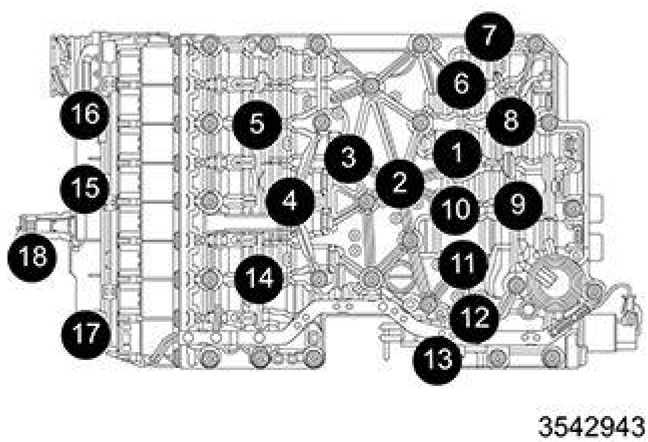
[Fig. 337: Valve Body Assembly End Retainer Bolts]
Courtesy of CHRYSLER GROUP, LLC

7. Install and lock the electrical connector lock (2) to the internal harness end.
8. Install the Output Shaft Speed (OSS) sensor (4) and tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS**.



[Fig. 338: Hydraulic Impulse Storage Unit & Bolts](#)
Courtesy of CHRYSLER GROUP, LLC

9. If equipped, install the Hydraulic Impulse Oil Storage (HIS) accumulator (1).
10. Tighten the bolts (2 and 3) to the proper specification. Refer to **TORQUE SPECIFICATIONS**.
11. Connect the HIS electrical connector.
12. Install the valve body bolts (3) and hand tighten.



[Fig. 339: Valve Body Bolts Loosening And Tightening Sequence](#)
Courtesy of CHRYSLER GROUP, LLC

13. Tighten the valve body bolts to the proper specification. Refer to **TORQUE SPECIFICATIONS**.

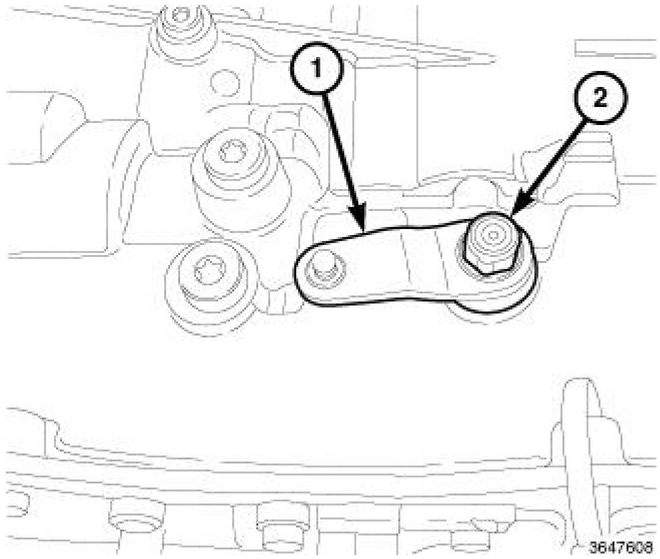


Fig. 340: Manual Park Release Lever Retaining Nut & Lever
Courtesy of CHRYSLER GROUP, LLC

14. Remove the tie strap and return the Manual Park Release (MPR) lever (1) to the original position. Tighten the MPR bolt (2) to the proper specification. Refer to **TORQUE SPECIFICATIONS**.

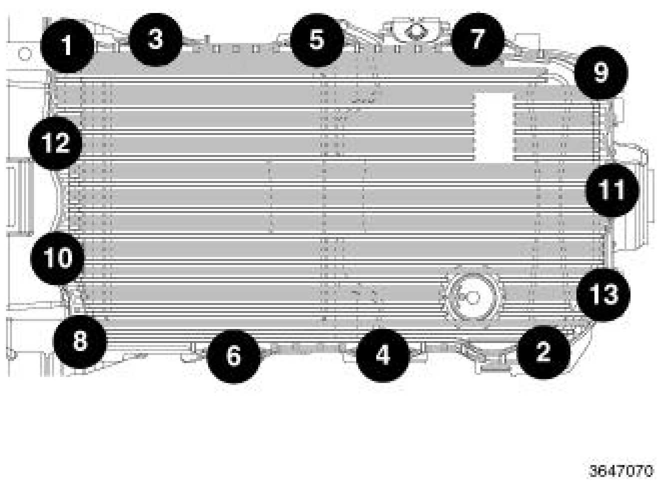

Fig. 341: Oil Pan Retaining Bolts Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

15. Install the transmission oil pan and gasket.
16. Install the thirteen transmission oil pan bolts and tighten the to the proper specification using the sequence given. Refer to **TORQUE SPECIFICATIONS**.

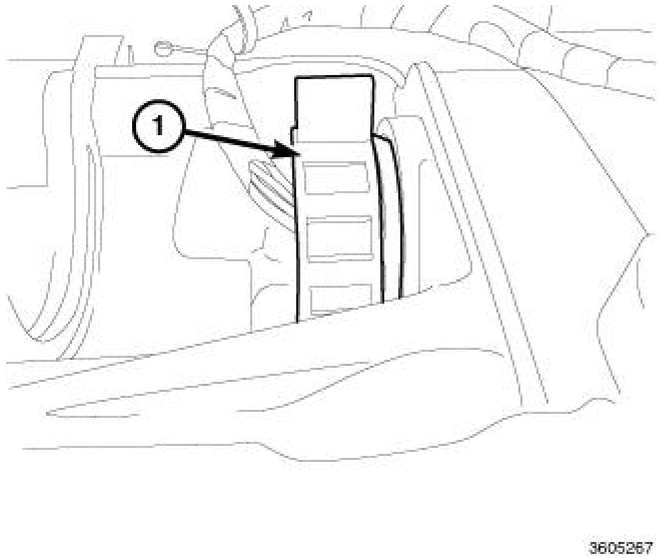

Fig. 342: Adapter Plug Connector
Courtesy of CHRYSLER GROUP, LLC

17. Connect the transmission wire harness connector (1).

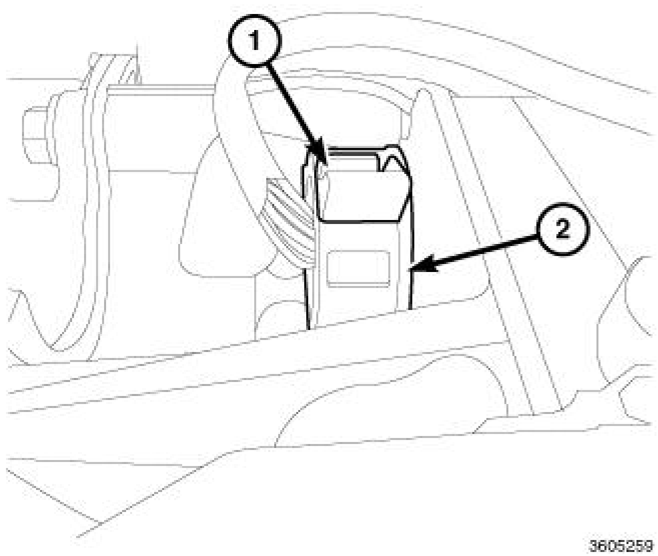

Fig. 343: Locking Mechanism Lock & Adapter Plug Connector
Courtesy of CHRYSLER GROUP, LLC

18. Turn the locking mechanism (1) of the transmission wire harness connector (2) clockwise to lock it in place.
19. If the valve body is replaced, program the Transmission Control Module (TCM). Refer to **MODULE, TRANSMISSION CONTROL, MODULE PROGRAMMING** .
20. Perform the TRANSMISSION FILL AFTER SERVICE procedure. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
21. Perform the TRANSMISSION VERIFICATION TEST. Refer to **TRANSMISSION VERIFICATION TEST** .

DTC TROUBLESHOOTING

B222F-00-FLASH WRITE PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

- Continuously with the ignition on.

SET CONDITION

- The module disables a safety controller when programming the module with new software. The safety controller stops the controller from resetting during a flash update. This Diagnostic Trouble Code (DTC) indicates that the controller has not reset.

DEFAULT ACTION

- The Electronic Vehicle Information Center (EVIC) will display "ACC/FCW Unavailable Service Required".
- The Adaptive Cruise Control (ACC) and Forward Collision Warning (FCW) systems will be disabled.
- Once the DTC changes from active to stored, the ACC and FCW features will return to normal operation.

POSSIBLE CAUSES

Possible Causes
ADAPTIVE CRUISE CONTROL (ACC) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read ACC DTCs and record on the repair order.
    2. With the scan tool, erase Adaptive Cruise Control (ACC) DTCs.
    3. Cycle the ignition switch from off to on at least five times, leaving the ignition on for a minimum

of 90 seconds per cycle.

4. With the scan tool, read ACC DTCs.

   Is the DTC active?

   Yes

   - With a scan tool, program the Adaptive Cruise Control (ACC) Module with latest software version and align the ACC Module in accordance with the Service Information.
   - After the above procedure, Go To 2

   No

   - Go To 3

2. **CONTINUED ACTIVE DTC AFTER PROGRAMING**
   1. With the scan tool, read ACC DTCs.

      Does the scan tool display this DTC as active after programming?

      Yes

      - Replace and align the Adaptive Cruise Control (ACC) Module in accordance with the Service Information. Refer to **MODULE, ADAPTIVE CRUISE CONTROL, REMOVAL**
        .
      - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

3. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this Module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

- Test complete.

C0063-9A-YAW RATE SENSOR - COMPONENT OR SYSTEM OPERATING CONDITIONS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- No CAN Bus DTCs present.
- Adaptive Cruise Control (ACC) Module is not in Plant-Mode.
- ESP is not in diagnostic mode.

SET CONDITION

- A ready conflict between the ACC Module and the Electronic Stability Program (ESP) system has occurred.
- The Module receives over the CAN Bus from the Antilock Brake System (ABS) Module that the yaw rate offset of the Dynamic Sensor is beyond an allowable threshold of 4 degrees per second.

DEFAULT ACTION

- The Electronic Vehicle Information Center (EVIC) will display "ACC/FCW Unavailable Service Required".
- The Adaptive Cruise Control (ACC) and Forward Collision Warning (FCW) systems will be disabled.
- Once the DTC changes from active to stored, the ACC and FCW features will return to normal operation.

POSSIBLE CAUSES

Possible Causes
ANTILOCK BRAKE SYSTEM (ABS) DTCS PRESENT
ABS MODULE DYNAMIC SENSOR
ABS MODULE NOT INITIALIZED/PROGRAMED

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Test drive the vehicle.
    2. Park the vehicle on a level surface and allow to idle for a minimum of 10 seconds.
    3. With the scan tool, erase ACC DTCs.
    4. Turn the ignition off.
    5. Start the engine.
    6. With the scan tool read ACC DTCs.

Does this DTC return?

Yes

- Go To 2

No

- If the DTC can be erased without returning, no further repair is necessary, test complete.
- Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

2. **ANTI-LOCK BRAKE SYSTEM**
   1. This DTC is an informational DTC detecting that there is a DTC stored in the Anti-lock Brake System (ABS) Module.

      Repair

      - Repair the ABS DTC(s). Refer to **DIAGNOSIS AND TESTING** .

      NOTE: **It may be necessary to perform the ABS Initialization routine with the scan tool to reset the vehicle configuration.**

C008E-00-ECU INTERNAL PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- No CAN Bus DTCs present.
- Adaptive Cruise Control (ACC) Module is not in Plant-Mode.
- ESP is not in diagnostic mode.

SET CONDITION

- The Adaptive Cruise Control (ACC) Module runs a self diagnostic test to validate proper controller operation. This DTC will set if the controller has failed one or more internal test.

DEFAULT ACTION

- The Electronic Vehicle Information Center (EVIC) will display "ACC/FCW Unavailable Service Required".
- The Adaptive Cruise Control (ACC) system will be disabled.
- Once the DTC changes from active to stored, the ACC feature will return to normal operation.
- The DTC will be cleared after a 100 consecutive ignition cycles with no active detection.

POSSIBLE CAUSES

Possible Causes
ADAPTIVE CRUISE CONTROL (ACC) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Start the engine.
    2. With the scan tool, read Adaptive Cruise Control (ACC) Module DTCs and record on the repair order.

       Is the DTC active?

       Yes

       - Replace and program the Adaptive Cruise Control (ACC) Module in accordance with the Service Information. Refer to **MODULE, ADAPTIVE CRUISE CONTROL, REMOVAL** .
       - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 2
2. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this Module. Wiggle the wiring and connectors while checking for shorted and open circuits.
    3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Check Service Bulletins for any possible causes that may apply.

       Were there any problems found?

       Yes

       - Repair as necessary.
       - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Test complete.

C1240-00-STEERING ANGLE SENSOR ANGLE OVERTRAVEL PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- No CAN Bus DTCs present.
- Adaptive Cruise Control (ACC) Module is not in Plant-Mode.
- ESP is not in diagnostic mode.

SET CONDITION

- A ready conflict with the Steering Column Control Module (SCCM) has occurred.
- The Module receives a message over the Can Bus from the Steering Column Control Module (SCCM) that the Steering Angle Sensor (SAS) steering angle offset is beyond an allowable threshold of 12 degrees.

DEFAULT ACTION

- The Electronic Vehicle Information Center (EVIC) will display "ACC/FCW Unavailable Service Required".
- The Adaptive Cruise Control (ACC) system will be disabled.
- Once the DTC changes from active to stored, the ACC feature will return to normal operation.
- The DTC will be cleared after a 100 consecutive ignition cycles with no active detection.

POSSIBLE CAUSES

Possible Causes
STEERING COLUMN CONTROL MODULE DTCS PRESENT
STEERING COLUMN CONTROL MODULE (SCCM) - STEERING ANGLE SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read Adaptive Cruise Control (ACC) Module DTCs and record on the repair order.
    2. With the scan tool, erase ACC DTCs.
    3. Turn the ignition off.
    4. Start the Engine.
    5. With the scan tool, read ACC DTCs.

       Does the DTC return?

       Yes

       - Go To 2

No

- If the DTC can be erased without returning, no further repair is necessary, test complete.
- Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

2. **REPAIR STEERING COLUMN CONTROL MODULE DTCS**
    1. This DTC is an informational DTC indicating that there is a DTC stored in the Steering Column Control Module (SCCM).

    Repair

    - Repair the SCCM DTC(s). Refer to **DIAGNOSIS AND TESTING** .

C127A-00-ESP DID NOT RESPOND TO DECELERATION REQUEST

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- No CAN Bus DTCs present.
- Adaptive Cruise Control (ACC) Module is not in Plant-Mode.
- ESP is not in diagnostic mode.
- ACC or Forward Collision Warning (FCW) system is enabled.

SET CONDITION

- Module detects the Antilock Brake System (ABS) Module for ESP/ESC does not brake when requested.

DEFAULT ACTION

- The Electronic Vehicle Information Center (EVIC) will display "ACC/FCW Unavailable Service Required".
- The Adaptive Cruise Control (ACC) system will be disabled.
- Once the DTC changes from active to stored, the ACC feature will return to normal operation.
- The DTC will be cleared after a 100 consecutive ignition cycles with no active detection.

POSSIBLE CAUSES

Possible Causes
ANTILOCK BRAKE SYSTEM (ABS) ESP/ESC DTCS PRESENT
CAN MESSAGE CONFLICT
VEHICLE IMPROPERLY CONFIGURED

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Test drive the vehicle.
    2. Park the vehicle on a level surface and allow to idle for a minimum of 10 seconds.
    3. With the scan tool, erase ACC DTCs.
    4. Turn the ignition off.
    5. Start the engine.
    6. Activate the ACC.
    7. With the scan tool read ACC DTCs.

    Does this DTC return?

    Yes

    - Go To 2

    No

    - If the DTC can be erased without returning, no further repair is necessary, test complete.
    - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
2. **ANTI-LOCK BRAKE SYSTEM**
    1. This DTC is an informational DTC detecting that there is a DTC stored in the Anti-lock Brake System (ABS) Module.

    Repair

    - Repair the ABS DTC(s). Refer to **DIAGNOSIS AND TESTING** .

    NOTE: **It may be necessary to perform the ABS Initialization routine with the scan tool to reset the vehicle configuration.**

C14A3-00-XBW RULE VIOLATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- No CAN Bus DTCs present.
- Adaptive Cruise Control (ACC) Module is not in Plant-Mode.
- ESP is not in diagnostic mode.
- ACC or Forward Collision Warning (FCW) system is enabled.

SET CONDITION

- The Module detects an sudden deceleration/acceleration induced externally or a DTC in another Module.

DEFAULT ACTION

- The Electronic Vehicle Information Center (EVIC) will display "ACC/FCW Unavailable Service Required".
- The Adaptive Cruise Control (ACC) system will be disabled.
- Once the DTC changes from active to stored, the ACC feature will return to normal operation.
- The DTC will be cleared after a 100 consecutive ignition cycles with no active detection.

POSSIBLE CAUSES

Possible Causes
DTCS IN OTHER MODULE(S)
IGNITION CYCLE
BRAKE SYSTEM FUNCTIONALITY
DRIVING CONDITIONS OR ACCIDENT OCCURRED

DIAGNOSTIC TEST

1. **CHECK FOR DTCS IN OTHER MODULES**
    1. With the scan tool, read DTCs.

       Are other modules reporting any DTCs?

       Yes

       - If DTCs are set in the PCM, TCM, or ABS, refer to those diagnostic categories first and perform the appropriate diagnostic procedure(s).

       No

       - Go To 2
2. **CHECK FOR AN ACTIVE DTC**

   NOTE: **To help in the service of the Adaptive Cruise Control (ACC) system, it is recommended to communicate with the customer to obtain the environmental conditions they were driving in when the cruise control concern took place. Heavy rain, snow, ice, and fog can cause the ACC system to become inoperative. This is considered as a normal operational reaction of the ACC system and no repair is necessary.**

    1. With the scan tool, attempt to erase Adaptive Cruise Control (ACC) DTCs.

       Can you erase this DTC?

       Yes

       - If the DTC can be erased without resetting, no further repair is necessary. Test complete.

- Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

NOTE: **This DTC cannot be caused without faults elsewhere, other than deceleration/acceleration induced externally (e.g. driving in sand or accident).**

- If there are no other DTCs present, and the DTC cannot be cleared or go into a stored state, replace and program the Adaptive Cruise Control (ACC) Module in accordance with the Service Information. Refer to **MODULE, ADAPTIVE CRUISE CONTROL, REMOVAL** .
- Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C14A4-00-SENSOR ADJUSTMENT REQUIRED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- No CAN Bus DTCs present.
- Adaptive Cruise Control (ACC) Module is not in Plant-Mode.
- ESP is not in diagnostic mode.

SET CONDITION

- Module detects that it is physically misaligned for one minute.

DEFAULT ACTION

- The Electronic Vehicle Information Center (EVIC) will display "ACC/FCW Unavailable Service Required".
- The Adaptive Cruise Control (ACC) system will be disabled.
- Once the DTC changes from active to stored, the ACC feature will return to normal operation.
- The DTC will be cleared after a 100 consecutive ignition cycles with no active detection.

POSSIBLE CAUSES

Possible Causes
ADAPTIVE CRUISE CONTROL (ACC) MODULE/LENS MISALIGNED
ADAPTIVE CRUISE CONTROL (ACC) MODULE BRACKET, SECURING CLIPS BROKEN OR BENT

Possible Causes
ADAPTIVE CRUISE CONTROL (ACC) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: A secure and unmodified mounting location is critical to the proper operation of the Adaptive Cruise Control (ACC) system.

   NOTE: To help in the service of the Adaptive Cruise Control (ACC) system, it is recommended to communicate with the customer to obtain the environmental conditions they were driving in when the cruise control concern took place. Heavy rain, snow, ice, and fog can cause the ACC system to become inoperative. This is considered as a normal operational reaction of the ACC system and no repair is necessary.

   NOTE: Vehicles that have had the suspension modified and/or an aftermarket grill installed that blocks the ACC Module can cause the ACC system to not function properly.

   1. Start the engine.
   2. With the scan tool, read ACC DTCs and record on the repair order.

      Is the DTC active?

      Yes

      - Go To 2

      No

      - Make sure the lens is free of dirt, damage, and other obstructions. Clear the DTC and verify proper operation of the ACC system.
      - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

2. **INSPECT ACC MODULE MOUNTING AND LENS ALIGNMENT**

   NOTE: Make sure the ACC Sensor lens is free from dirt and debris (mud, dirt, ice, road debris) that would compromise the function of the ACC system.

   1. Perform a thorough visual and physical inspect of the ACC Module and the mounting bracket and location.
   2. Check for:
      - Bent mounting bracket
      - Damage to the ACC Module
      - Damaged, obscured, or out of alignment lens

- ACC Module not fully seated or broken/missing securing clips

Were there any problems found?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Align the Adaptive Cruise Control (ACC) Module/sensor lens in accordance to the Service Information. If the alignment is correct, and the DTC continues to set, replace and program the Adaptive Cruise Control (ACC) Module in accordance with the Service Information. Refer to **MODULE, ADAPTIVE CRUISE CONTROL, REMOVAL** .
- Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C14A5-00-SENSOR BLINDED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- No CAN Bus DTCs present.
- Adaptive Cruise Control (ACC) Module is not in Plant-Mode.
- ESP is not in diagnostic mode.

SET CONDITION

- Module detects that the lens is damaged or obstructed.

DEFAULT ACTION

- The Electronic Vehicle Information Center (EVIC) will display "ACC/FCW Unavailable Service Required".
- The Adaptive Cruise Control (ACC) system will be disabled.
- Once the DTC changes from active to stored, the ACC feature will return to normal operation.
- The DTC will be cleared after a 100 consecutive ignition cycles with no active detection.

POSSIBLE CAUSES

Possible Causes
SENSOR LENS OBSTRUCTION

Possible Causes
DAMAGE SENSOR LENS OR MOUNTING LOCATION
VERTICAL MISALIGNMENT
ADAPTIVE CRUISE CONTROL (ACC) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

NOTE: **A secure and unmodified mounting location is critical to the proper operation of the Adaptive Cruise Control (ACC) system.**

NOTE: **To help in the service of the Adaptive Cruise Control (ACC) system, it is recommended to communicate with the customer to obtain the environmental conditions they were driving in when the cruise control concern took place. Heavy rain, snow, ice, and fog can cause the ACC system to become inoperative. This is considered as a normal operational reaction of the ACC system and no repair is necessary.**

NOTE: **Vehicles that have had the suspension modified and/or an aftermarket grill installed that blocks the ACC Module can cause the ACC system to not function properly.**

   1. Start the engine.
   2. Wait a minimum of one minute.
   3. With the scan tool, read ACC DTCs and record on the repair order.

   Is the DTC active?

   Yes

   - Go To 2

   No

   - Make sure the lens is free of dirt, damage, and other obstructions. If no problems are found, clear the DTC and verify proper operation of the ACC system. Test complete.
   - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to STANDARD PROCEDURE.

2. **INSPECT ACC MODULE MOUNTING AND LENS ALIGNMENT**

NOTE: **Make sure the ACC Sensor lens is free from dirt and debris (mud, dirt, ice, road debris) that would compromise the function of the ACC system.**

   1. Perform a thorough visual and physical inspection of the ACC Module and the mounting bracket and location.
   2. Check for:

- Bent mounting bracket
- Damage to the ACC Module
- Damaged, obscured, or out of alignment lens
- ACC Module not fully seated or broken/missing securing clips

Were there any problems found?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Align the Adaptive Cruise Control (ACC) Module/sensor lens in accordance to the Service Information. If the alignment is correct, and the DTC continues to set, replace and program the Adaptive Cruise Control (ACC) Module in accordance with the Service Information. Refer to **MODULE, ADAPTIVE CRUISE CONTROL, REMOVAL** .
- Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C15D8-00-MISMATCH TIRE SIZE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- No CAN Bus DTCs present.
- Adaptive Cruise Control (ACC) Module is not in Plant-Mode.
- ESP is not in diagnostic mode.

SET CONDITION

- Module detects that the tire size on the vehicle is greater the 10% of the programed size.

DEFAULT ACTION

- The Electronic Vehicle Information Center (EVIC) will display "ACC/FCW Unavailable Service Required".
- The Adaptive Cruise Control (ACC) system will be disabled.
- Once the DTC changes from active to stored, the ACC feature will return to normal operation.
- The DTC will be cleared after a 100 consecutive ignition cycles with no active detection.

POSSIBLE CAUSES

Possible Causes
INCORRECT TIRE SIZE PROGRAMED INTO BODY CONTROL MODULE (BCM)
INCORRECT TIRE SIZE PROGRAMED INTO ANTILOCK BRAKE SYSTEM (ABS)
ANTILOCK BRAKE SYSTEM (ABS) DTCS PRESENT
WRONG TIRE SIZE INSTALLED ON VEHICLE

DIAGNOSTIC TEST

CHECK THE TIRE SIZE

1. This is an informational Diagnostic Trouble Code (DTC). The Adaptive Cruise Control (ACC) Module receives the vehicle configuration information over the Can Bus. Tire size is stored in the Body Control Module (BCM) and also in the Anti-lock Brake System (ABS) Module.

   Possible causes but not limited too:

   - Wrong tires installed on vehicle.
   - Incorrect tire size written/stored in the BCM and/or ABS.
   - ABS DTCs present.
   - Any Service Bulletins that may apply.

   Were any of the above conditions present?

   Yes

   - Repair/reprogram as necessary.
   - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - With the scan tool, perform an ACC Aim Mode - Auto Alignment procedure to relearn a different tire size and to verify the Adaptive Cruise Control (ACC) Module alignment.
   - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C2129-16-BATTERY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

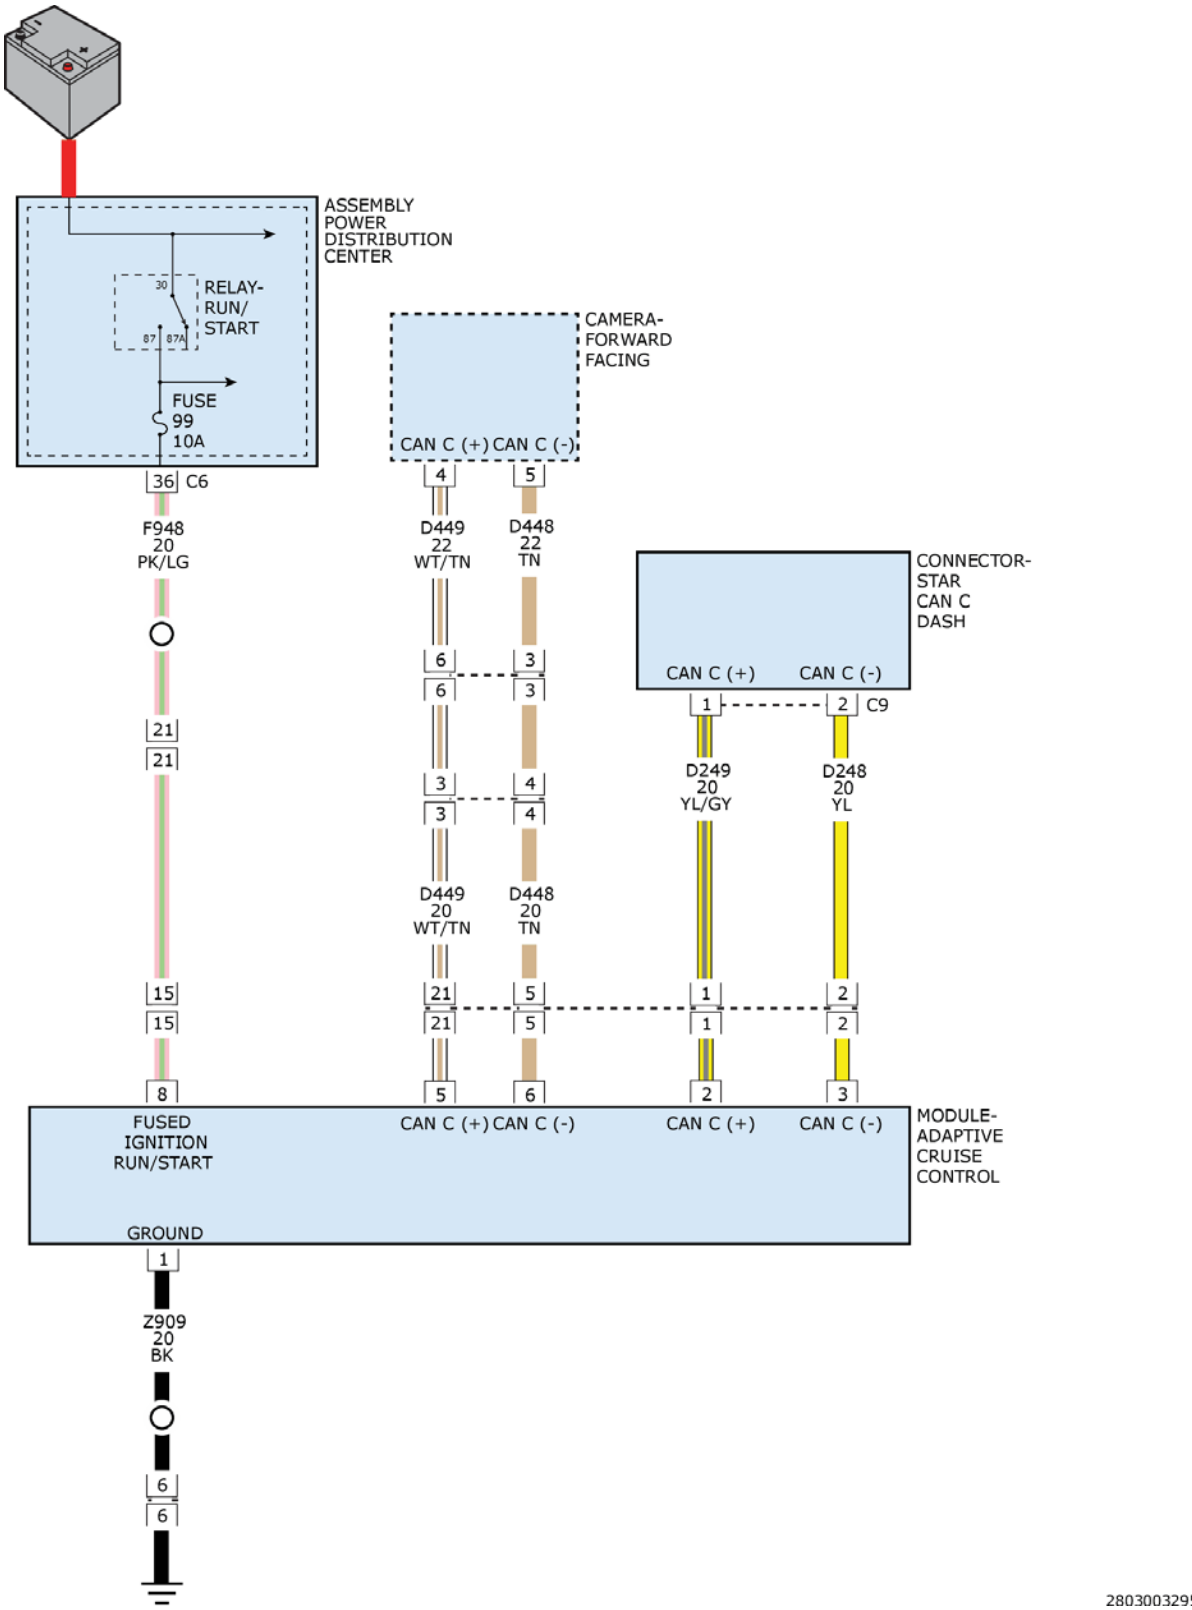

Fig. 1: Identifying Adaptive Cruise Control Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Engine not cranking.
- Adaptive Cruise Control (ACC) Module is not in Plant-Mode.
- ESP is not in diagnostic mode.

SET CONDITION

- The monitored voltage to the Adaptive Cruise Control (ACC) Module is below 9.0 volts.

DEFAULT ACTION

- The Electronic Vehicle Information Center (EVIC) will display "ACC/FCW Unavailable Wipe Off Front Radar Sensor plus Graphic".
- The Adaptive Cruise Control (ACC) system will be disabled.
- Once the DTC changes from active to stored, the ACC feature will return to normal operation.
- The DTC will be cleared after a 100 consecutive ignition cycles with no active detection.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT IN POWERTRAIN CONTROL MODULE (PCM)
LOW BATTERY VOLTAGE
FUSED IGNITION OPEN OR HIGH RESISTANCE
GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ADAPTIVE CRUISE CONTROL (ACC) MODULE

DIAGNOSTIC TEST

1. **RELATED DTCS PRESENT IN PCM**
    1. Start the engine.
    2. With the scan tool, read Powertrain Control Module (PCM) DTCs and record on the repair order.

       Are there any charging system or battery related DTCs present?

       Yes

       - Repair the PCM DTC(s). Refer to **DTC INDEX** .

       No

       - Go To 2
2. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read Adaptive Cruise Control (ACC) Module DTCs and record on the repair order.

       Is the DTC active?

       Yes

- Go To 3

No

- Go To 5

3. **CHECK THE (F948) FUSED IGNITION CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the ACC Module harness connector.
   3. Turn the ignition on.
   4. Using a 12-volt test light connected to ground, check the (F948) Fused Ignition circuit at the ACC Module harness connector.

   NOTE: **The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

   Does the test light illuminate brightly?

   Yes

   - Go To 4

   No

   - Repair the (F948) Fused Ignition circuit for an open or high resistance.

     NOTE: **If the fuse is open, make sure to check for a short to ground.**

   - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **CHECK THE (Z909) GROUND CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Using a 12-volt test light connected to 12-volts, check the ground and the (Z909) Ground circuit in the ACC harness connector.

   Does the test light illuminate brightly?

   Yes

   - Replace and program the Adaptive Cruise Control (ACC) Module in accordance with the Service Information. Refer to **MODULE, ADAPTIVE CRUISE CONTROL, REMOVAL** .
   - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Repair the (Z909) Ground circuit for an open or high resistance.
   - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to

STANDARD PROCEDURE.

5. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits.
    3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. With the scan tool, check for any Environmental Data to help identify the conditions in which the DTC was set.
    5. Check for any Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

C2129-17-BATTERY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

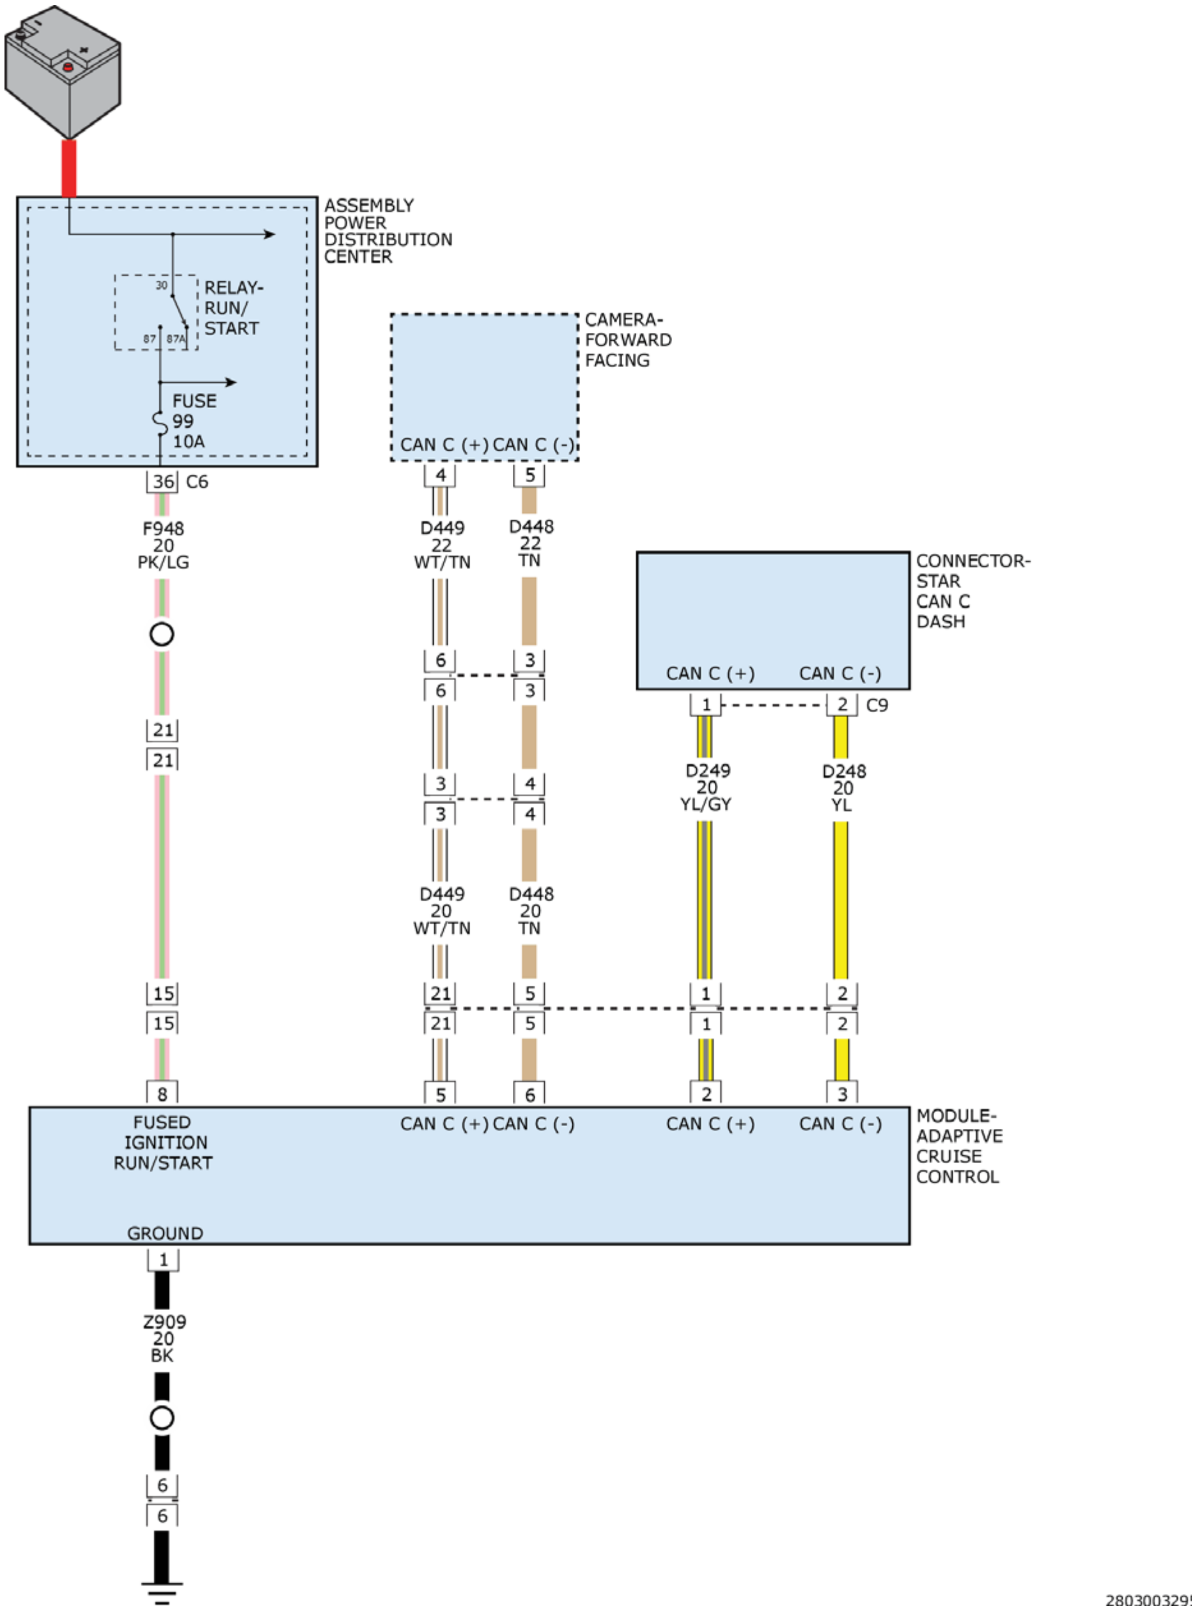

Fig. 2: Identifying Adaptive Cruise Control Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Adaptive Cruise Control (ACC) Module is not in Plant-Mode.
- ESP is not in diagnostic mode.

SET CONDITION

- Module detects that the voltage to the module is above 16.0 volts.

DEFAULT ACTION

- The Electronic Vehicle Information Center (EVIC) will display "ACC/FCW Unavailable Service Required".
- The Adaptive Cruise Control (ACC) system will be disabled.
- Once the DTC changes from active to stored, the ACC feature will return to normal operation.
- The DTC will be cleared after a 100 consecutive ignition cycles with no active detection.

POSSIBLE CAUSES

Possible Causes
RELATED DTC(S) PRESENT IN THE PCM
HIGH BATTERY VOLTAGE
ADAPTIVE CRUISE CONTROL (ACC) MODULE

DIAGNOSTIC TEST

1. **RELATED DTCS PRESENT IN THE PCM**
    1. Start the Engine.
    2. With the scan tool, read Powertrain Control Module (PCM) DTCs and record on the repair order.

       Are there any charging system or battery related DTCs present in the PCM?

       Yes

       - Repair the PCM DTC(s). Refer to **DTC INDEX** .

       No

       - Go To 2
2. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read ACC Module DTCs and record on the repair order.

       Is the DTC active?

       Yes

       - Replace and program the Adaptive Cruise Control (ACC) Module in accordance with the Service Information. Refer to **MODULE, ADAPTIVE CRUISE CONTROL, REMOVAL** .

- Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this Module. Wiggle the wiring and connectors while checking for shorted and open circuits.
    3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Check Service Bulletins for any possible causes that may apply.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

C212A-84-SYSTEM VOLTAGE - SIGNAL BELOW ALLOWABLE RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Adaptive Cruise Control (ACC) Module is not in Plant-Mode.
- ESP is not in diagnostic mode.

SET CONDITION

- Module receives a low charging system voltage message over the CAN Bus.

DEFAULT ACTION

- The Electronic Vehicle Information Center (EVIC) will display "ACC/FCW Unavailable Service Required".
- The Adaptive Cruise Control (ACC) system will be disabled.
- Once the DTC changes from active to stored, the ACC feature will return to normal operation.

- The DTC will be cleared after a 100 consecutive ignition cycles with no active detection.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM VOLTAGE LOW
ADAPTIVE CRUISE CONTROL (ACC) MODULE

DIAGNOSTIC TEST

1. **CHECK PCM FOR CHARGING SYSTEM DTCS**
    1. With the scan tool, read the PCM DTCs.

    Are there any charging system or battery DTCs set in the PCM?

    Yes

    - Repair the PCM DTC(s). Refer to **DTC INDEX** .

    No

    - Go To 2
2. **CHECK OTHER MODULES FOR CHARGING SYSTEM DTCS**
    1. Start the Engine.
    2. With the scan tool, read DTCs.

    Are there any other modules setting a charging system or battery related DTC?

    Yes

    - This is an indication of a charging/battery system malfunction. Check the battery/charging system in accordance with the Service Information. Refer to **DIAGNOSIS AND TESTING** .

    No

    - Go To 3
3. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read ACC DTCs.

    Is the DTC active?

    Yes

    - If no other modules are reporting any charging system under voltage DTCs, replace and program the Adaptive Cruise Control (ACC) Module in accordance with the Service Information. Refer to **MODULE, ADAPTIVE CRUISE CONTROL, REMOVAL** .
    - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 4

4. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this Module. Wiggle the wiring and connectors while checking for shorted and open circuits.
    3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Check Service Bulletins for any possible causes that may apply.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

C212A-85-SYSTEM VOLTAGE - SIGNAL ABOVE ALLOWABLE RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- No CAN Bus DTCs present.
- Adaptive Cruise Control (ACC) Module is not in Plant-Mode.
- ESP is not in diagnostic mode.
- ACC system is enabled and engaged.

SET CONDITION

- Module receives a high charging system voltage message over the Can Bus.

DEFAULT ACTION

- The Electronic Vehicle Information Center (EVIC) will display "ACC/FCW Unavailable Service Required".
- The Adaptive Cruise Control (ACC) system will be disabled.
- Once the DTC changes from active to stored, the ACC feature will return to normal operation.
- The DTC will be cleared after a 100 consecutive ignition cycles with no active detection.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM VOLTAGE HIGH
RELATED DTC(S) PRESENT IN THE PCM
ADAPTIVE CRUISE CONTROL (ACC) MODULE

DIAGNOSTIC TEST

1. **CHECK PCM FOR CHARGING SYSTEM DTC**
    1. With the scan tool, read PCM DTCs and record on the repair order.

       Are there any charging system or battery DTCs set in the PCM?

       Yes

       - Repair the PCM DTC(s). Refer to **DTC INDEX** .

       No

       - Go To 2
2. **CHECK OTHER MODULES**
    1. Start the Engine.
    2. With the scan tool, read DTCs.

       Do any other modules display this type of DTC?

       Yes

       - This is an indication of a charging/battery system malfunction. Check the battery/charging system in accordance with the Service Information. Refer to **DIAGNOSIS AND TESTING** .

       No

       - Go To 3
3. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read ACC Module DTCs and record on the repair order.

       Is the DTC active?

       Yes

       - If no other modules are reporting any charging system or over voltage DTCs, replace and program the Adaptive Cruise Control (ACC) Module in accordance with the Service Information. Refer to **MODULE, ADAPTIVE CRUISE CONTROL, REMOVAL** .

       No

- Go To 4

4. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this Module. Wiggle the wiring and connectors while checking for shorted and open circuits.
    3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Check Service Bulletins for any possible causes that may apply.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

C2206-00-VEHICLE CONFIGURATION MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- No CAN Bus DTCs present.
- Adaptive Cruise Control (ACC) Module is not in Plant-Mode.
- ESP is not in diagnostic mode.

SET CONDITION

- The vehicle configuration does not match what is stored in the ACC Module

DEFAULT ACTION

- The Electronic Vehicle Information Center (EVIC) will display "ACC/FCW Unavailable Service Required".
- The Adaptive Cruise Control (ACC) system will be disabled.
- Once the DTC changes from active to stored, the ACC feature will return to normal operation.
- The DTC will be cleared after a 100 consecutive ignition cycles with no active detection.

POSSIBLE CAUSES

Possible Causes
VEHICLE CONFIGURATION
ADAPTIVE CRUISE CONTROL (ACC) MODULE

DIAGNOSTIC TEST

ADAPTIVE CRUISE CONTROL MODULE NOT PROPERLY CONFIGURED

1. Preform the horizontal sensor alignment procedure in accordance with the Service Information.
2. Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   Does this DTC reset?

   Yes

   - Replace and program the Adaptive Cruise Control (ACC) Module in accordance with the Service Information. Refer to **MODULE, ADAPTIVE CRUISE CONTROL, REMOVAL** .
   - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test Complete.

C2210-00-ECU OVERTEMPERATURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- System voltage between 10.0 and 16.0 volts.

SET CONDITION

- Module detects an internal temperature greater than 115Â°C (239Â°F).

DEFAULT ACTION

- The Electronic Vehicle Information Center (EVIC) will display "ACC/FCW Unavailable Service Required".
- The Adaptive Cruise Control (ACC) system will be disabled.
- Once the DTC changes from active to stored, the ACC feature will return to normal operation.
- The DTC will be cleared after a 100 consecutive ignition cycles with no active detection.

POSSIBLE CAUSES

Possible Causes
AMBIENT TEMPERATURE TOO HIGH
ADAPTIVE CRUISE CONTROL (ACC) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: **To help in the service of the Adaptive Cruise Control (ACC) System, it is recommended speaking to the customer to find out what type of environment they were driving in when the cruise concern took place. Heavy rain, snow, ice, and fog can cause the ACC system to become unavailable. This is considered normal operation and no repair is necessary.**

   1. With the scan tool, read ACC Module DTCs and record on the repair order.

      Is the DTC active?

      Yes

      - Go To 2

      No

      - Make sure the lens is free of dirt, damage, and other obstructions and clean/repair as necessary. If no problems are found, test complete.
      - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

2. **VERIFY AMBIENT TEMPERATURE READING**

   1. With the scan tool, read PCM ambient air temperature.

      Is the ambient air temperature reading 85Ā°C (185Ā°F) or above?

      Yes

      - The Adaptive Cruise Control (ACC) Module has detected the ambient temperature above operating range. Once the temperature has decreased below 85Ā°C (185Ā°F), ACC operation will be restored.
      - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Replace and program the Adaptive Cruise Control (ACC) Module in accordance with the Service Information. Refer to **MODULE, ADAPTIVE CRUISE CONTROL, REMOVAL** .
      - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C2212-00-ECU IN - PLANT MODE ACTIVE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- System voltage between 10.0 and 16.0 volts.
- No CAN Bus DTCs present.

SET CONDITION

- Module detects it is in the In-Plant mode.

DEFAULT ACTION

- The Electronic Vehicle Information Center (EVIC) will display "Front Radar Sensor Plant Mode".
- The Adaptive Cruise Control (ACC) system will be disabled.
- Once the DTC changes from active to stored, the ACC feature will return to normal operation.
- The DTC will be cleared after a 100 consecutive ignition cycles with no active detection.

POSSIBLE CAUSES

Possible Causes
ACC MODULE IN THE IN-PLANT MODE
ADAPTIVE CRUISE CONTROL (ACC) MODULE

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. With the scan tool, read ACC Module DTCs and record on the repair order.

   Is the DTC active?

   Yes

   - With the scan tool, perform the ACC Aim Mode Auto Alignment procedure.

     NOTE: **Performing the ACC Aim Mode Auto Alignment procedure will remove the Module from the In-Plant mode.**

   - Perform the ACC MODULE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - No repair is necessary. Make sure the lens is free of dirt, damage, and other obstructions that would hinder the performance of the ACC imager lens. Clear the DTC and verify proper operation of the

ACC system.

C2223-00-ECU CONFIGURATION MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- No CAN Bus DTCs present.
- Adaptive Cruise Control (ACC) Module is not in Plant-Mode.
- ESP is not in diagnostic mode.

SET CONDITION

- Body Control Module (BCM) does not expect the Adaptive Cruise Control (ACC) module to be present.

DEFAULT ACTION

- The Electronic Vehicle Information Center (EVIC) will display "ACC/FCW Unavailable Service Required".
- The Adaptive Cruise Control (ACC) system will be disabled.
- Once the DTC changes from active to stored, the ACC feature will return to normal operation.
- The DTC will be cleared after a 100 consecutive ignition cycles with no active detection.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) NOT CONFIGURED FOR ADAPTIVE CRUISE CONTROL (ACC) MODULE
ADAPTIVE CRUISE CONTROL (ACC) MODULE NOT CONFIGURED

DIAGNOSTIC TEST

ADAPTIVE CRUISE CONTROL MODULE NOT PROGRAMED

This Diagnostic Trouble Code will set if the Body Control Module (BCM) is not configured for Adaptive Cruise Control (ACC).

- Program the BCM with the correct sales code. Refer to **STANDARD PROCEDURE** .
- Verify that both the ACC Horizontal and Vertical alignments are correct. Perform the Adaptive Speed Control Module Alignment procedures. Refer to **MODULE, ADAPTIVE CRUISE CONTROL, MODULE PROGRAMMING** .
- Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C2225-00-PCM DISABLED ECU

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- No CAN Bus DTCs present.
- Adaptive Cruise Control (ACC) Module is not in Plant-Mode.
- ESP is not in diagnostic mode.

SET CONDITION

- Module detects an active Diagnostic Trouble Code (DTC) is set in the Powertrain Control Module (PCM).

DEFAULT ACTION

- The Electronic Vehicle Information Center (EVIC) will display "ACC/FCW Unavailable Service Required".
- The Adaptive Cruise Control (ACC) system will be disabled.
- Once the DTC changes from active to stored, the ACC feature will return to normal operation.
- The DTC will be cleared after a 100 consecutive ignition cycles with no active detection.

POSSIBLE CAUSES

Possible Causes
POWERTRAIN CONTROL MODULE DTC PRESENT

DIAGNOSTIC TEST

CHECK FOR POWERTRAIN CONTROL MODULE (PCM) DTCS

This Diagnostic Trouble Code (DTC) will set if a DTC is detected in the Powertrain Control Module (PCM).

- Repair the PCM DTC(s). Refer to **DTC INDEX** .
- Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C2226-00-TCM DISABLED ECU

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- No CAN Bus DTCs present.
- Adaptive Cruise Control (ACC) Module is not in Plant-Mode.
- ESP is not in diagnostic mode.
- ACC or Forward Collision Warning (FCW) system is enabled.

SET CONDITION

- Module detects an active Diagnostic Trouble Code (DTC) is set in the Transmission Control Module (TCM).

DEFAULT ACTION

- The Electronic Vehicle Information Center (EVIC) will display "ACC/FCW Unavailable Service Required".
- The Adaptive Cruise Control (ACC) system will be disabled.
- Once the DTC changes from active to stored, the ACC feature will return to normal operation.
- The DTC will be cleared after a 100 consecutive ignition cycles with no active detection.

POSSIBLE CAUSES

Possible Causes
TRANSMISSION CONTROL MODULE (TCM) DTC(S) PRESENT

DIAGNOSTIC TEST

CHECK FOR TRANSMISSION CONTROL MODULE (TCM) DTCS

This Diagnostic Trouble Code (DTC) will set if a DTC is detected in the Transmission Control Module (TCM).

- Repair the TCM DTC(s). Refer to **DTC INDEX** .
- Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C2227-00-ABS DISABLED ECU

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- No CAN Bus DTCs present.
- Adaptive Cruise Control (ACC) Module is not in Plant-Mode.

- ESP is not in diagnostic mode.

SET CONDITION

- Module detects an active Diagnostic Trouble Code (DTC) is set in the Antilock Brake System (ABS) Module.

DEFAULT ACTION

- The Electronic Vehicle Information Center (EVIC) will display "ACC/FCW Unavailable Service Required".
- The Adaptive Cruise Control (ACC) system will be disabled.
- Once the DTC changes from active to stored, the ACC feature will return to normal operation.
- The DTC will be cleared after a 100 consecutive ignition cycles with no active detection.

POSSIBLE CAUSES

Possible Causes
ANTILOCK BRAKE SYSTEM (ABS) MODULE DTC(S) PRESENT

DIAGNOSTIC TEST

CHECK FOR ANTILOCK BRAKE SYSTEM (ABS) MODULE DTCS

This Diagnostic Trouble Code (DTC) will set if a DTC is detected in the Antilock Brake System (ABS) module.

- Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.
- Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

P0585-00 SPEED CONTROL SWITCH 1/2 CORRELATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Speed Control Switch uses a Lin Bus to communicate to the Steering Column Control Module (SCCM). The SCCM then broadcast the speed control switch status over the Can Bus. The Adaptive Cruise Control (ACC) module monitors the Can Bus for speed control switch status.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- No CAN Bus DTCs present.
- Adaptive Cruise Control (ACC) Module is not in Plant-Mode.
- ESP is not in diagnostic mode.

SET CONDITION

- Module has received over the Can Bus that the Speed Control Switch is functioning improperly.

DEFAULT ACTION

- The Electronic Vehicle Information Center (EVIC) will display "ACC/FCW Unavailable Service Required".
- The Adaptive Cruise Control (ACC) system will be disabled.
- Once the DTC changes from active to stored, the ACC feature will return to normal operation.
- The DTC will be cleared after a 100 consecutive ignition cycles with no active detection.

POSSIBLE CAUSES

Possible Causes
SPEED CONTROL SWITCH
STEERING WHEEL WIRING HARNESS / CONNECTORS
STEERING COLUMN CONTROL MODULE (SCCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ACC Module DTCs and record on the repair order.
    3. With the scan tool, erase ACC DTCs,
    4. Turn the ignition off.
    5. Start the engine.
    6. With the scan tool, read ACC Module DTCs.

    Does the DTC return?

    Yes

    - Go To 2

    No

    - Go To 3
2. **CHECK SPEED CONTROL SWITCH OPERATION**
    1. With the scan tool, read the Speed Control Switch status under the Steering Column Control Module (SCCM) while pressing multiple switch positions.

    Does the switch positions change correctly in the scan tool?

    Yes

    - If any Body Control Module (BCM) Bus related DTCs are present, perform those respective diagnostic procedures first and recheck. Inspect the wiring and connectors between the

SCCM and the Speed Control Switch and the output to the BCM for any possible problems. If no problems are found, replace and program the SCCM in accordance with the Service Information.

No

- Inspect the wiring and connectors between the SCCM and the Speed Control Switch. If no problems are found, replace the Speed Control Switch in accordance with the Service Information. Refer to **SWITCH, SPEED CONTROL, REMOVAL** .

3. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this Module, Speed Control Switch and the Steering Column Control Module (SCCM). Wiggle the wiring and connectors while checking for shorted and open circuits.
    3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Check Service Bulletins for any possible causes that may apply.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

P1593-2A-SPEED CONTROL SWITCH 1/2 STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Speed Control Switch uses a Lin Bus to communicate to the Steering Column Control Module (SCCM). The SCCM then broadcast the speed control switch status over the Can Bus. The Adaptive Cruise Control (ACC) module monitors the Can Bus for speed control switch status.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- No CAN Bus DTCs present.
- Adaptive Cruise Control (ACC) Module is not in Plant-Mode.

- ESP is not in diagnostic mode.
- ACC is enabled and engaged.

SET CONDITION

- Module has received over the Can Bus that the Speed Control Switch is stuck in an on position.

DEFAULT ACTION

- The Electronic Vehicle Information Center (EVIC) will display "ACC/FCW Unavailable Service Required".
- The Adaptive Cruise Control (ACC) system will be disabled.
- Once the DTC changes from active to stored, the ACC feature will return to normal operation.
- The DTC will be cleared after a 100 consecutive ignition cycles with no active detection.

POSSIBLE CAUSES

Possible Causes
SPEED CONTROL SWITCH STUCK
STEERING WHEEL WIRING HARNESS / CONNECTORS
SPEED CONTROL SWITCH
STEERING COLUMN CONTROL MODULE (SCCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read Adaptive Cruise Control (ACC) Module DTCs and record on the repair order.
    3. With the scan tool, erase ACC Module DTCs.
    4. Turn the ignition off
    5. Start the engine.
    6. Activate the ACC.
    7. With the scan tool, read ACC Module DTCs.

    Did the DTC return?

    Yes

    - Go To 2

    No

    - Go To 3
2. **CHECK SPEED CONTROL SWITCH OPERATION**
    1. With the scan tool, read the Speed Control Switch status under the Steering Column Control Module (SCCM) while pressing multiple switch positions.

Does the switch positions change correctly in the scan tool?

Yes

- If any Body Control Module (BCM) Bus related DTCs are present, perform those respective diagnostic procedures first and recheck. Inspect the wiring and connectors between the SCCM and the Speed Control Switch and the output to the BCM for any possible problems. If no problems are found, replace and program the SCCM in accordance with the Service Information.

No

- Inspect the wiring and connectors between the SCCM and the Speed Control Switch. If no problems are found, replace the Speed Control Switch in accordance with the Service Information. Refer to **SWITCH, SPEED CONTROL, REMOVAL** .

3. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this Module, Speed Control Switch and the Steering Column Control Module (SCCM). Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

P1666-00-CRUISE CONTROL MODULE INTERNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- System voltage between 10.0 and 16.0 volts.

SET CONDITION

- The Module regularly performs internal controller diagnostic test and an internal hardware failure has been detected.

DEFAULT ACTION

- The Electronic Vehicle Information Center (EVIC) will display "ACC/FCW Unavailable Service Required".
- The Adaptive Cruise Control (ACC) system will be disabled.
- Once the DTC changes from active to stored, the ACC feature will return to normal operation.
- The DTC will be cleared after a 100 consecutive ignition cycles with no active detection.

POSSIBLE CAUSES

Possible Causes
ADAPTIVE CRUISE CONTROL (ACC) MODULE

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

1. Using a scan tool, read ACC DTCs.

   Is this DTC active?

   Yes

   - Check for any controller updates. If no updates are available, erase DTC and cycle the ignition off then on. If the DTC resets, repeat erasing the DTC and cycling the ignition at least 3 times. If the DTC continues to reset, replace and program the Adaptive Cruise Control (ACC) module in accordance with the Service Information. Refer to **MODULE, ADAPTIVE CRUISE CONTROL, REMOVAL** .
   - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - No repair is necessary. Make sure the lens is free of dirt, damage, and other obstructions. Clear the DTC and verify the proper operation of the ACC system.
   - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U0002-00-CAN C BUS OFF PERFORMANCE

U0155-00-LOST COMMUNICATION WITH CLUSTER-CCN

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0401-00-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- Adaptive Cruise Control (ACC) Module is not in Plant-Mode.
- ESP is not in diagnostic mode.
- ACC or Forward Collision Warning (FCW) system is enabled.

SET CONDITION

- Module receives an implausible (default/error value, toggle error or parity error) message from the Powertrain Control Module (PCM).

DEFAULT ACTION

- The Electronic Vehicle Information Center (EVIC) will display "ACC/FCW Unavailable Service Required".
- The Adaptive Cruise Control (ACC) system will be disabled.
- Once the DTC changes from active to stored, the ACC feature will return to normal operation.
- The DTC will be cleared after a 100 consecutive ignition cycles with no active detection.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) DTCS PRESENT

Possible Causes
POWERTRAIN CONTROL MODULE (PCM) DTCS PRESENT
POWERTRAIN CONTROL MODULE (PCM)
ADAPTIVE CRUISE CONTROL (ACC) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read Adaptive Cruise Control (ACC) Module DTCs and record on the repair order.
    3. With the scan tool, erase ACC Module DTCs.
    4. Turn the ignition off.
    5. Start the engine.
    6. Activate the ACC.
    7. With the scan tool, read ACC Module DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
    1. With the scan tool, read BCM DTCs and record on the repair order.

    Are there any BCM DTCs present?

    Yes

    - Repair the BCM DTC(s). Refer to **DIAGNOSIS AND TESTING** .

    No

    - Go To 3
3. **CHECK FOR POWERTRAIN CONTROL MODULE (PCM) DTCS**
    1. With the scan tool, read PCM DTCs and record on the repair order.

    Are there any PCM DTCs present?

    Yes

    - Repair the PCM DTC(s). Refer to **DTC INDEX** .

No

- Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
    1. With the scan tool, read DTCs.

    Are there any other modules reporting communication DTCs against the PCM?

    Yes

    - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .

    No

    - Using the schematics as a guide, check the ACC Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the Adaptive Cruise Control (ACC) Module in accordance with the Service Information. Refer to **MODULE, ADAPTIVE CRUISE CONTROL, REMOVAL** .
    - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
5. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this Module. Wiggle the wiring and connectors while checking for shorted and open circuits.
    3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Check Service Bulletins for any possible causes that may apply.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

U0402-00-IMPLAUSIBLE DATA RECEIVED FROM TCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.

TRANSMISSION CONTROL MODULE (TCM)
ADAPTIVE CRUISE CONTROL (ACC) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read Adaptive Cruise Control (ACC) Module DTCs and record on the repair order.
    3. With the scan tool, erase ACC Module DTCs.
    4. Turn the ignition off.
    5. Start the engine.
    6. Activate the ACC.
    7. With the scan tool, read ACC Module DTCs.

        Is the DTC active?

        Yes

        - Go To 2

No

- Go To 5

2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
    1. With the scan tool, read BCM DTCs and record on the repair order.

       Are there any BCM DTCs present?

       Yes

       - Repair the BCM DTC(s). Refer to **DIAGNOSIS AND TESTING** .

       No

       - Go To 3

3. **CHECK FOR TRANSMISSION CONTROL MODULE (TCM) DTCS**
    1. With the scan tool, read TCM DTCs.

       Are there any TCM DTCs present?

       Yes

       - Refer to **DTC INDEX** and perform the appropriate diagnostic procedure.

       No

       - Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
    1. With the scan tool, read DTCs.

       Are there any other modules reporting communication DTCs against the TCM?

       Yes

       - Replace and program the Transmission Control Module (TCM) in accordance with the Service Information.

       No

       - Using the schematics as a guide, check the ACC Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the Adaptive Cruise Control (ACC) Module in accordance with the Service Information. Refer to **MODULE, ADAPTIVE CRUISE CONTROL, REMOVAL** .
       - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.

2. Using the schematics as a guide, inspect the wiring and connectors specific to this Module. Wiggle the wiring and connectors while checking for shorted and open circuits.
3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
4. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

7. With the scan tool, read ACC Module DTCs.

   Did the DTC return?

   Yes

   - Go To 2

   No

   - Go To 5

2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
   1. With the scan tool, read BCM DTCs and record on the repair order.

      Are there any BCM DTCs present?

      Yes

      - Repair the BCM DTC(s). Refer to **DIAGNOSIS AND TESTING** .

      No

      - Go To 3

3. **CHECK FOR OCCUPANT RESTRAINT CONTROLLER (ORC) DTCS**
   1. With the scan tool, read ORC DTCs.

      Are there any ORC DTCs present?

      Yes

      - Repair the ORC DTC(s). Refer to **DIAGNOSIS AND TESTING** .

      No

      - Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting communication DTCs against the ORC?

      Yes

      - Replace and program the Occupant Restraint Controller (ORC) in accordance with the Service Information.
      - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Using the schematics as a guide, check the ACC Module pins, terminals, and connectors for

corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace and program the Adaptive Cruise Control (ACC) Module in accordance with the Service Information. Refer to **MODULE, ADAPTIVE CRUISE CONTROL, REMOVAL** .

- Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this Module. Wiggle the wiring and connectors while checking for shorted and open circuits.
    3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Check Service Bulletins for any possible causes that may apply.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

U110A-00-LOST COMMUNICATION WITH SCM - CAN-C

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U11F9-00-ENGINE DID NOT RESPOND TO ACC TORQUE REQUEST

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Engine running.
- System voltage between 10.0 and 16.0 volts.
- Adaptive Cruise Control (ACC) Module is not in Plant-Mode.
- ESP is not in diagnostic mode.
- ACC or Forward Collision Warning (FCW) system is enabled.

SET CONDITION

- Module detects that the Powertrain Control Module is not responding to Adaptive Cruise Control (ACC) module torque request.

DEFAULT ACTION

- The Electronic Vehicle Information Center (EVIC) will display "ACC/FCW Unavailable Service Required".
- The Adaptive Cruise Control (ACC) system will be disabled.
- Once the DTC changes from active to stored, the ACC feature will return to normal operation.
- The DTC will be cleared after a 100 consecutive ignition cycles with no active detection.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) DTCS PRESENT
POWERTRAIN CONTROL MODULE (PCM) DTCS PRESENT
POWERTRAIN CONTROL MODULE (PCM) IMPROPERLY CONFIGURED

DIAGNOSTIC TEST

CHECK FOR OTHER DTCS

NOTE: **To help in the service of the Adaptive Cruise Control (ACC) system, it is recommended to communicate with the customer to obtain the environmental conditions they were driving in when the cruise control concern took place. Heavy rain, snow, ice, and fog can cause the ACC system to become inoperative. This is considered as a normal operational reaction of the ACC system and no repair is necessary.**

1. This is an informational Diagnostic Trouble Code (DTC). The Adaptive Cruise Control (ACC) Module communicates over the CAN Bus with the Powertrain Control Module (PCM) to increase engine speed when needed. If other ACC Module DTCs are present, perform their respective diagnostic procedures first.

   Check for:

   - PCM DTCs present.
   - PCM improperly configured.
   - BCM DTCs present.
   - BCM improperly configured.
   - Implausible DTCs against the PCM.
   - Any Service Bulletins that may apply.

   Were any of the above conditions present?

   Yes

   - Refer to the appropriate diagnostic procedure repair/reprogram as necessary.
   - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Erase this DTC and perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
- If the DTC continues to set, no other modules are reporting any DTCs, and all modules are configured properly, replace and program the Adaptive Cruise Control (ACC) Module in accordance with the Service Information. Refer to **MODULE, ADAPTIVE CRUISE CONTROL, REMOVAL** .

U121E-00-LOST COMMUNICATION WITH STEERING WHEEL CRUISE CONTROL SWITCH

IF the Body Control Module (BCM), Adaptive Cruise Control (ACC) module, or Steering Column Control Module (SCCM) has any other lost communication DTCs present, perform those respective test first. If no other communication DTCs are set, refer to the SCCM diagnostics and perform the diagnostic procedure for U121E-00-Lost Communication With Steering Wheel Cruise Control Switch as if the DTC is active.

U1600-00-ECU APPLICATION SOFTWARE MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

- One time during an ignition cycle.

SET CONDITION

- The Adaptive Cruise Control (ACC) Module was reprogrammed with a corrupted flash file, or the reprogramming of the ACC was interrupted before it was complete.

DEFAULT ACTION

- The Electronic Vehicle Information Center (EVIC) will display "ACC/FCW Unavailable Service Required".
- The Adaptive Cruise Control (ACC) system will be disabled.
- Once the DTC changes from active to stored, the ACC feature will return to normal operation.
- The DTC will be cleared after a 100 consecutive ignition cycles with no active detection.

POSSIBLE CAUSES

Possible Causes
ADAPTIVE CRUISE CONTROL MODULE NOT PROGRAMMED PROPERLY
ADAPTIVE CRUISE CONTROL MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read Adaptive Cruise Control (ACC) Module DTCs and record on the repair order.

       Is the DTC active?

Yes

- This is an indication that the software installed on the vehicle is corrupted, incorrect or the flash procedure was interrupted. Flash the controller, making sure the correct flash file is used. If this DTC continues to set after flashing a at least three times, replace and program the Adaptive Cruise Control (ACC) Module in accordance with the Service Information. Refer to **MODULE, ADAPTIVE CRUISE CONTROL, REMOVAL** .
- Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 2

2. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this Module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADAPTIVE CRUISE CONTROL VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

STANDARD PROCEDURE

ADAPTIVE CRUISE CONTROL VERIFICATION TEST

ADAPTIVE CRUISE CONTROL VERIFICATION TEST

1. Disconnect all jumper wires and reconnect all previously disconnected components and connectors.
2. With the scan tool, erase Adaptive Cruise Control (ACC) DTCs.
3. Make sure that all accessories are turned off and that the battery is fully charged.
4. If the ACC Module was replaced or moved in any way, the ACC Module must be aligned. Perform both the Vertical and Horizontal Sensor Alignment procedures in accordance with the Service Information. Refer to **MODULE, ADAPTIVE CRUISE CONTROL, MODULE PROGRAMMING** .
5. Test drive the vehicle and verify proper operation.
6. With the scan tool, read ACC Module DTCs and record on the repair order.

Are there any DTCs present in the ACC Module?

Yes

- Repair the ACC Module DTC(s). Refer to **DIAGNOSIS AND TESTING**.

No

- Repair is complete.

.

DTC TROUBLESHOOTING

B222A-00-VEHICLE LINE MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- Battery voltage between 10 and 16 volts.
- No CAN Bus DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects a mismatch between stored (learned) vehicle variant and current evaluated vehicle variant over the CAN C Bus.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
VEHICLE CONFIGURATION NOT STORED IN THE BODY CONTROL MODULE (BCM)
CONTROL MODULE INSTALLED IN INCORRECT VEHICLE
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

CHECK THE VEHICLE CONFIGURATION

NOTE: The DTC must be active and no BUS communication DTCs present before performing this test. If BUS communication DTCs are present, perform their respective test first. If the DTC is stored, erase the DTC and cycle the ignition. If the DTC resets and changes to active, then proceed.

1. With the scan tool, check the vehicle configuration stored in the Body Control Module (BCM).
2. With the scan tool, check the vehicle configuration stored in the ADCM.

Pick the answer that best describes your findings:

BCM has wrong or no vehicle configuration.

- With the scan tool, program the proper vehicle configuration in the BCM.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

ADCM has wrong vehicle configuration but BCM has correct configuration.

- Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

ADCM and BCM have proper calibration and the DTC is active in the ADCM.

- Check if other modules such as the Powertrain Control Module (PCM) have the wrong configuration stored in the controller and reprogram or replace as necessary. If all other modules show the proper 8 configuration, replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C15AF-1F-LOW SIDE DRIVER - CIRCUIT INTERMITTENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **If any other DTCs are present, repair them first before continuing with this diagnostic procedure.**

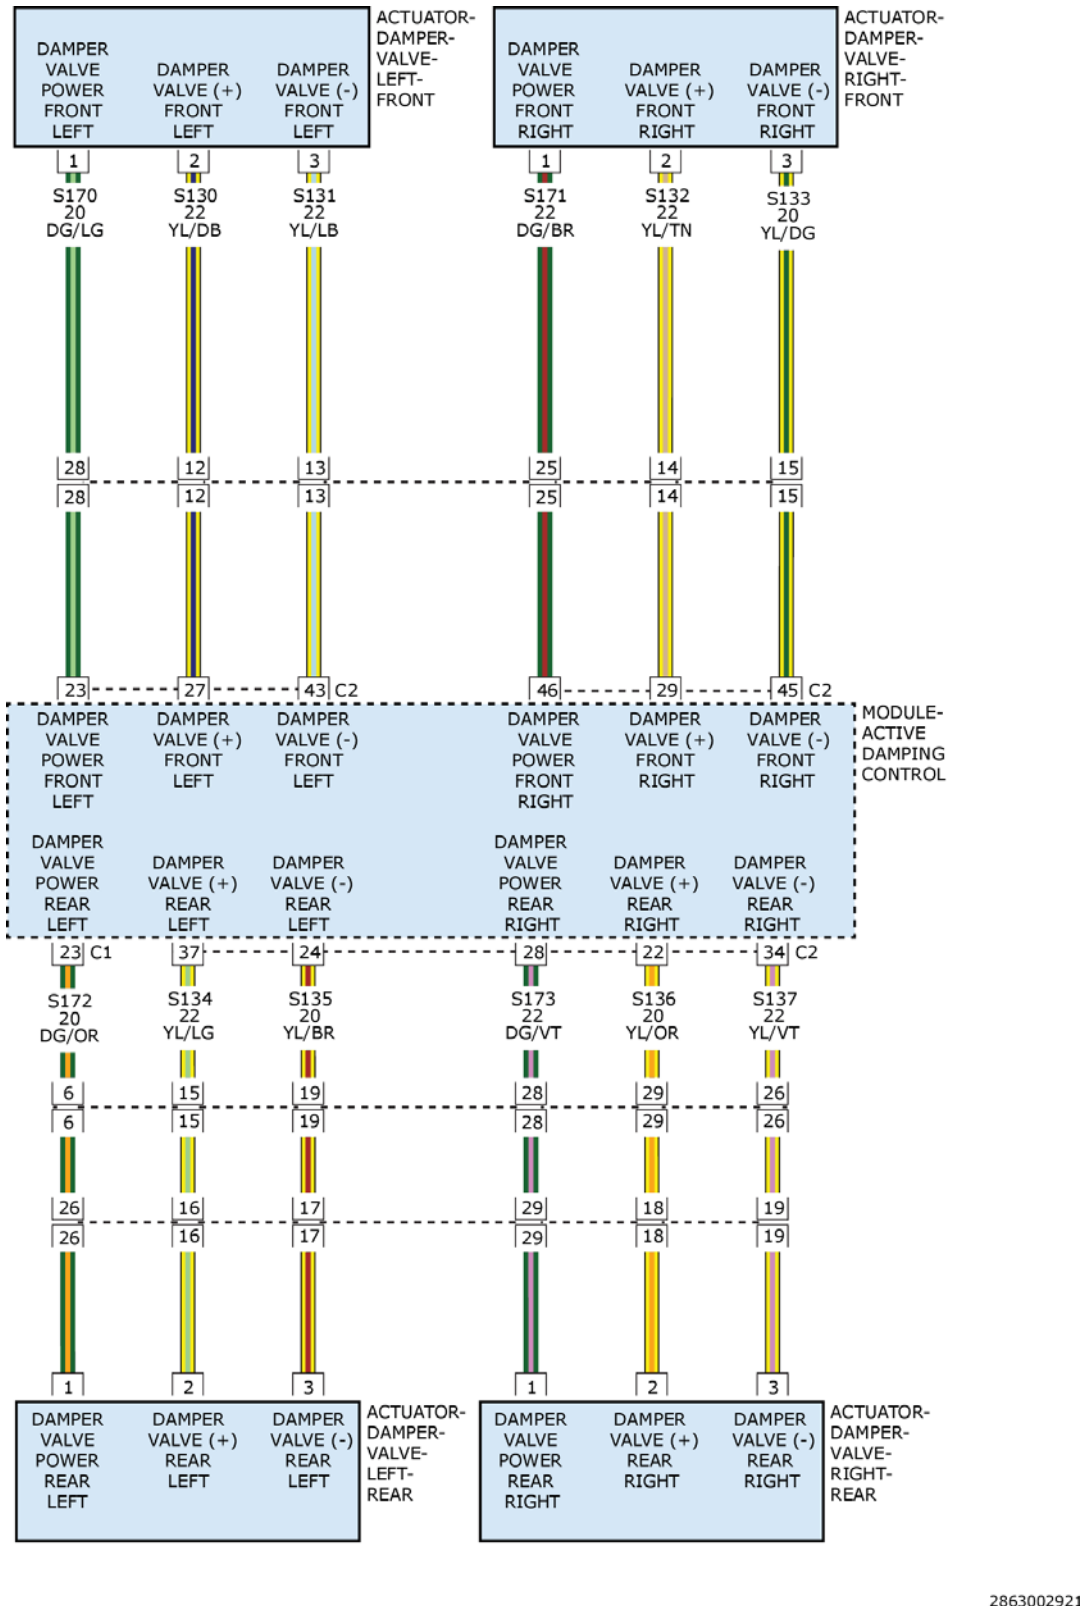

Fig. 1: Valve Damper Actuator Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects excessive voltage fluctuation on the Mode Sensor Signal circuit.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
(S130) LEFT FRONT DAMPER VALVE (+) CIRCUIT SHORTED TO GROUND
(S130) LEFT FRONT DAMPER VALVE (+) CIRCUIT OPEN OR HIGH RESISTANCE
(S170) LEFT FRONT DAMPER VALVE POWER CIRCUIT SHORTED TO GROUND
(S170) LEFT FRONT DAMPER VALVE POWER CIRCUIT OPEN OR HIGH RESISTANCE
(S132) RIGHT FRONT DAMPER VALVE (+) CIRCUIT SHORTED TO GROUND
(S132) RIGHT FRONT DAMPER VALVE (+) CIRCUIT OPEN OR HIGH RESISTANCE
(S171) RIGHT FRONT DAMPER VALVE POWER CIRCUIT SHORTED TO GROUND
(S171) RIGHT FRONT DAMPER VALVE POWER CIRCUIT OPEN OR HIGH RESISTANCE
(S134) LEFT REAR DAMPER VALVE (+) CIRCUIT SHORTED TO GROUND
(S134) LEFT REAR DAMPER VALVE (+) CIRCUIT OPEN OR HIGH RESISTANCE
(S172) LEFT REAR DAMPER VALVE POWER CIRCUIT SHORTED TO GROUND
(S172) LEFT REAR DAMPER VALVE POWER CIRCUIT OPEN OR HIGH RESISTANCE
(S136) RIGHT REAR DAMPER VALVE (+) CIRCUIT SHORTED TO GROUND
(S136) RIGHT REAR DAMPER VALVE (+) CIRCUIT OPEN OR HIGH RESISTANCE
(S173) RIGHT REAR DAMPER VALVE POWER CIRCUIT SHORTED TO GROUND
(S173) RIGHT REAR DAMPER VALVE POWER CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.

2. With the scan tool, read ADCM DTCs and record on the repair order.
3. With the scan tool, erase DTCs.
4. Start the Engine.
5. With the scan tool, read the DTCs in the ADCM.

   Is the DTC active?

   Yes

   - Go To 2

   No

   - Go To 20

2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

   NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

   1. Turn the ignition off.
   2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (S130) LEFT FRONT DAMPER VALVE (+) CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Check for continuity between ground and the (S130) Left Front Damper Valve (+) circuit at the ADCM C2 harness connector.

   Is there continuity between ground and the (S130) Left Front Damper Valve (+) circuit?

   Yes

   - Repair the (S130) Left Front Damper Valve (+) circuit for a short ground.

- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 4

4. **CHECK THE (S130) LEFT FRONT DAMPER VALVE (+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Measure the resistance of the (S130) Left Front Damper Valve (+) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly C2 harness connector.

       Is the resistance above 5.0 Ohms?

       Yes

       - Repair the (S130) Left Front Damper Valve (+) circuit for an open or high resistance.
       - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 5
5. **CHECK THE (S170) LEFT FRONT DAMPER VALVE POWER CIRCUIT FOR A SHORT TO GROUND**
    1. Check for continuity between ground and the (S170) Left Front Damper Valve Power circuit at the ADCM C2 harness connector.

       Is there continuity between ground and the (S170) Left Front Damper Valve Power circuit?

       Yes

       - Repair the (S170) Left Front Damper Valve Power circuit for a short ground.
       - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 6
6. **CHECK THE (S170) LEFT FRONT DAMPER VALVE POWER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Measure the resistance of the (S170) Left Front Damper Valve Power circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

       Is the resistance above 5.0 Ohms?

       Yes

       - Repair the (S170) Left Front Damper Valve Power circuit for an open or high resistance.
       - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

- Go To 7

7. **CHECK THE (S132) RIGHT FRONT DAMPER VALVE (+) CIRCUIT FOR A SHORT TO GROUND**
    1. Check for continuity between ground and the (S132) Right Front Damper Valve (+) circuit at the ADCM C2 harness connector.

       Is there continuity between ground and the (S132) Right Front Damper Valve (+) circuit?

       Yes

       - Repair the (S132) Right Front Damper Valve (+) circuit for a short ground.
       - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 8

8. **CHECK THE (S132) RIGHT FRONT DAMPER VALVE (+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Measure the resistance of the (S132) Right Front Damper Valve (+) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

       Is the resistance above 5.0 Ohms?

       Yes

       - Repair the (S132) Right Front Damper Valve (+) circuit for an open or high resistance.
       - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 9

9. **CHECK THE (S171) RIGHT FRONT DAMPER VALVE POWER CIRCUIT FOR A SHORT TO GROUND**
    1. Check for continuity between ground and the (S171) Right Front Damper Valve Power circuit at the ADCM C2 harness connector.

       Is there continuity between ground and the (S171) Right Front Damper Valve Power circuit?

       Yes

       - Repair the (S171) Right Front Damper Valve Power circuit for a short ground.
       - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 10

10. **CHECK THE (S171) RIGHT FRONT DAMPER VALVE POWER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

1. Measure the resistance of the (S171) Right Front Damper Valve Power circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (S171) Right Front Damper Valve Power circuit for an open or high resistance.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 11

11. **CHECK THE (S134) LEFT REAR DAMPER VALVE (+) CIRCUIT FOR A SHORT TO GROUND**
    1. Check for continuity between ground and the (S134) Left Rear Damper Valve (+) circuit at the ADCM C2 harness connector.

       Is there continuity between ground and the (S134) Left Rear Damper Valve (+) circuit?

       Yes

       - Repair the (S134) Left Rear Damper Valve (+) circuit for a short ground.
       - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 12
12. **CHECK THE (S134) LEFT REAR DAMPER VALVE (+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Measure the resistance of the (S134) Left Rear Damper Valve (+) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

       Is the resistance above 5.0 Ohms?

       Yes

       - Repair the (S134) Left Rear Damper Valve (+) circuit for an open or high resistance.
       - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 13
13. **CHECK THE (S172) LEFT REAR DAMPER VALVE POWER CIRCUIT FOR A SHORT TO GROUND**
    1. Check for continuity between ground and the (S172) Left Rear Damper Valve Power circuit at the ADCM C2 harness connector.

Is there continuity between ground and the (S172) Left Rear Damper Valve Power circuit?

Yes

- Repair the (S172) Left Rear Damper Valve Power circuit for a short ground.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 14

14. **CHECK THE (S172) LEFT REAR DAMPER VALVE POWER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Measure the resistance of the (S172) Left Rear Damper Valve Power circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

       Is the resistance above 5.0 Ohms?

       Yes

       - Repair the (S172) Left Rear Damper Valve Power circuit for an open or high resistance.
       - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 15
15. **CHECK THE (S136) RIGHT REAR DAMPER VALVE (+) CIRCUIT FOR A SHORT TO GROUND**
    1. Check for continuity between ground and the (S136) Right Rear Damper Valve (+) circuit at the ADCM C2 harness connector.

       Is there continuity between ground and the (S136) Right Rear Damper Valve (+) circuit?

       Yes

       - Repair the (S136) Right Rear Damper Valve (+) circuit for a short ground.
       - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 16
16. **CHECK THE (S136) RIGHT REAR DAMPER VALVE (+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Measure the resistance of the (S136) Right Rear Damper Valve (+) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

       Is the resistance above 5.0 Ohms?

       Yes

- Repair the (S136) Right Rear Damper Valve (+) circuit for an open or high resistance.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 17

17. **CHECK THE (S173) RIGHT REAR DAMPER VALVE POWER CIRCUIT FOR A SHORT TO GROUND**
    1. Check for continuity between ground and the (S173) Right Rear Damper Valve Power circuit at the ADCM C2 harness connector.

       Is there continuity between ground and the (S173) Right Rear Damper Valve Power circuit?

       Yes

       - Repair the (S173) Right Rear Damper Valve Power circuit for a short ground.
       - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 18
18. **CHECK THE (S173) RIGHT REAR DAMPER VALVE POWER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Measure the resistance of the (S173) Right Rear Damper Valve Power circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

       Is the resistance above 5.0 Ohms?

       Yes

       - Repair the (S173) Right Rear Damper Valve Power circuit for an open or high resistance.
       - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 19
19. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
    1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the Engine.
    6. With the scan tool, read ADCM DTCs.

       Does the DTC remain active?

Yes

- Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** or **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

20. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

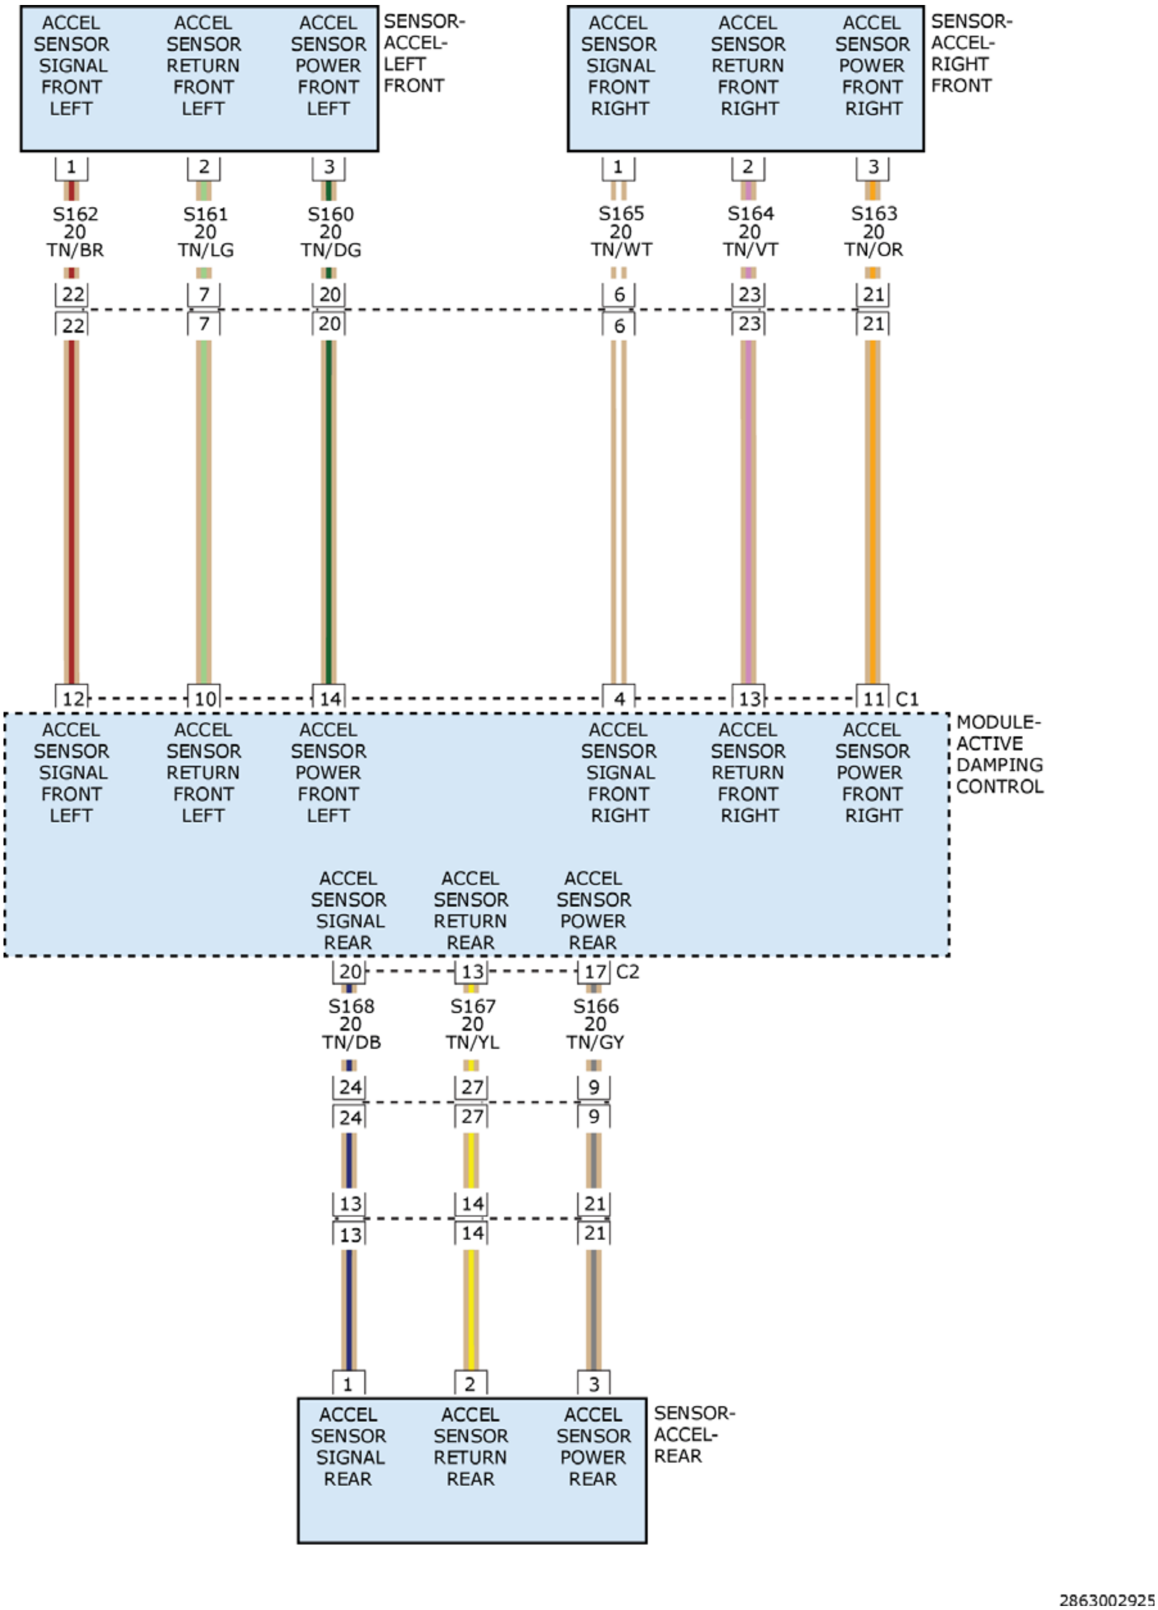
    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B1-11-REAR ACCELERATION SENSOR - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .



[Fig. 2: Acceleration Sensor Circuit Diagram]
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects when the Rear Acceleration Sensor Signal circuit is shorted to ground.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S168) REAR ACCELERATION SENSOR SIGNAL CIRCUIT SHORT TO GROUND
(S168) REAR ACCELERATION SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(S166) REAR ACCELERATION SENSOR POWER CIRCUIT OPEN OR HIGH RESISTANCE
REAR ACCELERATION SENSOR
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs and record on the repair order.
   3. With the scan tool, erase DTCs.
   4. Start the Engine.
   5. With the scan tool, read ADCM DTCs.

      Is the DTC active?

      Yes

      - Go To 2

      No

      - Go To 7
2. **REAR ACCELERATION SENSOR HARNESS CONNECTOR**

   NOTE: Make sure the Acceleration Sensor harness connector is connected correctly.

   1. Turn the ignition off.

2. Inspect the Acceleration Sensor harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (S168) REAR ACCELERATION SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Acceleration Sensor harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Check for continuity between ground and the (S168) Rear Acceleration Sensor Signal circuit at the ADCM C2 harness connector.

      Is there continuity between ground and the (S168) Rear Acceleration Sensor Signal circuit?

      Yes

      - Go To 5

      No

      - Repair the (S168) Rear Acceleration Sensor Signal circuit for a short ground.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
4. **CHECK THE (S168) REAR ACCELERATION SENSOR SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (S168) Rear Acceleration Sensor Signal circuit between the Rear Acceleration Sensor harness connector and the ADCM C2 harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S166) Rear Acceleration Sensor Signal circuit for an open or high resistance.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 5
5. **CHECK THE (S166) REAR ACCELERATION SENSOR POWER CIRCUIT FOR AN OPEN OR**

HIGH RESISTANCE

1. Measure the resistance of the (S166) Rear Acceleration Sensor Power circuit between the Rear Acceleration Sensor harness connector and the ADCM C2 harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (S166) Rear Acceleration Sensor Power circuit for an open or high resistance.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 6

6. **ACCELERATION SENSOR**
   1. Replace the Acceleration Sensor in accordance with the Service Information. Refer to **SENSOR, ACTIVE DAMPING, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the Engine.
   6. With the scan tool, read the DTCs in the ADCM.

      Does the DTC remain active?

      Yes

      - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

7. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

      Were any problems found?

      Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B1-12- REAR ACCELERATION - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

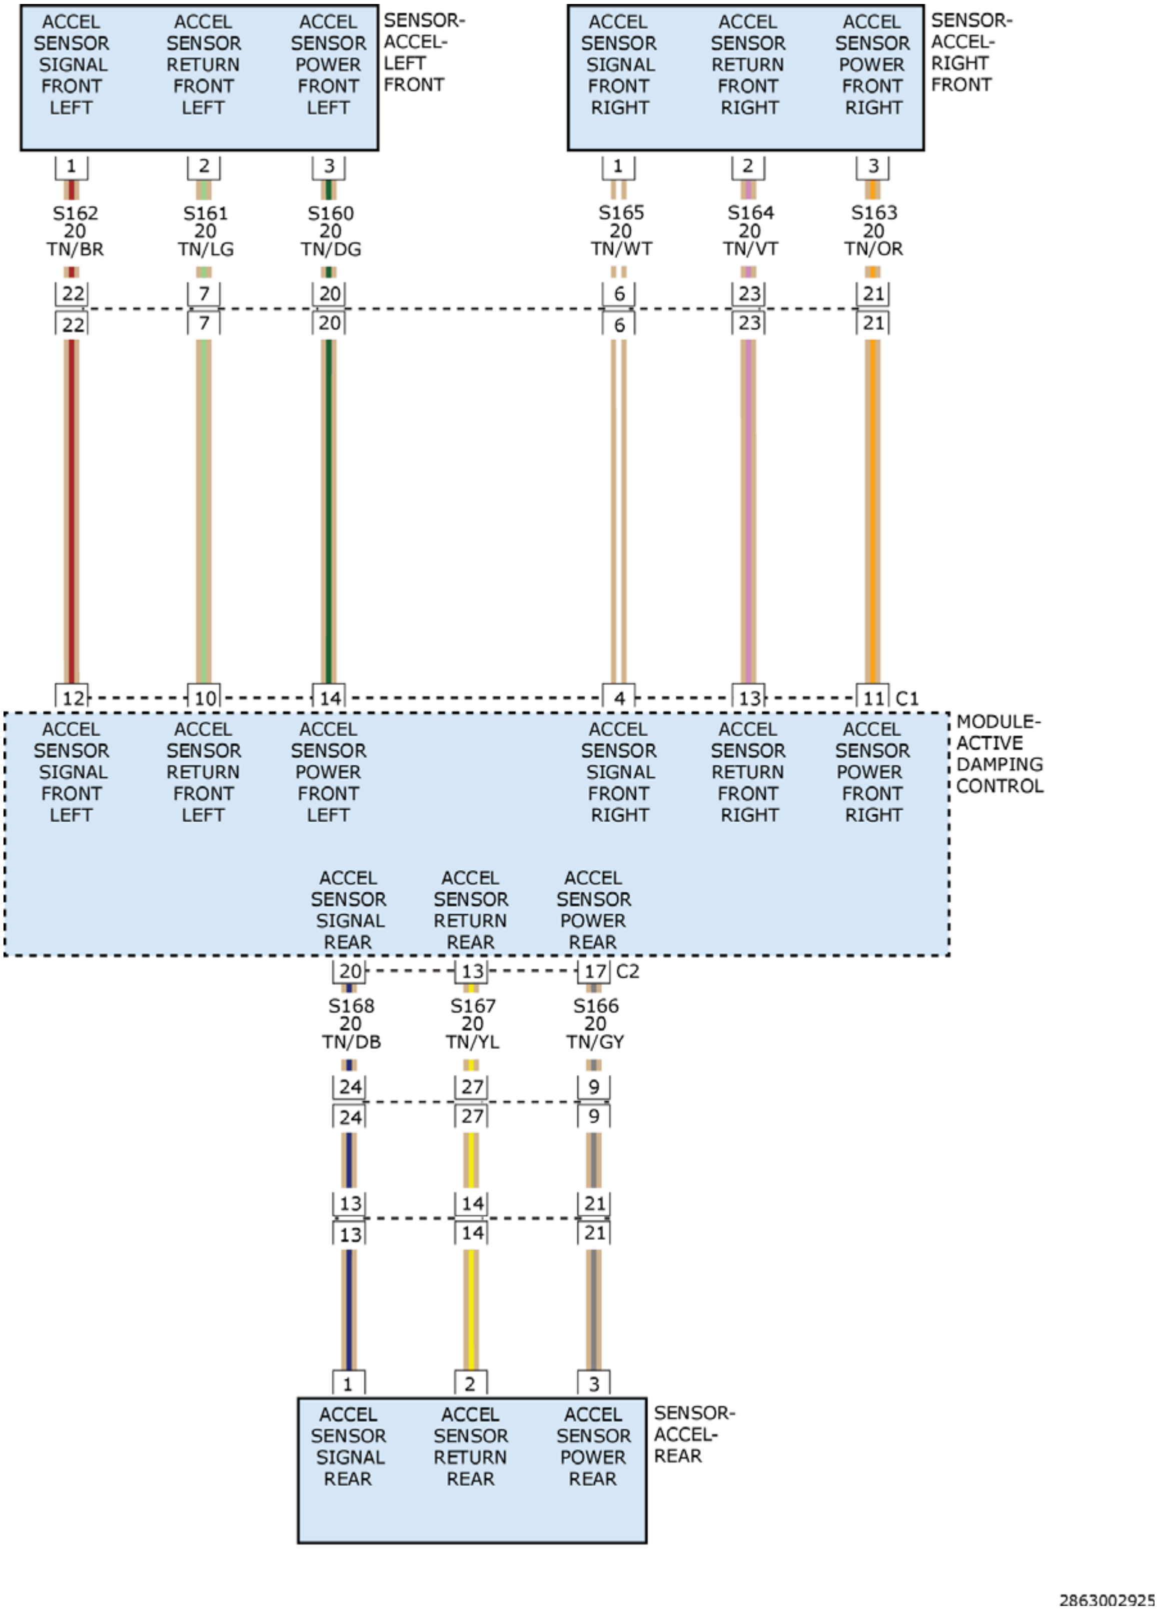


Fig. 3: Acceleration Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects that the Rear Acceleration Sensor Signal is shorted to voltage.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S168) REAR ACCELERATION SENSOR SIGNAL CIRCUIT SHORT TO BATTERY
(S167) REAR ACCELERATION SENSOR RETURN CIRCUIT OPEN OR HIGH RESISTANCE
REAR ACCELERATION SENSOR
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read the ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 6
2. **REAR ACCELERATION SENSOR HARNESS CONNECTOR**

    NOTE: **Make sure the Acceleration Sensor harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Acceleration Sensor harness connector for signs of water intrusion, corrosion, pushed

out or bent terminals, and correct pin tension.

3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (S168) REAR ACCELERATION SENSOR SIGNAL CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition off.
   2. Disconnect the Rear Acceleration Sensor harness connector.
   3. Disconnect the ADCM C2 harness connector.
   4. Turn the ignition on.
   5. Measure the voltage between ground and the (S168) Rear Acceleration Sensor Signal circuit.

      Is the voltage above 5.25 volts?

      Yes

      - Repair the (S168) Rear Acceleration Sensor Power circuit for a short battery.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **CHECK THE (S167) REAR ACCELERATION SENSOR RETURN CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Measure the resistance of the (S167) Rear Acceleration Sensor Return circuit between the Rear Acceleration Sensor harness connector and the ADCM C2 harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S167) Rear Acceleration Sensor Return circuit for an open or high resistance.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

- Go To 5

5. **ACCELERATION SENSOR**
    1. Replace the Acceleration Sensor in accordance with the Service Information. Refer to **SENSOR, ACTIVE DAMPING, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the Engine.
    6. With the scan tool, read the DTCs in the ADCM.

    Does the DTC remain active?

    Yes

    - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

6. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B1-76-REAR ACCELERATION SENSOR - WRONG MOUNTING POSITION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects the Acceleration Sensor is installed incorrectly or damaged.

DEFAULT ACTION

- Active Damping Suspension (ADS) is disabled.

POSSIBLE CAUSES

Possible Causes
REAR ACCELERATION SENSOR DAMAGED, DISCONNECTED, LOOSE, OR INSTALLED INCORRECTLY
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
2. **REAR ACCELERATION SENSOR**

    NOTE: **Make sure the Acceleration Sensor harness connector is connected correctly.**

    1. Turn the ignition off.

2. Verify the Acceleration Sensor is mounted correctly.
3. Inspect the Acceleration Sensor harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
4. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C15B2-11-LEFT FRONT ACCELERATION SENSOR - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

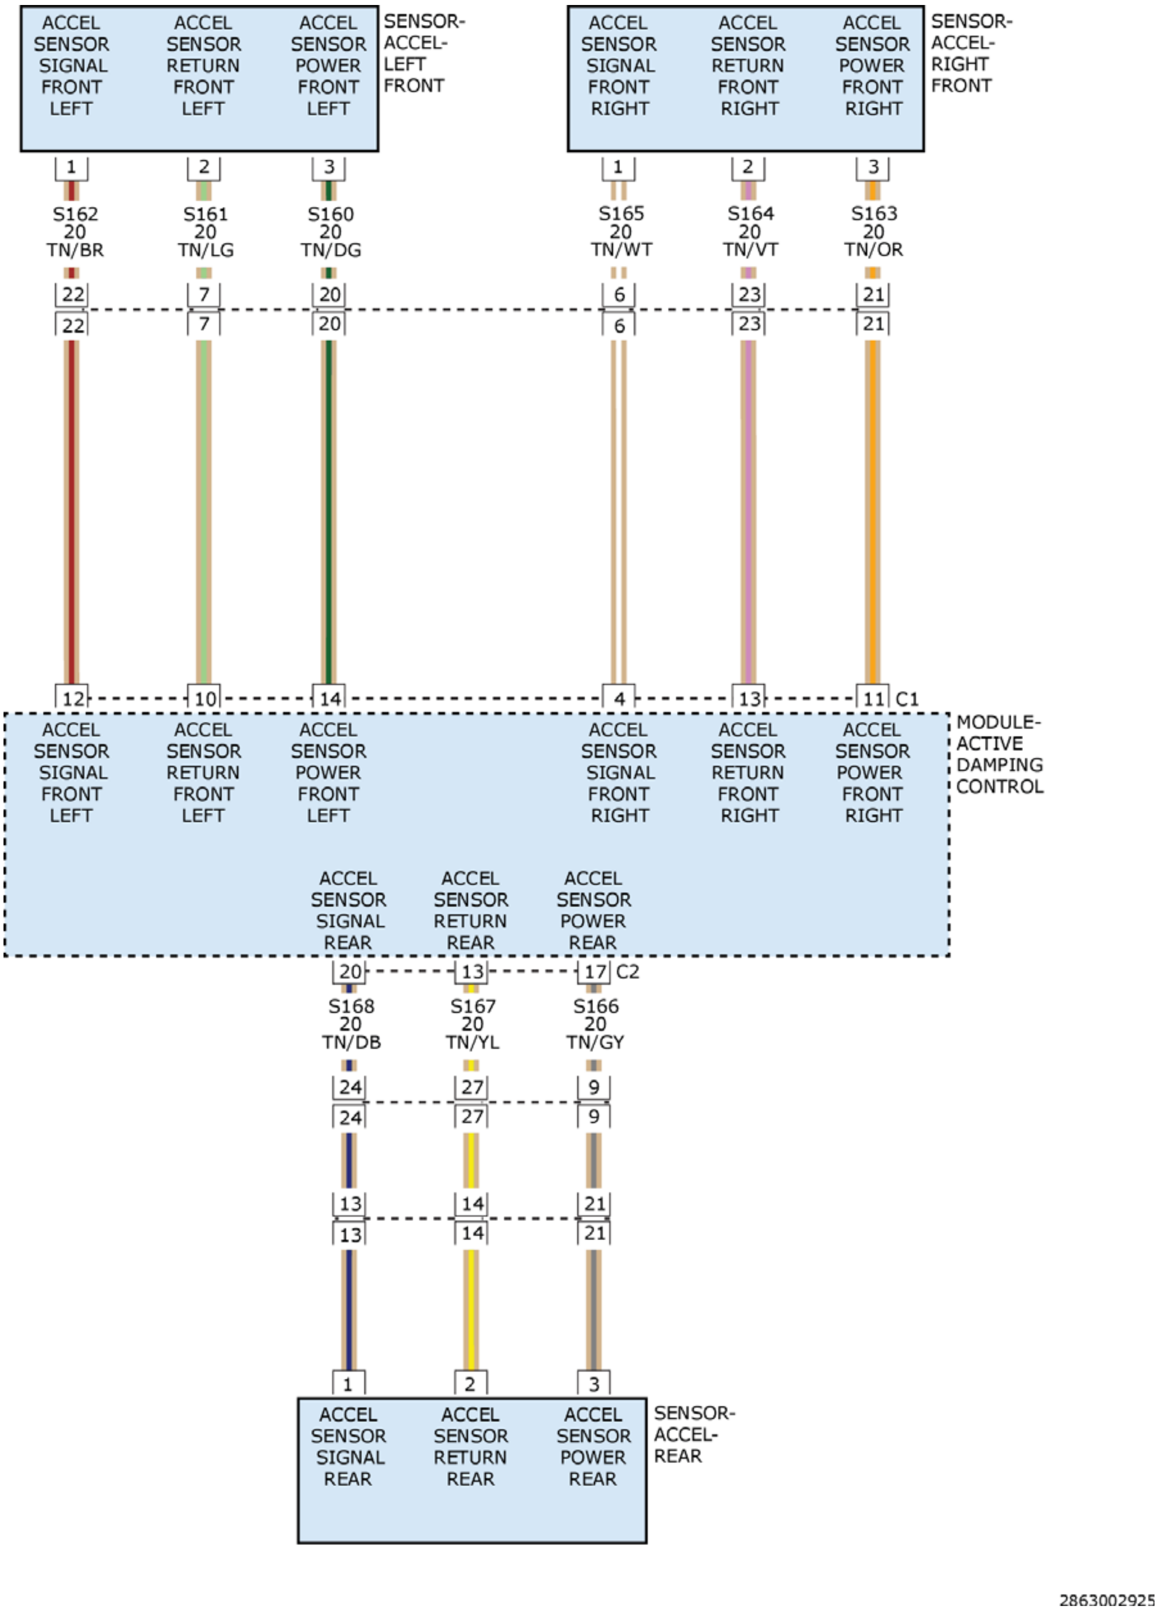

Fig. 4: Acceleration Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects when the Left Front Acceleration Sensor Signal circuit is shorted to ground.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S162) LEFT FRONT ACCELERATION SENSOR SIGNAL CIRCUIT SHORT TO GROUND
(S162) LEFT FRONT ACCELERATION SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(S160) LEFT FRONT ACCELERATION SENSOR POWER CIRCUIT OPEN OR HIGH RESISTANCE
LEFT FRONT ACCELERATION SENSOR
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, read ADCM DTCs and record on the repair order.
   3. With the scan tool, erase DTCs.
   4. Start the Engine.
   5. With the scan tool, read ADCM DTCs.

      Is the DTC active?

      Yes

      - Go To 2

      No

      - Go To 7
2. **LEFT FRONT ACCELERATION SENSOR HARNESS CONNECTOR**

   NOTE: **Make sure the Acceleration Sensor harness connector is connected correctly.**

   1. Turn the ignition off.

2. Inspect the Acceleration Sensor harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (S162) LEFT FRONT ACCELERATION SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Acceleration Sensor harness connector.
   2. Disconnect the ADCM C1 harness connector.
   3. Check for continuity between ground and the (S162) Left Front Acceleration Sensor Signal circuit at the ADCM C1 harness connector.

      Is there continuity between ground and the (S162) Left Front Acceleration Sensor Signal circuit?

      Yes

      - Go To 5

      No

      - Repair the (S162) Left Front Acceleration Sensor Signal circuit for a short ground.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
4. **CHECK THE (S162) LEFT FRONT ACCELERATION SENSOR SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (S162) Left Front Acceleration Sensor Signal circuit between the Left Front Acceleration Sensor harness connector and the ADCM C1 harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S160) Left Front Acceleration Sensor Signal circuit for an open or high resistance.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 5

5. **CHECK THE (S160) LEFT FRONT ACCELERATION SENSOR POWER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Measure the resistance of the (S160) Left Front Acceleration Sensor Power circuit between the Left Front Acceleration Sensor harness connector and the ADCM C1 harness connector.

       Is the resistance above 5.0 Ohms?

       Yes

       - Repair the (S160) Left Front Acceleration Sensor Power circuit for an open or high resistance.
       - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 6
6. **ACCELERATION SENSOR**
    1. Replace the Acceleration Sensor in accordance with the Service Information. Refer to **SENSOR, ACTIVE DAMPING, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the Engine.
    6. With the scan tool, read ADCM DTCs.

       Does the DTC remain active?

       Yes

       - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
       - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Test complete.
7. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

       Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B2-12-LEFT FRONT ACCELERATION SENSOR - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

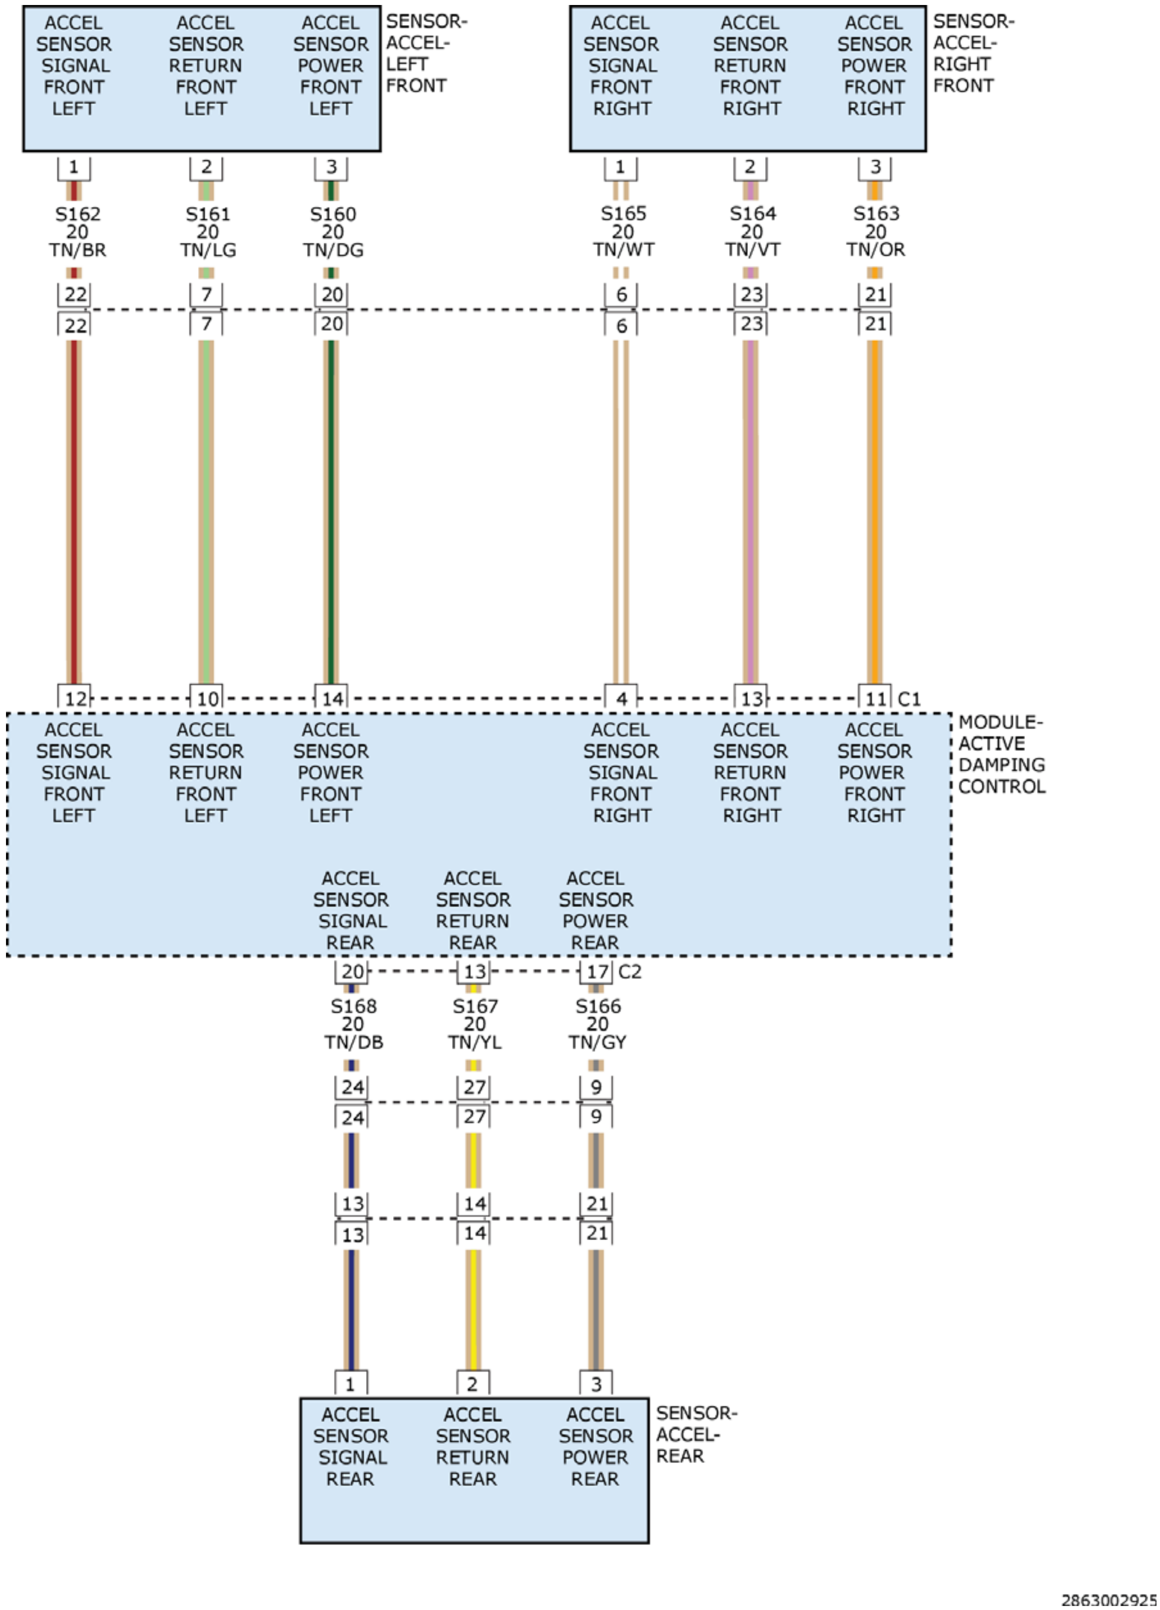

Fig. 5: Acceleration Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects when the Left Front Acceleration Sensor Signal is shorted to voltage.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S162) LEFT FRONT ACCELERATION SENSOR SIGNAL CIRCUIT SHORT TO BATTERY
(S161) LEFT FRONT ACCELERATION SENSOR RETURN CIRCUIT OPEN OR HIGH RESISTANCE
LEFT FRONT ACCELERATION SENSOR
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 6
2. **LEFT FRONT ACCELERATION SENSOR HARNESS CONNECTOR**

    NOTE: **Make sure the Acceleration Sensor harness connector is connected correctly.**

    1. Turn the ignition off.

2. Inspect the Acceleration Sensor harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (S162) LEFT FRONT ACCELERATION SENSOR SIGNAL CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition off.
   2. Disconnect the Left Front Acceleration Sensor harness connector.
   3. Disconnect the ADCM C1 harness connector.
   4. Turn the ignition on.
   5. Measure the voltage between ground and the (S162) Left Front Acceleration Sensor Signal circuit.

   Is the voltage above 5.25 volts?

   Yes

   - Repair the (S162) Left Front Acceleration Sensor Power circuit for a short battery.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **CHECK THE (S161) LEFT FRONT ACCELERATION SENSOR RETURN CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Measure the resistance of the (S161) Right Front Acceleration Sensor Return circuit between the Left Front Acceleration Sensor harness connector and the ADCM C1 harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (S161) Right Front Acceleration Sensor Return circuit for an open or high resistance.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **ACCELERATION SENSOR**
    1. Replace the Acceleration Sensor in accordance with the Service Information. Refer to **SENSOR, ACTIVE DAMPING, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the Engine.
    6. With the scan tool, read ADCM DTCs.

    Does the DTC remain active?

    Yes

    - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

6. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B2-76-LEFT FRONT ACCELERATION SENSOR - WRONG MOUNTING POSITION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects the Acceleration Sensor is installed incorrectly or damaged.

DEFAULT ACTION

- Active Damping Suspension (ADS) is disabled.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT ACCELERATION SENSOR DAMAGED, DISCONNECTED, LOOSE, OR INSTALLED INCORRECTLY
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
2. **LEFT FRONT ACCELERATION SENSOR**

NOTE: **Make sure the Acceleration Sensor harness connector is connected**

correctly.

1. Turn the ignition off.
2. Verify the Acceleration Sensor is mounted correctly.
3. Inspect the Acceleration Sensor harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
4. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C15B3-11-RIGHT FRONT ACCELERATION SENSOR - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

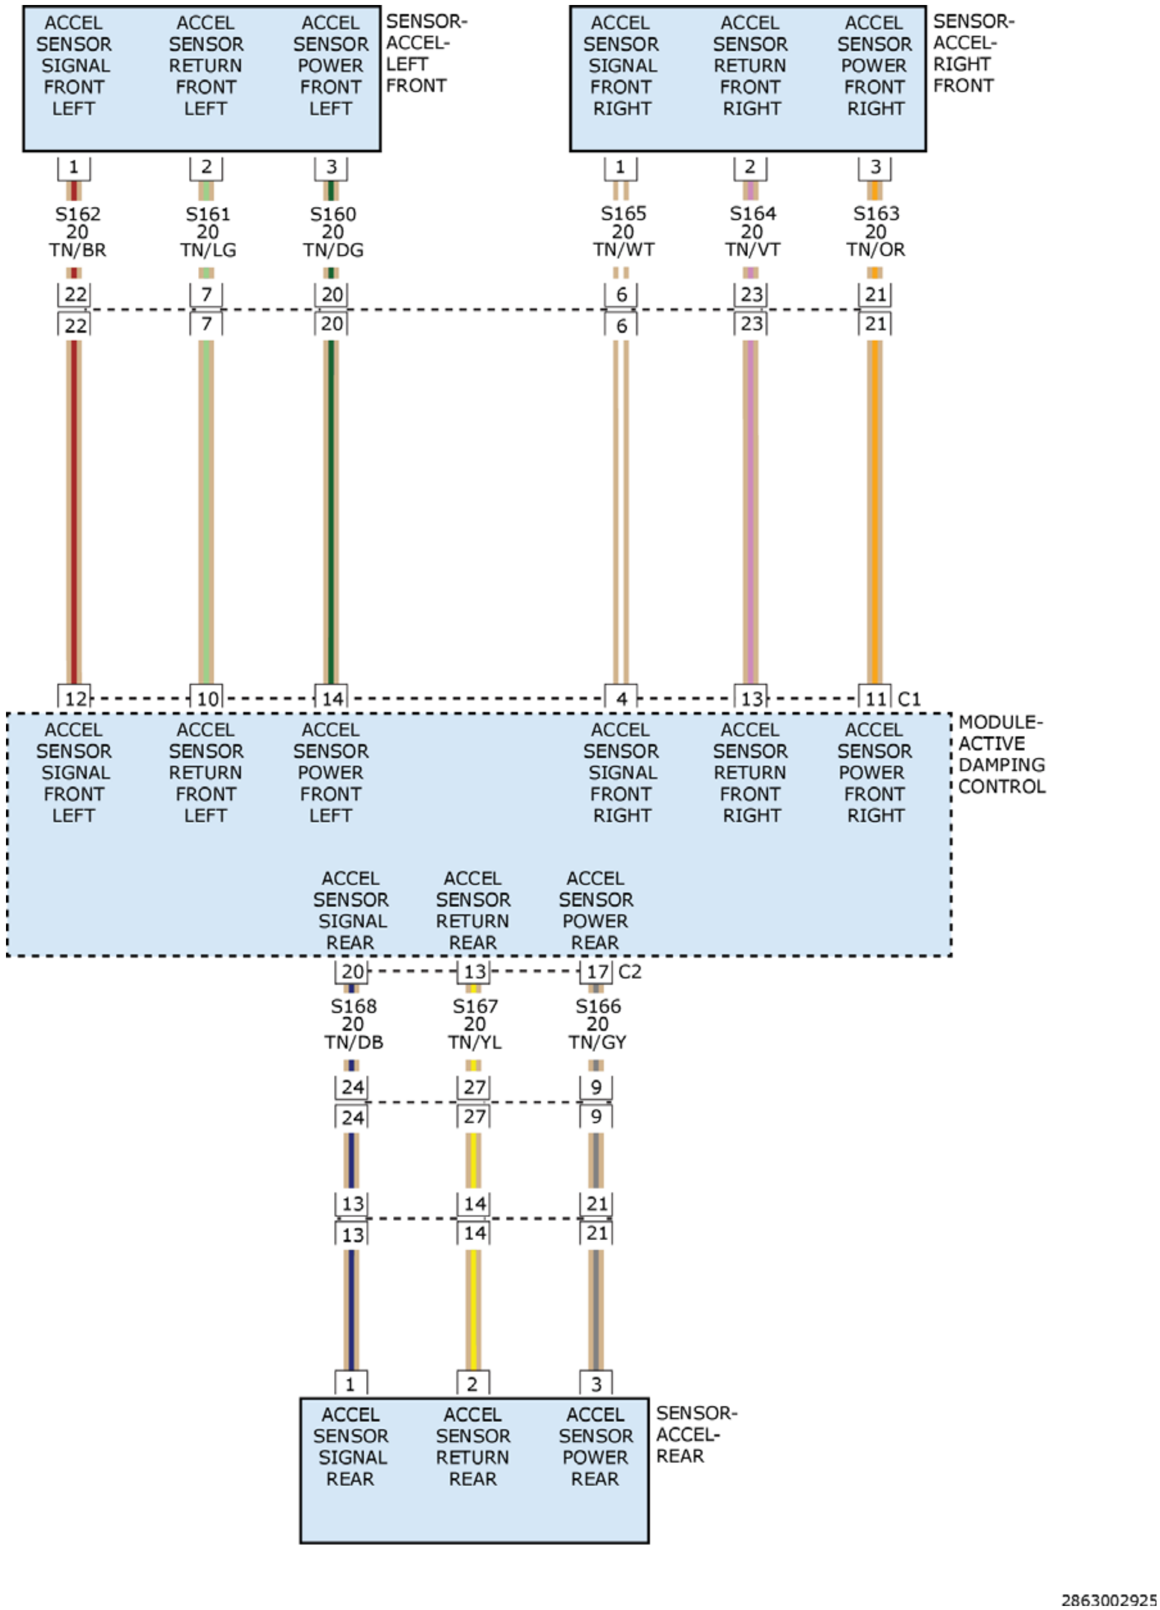

Fig. 6: Acceleration Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects when the Right Front Acceleration Sensor Signal circuit is shorted to ground.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S165) RIGHT FRONT ACCELERATION SENSOR SIGNAL CIRCUIT SHORT TO GROUND
(S165) RIGHT FRONT ACCELERATION SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(S163) RIGHT FRONT ACCELERATION SENSOR POWER CIRCUIT OPEN OR HIGH RESISTANCE
RIGHT FRONT ACCELERATION SENSOR
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 7
2. **RIGHT FRONT ACCELERATION SENSOR HARNESS CONNECTOR**

NOTE: **Make sure the Acceleration Sensor harness connector is connected**

correctly.

1. Turn the ignition off.
2. Inspect the Acceleration Sensor harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (S165) RIGHT FRONT ACCELERATION SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Acceleration Sensor harness connector.
   2. Disconnect the ADCM C1 harness connector.
   3. Check for continuity between ground and the (S165) Right Front Acceleration Sensor Signal circuit at the ADCM C1 harness connector.

      Is there continuity between ground and the (S165) Right Front Acceleration Sensor Signal circuit?

      Yes

      - Go To 5

      No

      - Repair the (S165) Right Front Acceleration Sensor Signal circuit for a short ground.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
4. **CHECK THE (S165) RIGHT FRONT ACCELERATION SENSOR SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (S165) Right Front Acceleration Sensor Signal circuit between the Right Front Acceleration Sensor harness connector and the ADCM C1 harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S165) Right Front Acceleration Sensor Signal circuit for an open or high resistance.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **CHECK THE (S163) RIGHT FRONT ACCELERATION SENSOR POWER CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Measure the resistance of the (S163) Right Front Acceleration Sensor Power circuit between the Right Front Acceleration Sensor harness connector and the ADCM C1 harness connector.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the (S163) Right Front Acceleration Sensor Power circuit for an open or high resistance.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 6

6. **ACCELERATION SENSOR**
    1. Replace the Acceleration Sensor in accordance with the Service Information. Refer to **SENSOR, ACTIVE DAMPING, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the Engine.
    6. With the scan tool, read ADCM DTCs.

    Does the DTC remain active?

    Yes

    - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

7. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.

5. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B3-12-RIGHT FRONT ACCELERATION SENSOR - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

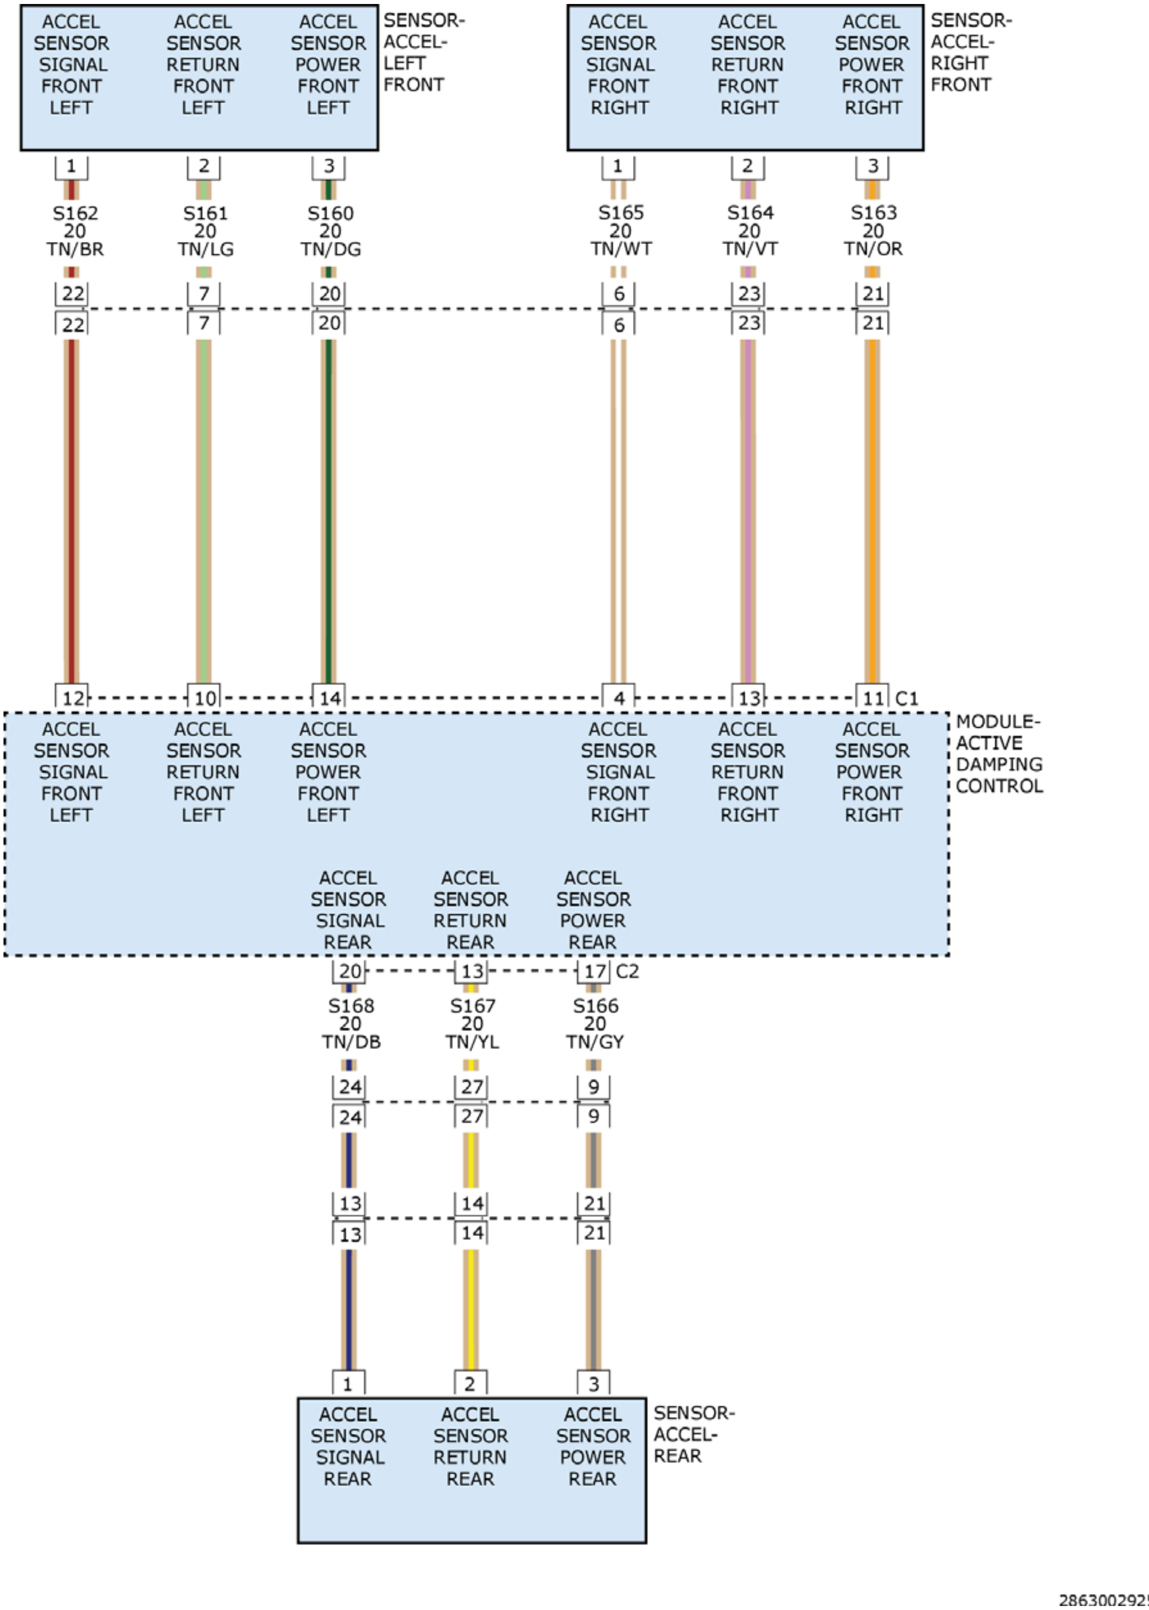

Fig. 7: Acceleration Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects when the Right Front Acceleration Sensor Signal is shorted to voltage.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S165) RIGHT FRONT ACCELERATION SENSOR SIGNAL CIRCUIT SHORT TO BATTERY
(S164) RIGHT FRONT ACCELERATION SENSOR RETURN CIRCUIT OPEN OR HIGH RESISTANCE
RIGHT FRONT ACCELERATION SENSOR
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 6
2. **RIGHT FRONT ACCELERATION SENSOR HARNESS CONNECTOR**

    NOTE: **Make sure the Acceleration Sensor harness connector is connected correctly.**

    1. Turn the ignition off.

2. Inspect the Acceleration Sensor harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (S165) RIGHT FRONT ACCELERATION SENSOR SIGNAL CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition off.
   2. Disconnect the Right Front Acceleration Sensor harness connector.
   3. Disconnect the ADCM C1 harness connector.
   4. Turn the ignition on.
   5. Measure the voltage between ground and the (S165) Right Front Acceleration Sensor Signal circuit.

      Is the voltage above 5.25 volts?

      Yes

      - Repair the (S165) Right Front Acceleration Sensor Power circuit for a short battery.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **CHECK THE (S164) RIGHT FRONT ACCELERATION SENSOR RETURN CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Measure the resistance of the (S164) Right Front Acceleration Sensor Return circuit between the Right Front Acceleration Sensor harness connector and the ADCM C1 harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S164) Right Front Acceleration Sensor Return circuit for an open or high resistance.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **ACCELERATION SENSOR**
    1. Replace the Acceleration Sensor in accordance with the Service Information. Refer to **SENSOR, ACTIVE DAMPING, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the Engine.
    6. With the scan tool, read ADCM DTCs.

    Does the DTC remain active?

    Yes

    - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.
6. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B3-76-RIGHT FRONT ACCELERATION SENSOR - WRONG MOUNTING POSITION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects the Acceleration Sensor is installed incorrectly or damaged.

DEFAULT ACTION

- Active Damping Suspension (ADS) is disabled.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT ACCELERATION SENSOR DAMAGED, DISCONNECTED, LOOSE, OR INSTALLED INCORRECTLY
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

        Is the DTC active?

        Yes

        - Go To 2

        No

        - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
2. **RIGHT FRONT ACCELERATION SENSOR**

NOTE: **Make sure the Acceleration Sensor harness connector is connected**

correctly.

1. Turn the ignition off.
2. Verify the Acceleration Sensor is mounted correctly.
3. Inspect the Acceleration Sensor harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
4. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C15B4-04-LEFT FRONT DAMPING VALVE LOW SIDE 1 - SYSTEM INTERNAL FAILURES

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **If any other DTCs are present, repair them first before continuing with this diagnostic procedure.**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects the Low Side 1 Damping Valve has an internal failure.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes

Possible Causes
AIR SUSPENSION CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 3

    No

    - Go To 2
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 3
3. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
    1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. Turn the ignition on.
4. With the scan tool, erase the DTCs.
5. Start the Engine.
6. With the scan tool, read ADCM DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

4. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

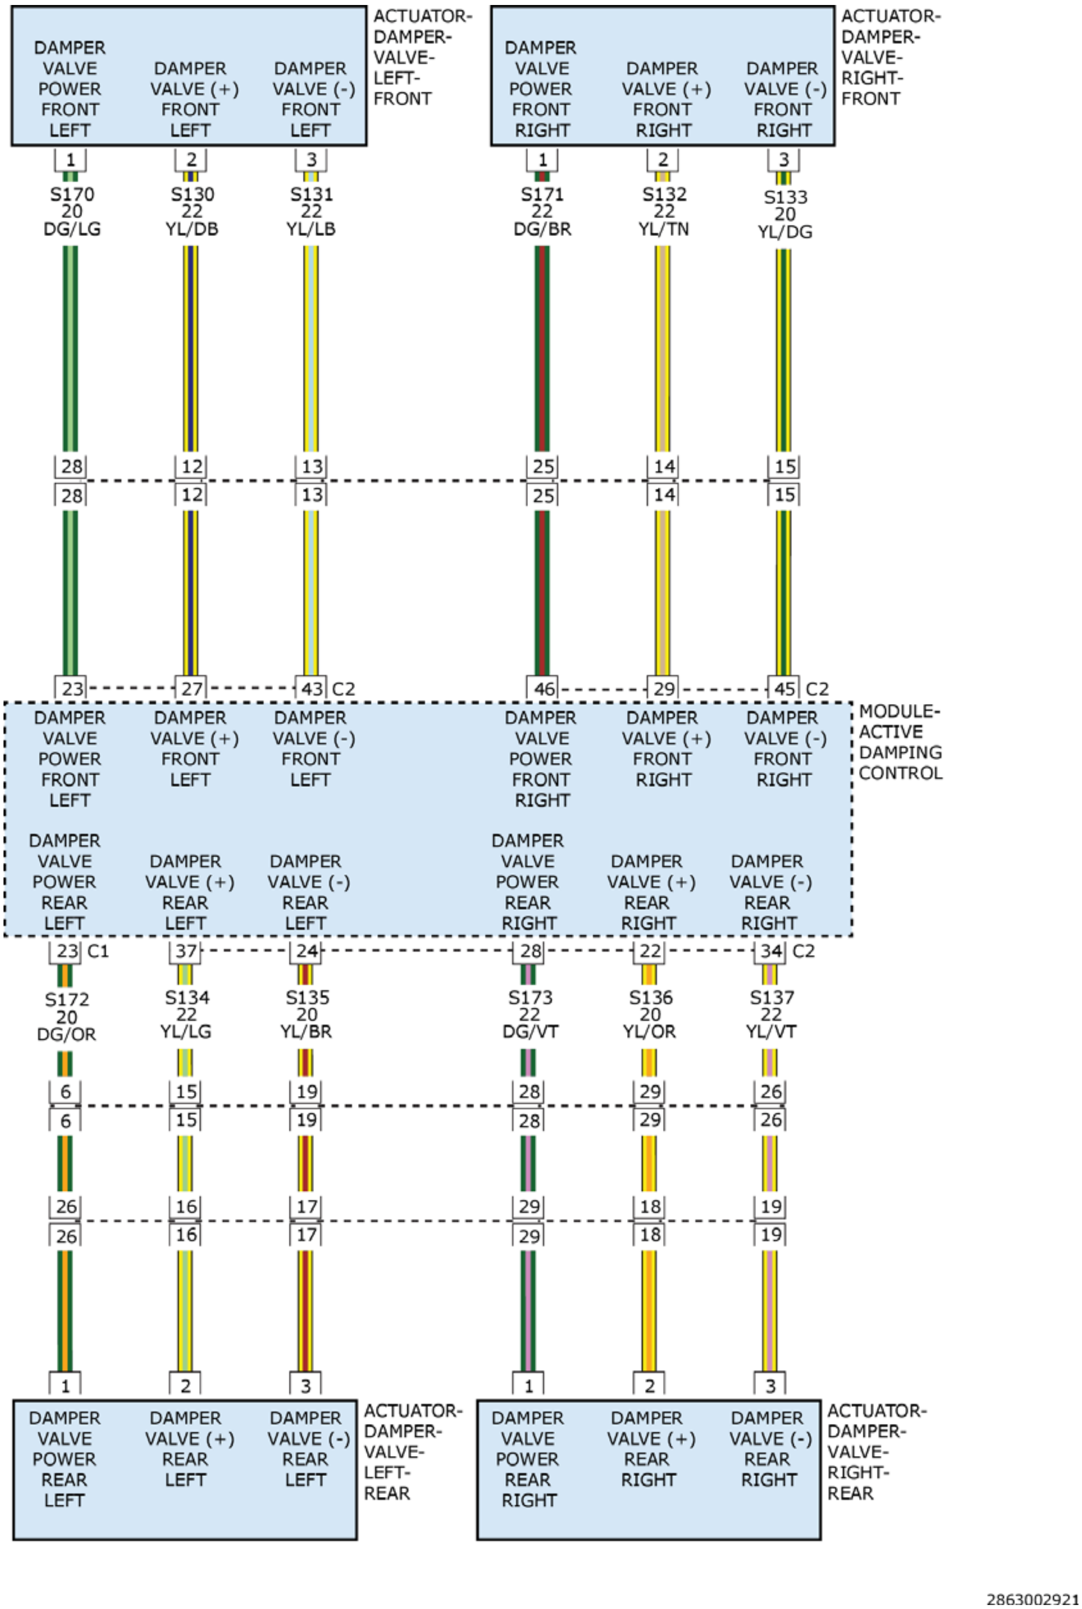
   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B4-11-LEFT FRONT DAMPING VALVE LOW SIDE 1 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .



[Fig. 8: Valve Damper Actuator Circuit Diagram]

Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Adaptive Damping Control Module (ADCM) detects when the Left Front Damping Valve circuit is shorted to ground.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S130) LEFT FRONT DAMPER VALVE (+) CIRCUIT SHORTED TO GROUND
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (S130) LEFT FRONT DAMPER VALVE (+) CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Check for continuity between ground and the (S130) Left Front Damper Valve (+) circuit at the ADCM C2 harness connector.

      Is there continuity between ground and the (S130) Left Front Damper Valve (+) circuit?

      Yes

      - Repair the (S130) Left Front Damper Valve (+) circuit for a short ground.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the Engine.
   6. With the scan tool, read ADCM DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B4-12-LEFT FRONT DAMPING VALVE LOW SIDE 1 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

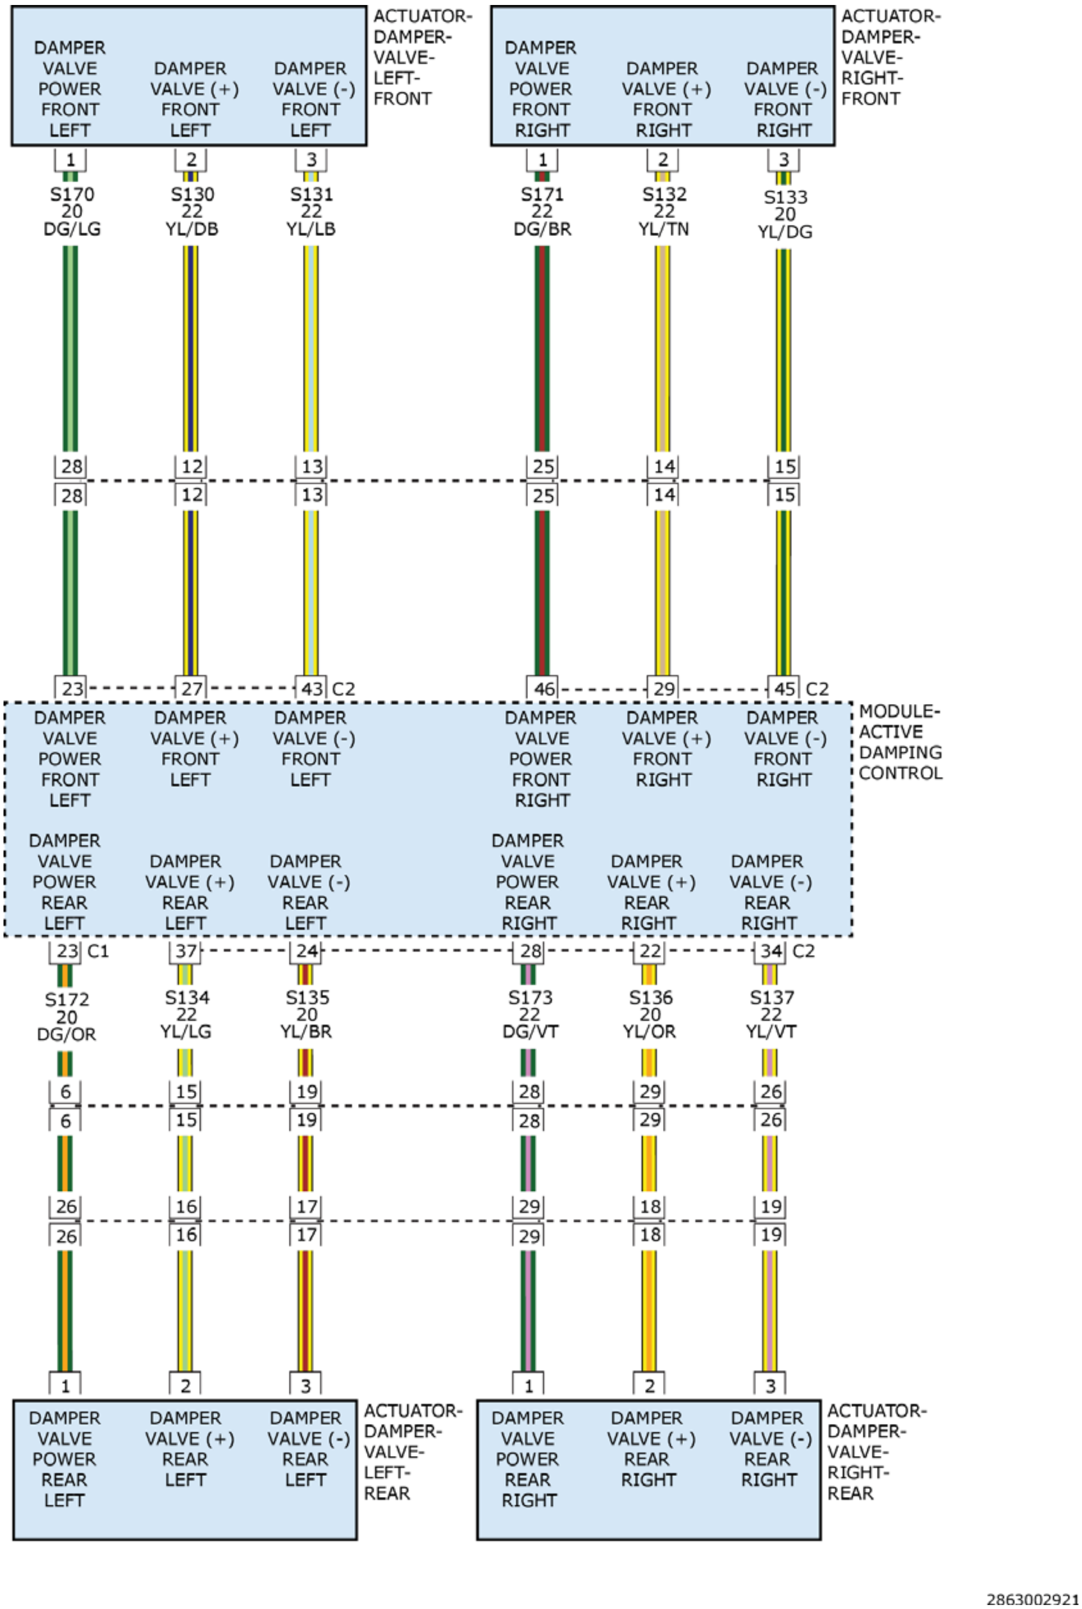


Fig. 9: Valve Damper Actuator Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects when the Left Front Damping Valve circuit is shorted to battery voltage.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S130) LEFT FRONT DAMPER VALVE (+) CIRCUIT SHORTED TO BATTERY
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (S130) LEFT FRONT DAMPER VALVE (+) CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition off.
   2. Disconnect the Damping Valve Shock Assembly harness connector.
   3. Disconnect the ADCM C2 harness connector.
   4. Turn the ignition on.
   5. Measure the voltage between ground and the (S130) Left Front Damper Valve (+) circuit.

      Is there any voltage present?

      Yes

      - Repair the (S130) Left Front Damper Valve (+) circuit for a short battery.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the Engine.
   6. With the scan tool, read ADCM DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .

- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B4-13-LEFT FRONT DAMPING VALVE LOW SIDE 1 - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

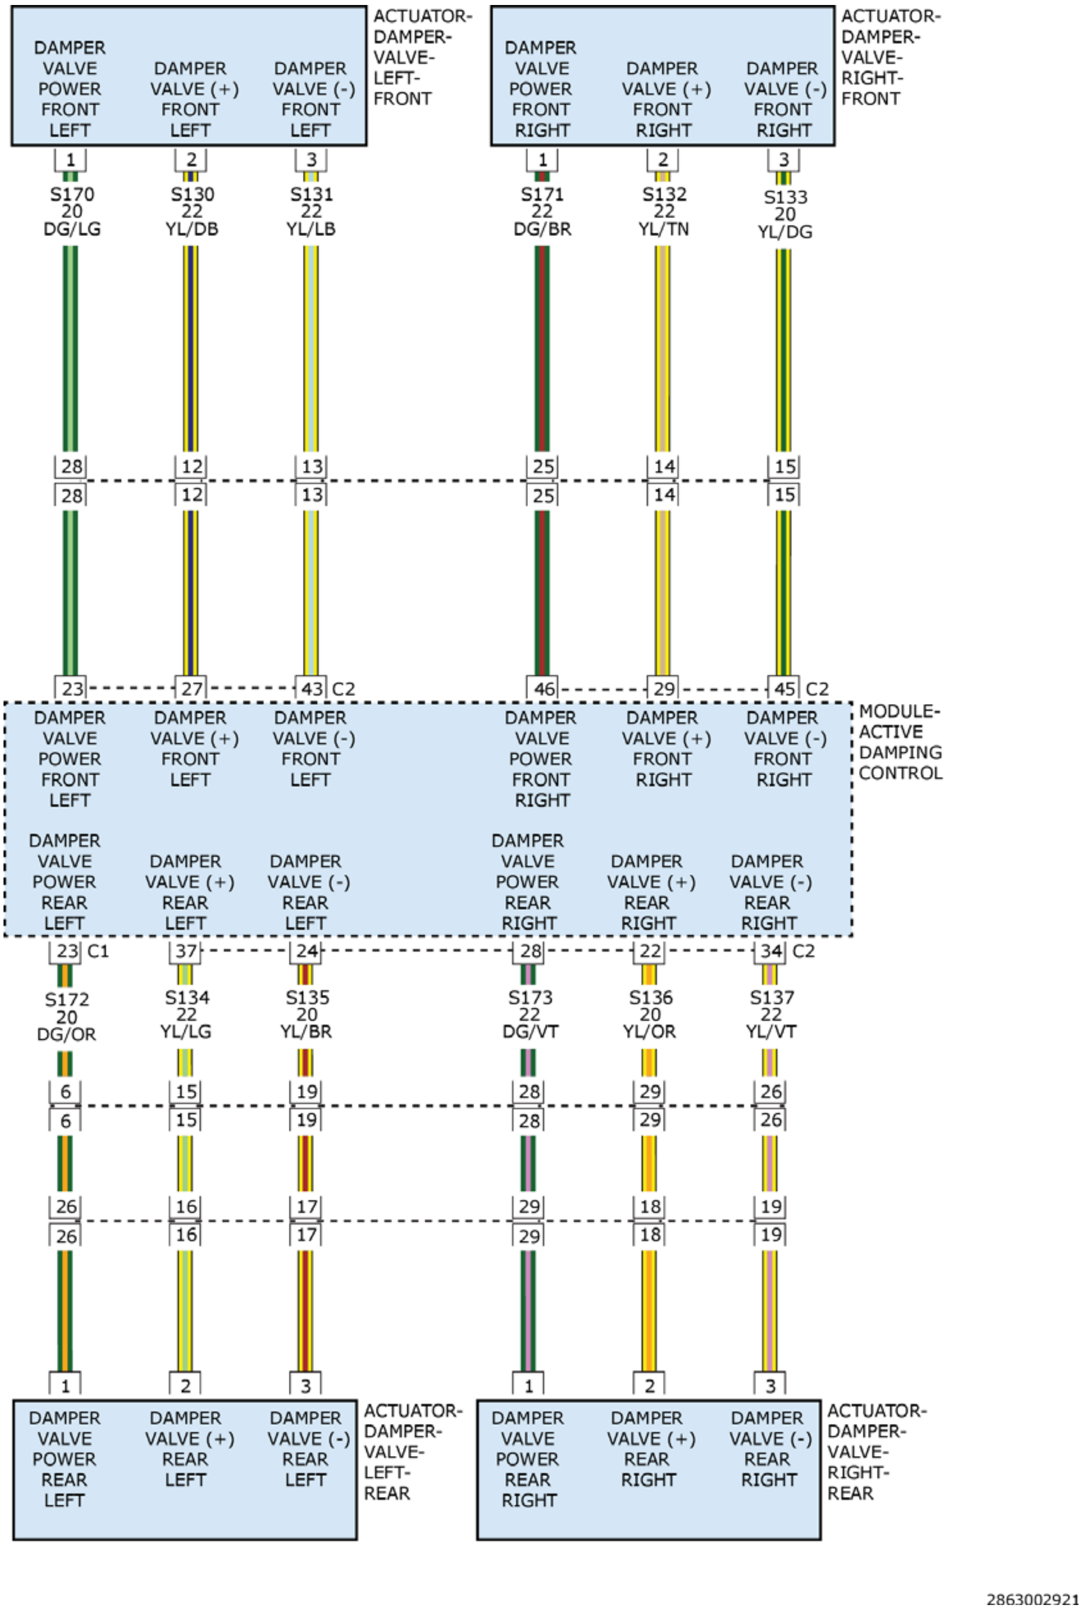

Fig. 10: Valve Damper Actuator Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Adaptive Damping Control Module (ADCM) detects when the Left Front Damping Valve circuit is open.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S130) LEFT FRONT DAMPER VALVE (+) CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (S130) LEFT FRONT DAMPER VALVE (+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Disconnect the Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Measure the resistance of the (S130) Left Front Damper Valve (+) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S130) Left Front Damper Valve (+) circuit for an open or high resistance.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the Engine.
   6. With the scan tool, read ADCM DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B5-08-LEFT FRONT DAMPING VALVE LOW SIDE 2 - BUS SIGNAL/MESSAGE FAILURES

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **If any other DTCs are present, repair them first before continuing with this diagnostic procedure.**

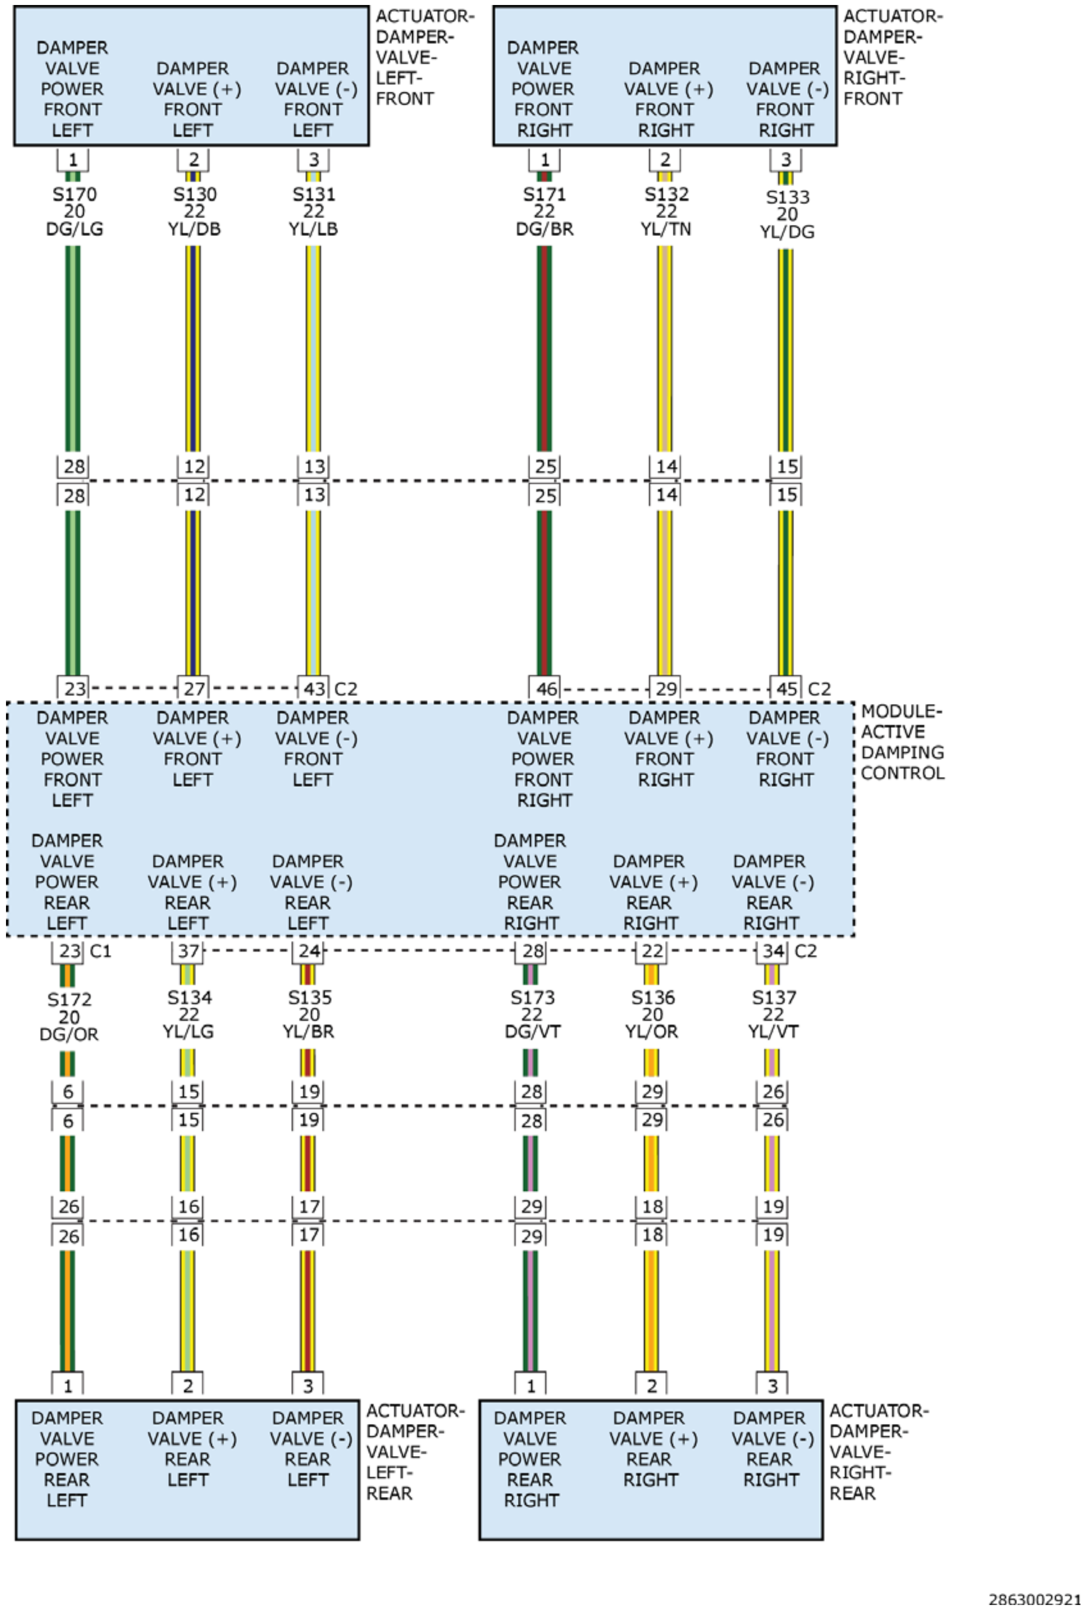

Fig. 11: Valve Damper Actuator Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Left Front Damper Valve (-) circuit is not communicating with the Active Damping Control Module (ADCM).

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S131) LEFT FRONT DAMPER VALVE (-) CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (S131) LEFT FRONT DAMPER VALVE (-) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Disconnect the Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Measure the resistance of the (S131) Left Front Damper Valve (-) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S131) Left Front Damper Valve (-) circuit for an open or high resistance.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the Engine.
   6. With the scan tool, read ADCM DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B5-11-LEFT FRONT DAMPING VALVE LOW SIDE 2 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

..

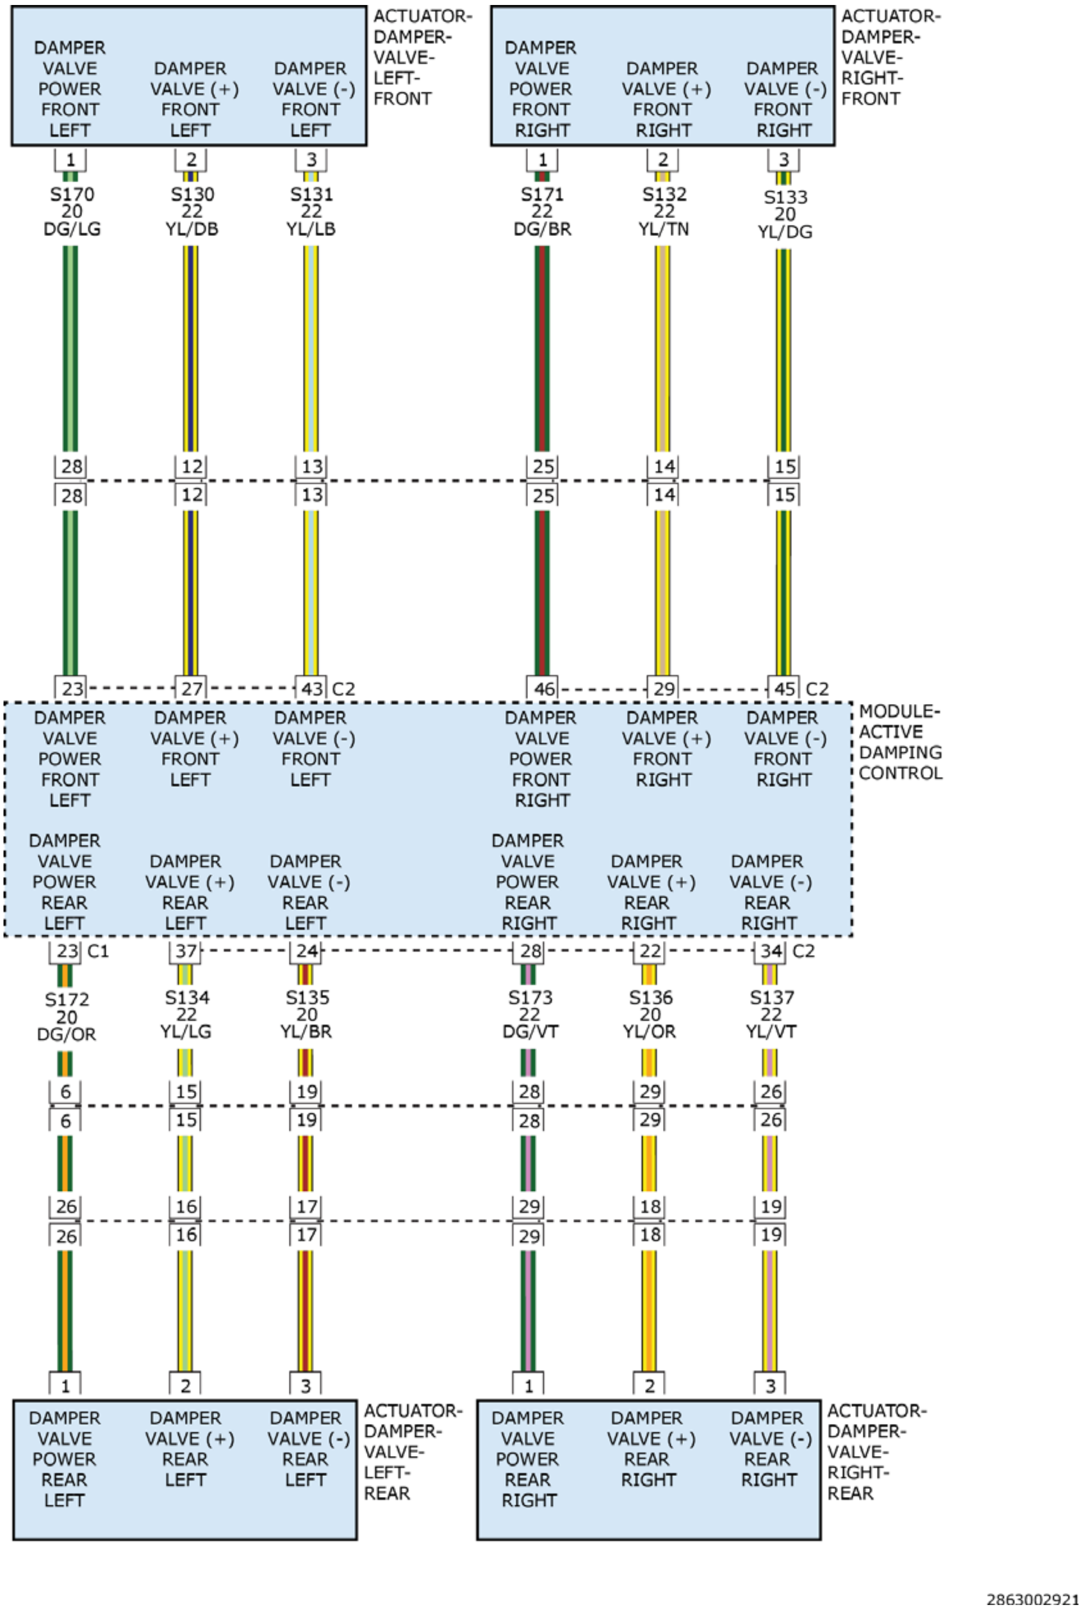

Fig. 12: Valve Damper Actuator Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects when the Left Front Damping Valve circuit is shorted to ground.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S131) LEFT FRONT DAMPER VALVE (-) CIRCUIT SHORTED TO GROUND
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (S131) LEFT FRONT DAMPER VALVE (-) CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Check for continuity between ground and the (S131) Left Front Damper Valve (-) circuit at the ADCM C2 harness connector.

      Is there continuity between ground and the (S131) Left Front Damper Valve (-) circuit?

      Yes

      - Repair the (S131) Left Front Damper Valve (-) circuit for a short ground.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the Engine.
   6. With the scan tool, read ADCM DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B5-12-LEFT FRONT DAMPING VALVE LOW SIDE 2 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

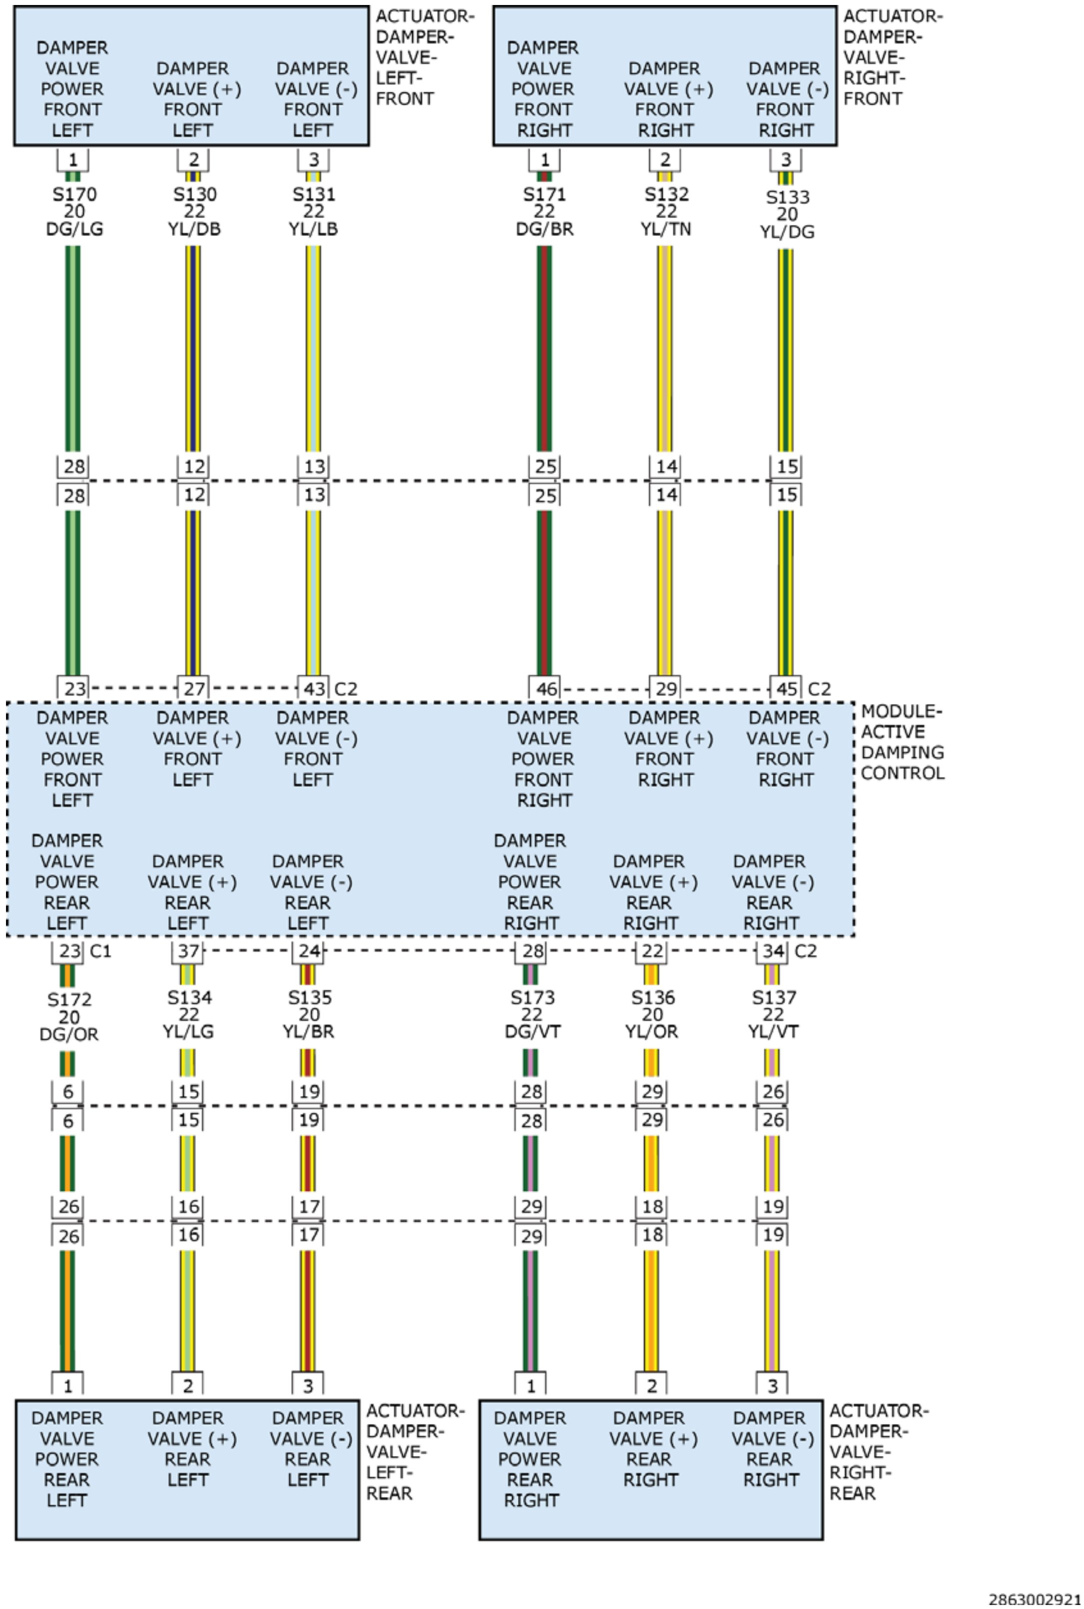

Fig. 13: Valve Damper Actuator Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Adaptive Damping Control Module (ADCM) detects when the Left Front Damping Valve circuit is shorted to battery voltage.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S131) LEFT FRONT DAMPER VALVE (-) CIRCUIT SHORTED TO BATTERY
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

       Is the DTC active?

       Yes

       - Go To 2

       No

       - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

   NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (S131) LEFT FRONT DAMPER VALVE (-) CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition off.
   2. Disconnect the Damping Valve Shock Assembly harness connector.
   3. Disconnect the ADCM C2 harness connector.
   4. Turn the ignition on.
   5. Measure the voltage between ground and the (S131) Left Front Damper Valve (-) circuit.

      Is there any voltage present?

      Yes

      - Repair the (S131) Left Front Damper Valve (-) circuit for a short battery.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the Engine.
   6. With the scan tool, read ADCM DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .

- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B5-13-LEFT FRONT DAMPING VALVE LOW SIDE 2 - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

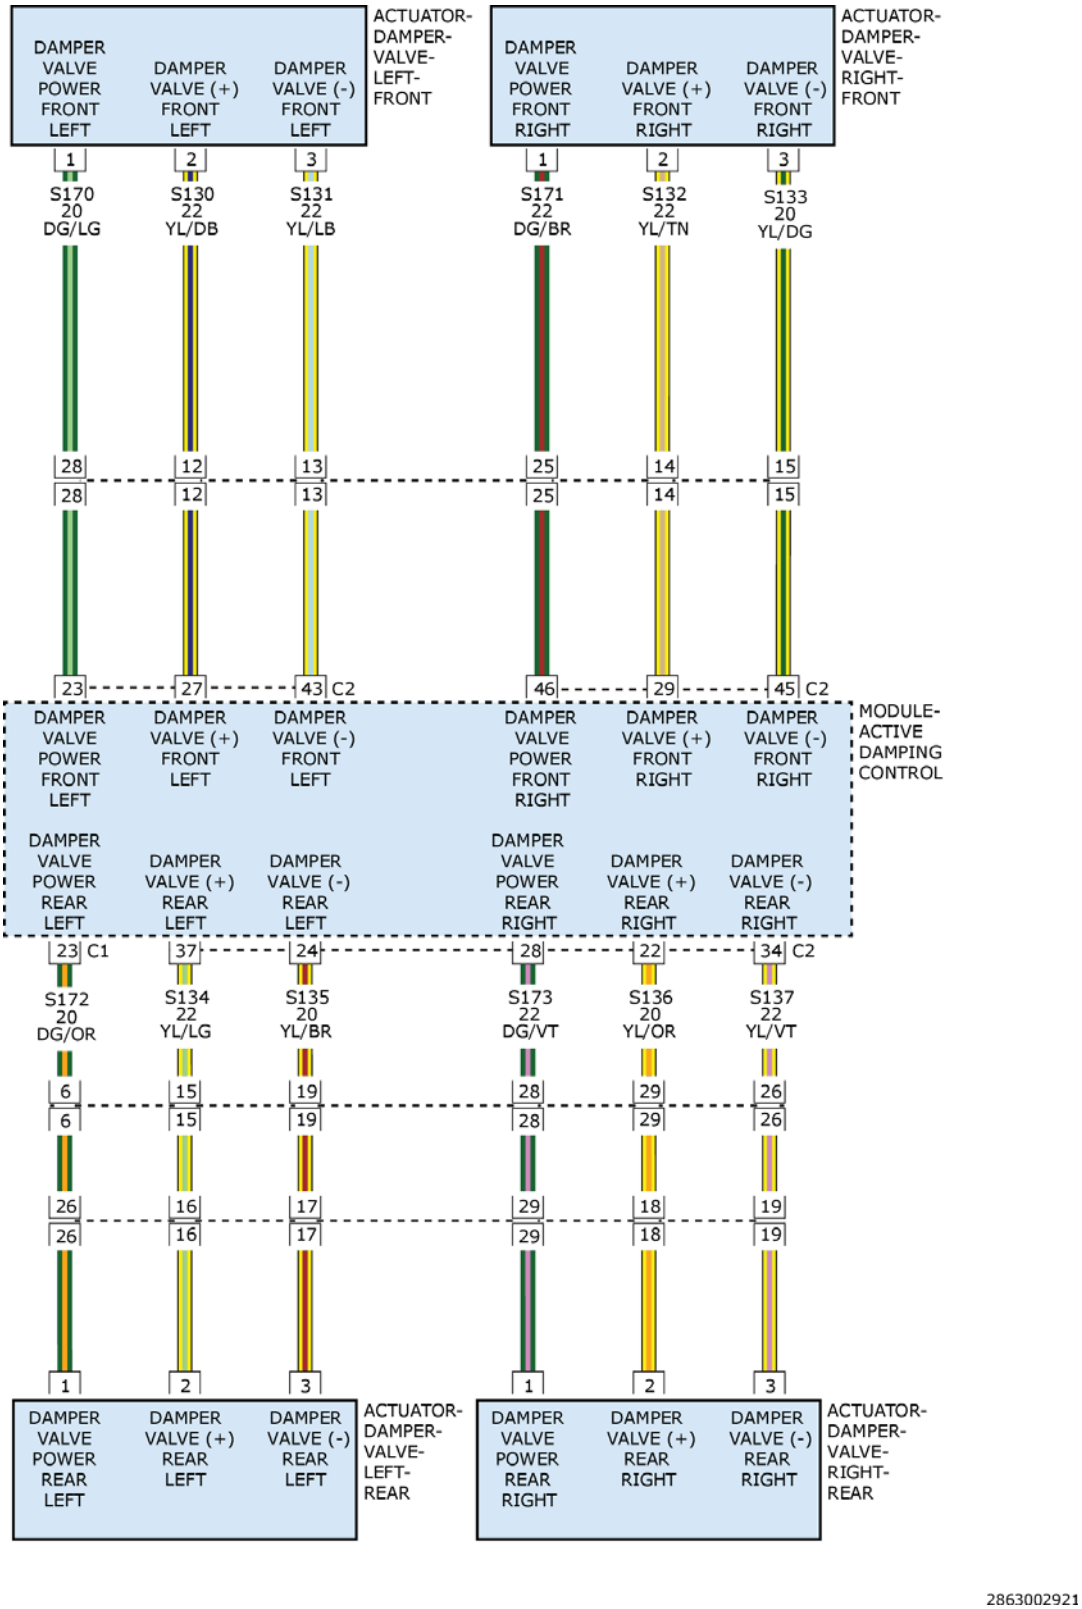

Fig. 14: Valve Damper Actuator Circuit Diagram

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects when the Left Front Damping Valve (-) circuit is open.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S131) LEFT FRONT DAMPER VALVE (-) CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (S131) LEFT FRONT DAMPER VALVE (-) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Disconnect the Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Measure the resistance of the (S131) Left Front Damper Valve (-) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S131) Left Front Damper Valve (-) circuit for an open or high resistance.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the Engine.
   6. With the scan tool, read ADCM DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B6-11-RIGHT FRONT DAMPING VALVE LOW SIDE 1 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

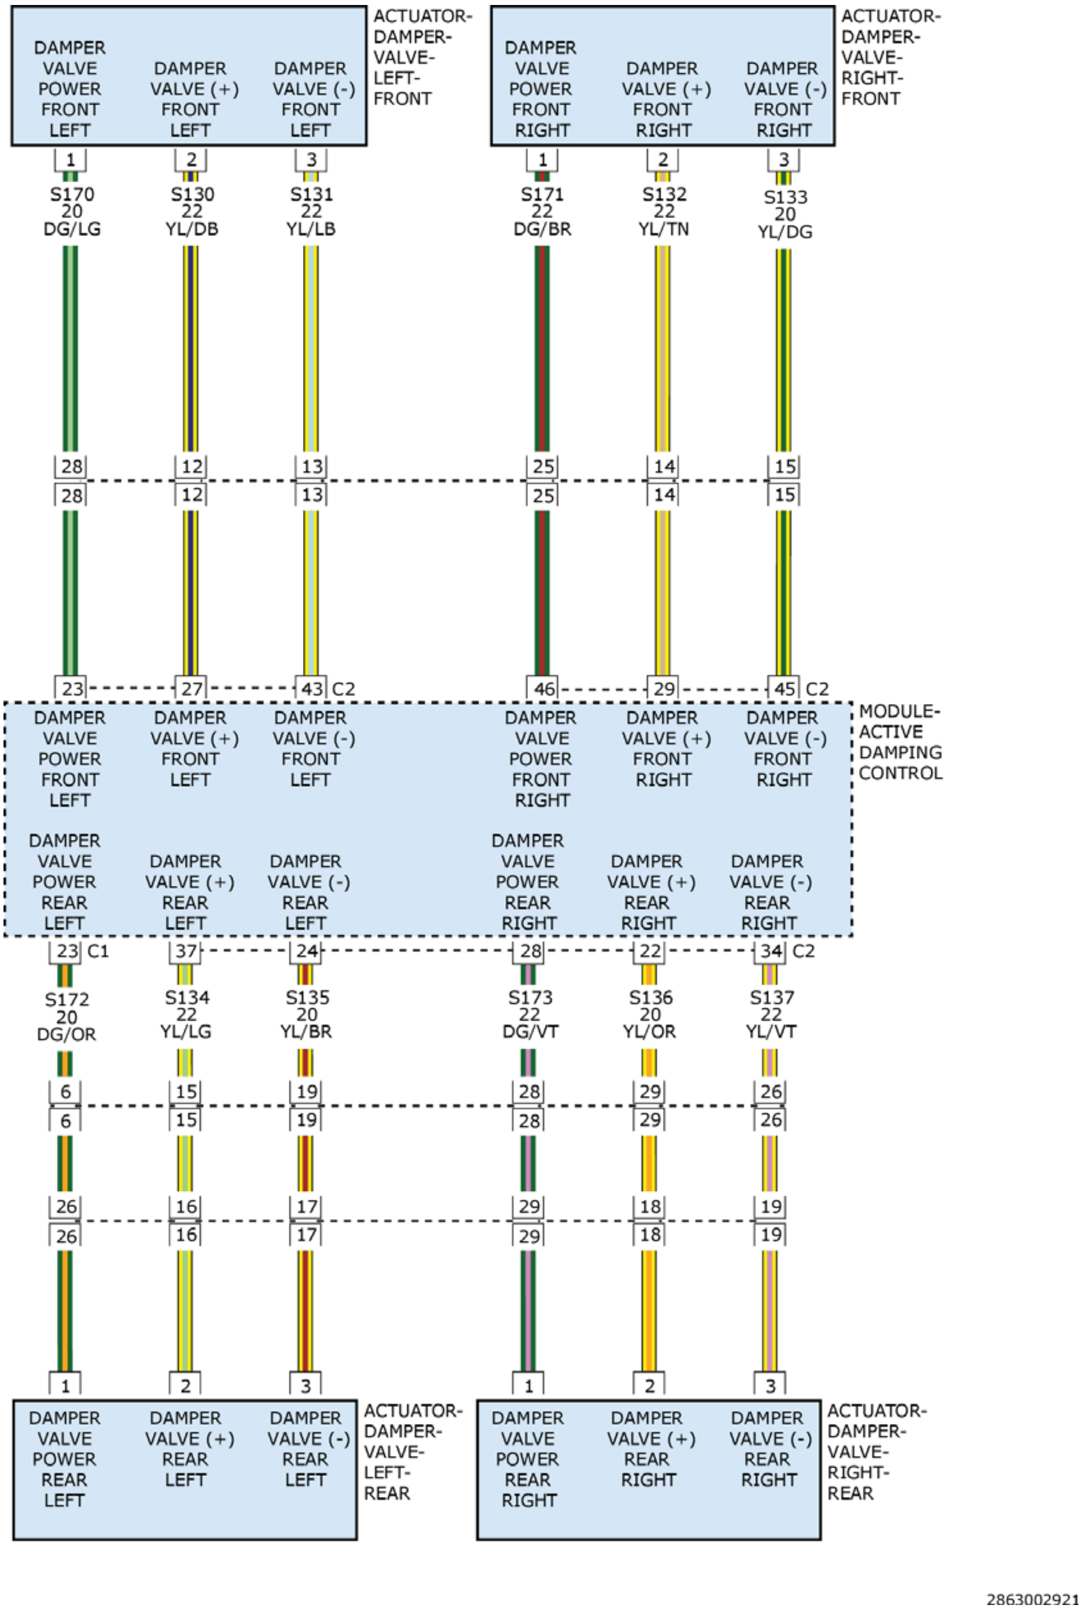

Fig. 15: Valve Damper Actuator Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Adaptive Damping Control Module (ADCM) detects when the Right Front Damping Valve circuit is shorted to ground.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S132) RIGHT FRONT DAMPER VALVE (+) CIRCUIT SHORTED TO GROUND
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (S132) RIGHT FRONT DAMPER VALVE (+) CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Check for continuity between ground and the (S132) Right Front Damper Valve (+) circuit at the ADCM C2 harness connector.

      Is there continuity between ground and the (S132) Right Front Damper Valve (+) circuit?

      Yes

      - Repair the (S132) Right Front Damper Valve (+) circuit for a short ground.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the Engine.
   6. With the scan tool, read ADCM DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B6-12-RIGHT FRONT DAMPING VALVE LOW SIDE 1 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Adaptive Damping Control Module (ADCM) detects when the Right Front Damping Valve circuit is shorted to battery voltage.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S132) RIGHT FRONT DAMPER VALVE (+) CIRCUIT SHORTED TO BATTERY
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (S132) RIGHT FRONT DAMPER VALVE (+) CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition off.
   2. Disconnect the Damping Valve Shock Assembly harness connector.
   3. Disconnect the ADCM C2 harness connector.
   4. Turn the ignition on.
   5. Measure the voltage between ground and the (S132) Right Front Damper Valve (+) circuit.

      Is there any voltage present?

      Yes

      - Repair the (S132) Right Front Damper Valve (+) circuit for a short battery.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the Engine.
   6. With the scan tool, read ADCM DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .

- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

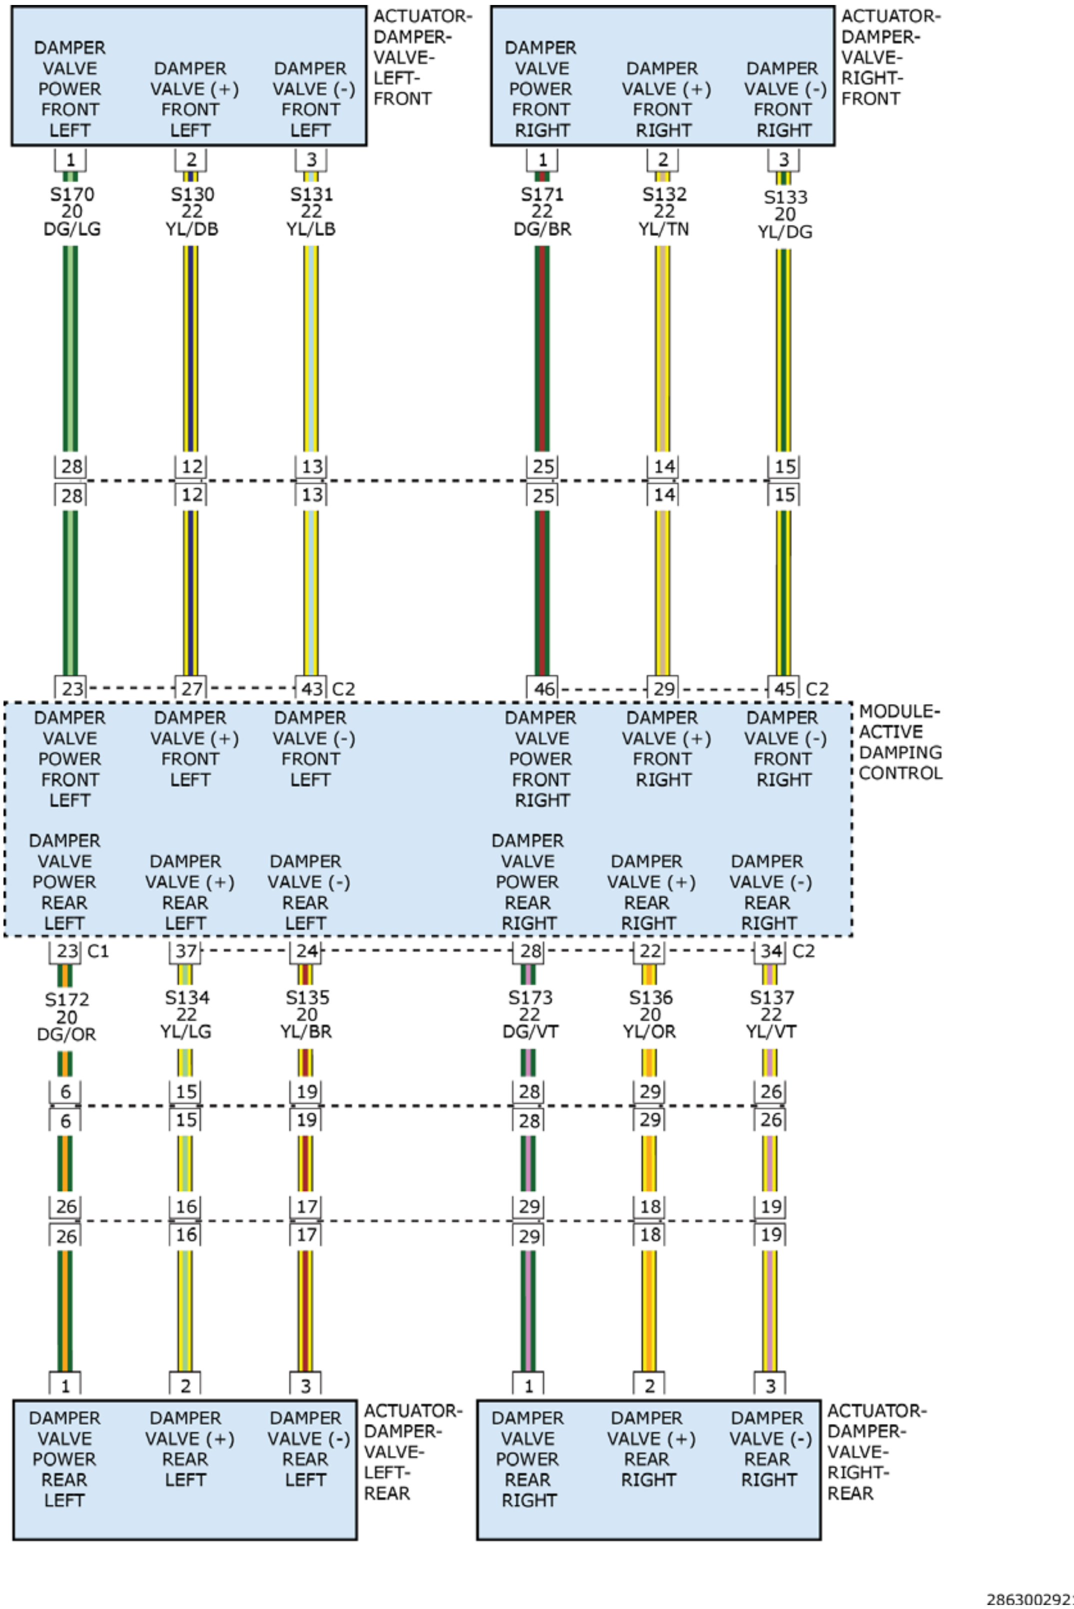
    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B6-13-RIGHT FRONT DAMPING VALVE LOW SIDE 1 - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .



[**Fig. 17: Valve Damper Actuator Circuit Diagram**]
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Adaptive Damping Control Module (ADCM) detects when the Left Front Damping Valve circuit is open.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S132) RIGHT FRONT DAMPER VALVE (+) CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

       Is the DTC active?

       Yes

       - Go To 2

       No

       - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

   NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (S132) RIGHT FRONT DAMPER VALVE (+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Disconnect the Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Measure the resistance of the (S132) Right Front Damper Valve (+) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S132) Right Front Damper Valve (+) circuit for an open or high resistance.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the Engine.
   6. With the scan tool, read ADCM DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B7-11-RIGHT FRONT DAMPING VALVE LOW SIDE 2 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Adaptive Damping Control Module (ADCM) detects when the Right Front Damping Valve circuit is shorted to ground.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S133) RIGHT FRONT DAMPER VALVE (-) CIRCUIT SHORTED TO GROUND
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, read ADCM DTCs and record on the repair order.
   3. With the scan tool, erase DTCs.
   4. Start the Engine.
   5. With the scan tool, read ADCM DTCs.

      Is the DTC active?

      Yes

      - Go To 2

      No

      - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

   NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

   1. Turn the ignition off.
   2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (S133) RIGHT FRONT DAMPER VALVE (-) CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Check for continuity between ground and the (S133) Right Front Damper Valve (-) circuit at the ADCM C2 harness connector.

      Is there continuity between ground and the (S133) Right Front Damper Valve (-) circuit?

      Yes

      - Repair the (S133) Right Front Damper Valve (-) circuit for a short ground.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the Engine.
   6. With the scan tool, read ADCM DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B7-12-RIGHT FRONT DAMPING VALVE LOW SIDE 2 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

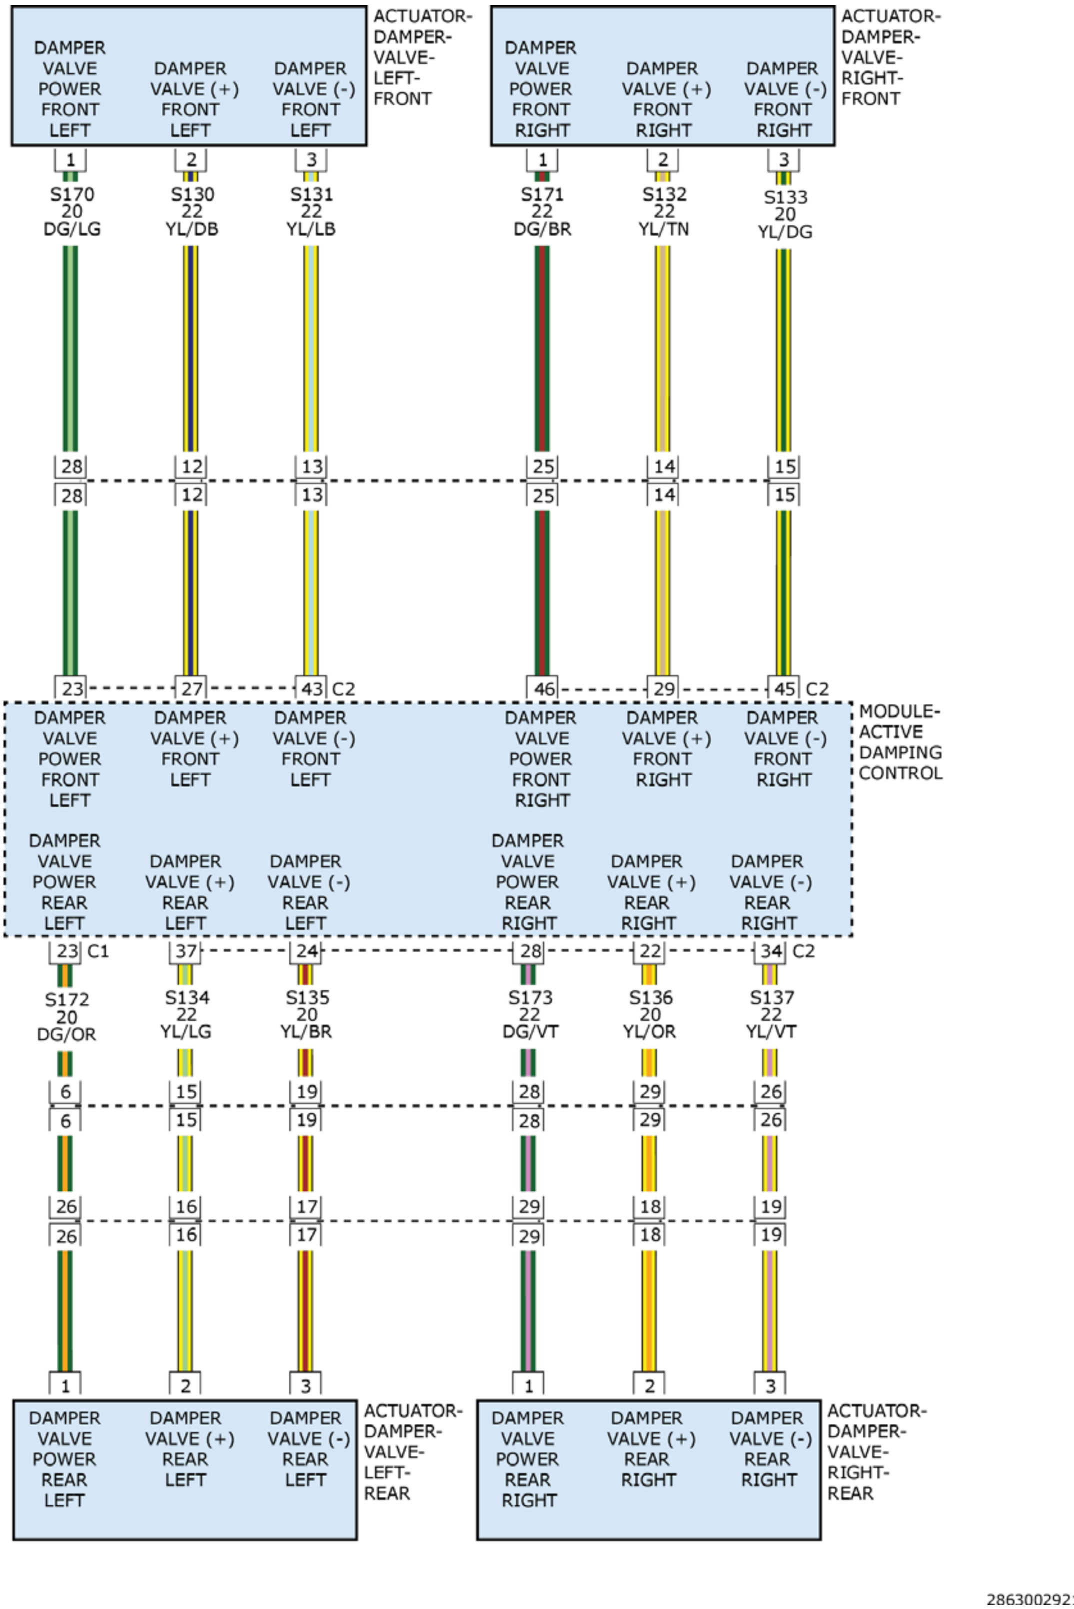

Fig. 19: Valve Damper Actuator Circuit Diagram

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Adaptive Damping Control Module (ADCM) detects the Right Front Damping Valve circuit is shorted to battery voltage.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S133) RIGHT FRONT DAMPER VALVE (-) CIRCUIT SHORTED TO BATTERY
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (S133) RIGHT FRONT DAMPER VALVE (-) CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition off.
   2. Disconnect the Damping Valve Shock Assembly harness connector.
   3. Disconnect the ADCM C2 harness connector.
   4. Turn the ignition on.
   5. Measure the voltage between ground and the (S133) Right Front Damper Valve (-) circuit.

      Is there any voltage present?

      Yes

      - Repair the (S133) Right Front Damper Valve (-) circuit for a short battery.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the Engine.
   6. With the scan tool, read ADCM DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .

- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

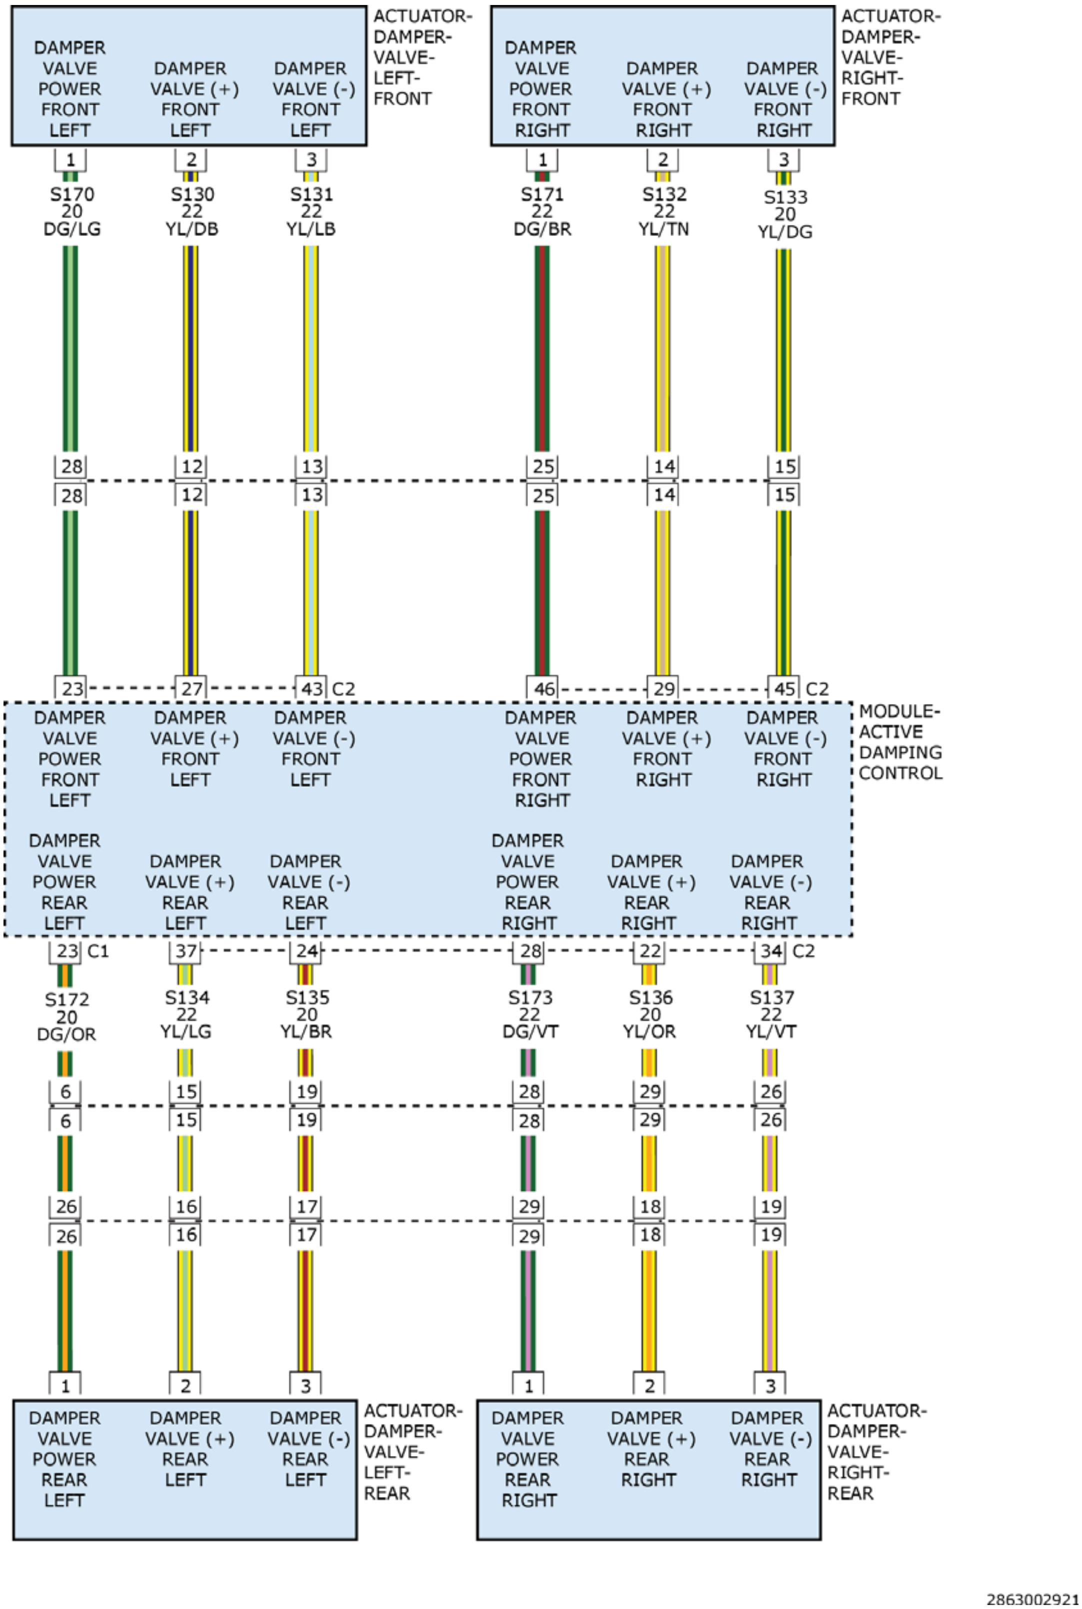
    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B7-13-RIGHT FRONT DAMPING VALVE LOW SIDE 2 - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .



[Fig. 20: Valve Damper Actuator Circuit Diagram](#)
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Adaptive Damping Control Module (ADCM) detects when the Right Front Damping Valve circuit is open.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S133) RIGHT FRONT DAMPER VALVE (-) CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (S133) RIGHT FRONT DAMPER VALVE (-) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Disconnect the Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Measure the resistance of the (S133) Right Front Damper Valve (-) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S133) Right Front Damper Valve (-) circuit for an open or high resistance.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the Engine.
   6. With the scan tool, read ADCM DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B8-11-LEFT REAR DAMPING VALVE LOW SIDE 1 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

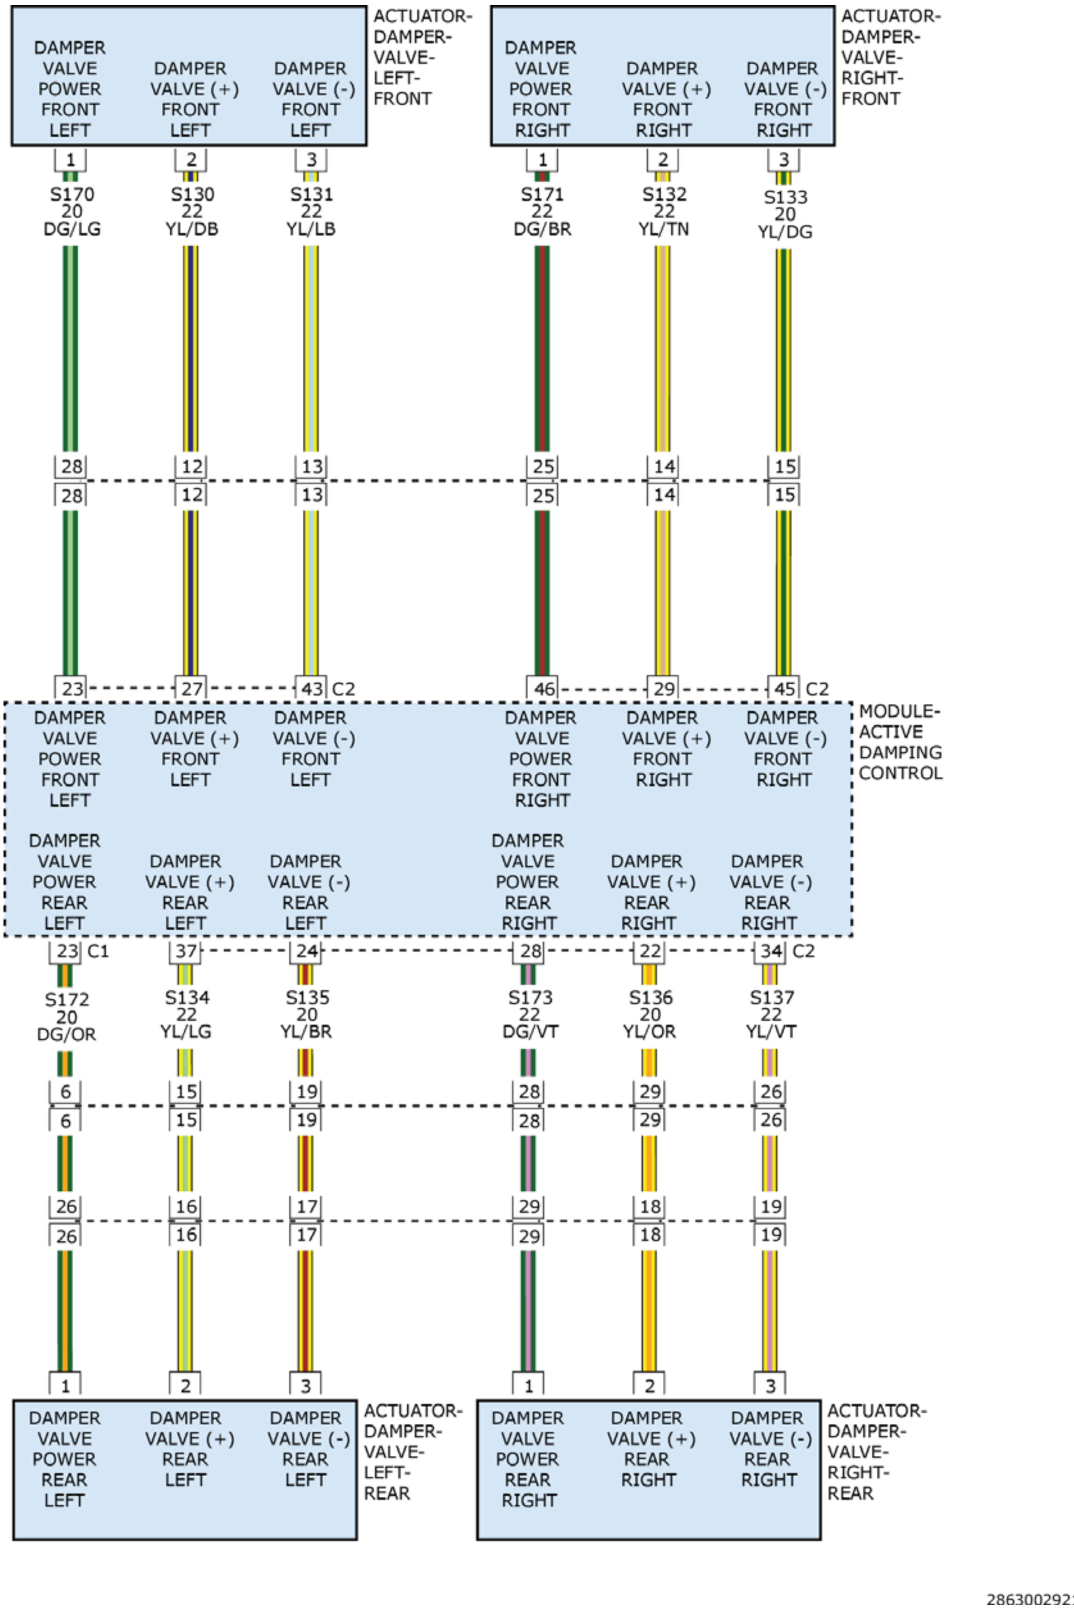


Fig. 21: Valve Damper Actuator Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Adaptive Damping Control Module (ADCM) detects when the Left Rear Damping Valve circuit is shorted to ground.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S134) LEFT REAR DAMPER VALVE (+) CIRCUIT SHORTED TO GROUND
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, read ADCM DTCs and record on the repair order.
   3. With the scan tool, erase DTCs.
   4. Start the Engine.
   5. With the scan tool, read ADCM DTCs.

   Is the DTC active?

   Yes

   - Go To 2

   No

   - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

   NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

   1. Turn the ignition off.
   2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (S134) LEFT REAR DAMPER VALVE (+) CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Check for continuity between ground and the (S134) Left Rear Damper Valve (+) circuit at the ADCM C2 harness connector.

      Is there continuity between ground and the (S134) Left Rear Damper Valve (+) circuit?

      Yes

      - Repair the (S134) Left Rear Damper Valve (+) circuit for a short ground.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the Engine.
   6. With the scan tool, read ADCM DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B8-12-LEFT REAR DAMPING VALVE LOW SIDE 1 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

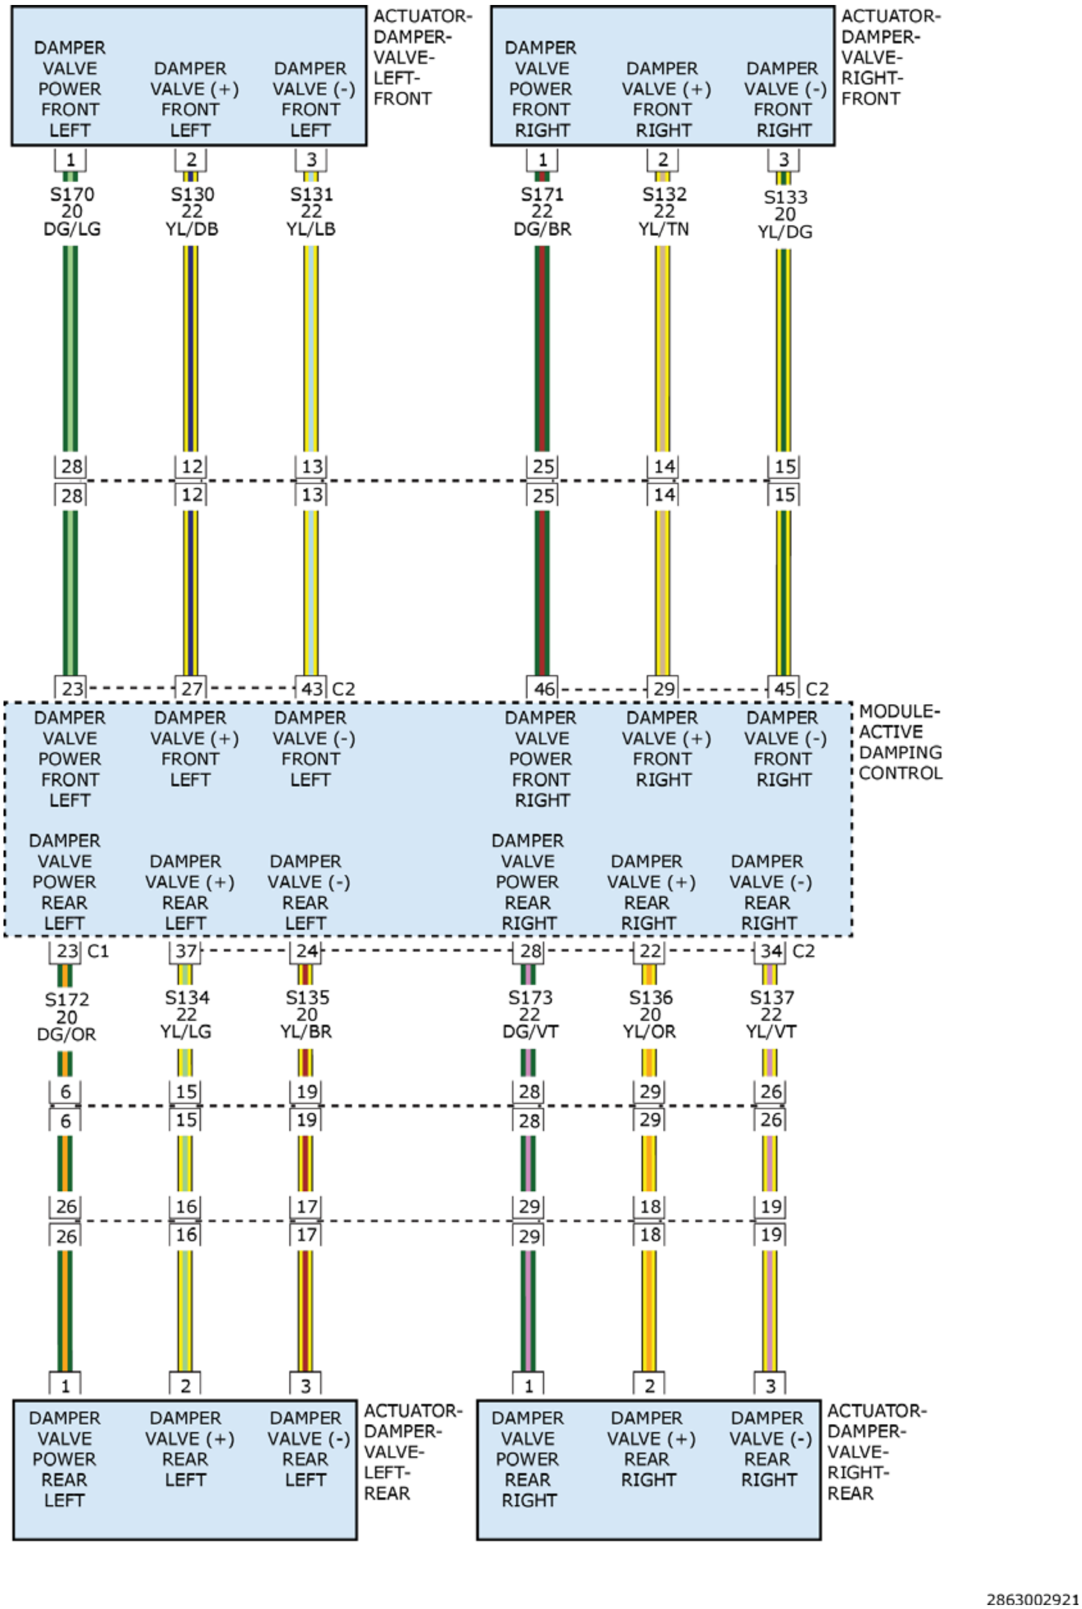

Fig. 22: Valve Damper Actuator Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects when the Left Rear Damping Valve circuit is shorted to battery.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S134) LEFT REAR DAMPER VALVE (+) CIRCUIT SHORTED TO BATTERY
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (S134) LEFT REAR DAMPER VALVE (+) CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition off.
   2. Disconnect the Damping Valve Shock Assembly harness connector.
   3. Disconnect the ADCM C2 harness connector.
   4. Turn the ignition on.
   5. Measure the voltage between ground and the (S134) Left Rear Damper Valve (+) circuit.

      Is there any voltage present?

      Yes

      - Repair the (S134) Left Rear Damper Valve (+) circuit for a short battery.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the Engine.
   6. With the scan tool, read ADCM DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .

- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B8-13-LEFT REAR DAMPING VALVE LOW SIDE 1 - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

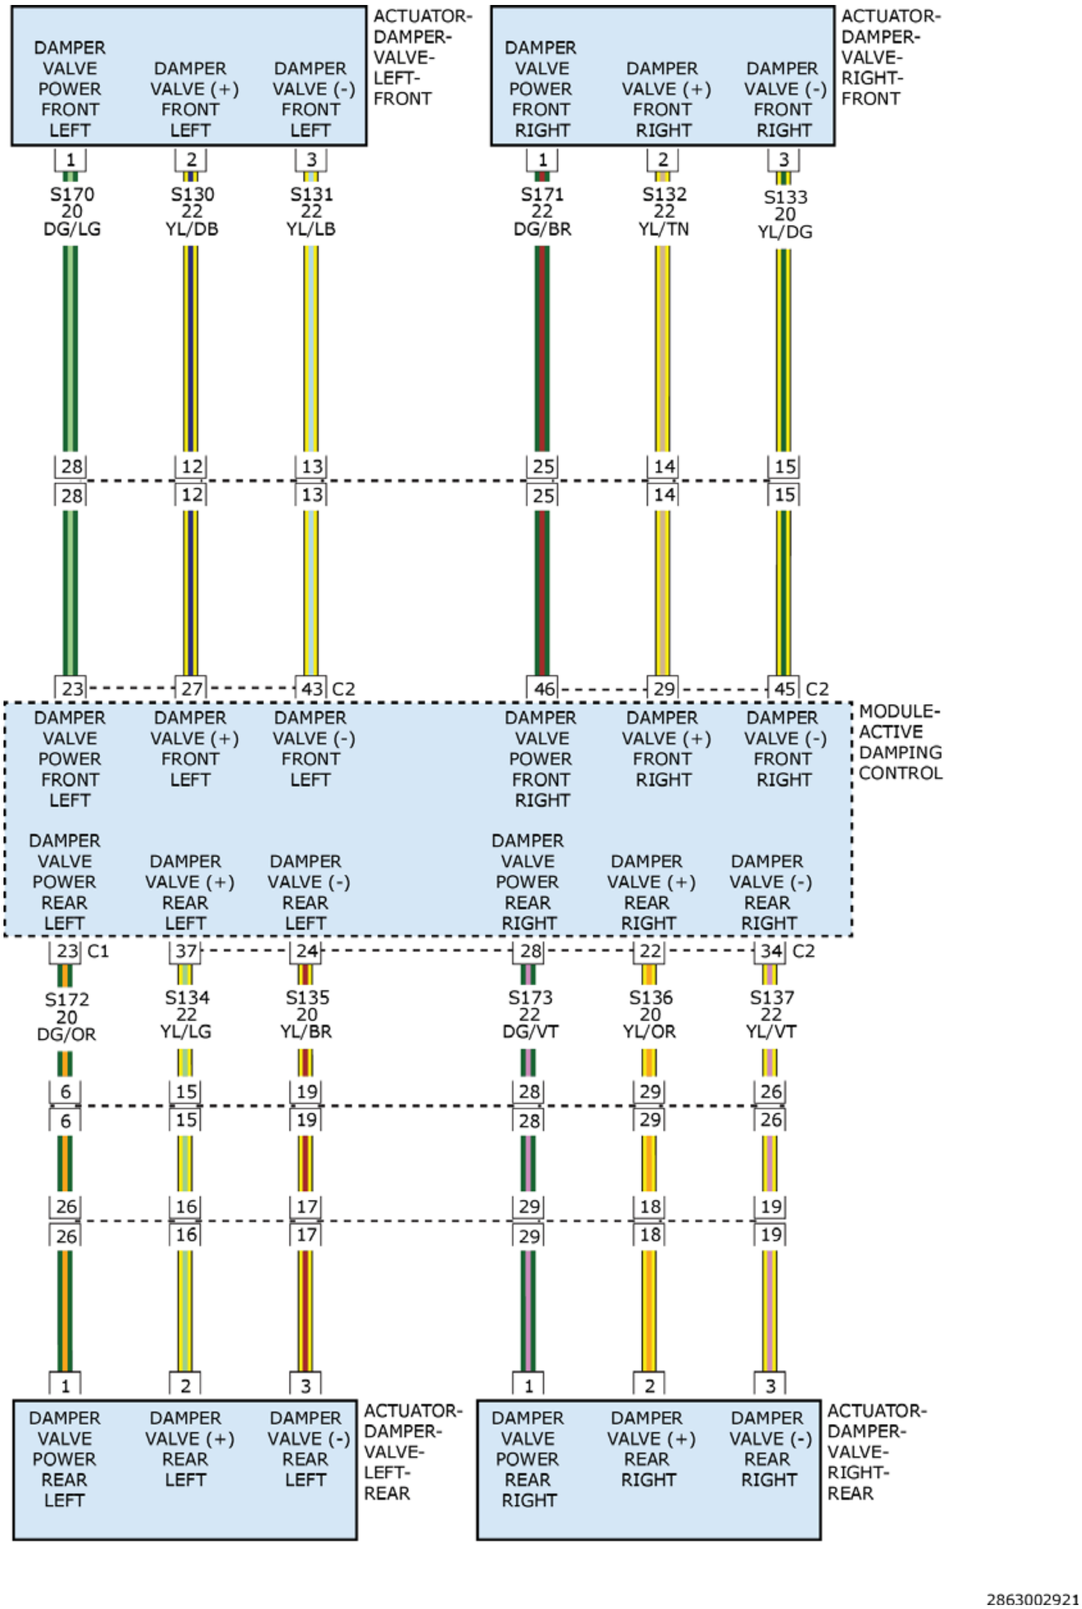

Fig. 23: Valve Damper Actuator Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects when the Left Rear Damping Valve circuit is open.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S134) LEFT REAR DAMPER VALVE (+) CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (S134) LEFT REAR DAMPER VALVE (+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Disconnect the Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Measure the resistance of the (S134) Left Rear Damper Valve (+) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (S134) Left Rear Damper Valve (+) circuit for an open or high resistance.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the Engine.
   6. With the scan tool, read ADCM DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B8-14-LEFT REAR DAMPING VALVE LOW SIDE 1 - CIRCUIT SHORT TO GROUND OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **If any other DTCs are present, repair them first before continuing with this diagnostic procedure.**

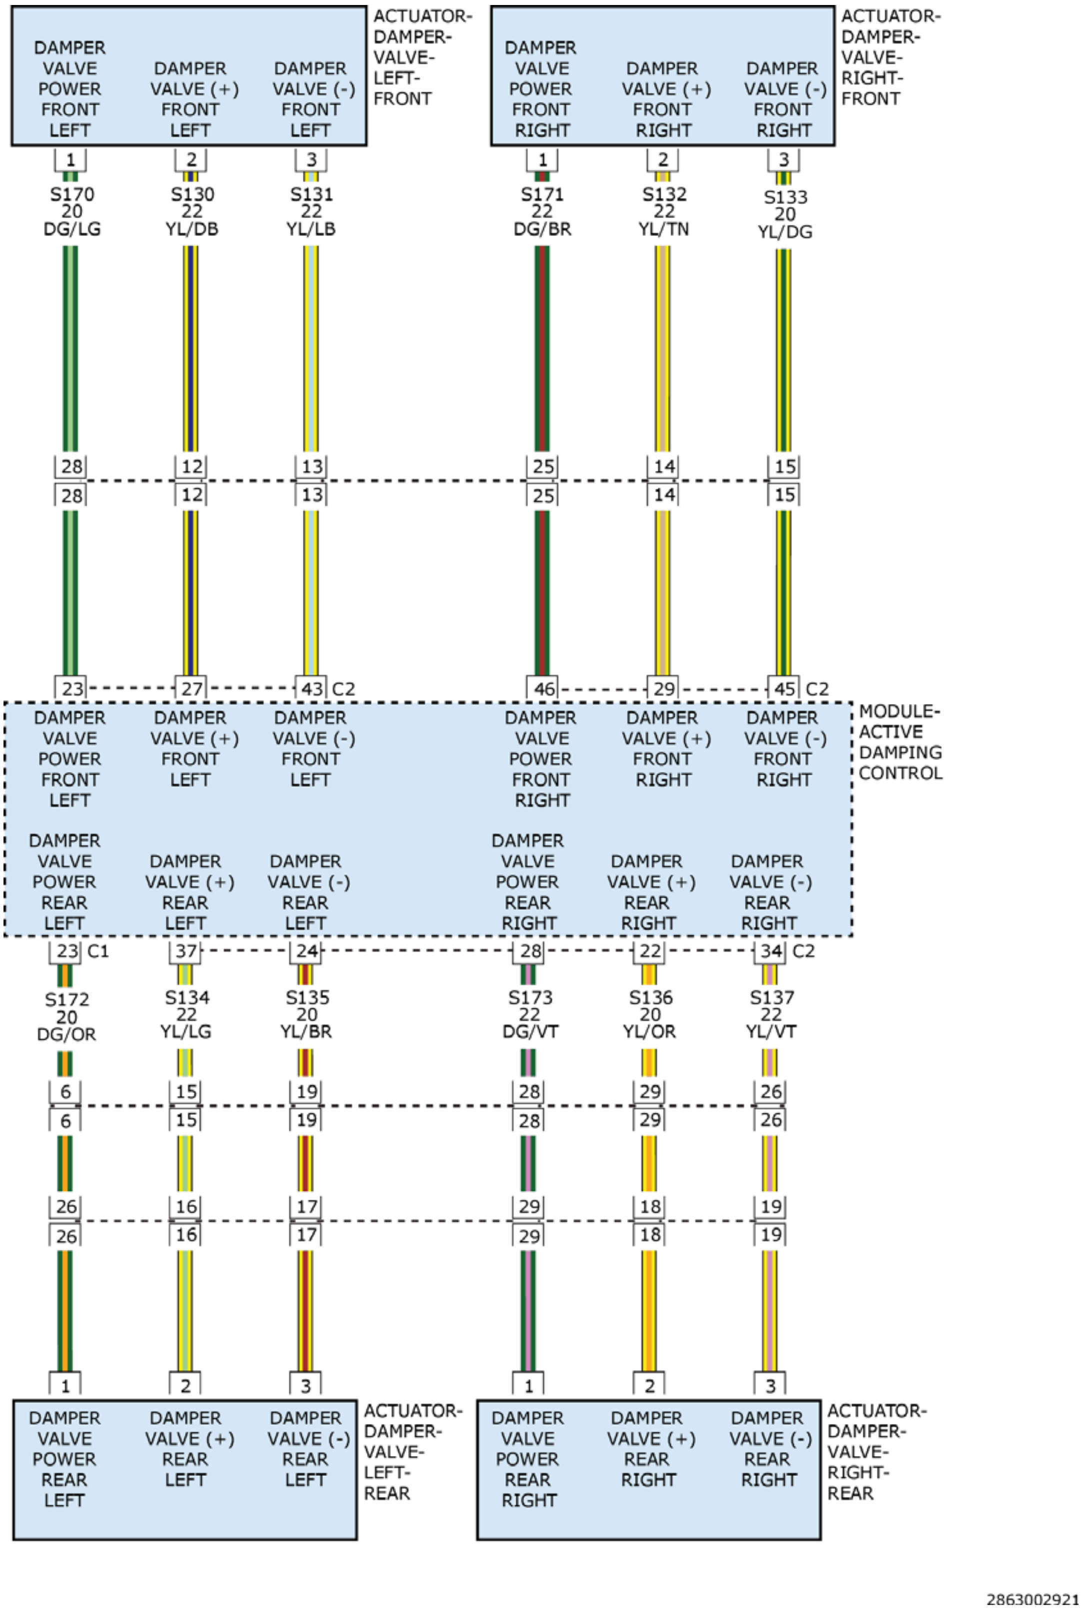

Fig. 24: Valve Damper Actuator Circuit Diagram

Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects when the Left Rear Damping Valve circuit is shorted to ground or open.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S134) LEFT REAR DAMPER VALVE (+) CIRCUIT SHORTED TO GROUND
(S134) LEFT REAR DAMPER VALVE (+) CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 6
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion,

corrosion, pushed out or bent terminals, and correct pin tension.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE (S134) LEFT FRONT DAMPER VALVE (+) CIRCUIT FOR A SHORT TO GROUND**
    1. Disconnect the Damping Valve Shock Assembly harness connector.
    2. Disconnect the ADCM C2 harness connector.
    3. Check for continuity between ground and the (S134) Left Rear Damper Valve (+) circuit at the ADCM C2 harness connector.

    Is there continuity between ground and the (S134) Left Rear Damper Valve (+) circuit?

    Yes

    - Repair the (S134) Left Rear Damper Valve (+) circuit for a short ground.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 4

4. **CHECK THE (S134) LEFT REAR DAMPER VALVE (+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Measure the resistance of the (S134) Left Rear Damper Valve (+) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the (S134) Left Rear Damper Valve (+) circuit for an open or high resistance.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 5

5. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
    1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. Turn the ignition on.
4. With the scan tool, erase the DTCs.
5. Start the Engine.
6. With the scan tool, read ADCM DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

6. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B9-11-LEFT REAR DAMPING VALVE LOW SIDE 2 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

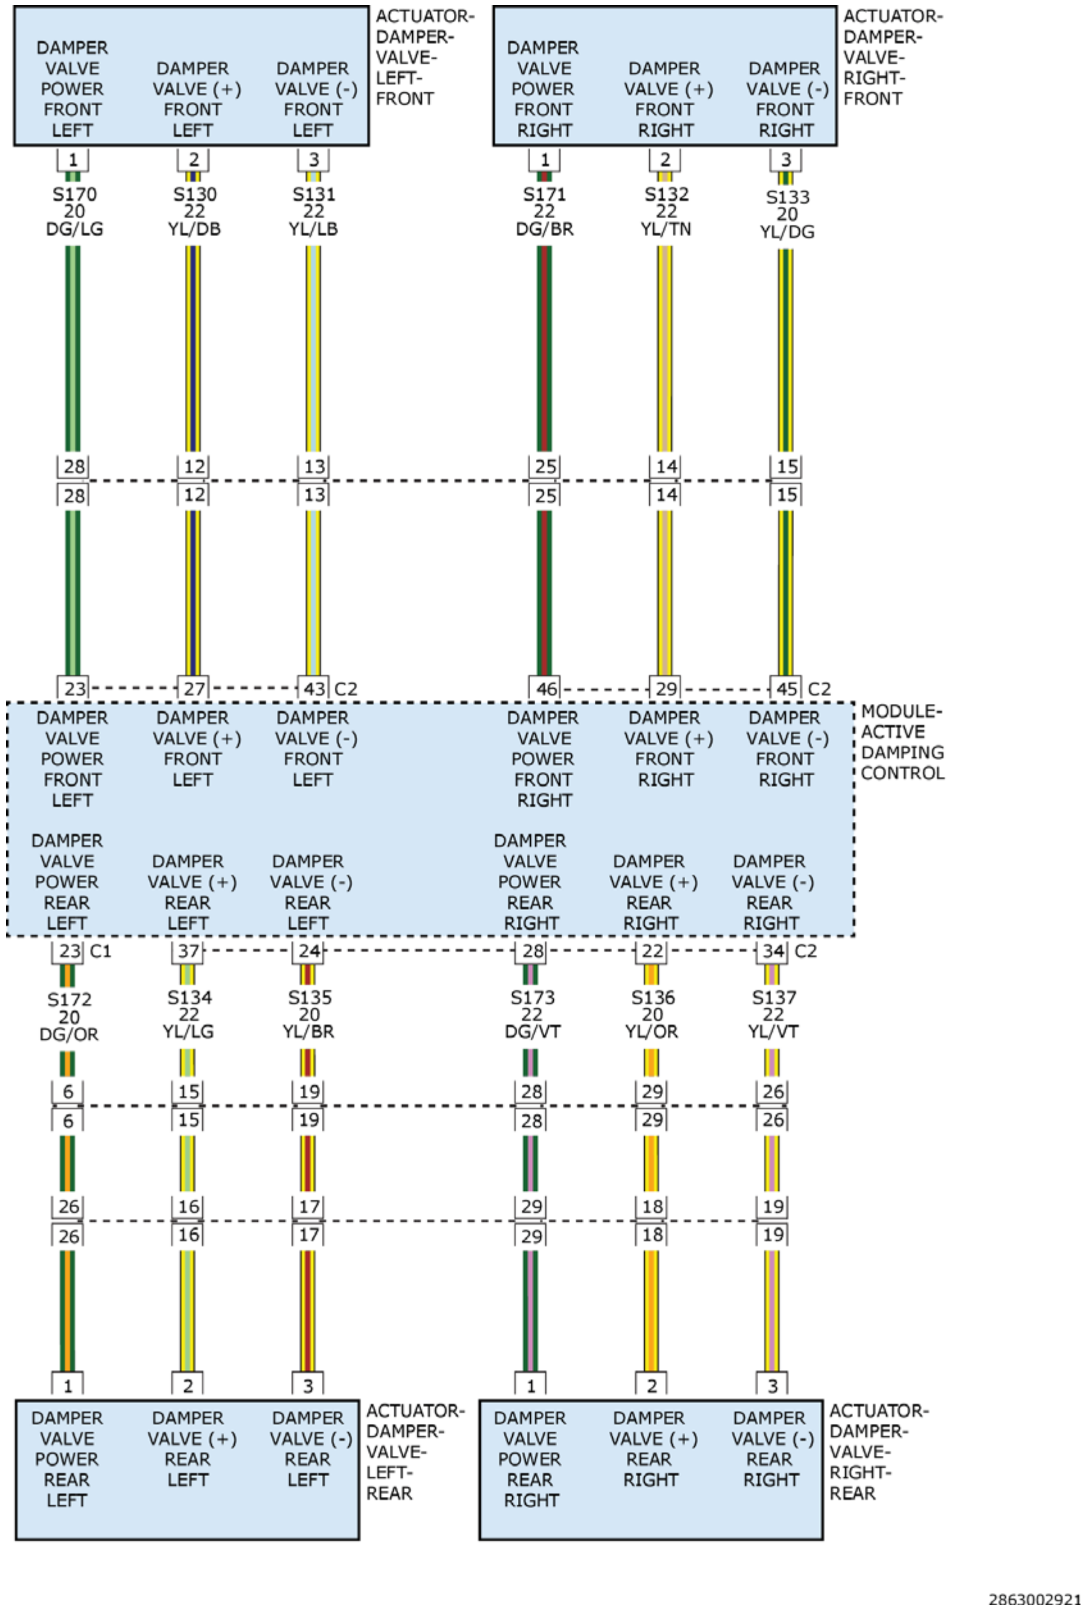

Fig. 25: Valve Damper Actuator Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects when the Left Rear Damping Valve circuit is shorted to ground.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S135) LEFT REAR DAMPER VALVE (-) CIRCUIT SHORTED TO GROUND
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE (S135) LEFT REAR DAMPER VALVE (-) CIRCUIT FOR A SHORT TO GROUND**
    1. Disconnect the Damping Valve Shock Assembly harness connector.
    2. Disconnect the ADCM C2 harness connector.
    3. Check for continuity between ground and the (S135) Left Rear Damper Valve (-) circuit at the ADCM C2 harness connector.

    Is there continuity between ground and the (S135) Left Rear Damper Valve (-) circuit?

    Yes

    - Repair the (S135) Left Rear Damper Valve (-) circuit for a short ground.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 4

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
    1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the Engine.
    6. With the scan tool, read ADCM DTCs.

    Does the DTC remain active?

    Yes

    - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**

1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
3. Look for the data to change or for the DTC to reset during the wiggle test.
4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
5. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B9-12-LEFT REAR DAMPING VALVE LOW SIDE 2 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

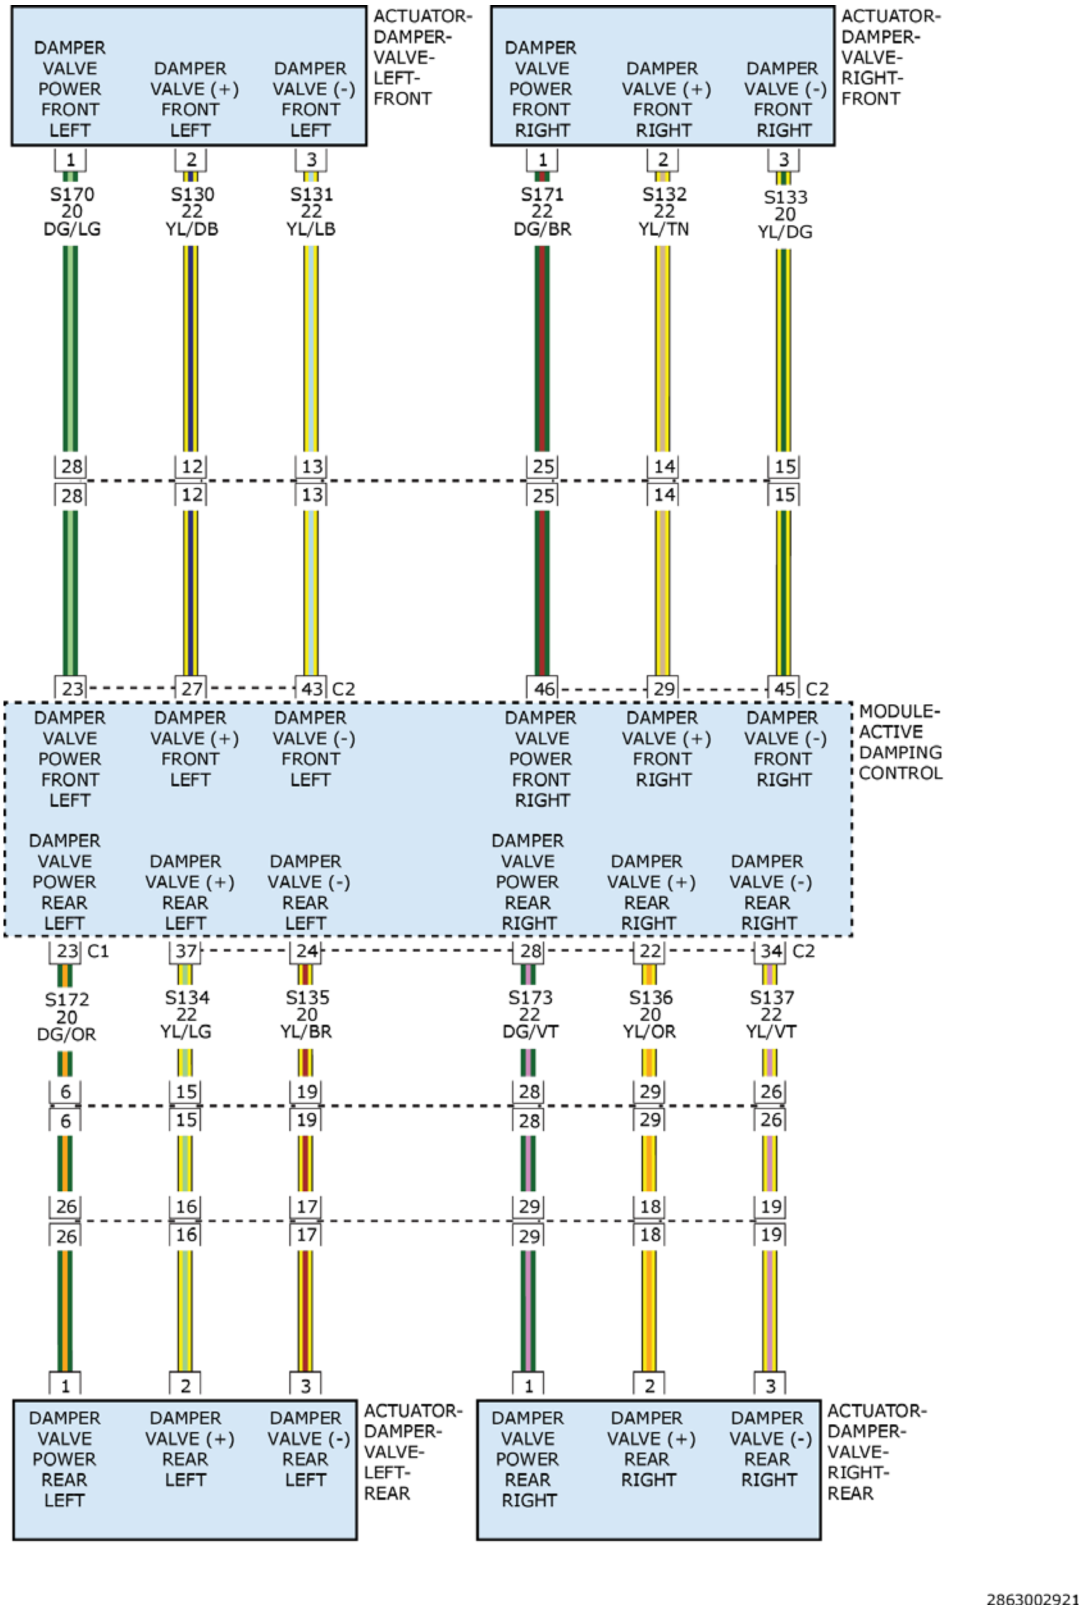

Fig. 26: Valve Damper Actuator Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects when the Left Rear Damping Valve circuit is shorted to battery voltage.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S135) LEFT REAR DAMPER VALVE (-) CIRCUIT SHORTED TO BATTERY
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE (S135) LEFT REAR DAMPER VALVE (-) CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition off.
   2. Disconnect the Damping Valve Shock Assembly harness connector.
   3. Disconnect the ADCM C2 harness connector.
   4. Turn the ignition on.
   5. Measure the voltage between ground and the (S135) Left Rear Damper Valve (-) circuit.

   Is there any voltage present?

   Yes

   - Repair the (S135) Left Rear Damper Valve (-) circuit for a short battery.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4
4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the Engine.
   6. With the scan tool, read ADCM DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B9-13-LEFT REAR DAMPING VALVE LOW SIDE 2 - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

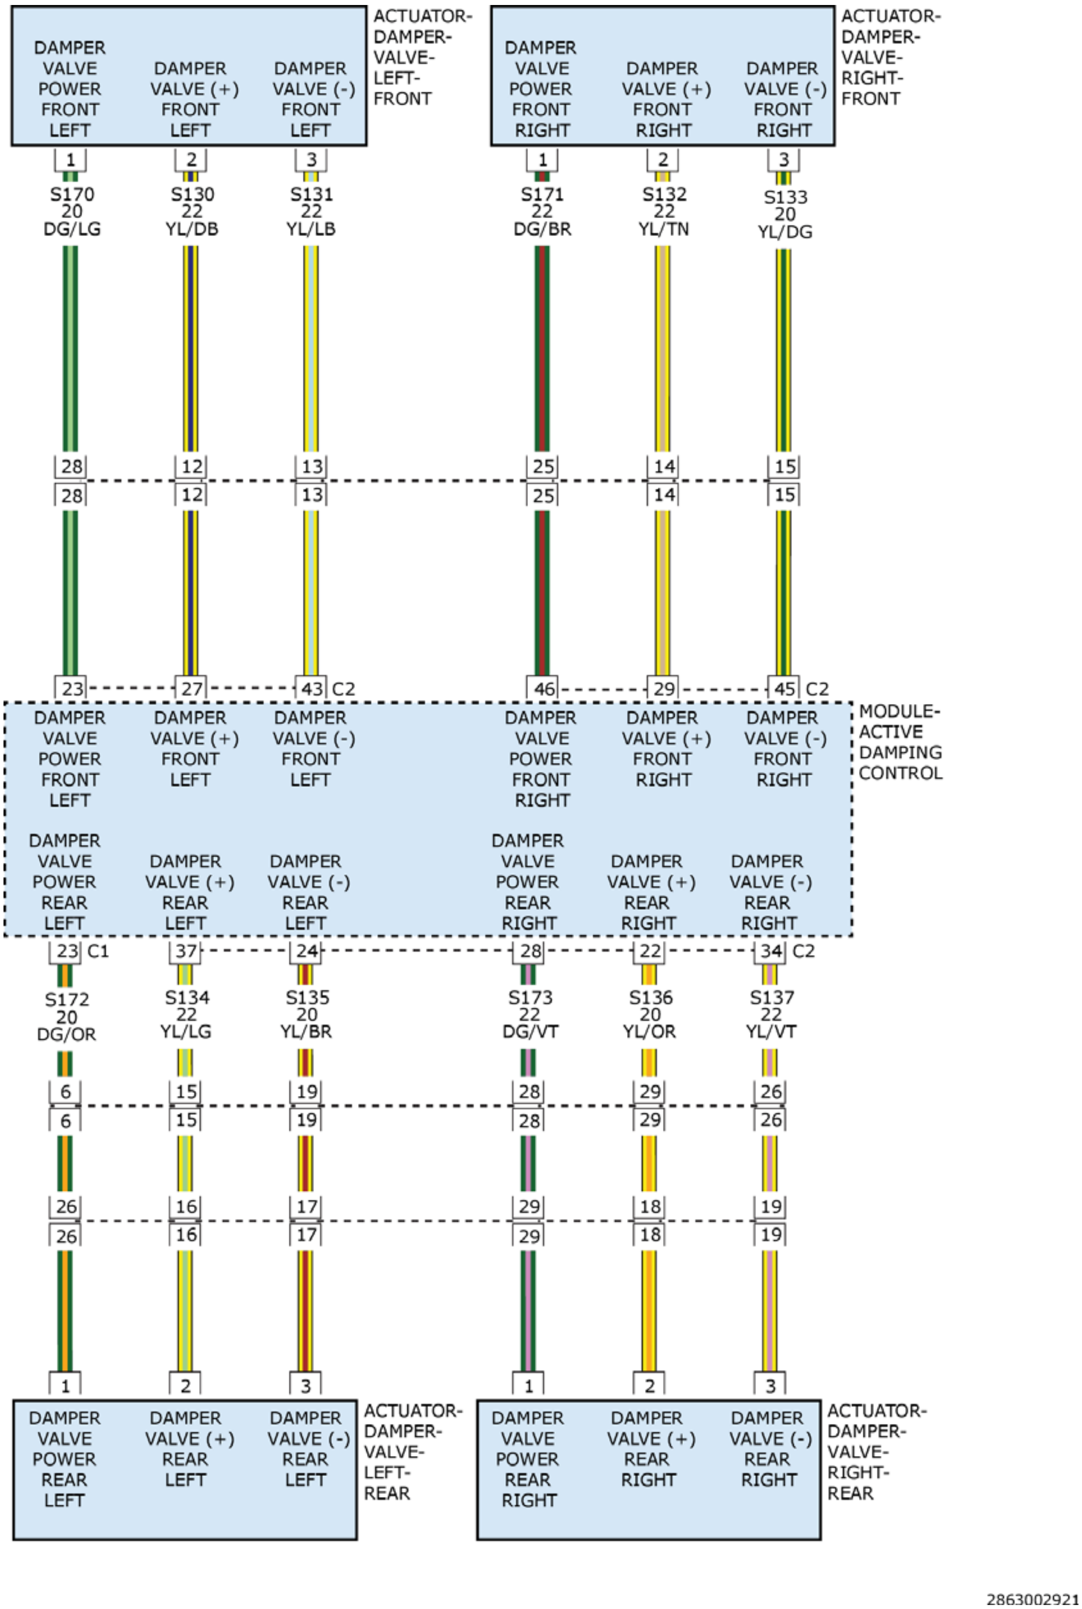

Fig. 27: Valve Damper Actuator Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects when the Left Rear Damping Valve circuit is open.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S135) LEFT REAR DAMPER VALVE (-) CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE (S135) LEFT REAR DAMPER VALVE (-) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Disconnect the Damping Valve Shock Assembly harness connector.
    2. Disconnect the ADCM C2 harness connector.
    3. Measure the resistance of the (S135) Left Rear Damper Valve (-) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the (S135) Left Rear Damper Valve (-) circuit for an open or high resistance.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 4

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
    1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the Engine.
    6. With the scan tool, read ADCM DTCs.

    Does the DTC remain active?

    Yes

    - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15B9-18-LEFT REAR DAMPING VALVE LOW SIDE 2 - UNDER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE:	**If any other DTCs are present, repair them first before continuing with this diagnostic procedure.**

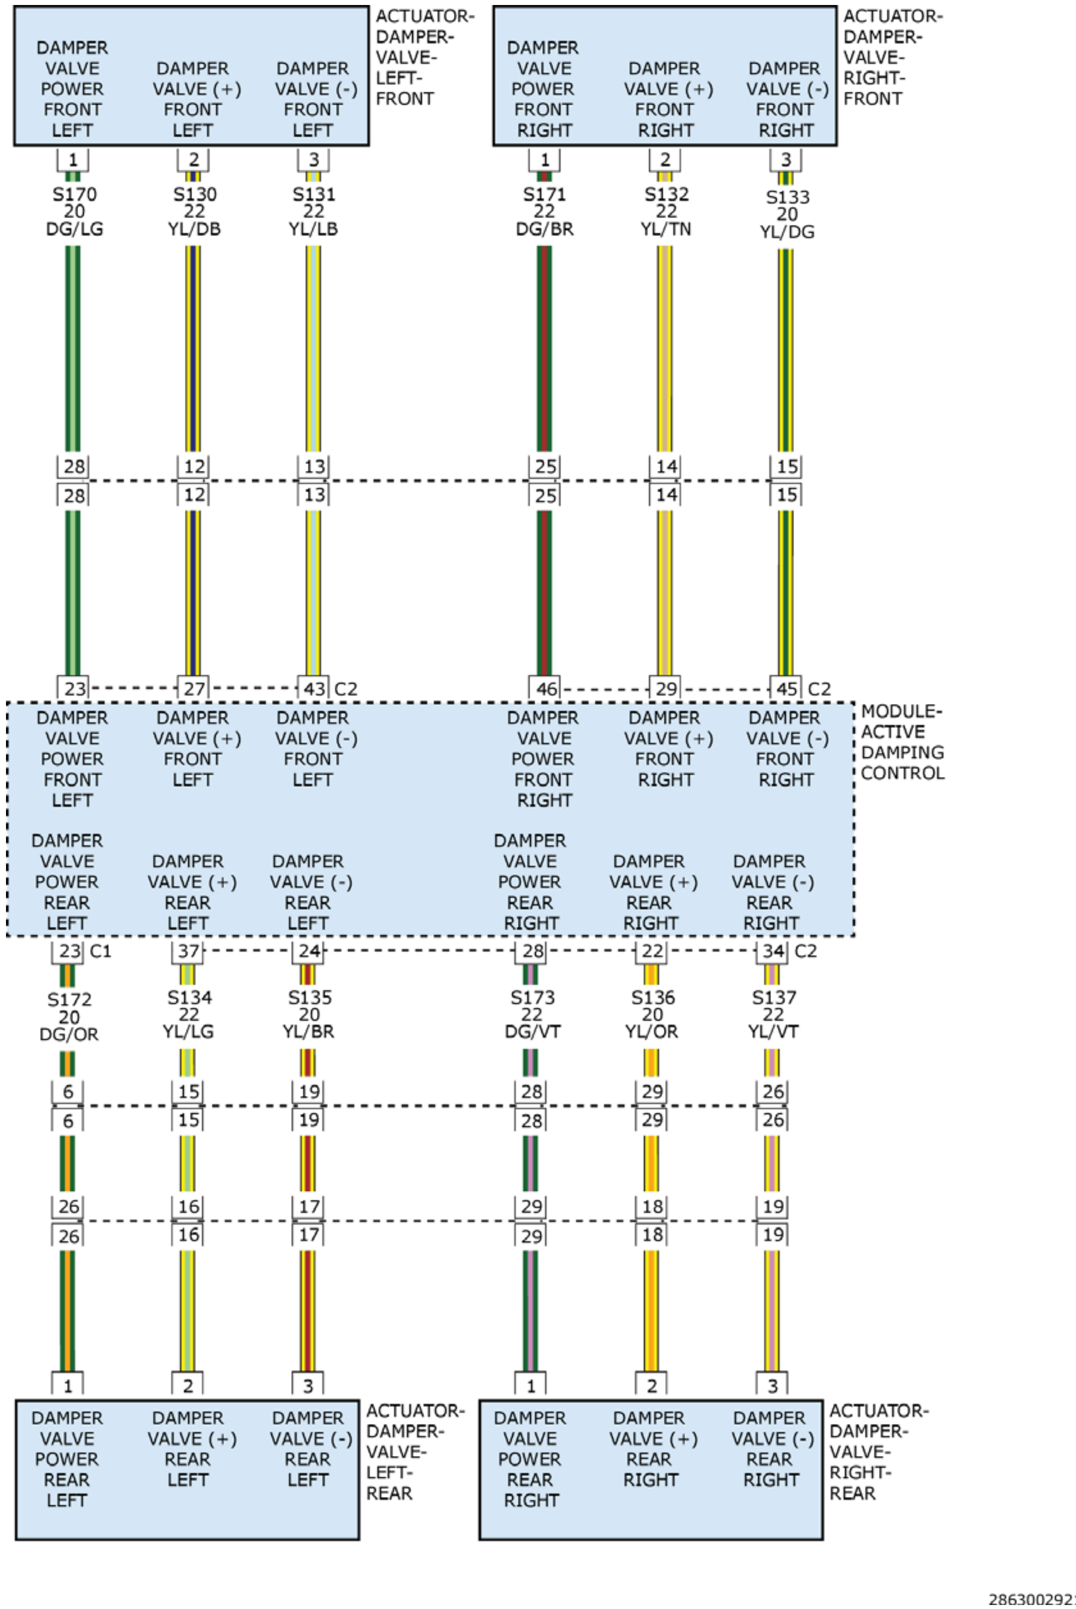

Fig. 28: Valve Damper Actuator Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects the Left Rear Damping Valve Solenoid Low Side 2 (rebound stage) is overcurrent caused by an internal failure in the Damping Valve Shock Assembly.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR
(S135) LEFT REAR DAMPER VALVE (-) CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, read ADCM DTCs and record on the repair order.
   3. With the scan tool, erase DTCs.
   4. Start the Engine.
   5. With the scan tool, read ADCM DTCs.

   Is the DTC active?

   Yes

   - Go To 2

   No

   - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

   NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

   1. Turn the ignition off.
   2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE (S135) LEFT REAR DAMPER VALVE (-) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Disconnect the Left Rear Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Measure the resistance of the (S135) Left Rear Damper Valve (-) circuit between the Left Rear Damping Valve Shock Assembly harness connector and the ADCM C2 harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (S135) Left Rear Damper Valve (-) circuit for an open or high resistance.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the Engine.
   6. With the scan tool, read ADCM DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15BA-11-RIGHT REAR DAMPING VALVE LOW SIDE 1 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

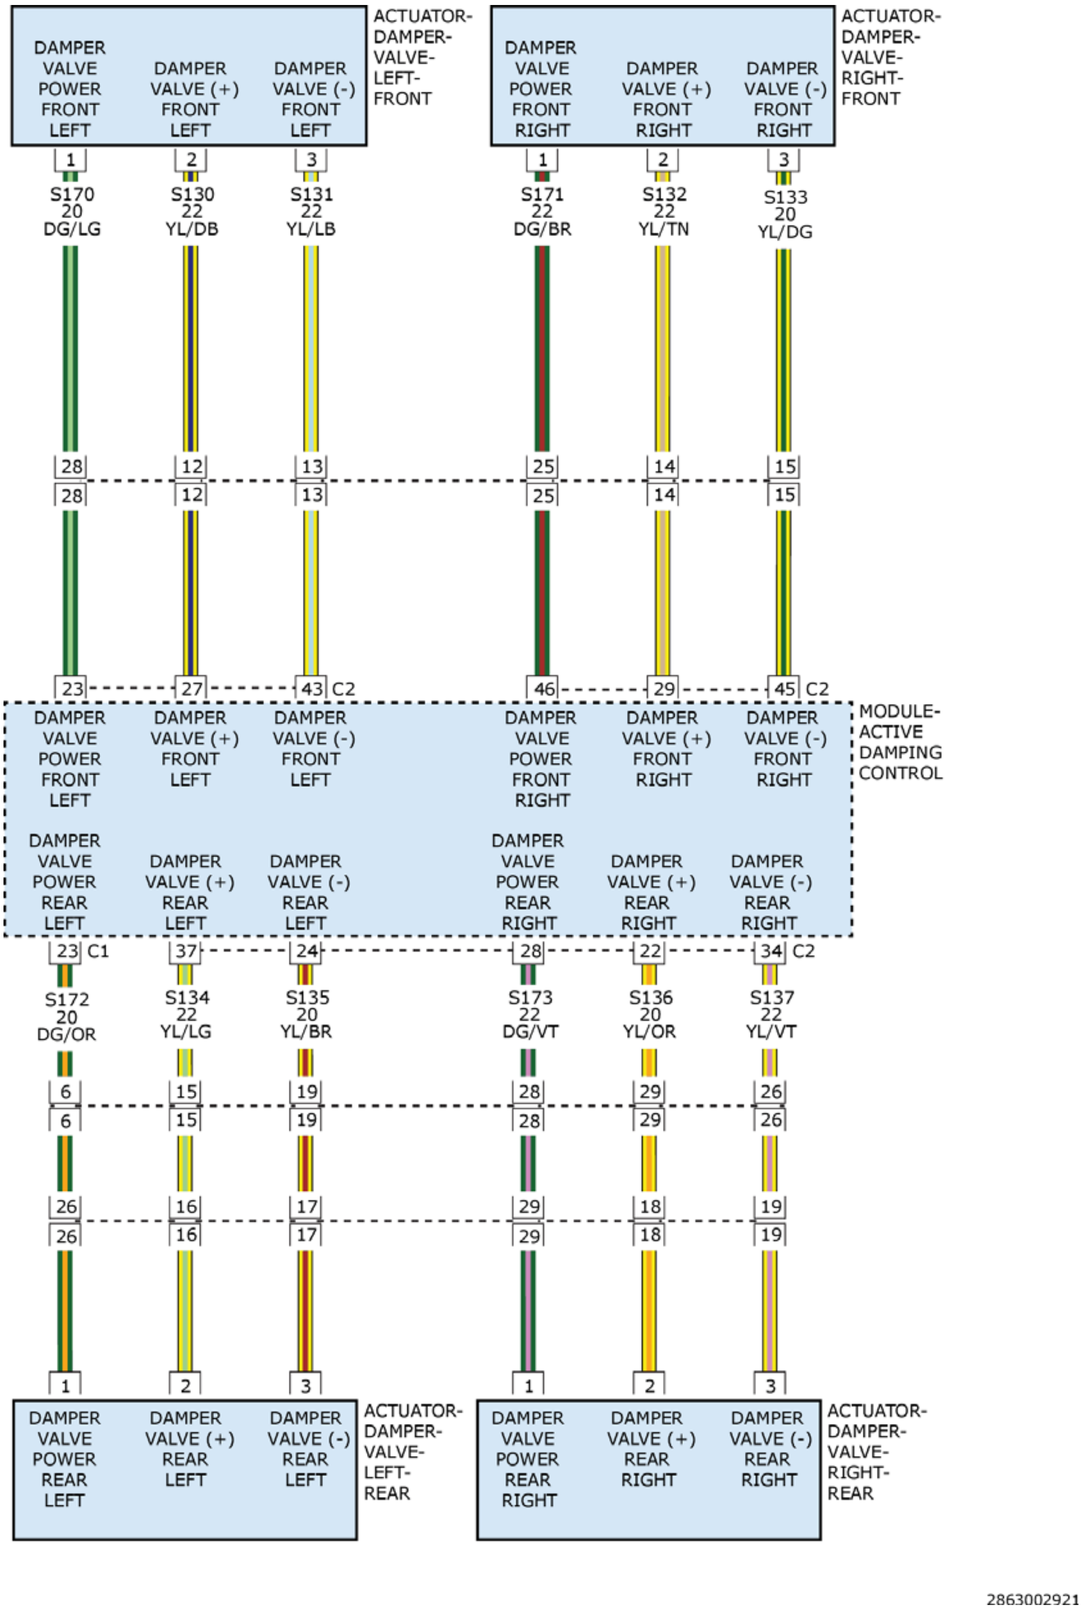

Fig. 29: Valve Damper Actuator Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects when the Right Rear Damping Valve circuit is shorted to ground.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S136) RIGHT REAR DAMPER VALVE (+) CIRCUIT SHORTED TO GROUND
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE (S136) RIGHT REAR DAMPER VALVE (+) CIRCUIT FOR A SHORT TO GROUND**
    1. Disconnect the Damping Valve Shock Assembly harness connector.
    2. Disconnect the ADCM C2 harness connector.
    3. Check for continuity between ground and the (S136) Right Rear Damper Valve (+) circuit at the ADCM C2 harness connector.

    Is there continuity between ground and the (S136) Right Rear Damper Valve (+) circuit?

    Yes

    - Repair the (S136) Right Rear Damper Valve (+) circuit for a short ground.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 4

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
    1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the Engine.
    6. With the scan tool, read ADCM DTCs.

    Does the DTC remain active?

    Yes

    - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15BA-12-RIGHT REAR DAMPING VALVE LOW SIDE 1 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

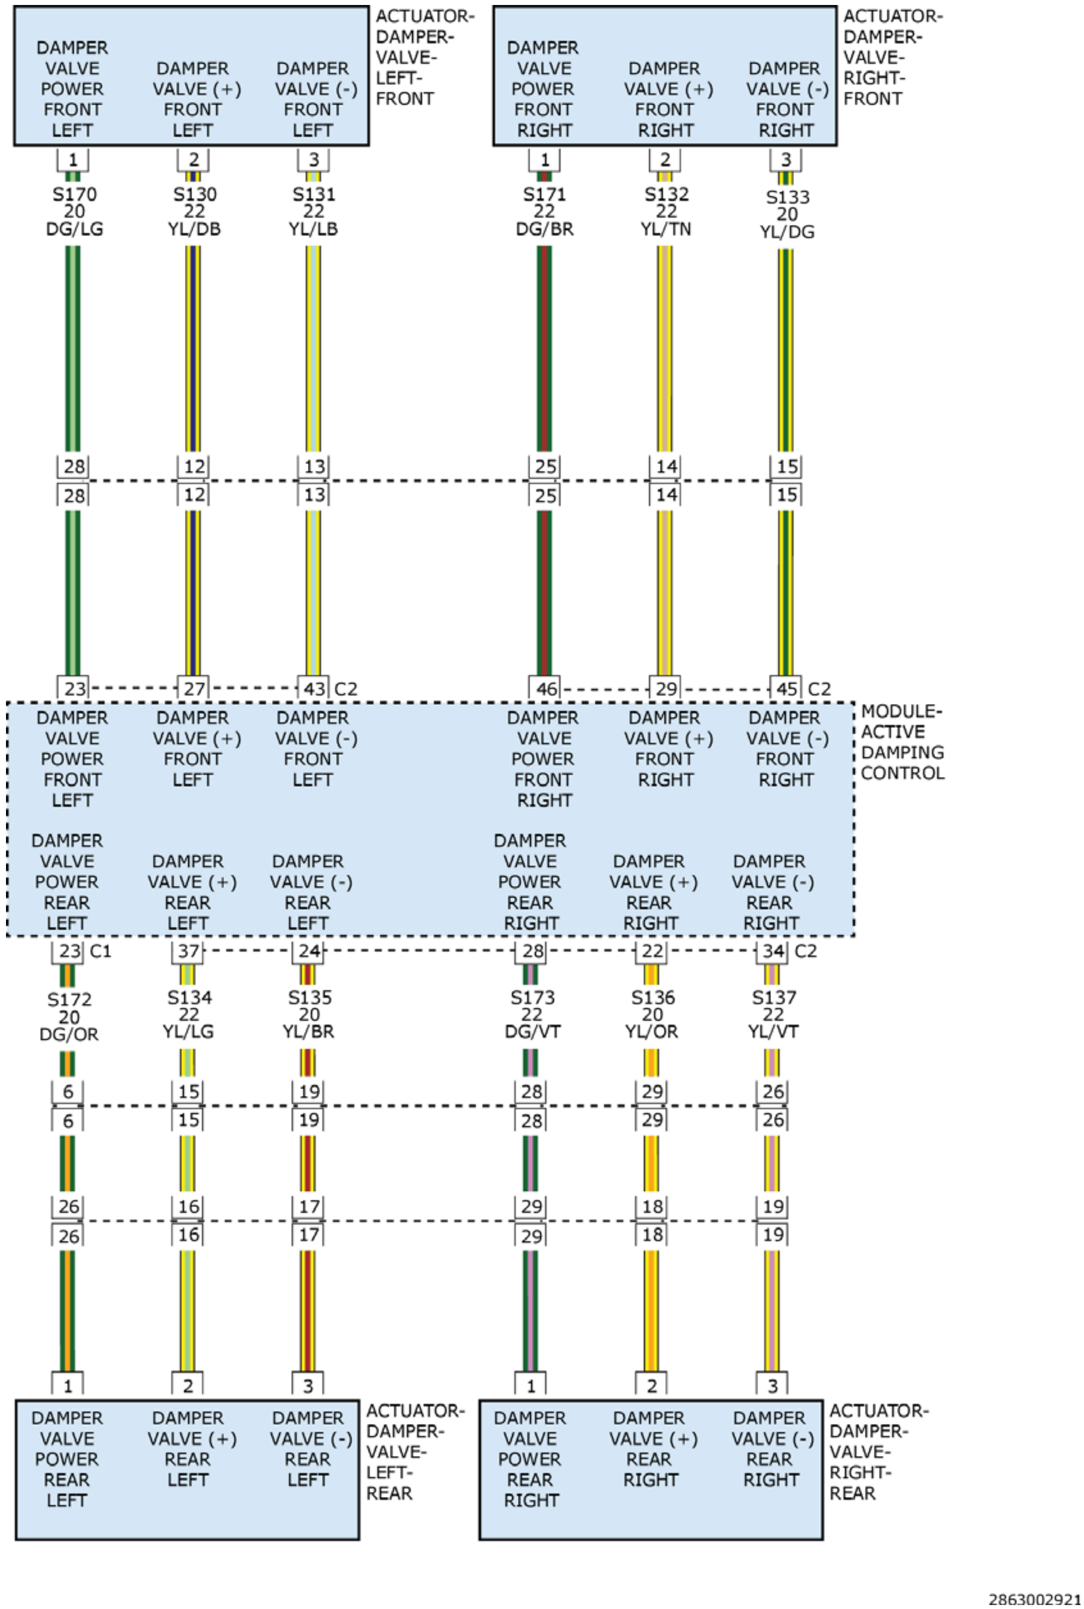

Fig. 30: Valve Damper Actuator Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects when the Right Rear Damping Valve circuit is shorted to battery voltage.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S136) RIGHT REAR DAMPER VALVE (+) CIRCUIT SHORTED TO BATTERY
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE (S136) RIGHT REAR DAMPER VALVE (+) CIRCUIT FOR A SHORT TO BATTERY**
    1. Turn the ignition off.
    2. Disconnect the Damping Valve Shock Assembly harness connector.
    3. Disconnect the ADCM C2 harness connector.
    4. Turn the ignition on.
    5. Measure the voltage between ground and the (S136) Right Rear Damper Valve (+) circuit.

    Is there any voltage present?

    Yes

    - Repair the (S136) Right Rear Damper Valve (+) circuit for a short battery.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 4

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
    1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the Engine.
    6. With the scan tool, read ADCM DTCs.

    Does the DTC remain active?

    Yes

    - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15BA-13-RIGHT REAR DAMPING VALVE LOW SIDE 1 - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

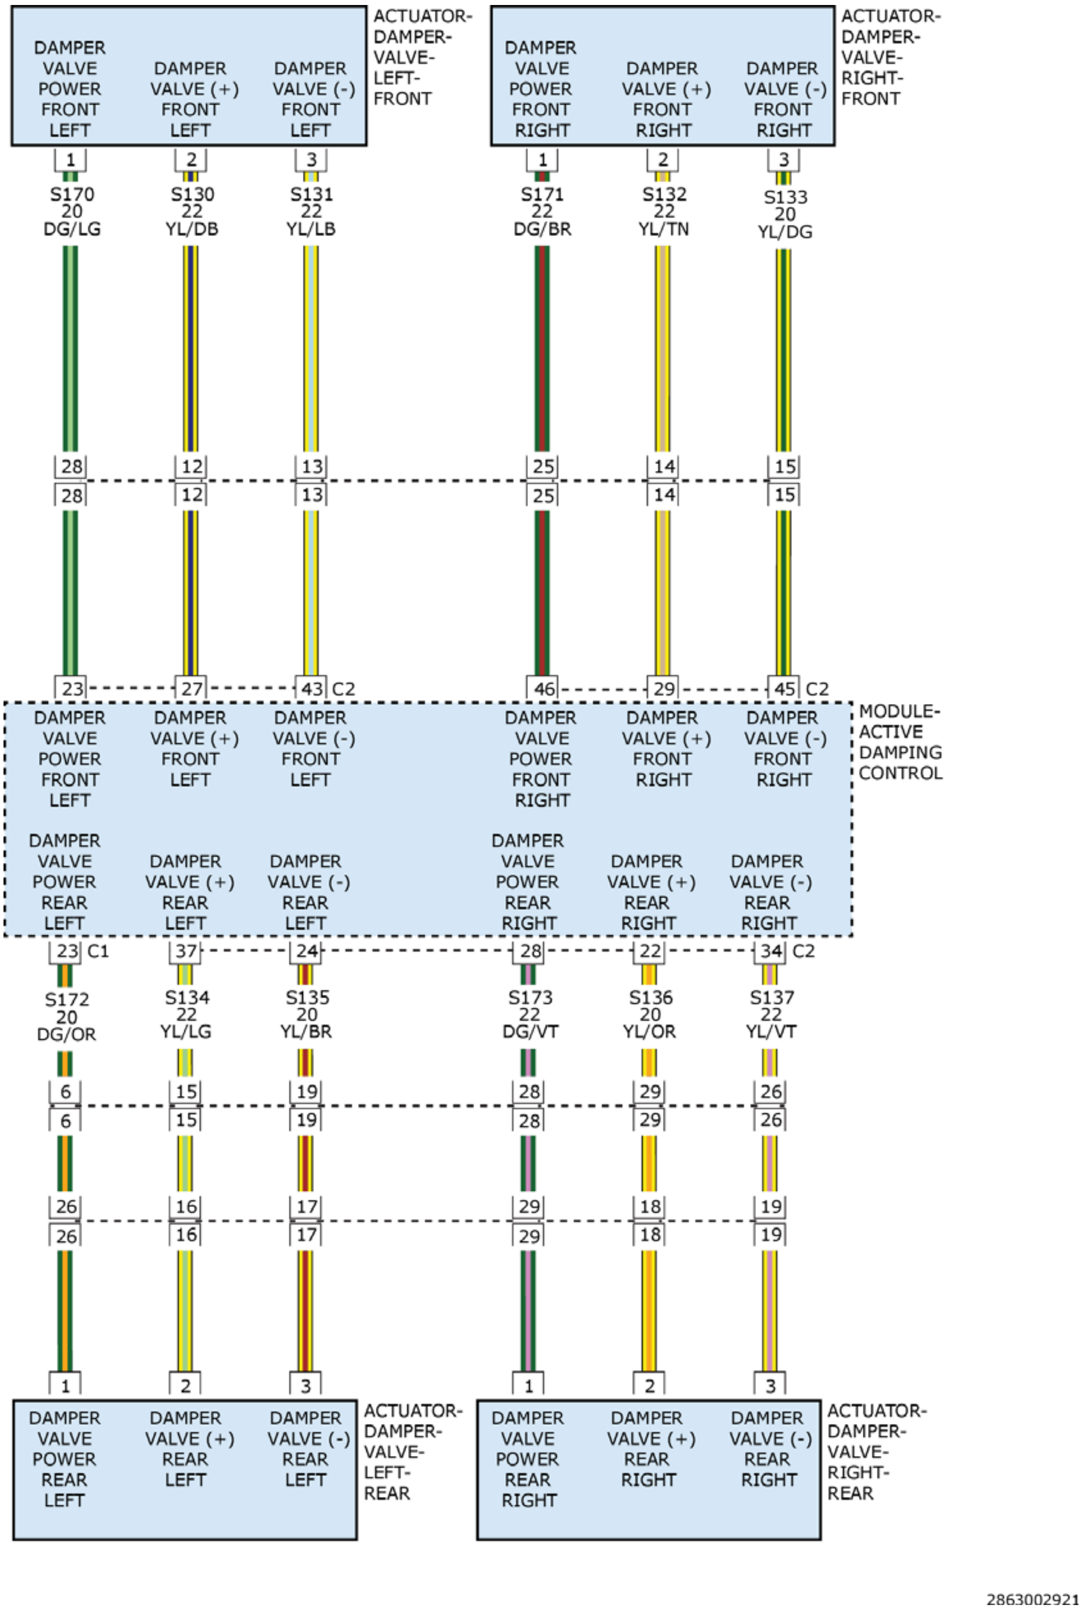

Fig. 31: Valve Damper Actuator Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects when the Right Rear Damping Valve circuit is open.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S136) RIGHT REAR DAMPER VALVE (+) CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE (S136) RIGHT REAR DAMPER VALVE (+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Disconnect the Damping Valve Shock Assembly harness connector.
    2. Disconnect the ADCM C2 harness connector.
    3. Measure the resistance of the (S136) Right Rear Damper Valve (+) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the (S136) Right Rear Damper Valve (+) circuit for an open or high resistance.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 4

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
    1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the Engine.
    6. With the scan tool, read ADCM DTCs.

    Does the DTC remain active?

    Yes

    - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15BA-1C-RIGHT REAR DAMPING VALVE LOW SIDE 1 - CIRCUIT VOLTAGE OUT OF RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

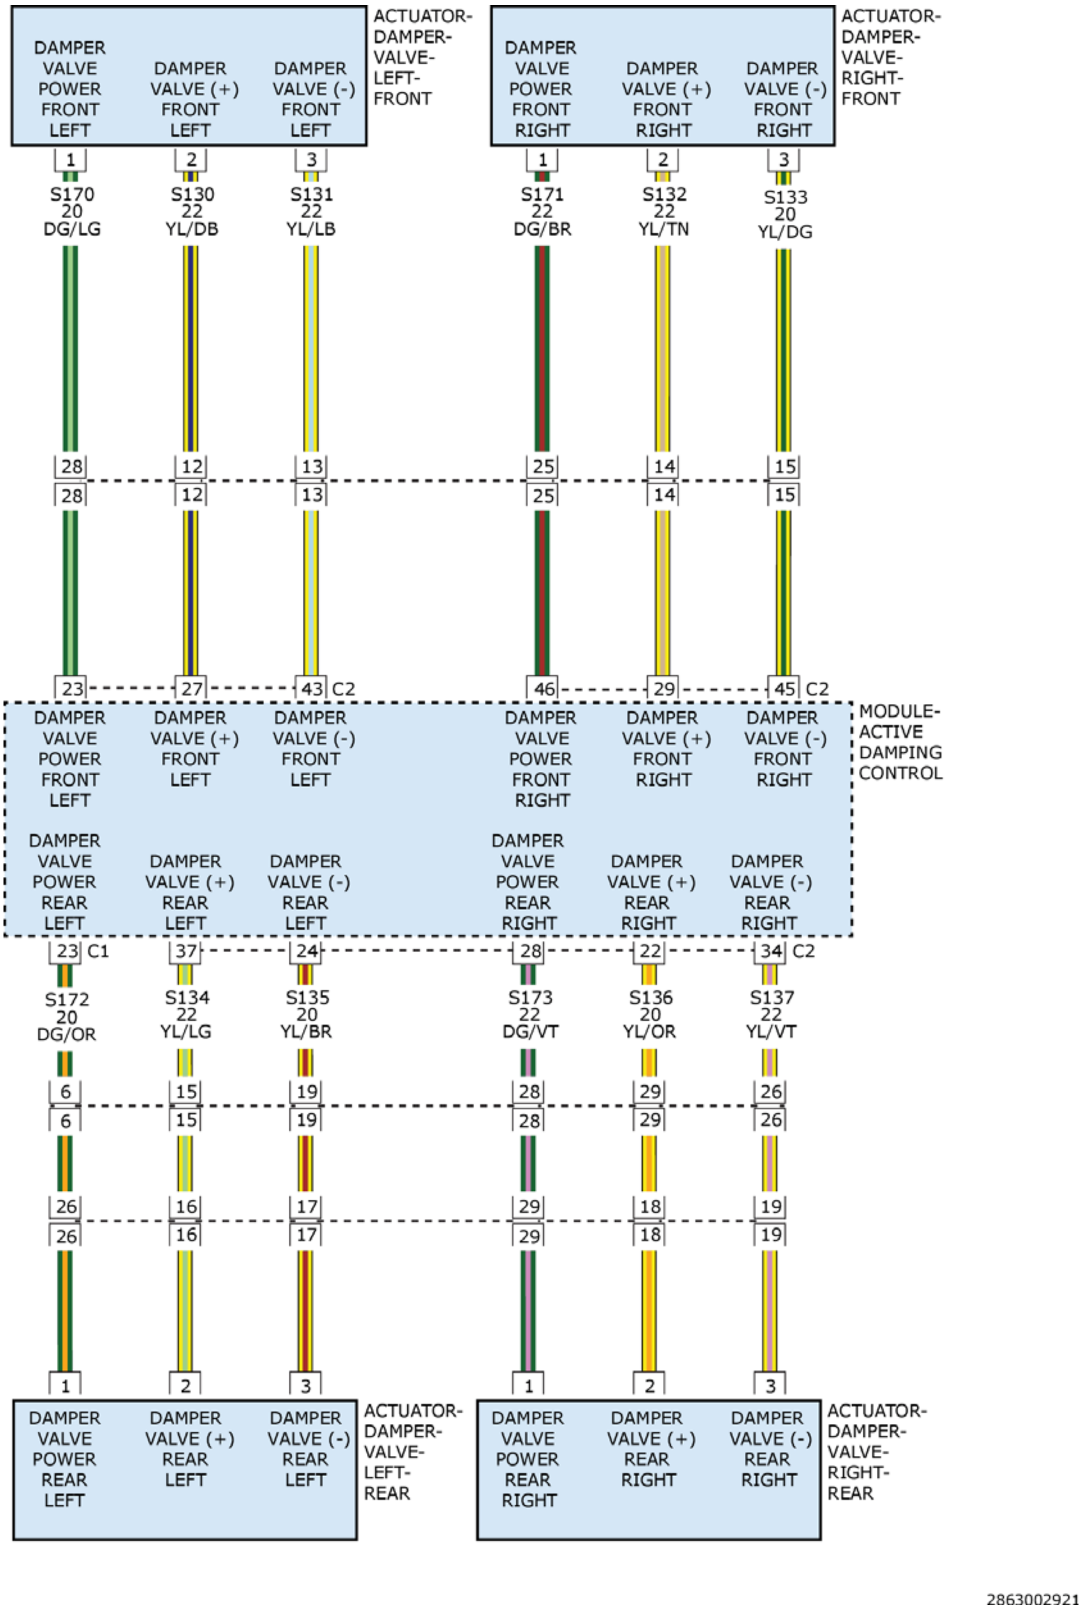

Fig. 32: Valve Damper Actuator Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects when the Right Rear Damper Valve voltage is out of range.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S136) RIGHT REAR DAMPER VALVE (+) CIRCUIT SHORTED TO BATTERY
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE (S136) RIGHT REAR DAMPER VALVE (+) CIRCUIT FOR A SHORT TO BATTERY**
    1. Turn the ignition off.
    2. Disconnect the Damping Valve Shock Assembly harness connector.
    3. Disconnect the ADCM C2 harness connector.
    4. Turn the ignition on.
    5. Measure the voltage between ground and the (S136) Right Rear Damper Valve (+) circuit.

    Is there any voltage present?

    Yes

    - Repair the (S136) Right Rear Damper Valve (+) circuit for a short battery.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 4

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
    1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the Engine.
    6. With the scan tool, read ADCM DTCs.

    Does the DTC remain active?

    Yes

    - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15BB-11-RIGHT REAR DAMPING VALVE LOW SIDE 2-CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

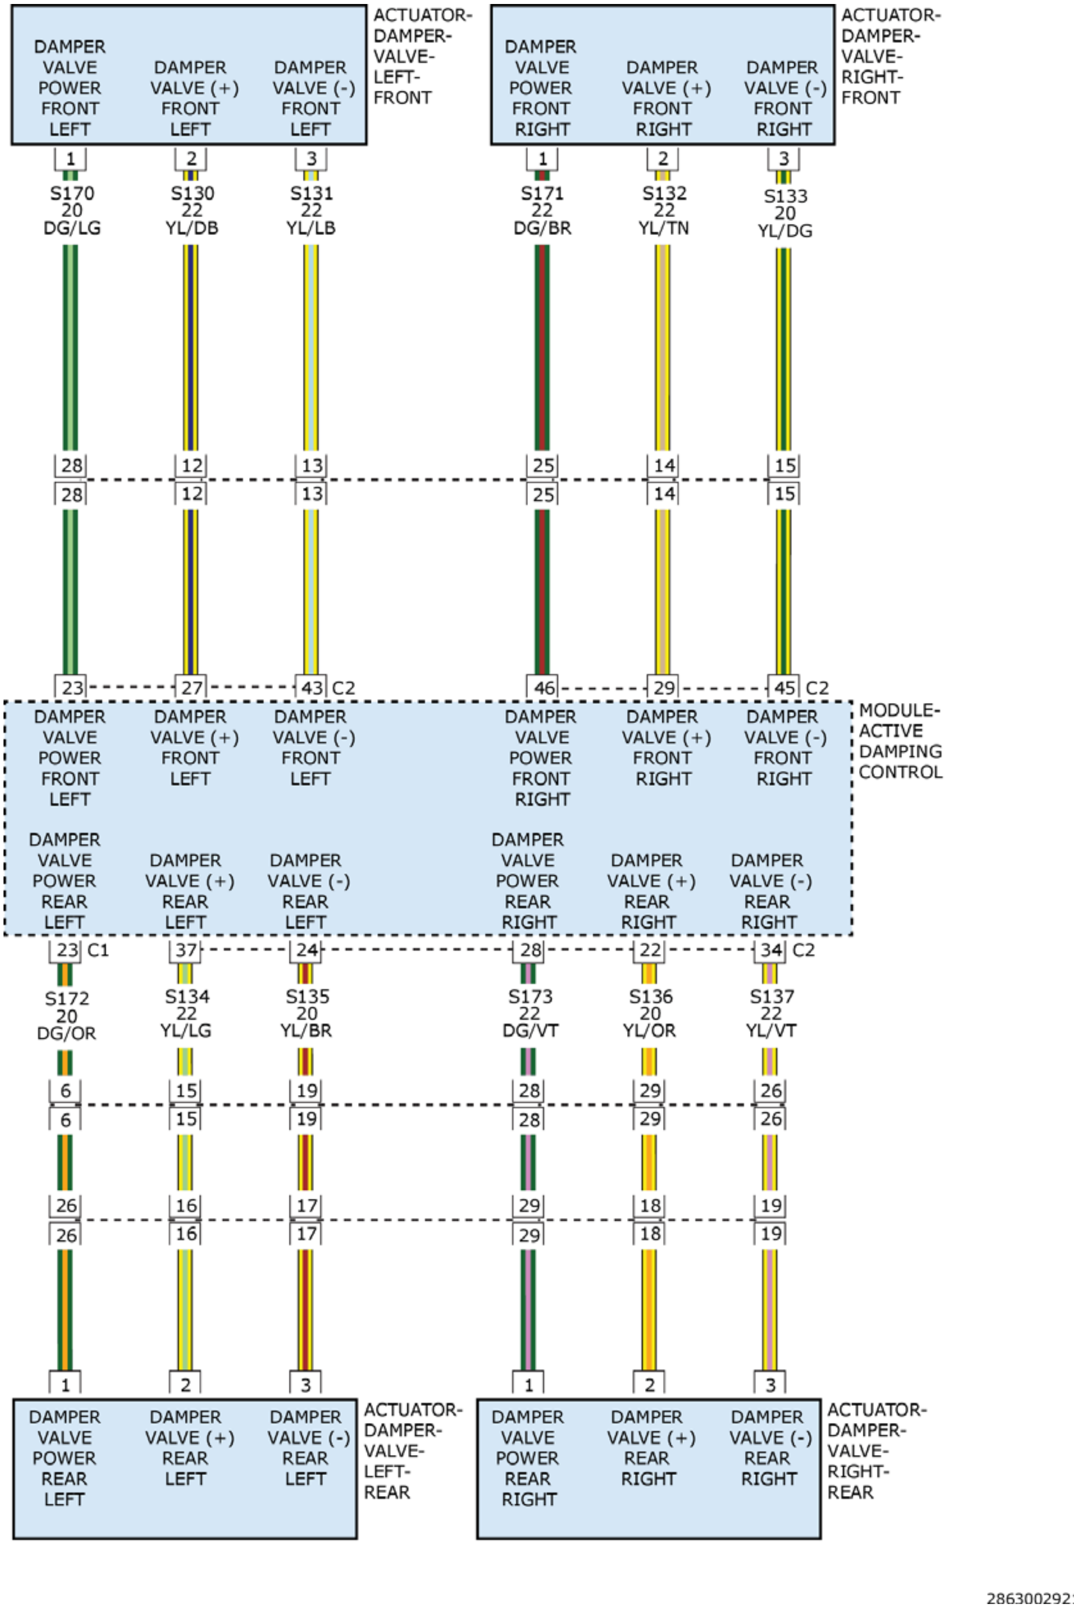

Fig. 33: Valve Damper Actuator Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects when the Right rear Damping Valve circuit is shorted to ground.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S137) RIGHT REAR DAMPER VALVE (-) CIRCUIT SHORTED TO GROUND
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE (S137) RIGHT REAR DAMPER VALVE (-) CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Check for continuity between ground and the (S137) Right Rear Damper Valve (-) circuit at the ADCM C2 harness connector.

   Is there continuity between ground and the (S137) Right Rear Damper Valve (-) circuit?

   Yes

   - Repair the (S137) Right Rear Damper Valve (-) circuit for a short ground.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
   1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the Engine.
   6. With the scan tool, read ADCM DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15BB-12-RIGHT REAR DAMPING VALVE LOW SIDE 2-CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

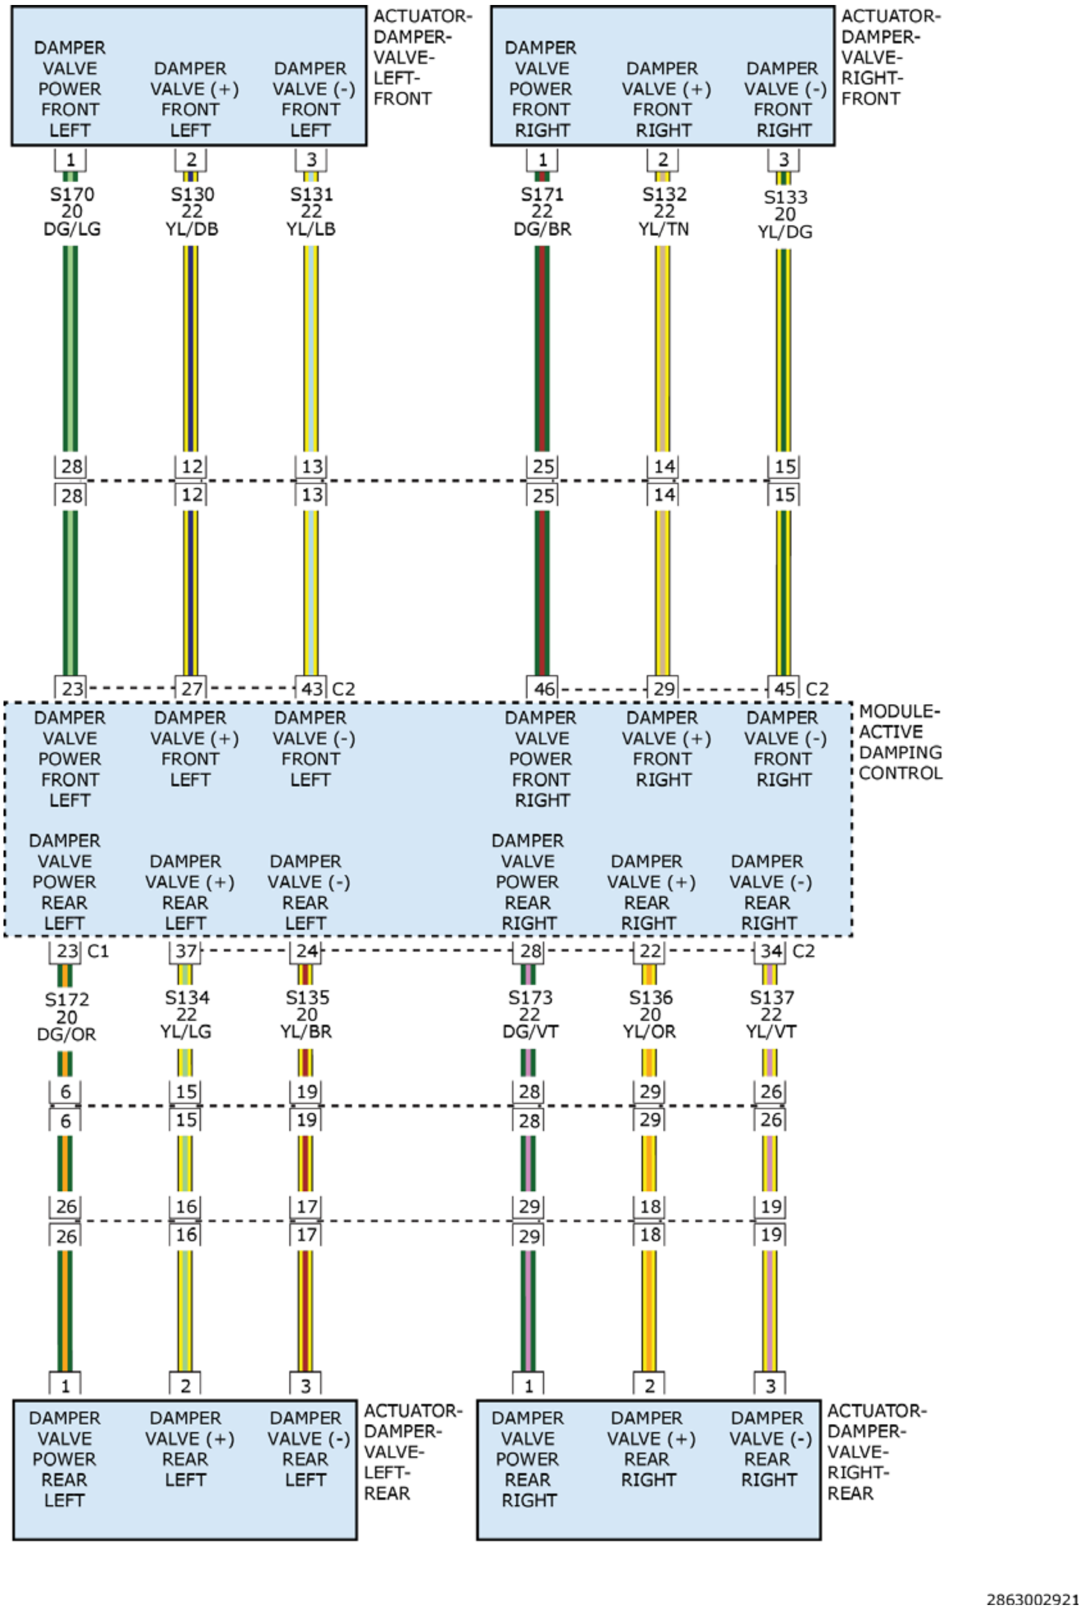

Fig. 34: Valve Damper Actuator Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects when the Right Rear Damping Valve circuit is shorted to battery voltage.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S137) RIGHT REAR DAMPER VALVE (-) CIRCUIT SHORTED TO BATTERY
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE (S137) RIGHT REAR DAMPER VALVE (-) CIRCUIT FOR A SHORT TO BATTERY**
    1. Turn the ignition off.
    2. Disconnect the Damping Valve Shock Assembly harness connector.
    3. Disconnect the ADCM C2 harness connector.
    4. Turn the ignition on.
    5. Measure the voltage between ground and the (S137) Right Rear Damper Valve (-) circuit.

    Is there any voltage present?

    Yes

    - Repair the (S137) Right Rear Damper Valve (-) circuit for a short battery.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 4
4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
    1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the Engine.
    6. With the scan tool, read ADCM DTCs.

    Does the DTC remain active?

    Yes

    - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15BB-13-RIGHT REAR DAMPING VALVE LOW SIDE 2-CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

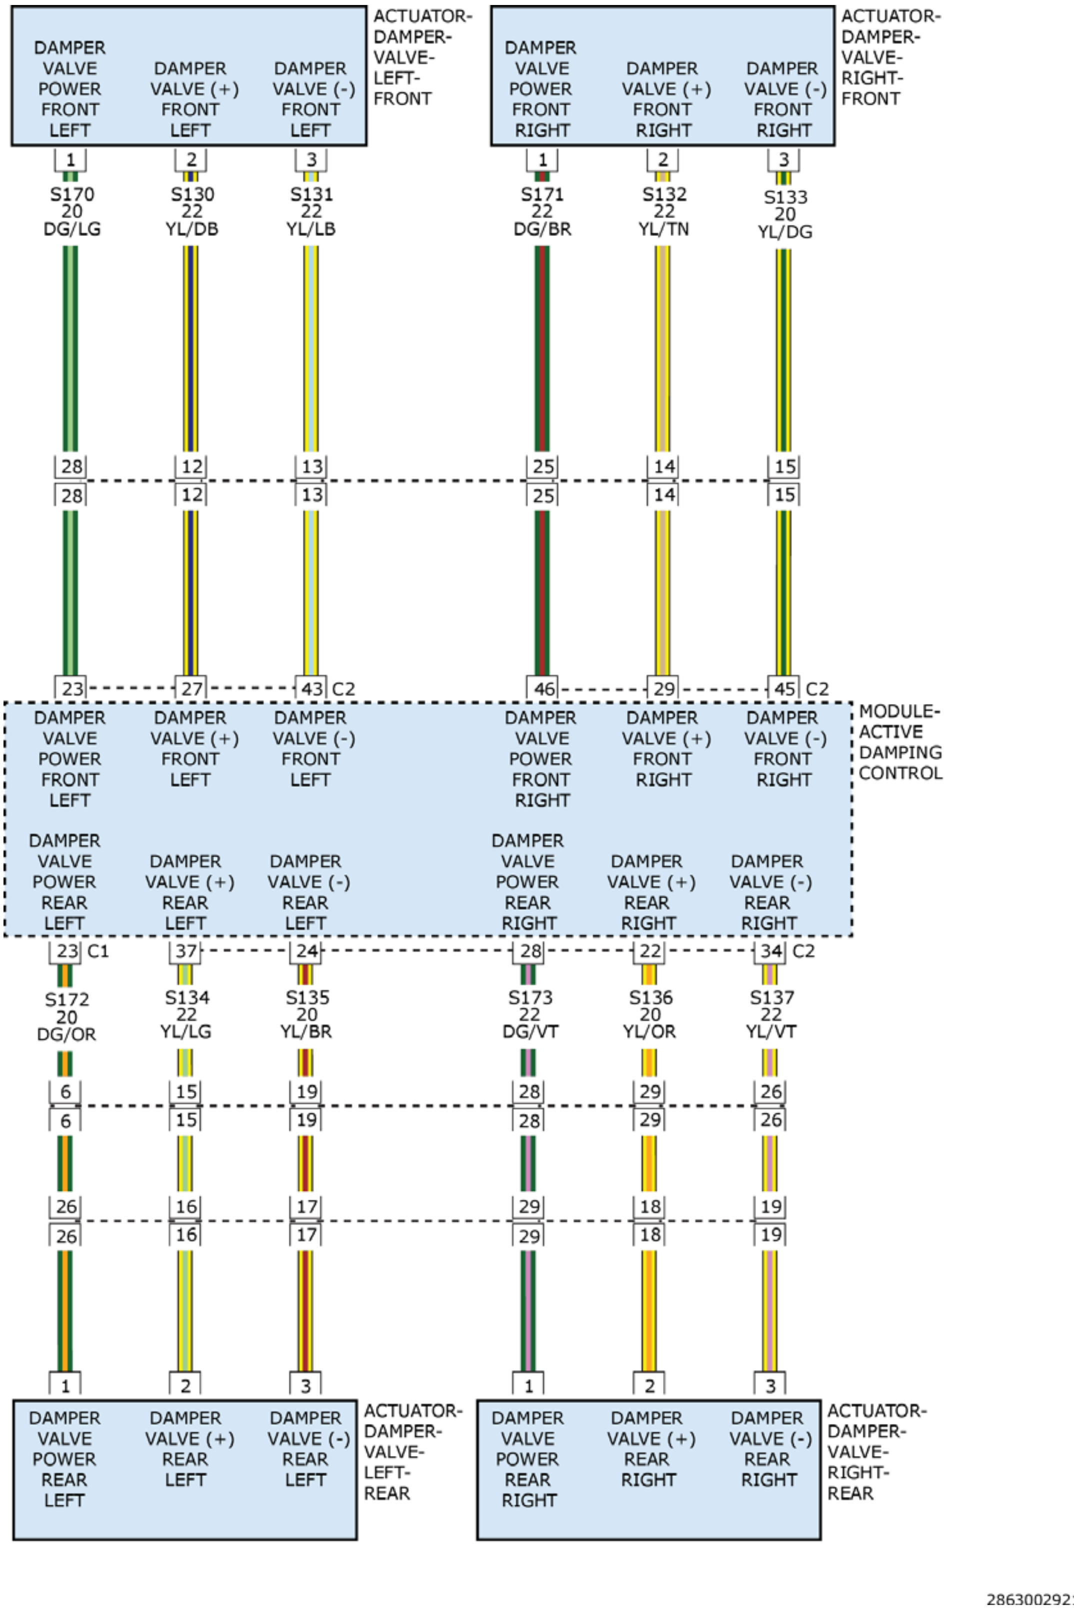

Fig. 35: Valve Damper Actuator Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects when the Right Rear Damping Valve circuit is open.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S137) RIGHT REAR DAMPER VALVE (-) CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)
DAMPING VALVE SHOCK ASSEMBLY

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE (S137) RIGHT REAR DAMPER VALVE (-) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Disconnect the Damping Valve Shock Assembly harness connector.
    2. Disconnect the ADCM C2 harness connector.
    3. Measure the resistance of the (S137) Right Rear Damper Valve (-) circuit between the ADCM C2 harness connector and the Damping Valve Shock Assembly harness connector.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the (S137) Right Rear Damper Valve (-) circuit for an open or high resistance.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 4

4. **ACTIVE DAMPING CONTROL MODULE (ADCM)**
    1. Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the Engine.
    6. With the scan tool, read ADCM DTCs.

    Does the DTC remain active?

    Yes

    - Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15BC-11-LEFT FRONT ACCELERATION SENSOR SUPPLY - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

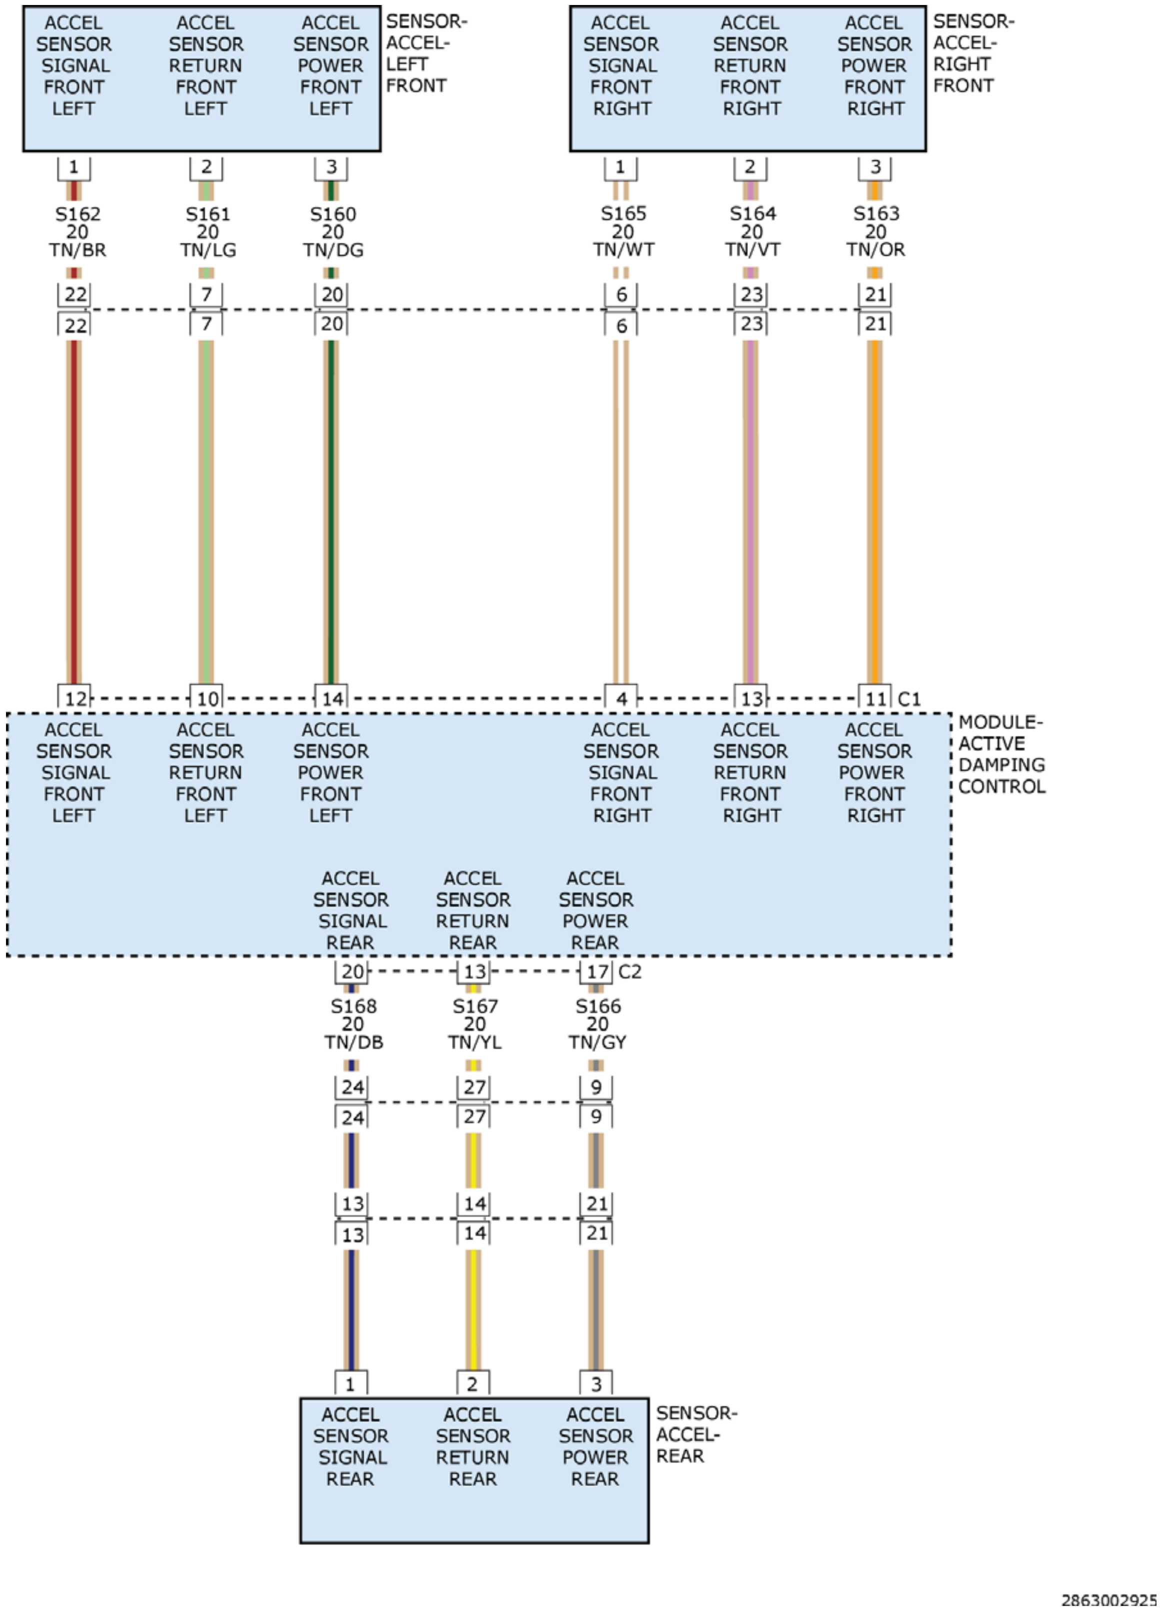

Fig. 36: Acceleration Sensor Circuit Diagram

Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects when the Left Front Acceleration Sensor Power circuit is shorted to ground.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S160) LEFT FRONT ACCELERATION SENSOR POWER CIRCUIT SHORT TO GROUND
(S160) LEFT FRONT ACCELERATION SENSOR POWER CIRCUIT SHORT TO (S161) LEFT FRONT ACCELERATION SENSOR RETURN
LEFT FRONT ACCELERATION SENSOR
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, read ADCM DTCs and record on the repair order.
   3. With the scan tool, read ADCM DTCs.

      Is the DTC active?

      Yes

      - Go To 2

      No

      - Go To 6
2. **LEFT FRONT ACCELERATION SENSOR HARNESS CONNECTOR**

   NOTE: **Make sure the Acceleration Sensor harness connector is connected correctly.**

   1. Turn the ignition off.
   2. Inspect the Acceleration Sensor harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE (S160) LEFT FRONT ACCELERATION SENSOR POWER CIRCUIT FOR A SHORT TO GROUND**
    1. Disconnect the Acceleration Sensor harness connector.
    2. Disconnect the ADCM C1 harness connector.
    3. Check for continuity between ground and the (S160) Left Front Acceleration Sensor Power circuit at the ADCM C1 harness connector.

    Is there continuity between ground and the (S160) Left Front Acceleration Sensor Power circuit?

    Yes

    - Go To 4

    No

    - Repair the (S160) Left Front Acceleration Sensor Power circuit for a short ground.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
4. **CHECK THE (S160) LEFT FRONT ACCELERATION SENSOR POWER CIRCUIT FOR A SHORT TO THE (S161) LEFT FRONT ACCELERATION SENSOR RETURN**
    1. Measure the resistance between the (S160) Left Front Acceleration Sensor Power circuit and the (S161) Left Front Acceleration Sensor Return circuit.

    Is the resistance above 5.0 Ohms?

    Yes

    - Go To 5

    No

    - Repair the (S160) Left Front Acceleration Sensor Power circuit for a short to the (S161) Acceleration Sensor Return circuit.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
5. **ACCELERATION SENSOR**
    1. Replace the Acceleration Sensor in accordance with the Service Information. Refer to **SENSOR, ACTIVE DAMPING, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. Turn the ignition on.
4. With the scan tool, erase the DTCs.
5. Start the Engine.
6. With the scan tool, read ADCM DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

6. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15BC-12-LEFT FRONT ACCELERATION SENSOR SUPPLY - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

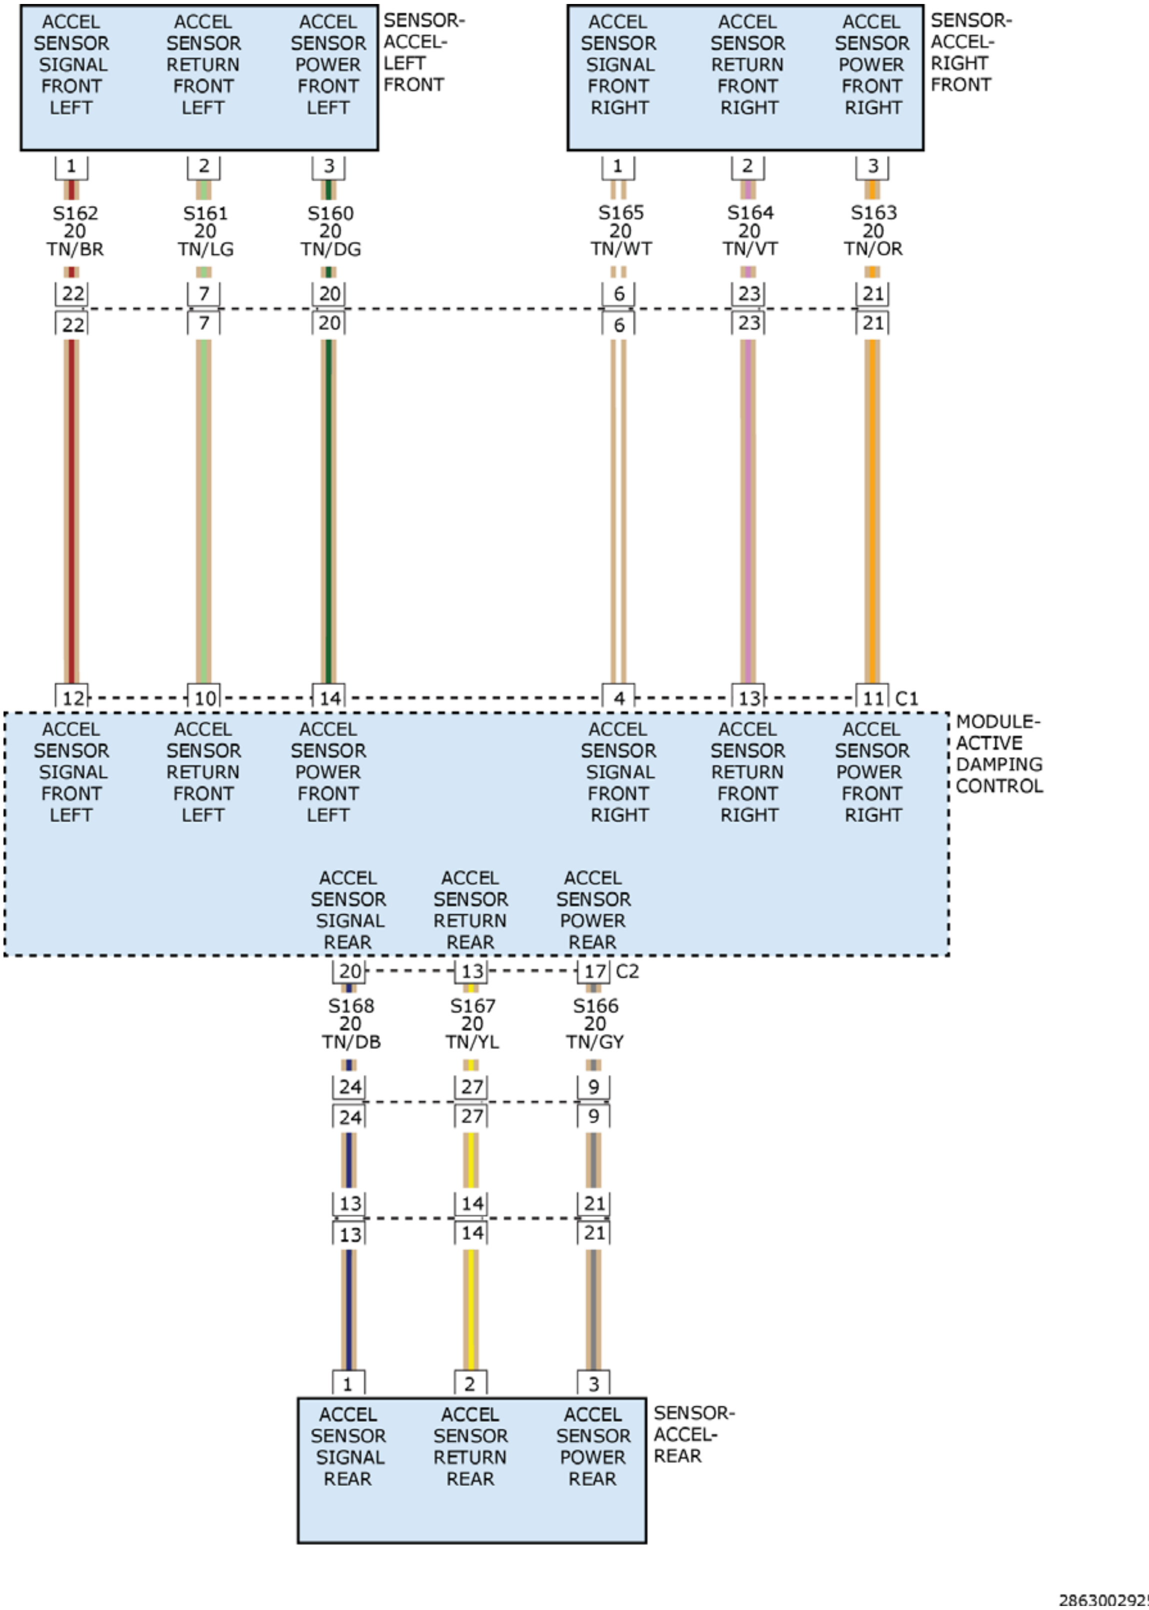

Fig. 37: Acceleration Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects when the Left Front Acceleration Sensor Power circuit is shorted to battery voltage.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S160) LEFT FRONT ACCELERATION SENSOR POWER CIRCUIT SHORT TO BATTERY
LEFT FRONT ACCELERATION SENSOR
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **LEFT FRONT ACCELERATION SENSOR HARNESS CONNECTOR**

    NOTE: **Make sure the Acceleration Sensor harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Acceleration Sensor harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE (S160) LEFT FRONT ACCELERATION SENSOR POWER CIRCUIT FOR A SHORT TO BATTERY**
    1. Turn the ignition off.
    2. Disconnect the Left Front Acceleration Sensor harness connector.
    3. Disconnect the ADCM C1 harness connector.
    4. Turn the ignition on.
    5. Measure the voltage between ground and the (S160) Left Front Acceleration Sensor Power circuit.

    Is the voltage above 5.25 volts?

    Yes

    - Repair the (S160) Left Front Acceleration Sensor Power circuit for a short battery.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 4
4. **ACCELERATION SENSOR**
    1. Replace the Acceleration Sensor in accordance with the Service Information. Refer to **SENSOR, ACTIVE DAMPING, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the Engine.
    6. With the scan tool, read ADCM DTCs.

    Does the DTC remain active?

    Yes

    - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15BD-11-RIGHT FRONT ACCELERATION SENSOR SUPPLY - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

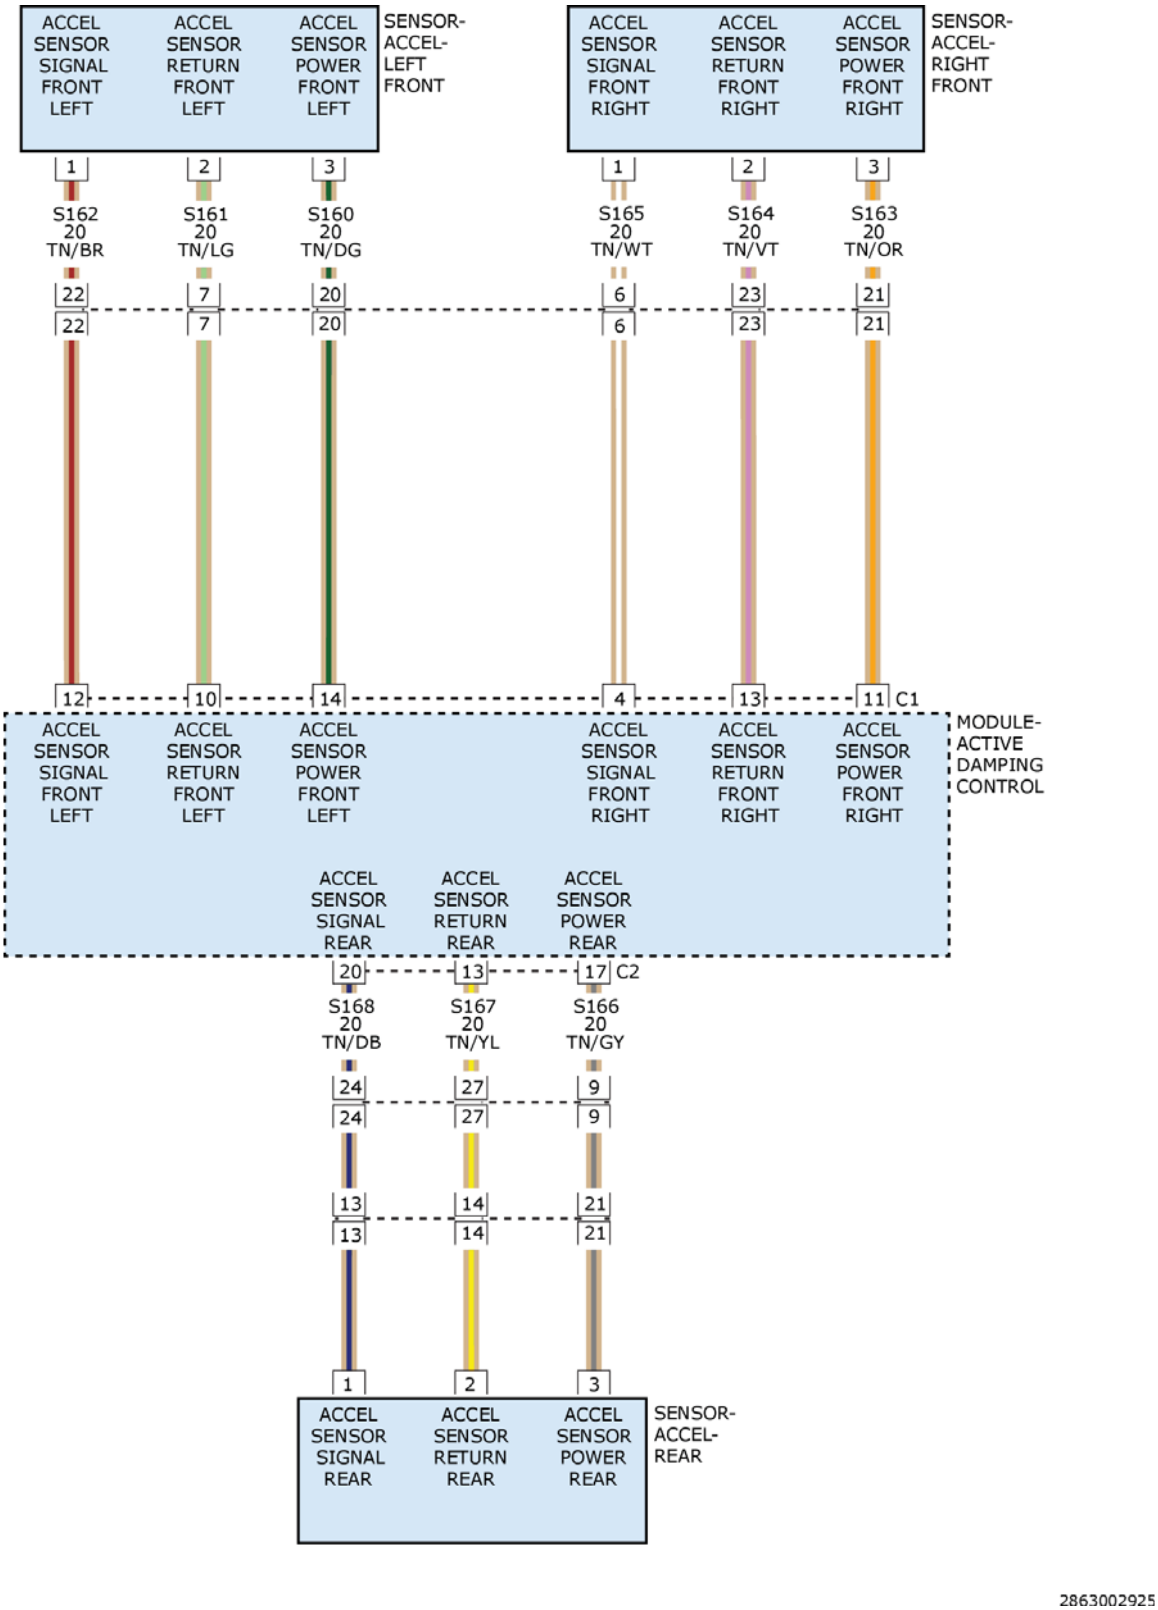

Fig. 38: Acceleration Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects when the Right Front Acceleration Sensor Power circuit is shorted to ground.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S163) RIGHT FRONT ACCELERATION SENSOR POWER CIRCUIT SHORT TO GROUND
(S163) RIGHT FRONT ACCELERATION SENSOR POWER CIRCUIT SHORT TO (S164) RIGHT FRONT ACCELERATION SENSOR RETURN
RIGHT FRONT ACCELERATION SENSOR
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 6
2. **RIGHT FRONT ACCELERATION SENSOR HARNESS CONNECTOR**

    NOTE: **Make sure the Acceleration Sensor harness connector is connected correctly.**

    1. Turn the ignition off.

2. Inspect the Acceleration Sensor harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (S163) RIGHT FRONT ACCELERATION SENSOR POWER CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Acceleration Sensor harness connector.
   2. Disconnect the ADCM C1 harness connector.
   3. Check for continuity between ground and the (S163) Right Front Acceleration Sensor Power circuit at the ADCM C1 harness connector.

      Is there continuity between ground and the (S163) Right Front Acceleration Sensor Power circuit?

      Yes

      - Go To 4

      No

      - Repair the (S163) Right Front Acceleration Sensor Power circuit for a short ground.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **CHECK THE (S163) RIGHT FRONT ACCELERATION SENSOR POWER CIRCUIT FOR A SHORT TO (S164) RIGHT FRONT ACCELERATION SENSOR RETURN**
   1. Measure the resistance between the (S163) Right Front Acceleration Sensor Power circuit and the (S164) Right Front Acceleration Sensor Return circuit.

      Is the resistance above 5.0 Ohms?

      Yes

      - Go To 5

      No

      - Repair the (S163) Right Front Acceleration Sensor Power circuit for a short to the (164) Right Front Acceleration Sensor Return circuit.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **ACCELERATION SENSOR**
   1. Replace the Acceleration Sensor in accordance with the Service Information. Refer to **SENSOR,**

ACTIVE DAMPING, REMOVAL .

2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
3. Turn the ignition on.
4. With the scan tool, erase the DTCs.
5. Start the Engine.
6. With the scan tool, read ADCM DTCs.

Does the DTC remain active?

Yes

- Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

6. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15BD-12-RIGHT FRONT ACCELERATION SENSOR SUPPLY - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

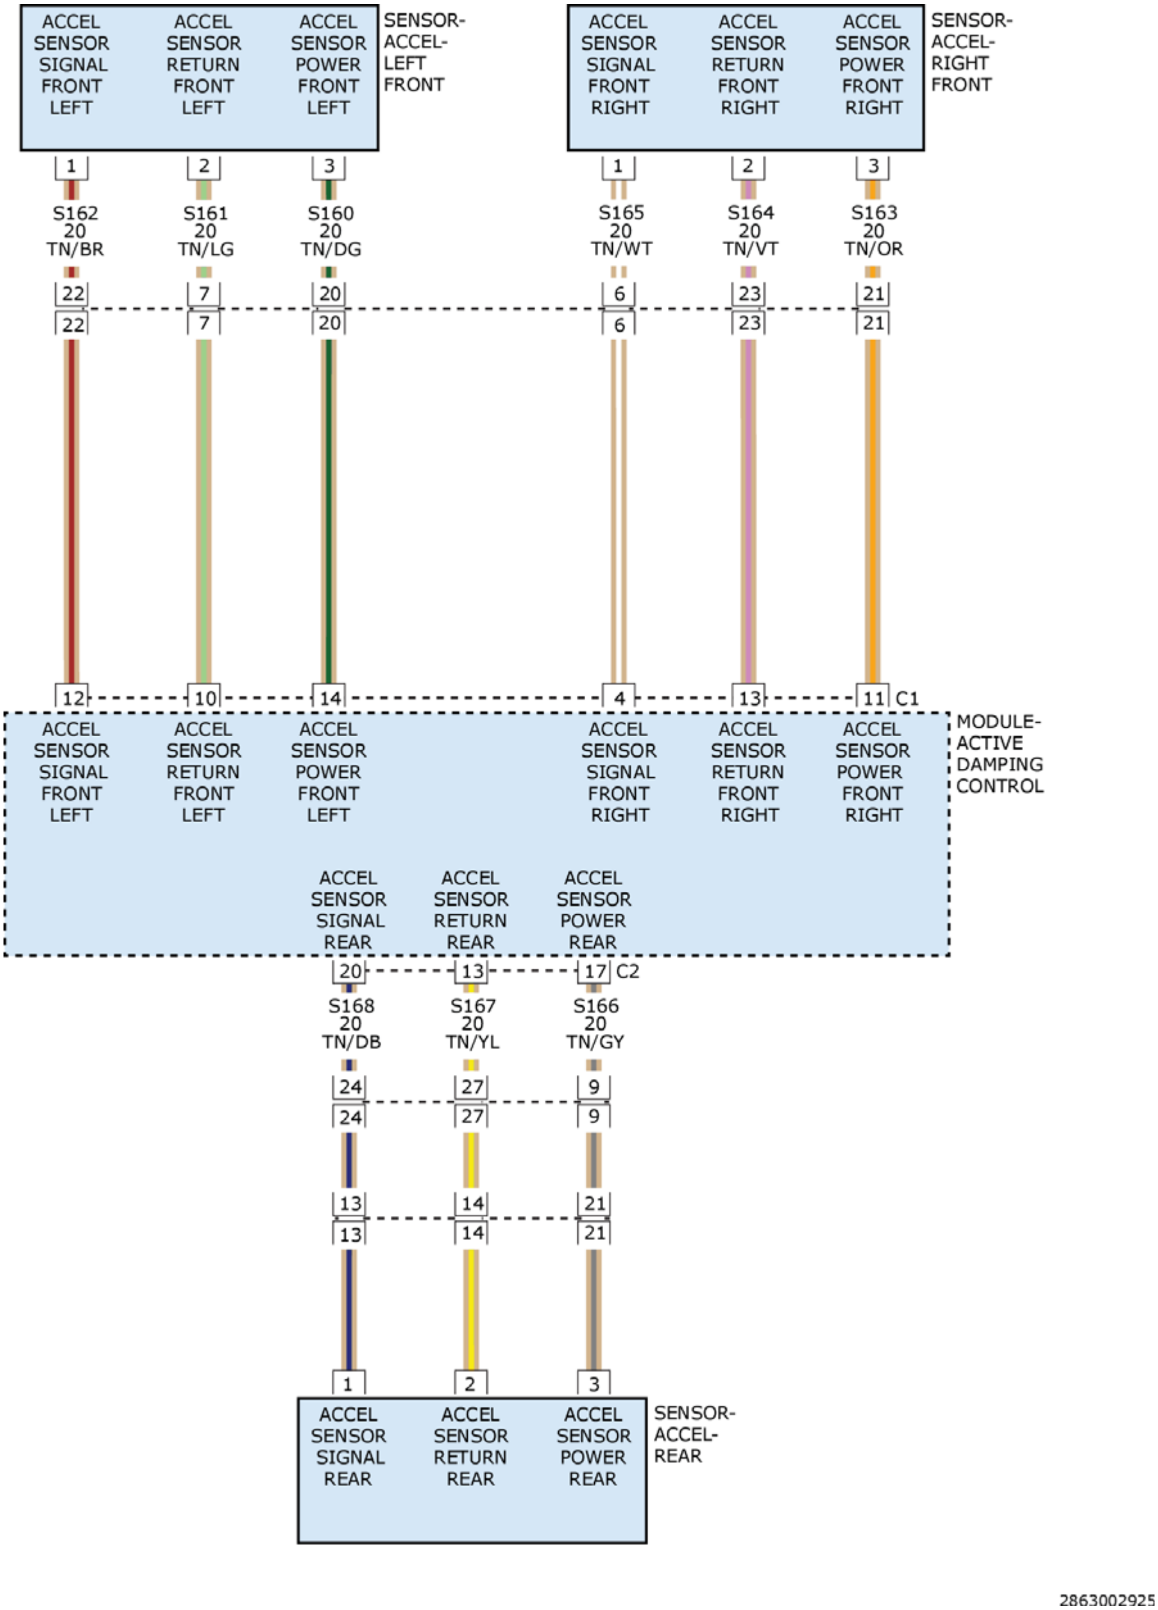

Fig. 39: Acceleration Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects when the Right Front Acceleration Sensor Power circuit is shorted to battery voltage.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S163) RIGHT FRONT ACCELERATION SENSOR POWER CIRCUIT SHORT TO BATTERY
RIGHT FRONT ACCELERATION SENSOR
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **RIGHT FRONT ACCELERATION SENSOR HARNESS CONNECTOR**

    NOTE: **Make sure the Acceleration Sensor harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Acceleration Sensor harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE (S163) RIGHT FRONT ACCELERATION SENSOR POWER CIRCUIT FOR A SHORT TO BATTERY**
    1. Turn the ignition off.
    2. Disconnect the Acceleration Sensor harness connector.
    3. Disconnect the ADCM C1 harness connector.
    4. Turn the ignition on.
    5. Measure the voltage between ground and the (S163) Right Front Acceleration Sensor Power circuit.

    Is the voltage above 5.25 volts?

    Yes

    - Repair the (S163) Right Front Acceleration Sensor Power circuit for a short battery.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 4

4. **ACCELERATION SENSOR**
    1. Replace the Acceleration Sensor in accordance with the Service Information. Refer to **SENSOR, ACTIVE DAMPING, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the Engine.
    6. With the scan tool, read ADCM DTCs.

    Does the DTC remain active?

    Yes

    - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15BE-11-REAR ACCELERATION SENSOR SUPPLY - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

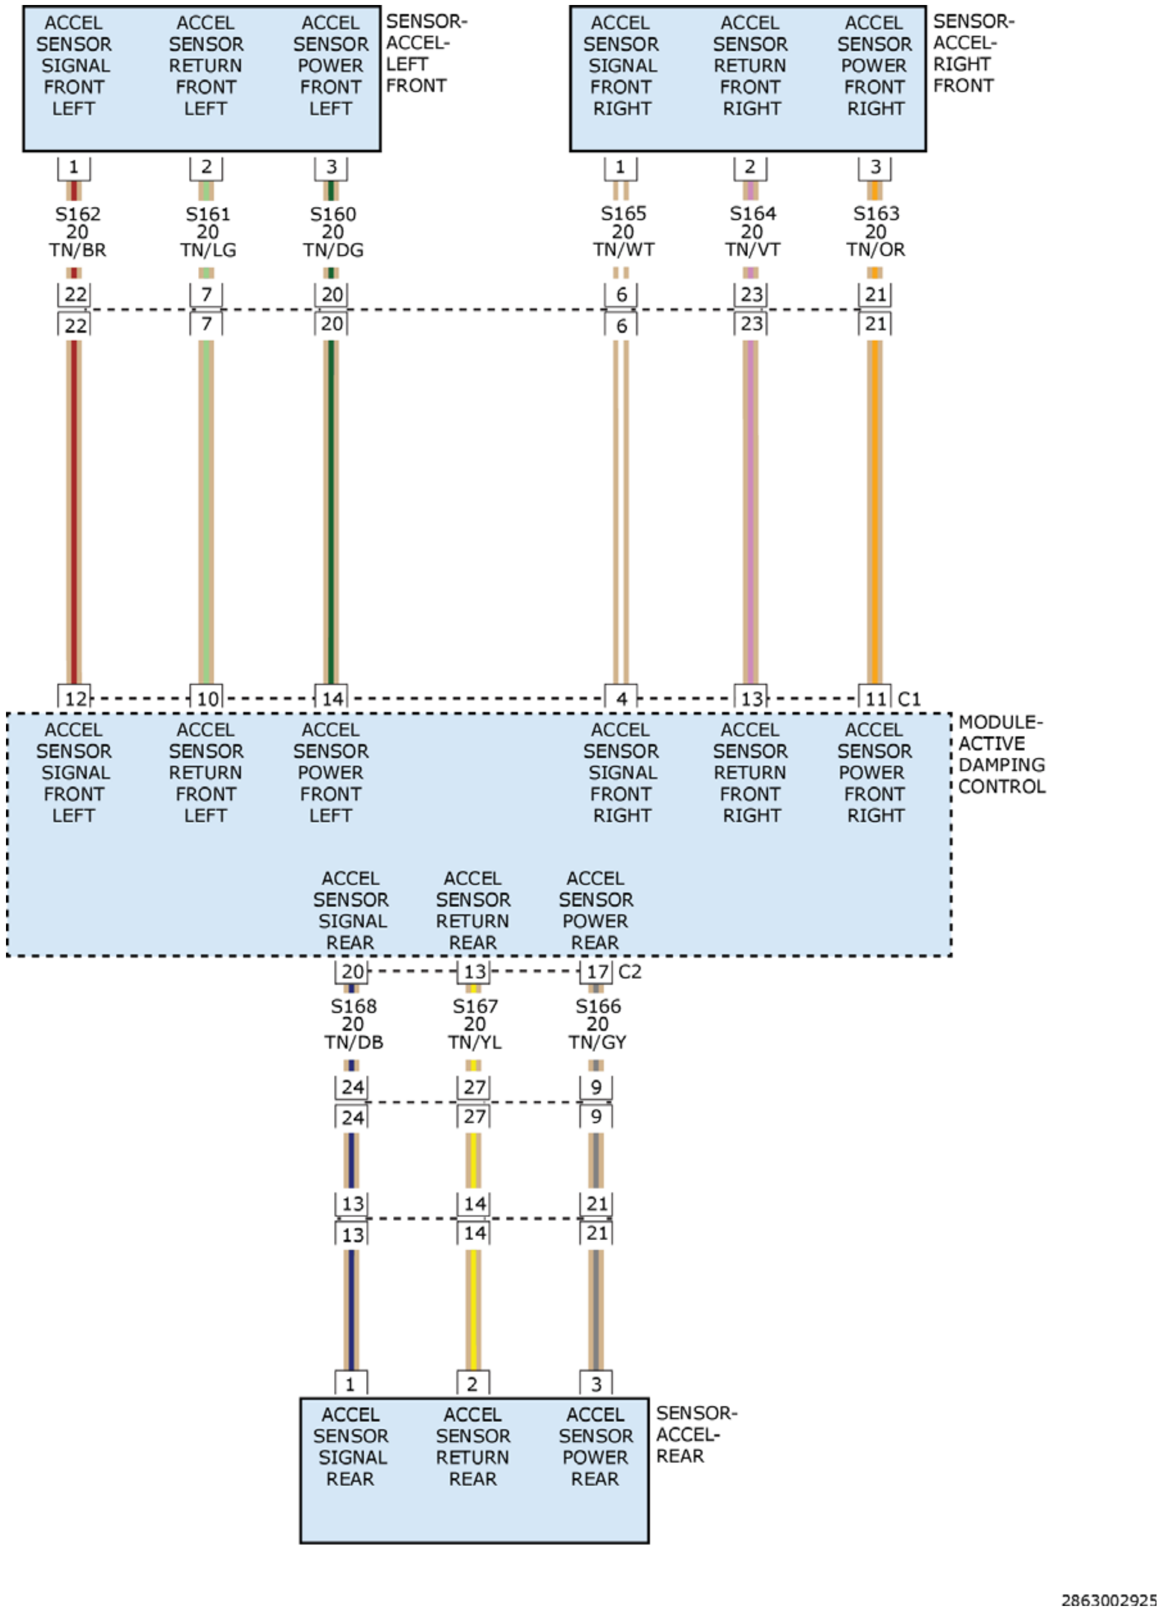

Fig. 40: Acceleration Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects when the Rear Acceleration Sensor Power circuit is shorted to ground.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S166) REAR ACCELERATION SENSOR POWER CIRCUIT SHORT TO GROUND
(S166) REAR ACCELERATION SENSOR POWER CIRCUIT SHORT TO (S167) REAR ACCELERATION SENSOR RETURN
REAR ACCELERATION SENSOR
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, read ADCM DTCs and record on the repair order.
   3. With the scan tool, erase DTCs.
   4. Start the Engine.
   5. With the scan tool, read ADCM DTCs.

      Is the DTC active?

      Yes

      - Go To 2

      No

      - Go To 6
2. **REAR ACCELERATION SENSOR HARNESS CONNECTOR**

   NOTE: **Make sure the Acceleration Sensor harness connector is connected correctly.**

   1. Turn the ignition off.

2. Inspect the Acceleration Sensor harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (S166) REAR ACCELERATION SENSOR POWER CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Acceleration Sensor harness connector.
   2. Disconnect the ADCM C1 harness connector.
   3. Check for continuity between ground and the (S166) Rear Acceleration Sensor Power circuit at the ADCM C2 harness connector.

      Is there continuity between ground and the (S166) Rear Acceleration Sensor Power circuit?

      Yes

      - Go To 4

      No

      - Repair the (S166) Rear Acceleration Sensor Power circuit for a short ground.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **CHECK THE (S166) REAR ACCELERATION SENSOR POWER CIRCUIT FOR A SHORT TO THE (S167) REAR ACCELERATION SENSOR RETURN**
   1. Measure the resistance between the (S166) Rear Acceleration Sensor Power circuit and the (S167) Rear Acceleration Sensor Return circuit.

      Is the resistance above 5.0 Ohms?

      Yes

      - Go To 5

      No

      - Repair the (S166) Rear Acceleration Sensor Power circuit for a short to the (160) Acceleration Sensor Return circuit.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **ACCELERATION SENSOR**
   1. Replace the Acceleration Sensor in accordance with the Service Information. Refer to **SENSOR,**

ACTIVE DAMPING, REMOVAL .

2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
3. Turn the ignition on.
4. With the scan tool, erase the DTCs.
5. Start the Engine.
6. With the scan tool, read ADCM DTCs.

Does the DTC remain active?

Yes

- Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

6. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15BE-12- REAR ACCELERATION SENSOR SUPPLY - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

..

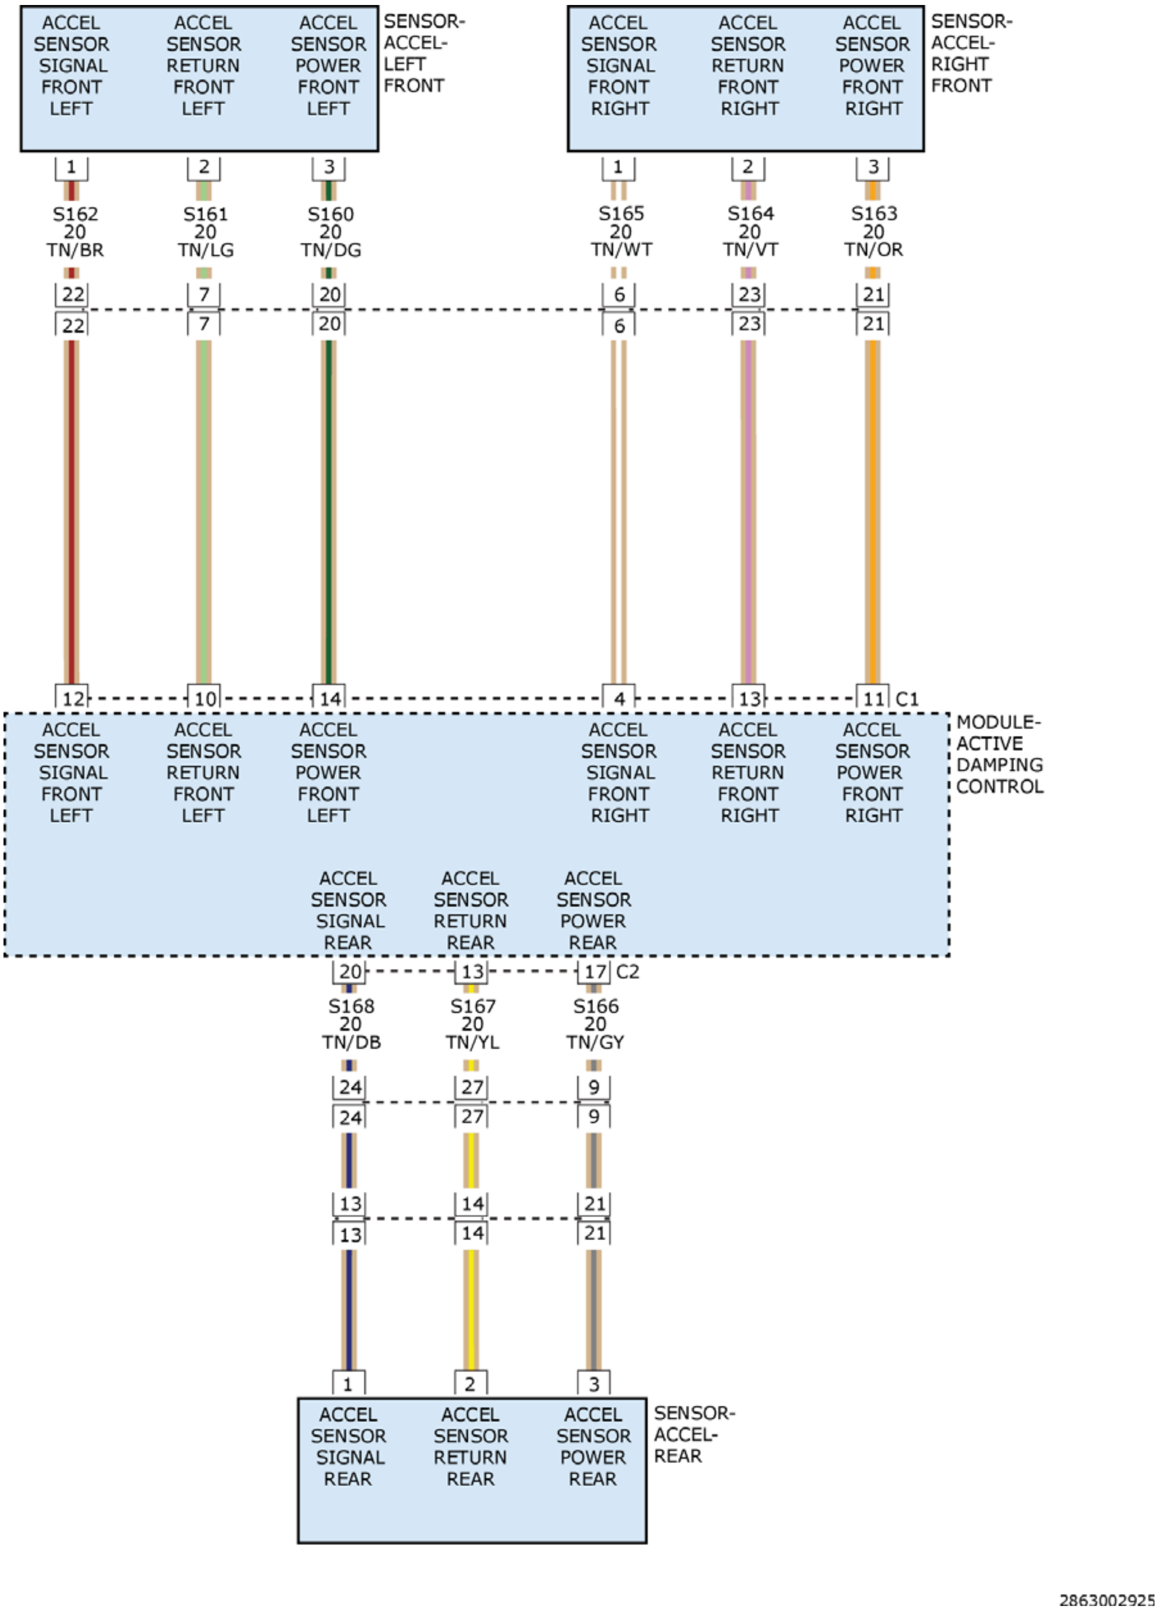

Fig. 41: Acceleration Sensor Circuit Diagram

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects when the Rear Acceleration Sensor Power circuit is shorted to battery voltage.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGED OR DISCONNECTED
(S166) REAR ACCELERATION SENSOR POWER CIRCUIT SHORT TO BATTERY
REAR ACCELERATION SENSOR
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **REAR ACCELERATION SENSOR HARNESS CONNECTOR**

    NOTE: **Make sure the Acceleration Sensor harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Acceleration Sensor harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE (S166) REAR ACCELERATION SENSOR POWER CIRCUIT FOR A SHORT TO BATTERY**
    1. Turn the ignition off.
    2. Disconnect the Rear Acceleration Sensor harness connector.
    3. Disconnect the ADCM C2 harness connector.
    4. Turn the ignition on.
    5. Measure the voltage between ground and the (S166) Rear Acceleration Sensor Power circuit.

    Is the voltage above 5.25 volts?

    Yes

    - Repair the (S166) Rear Acceleration Sensor Power circuit for a short battery.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 4
4. **ACCELERATION SENSOR**
    1. Replace the Acceleration Sensor in accordance with the Service Information. Refer to **SENSOR, ACTIVE DAMPING, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the Engine.
    6. With the scan tool, read ADCM DTCs.

    Does the DTC remain active?

    Yes

    - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

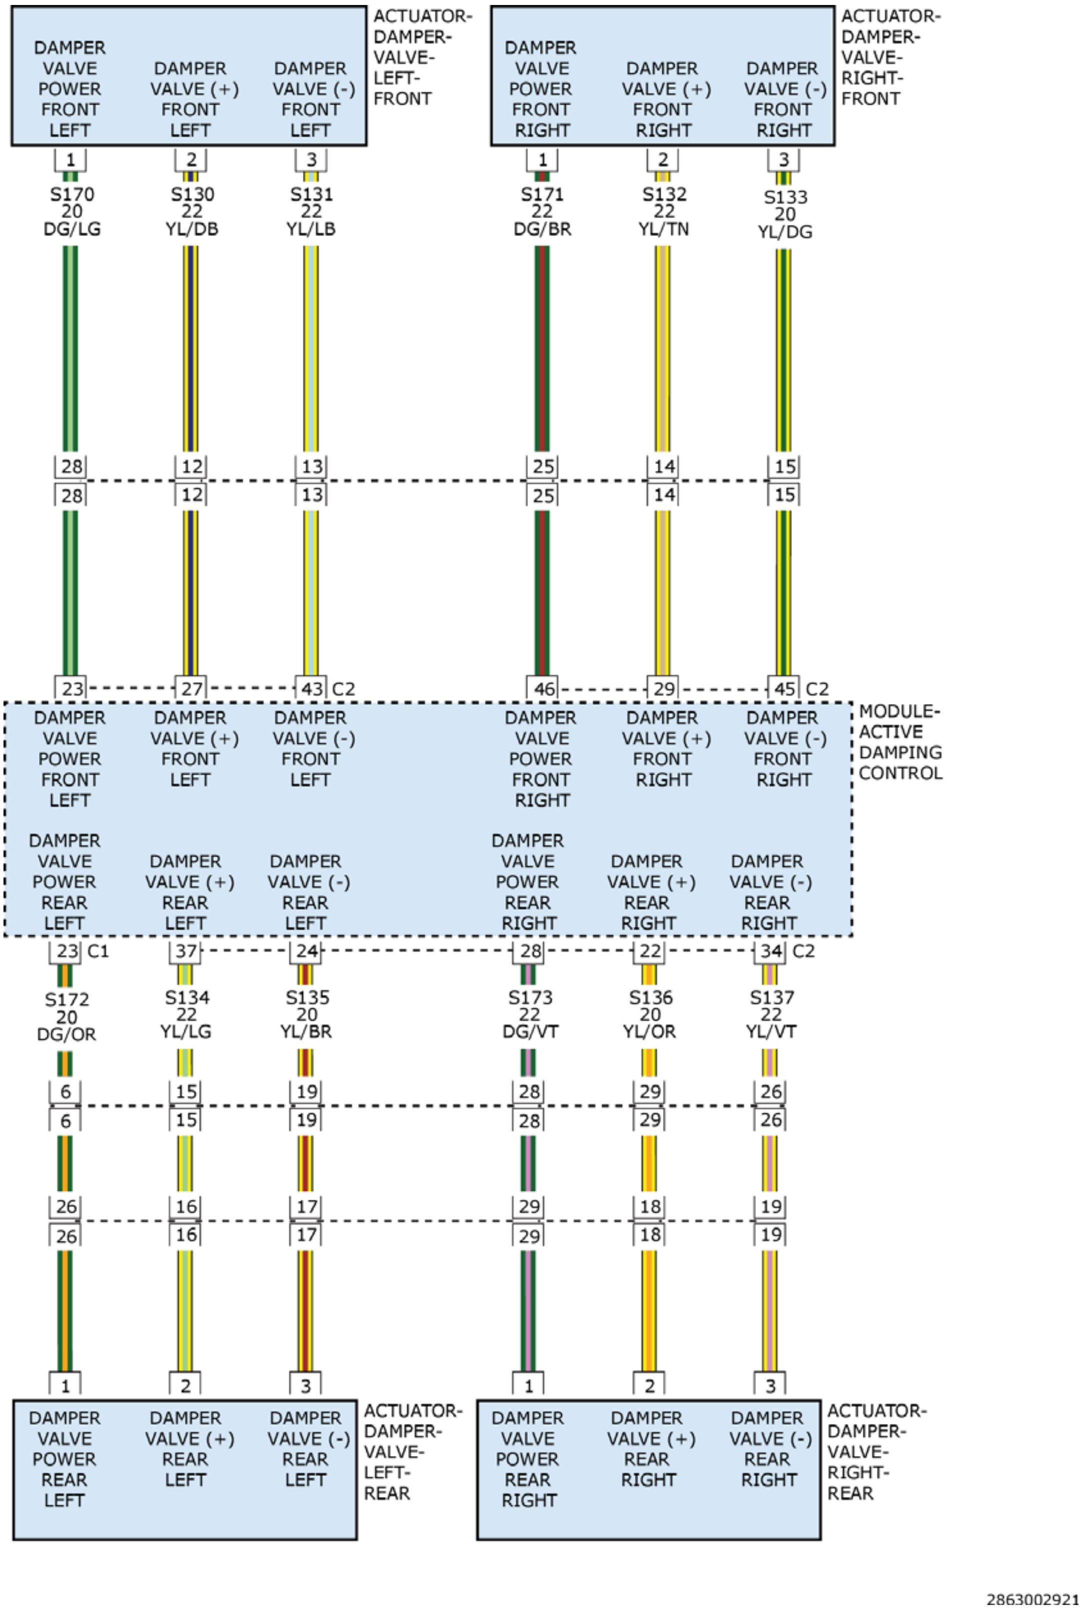
    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15C2-19-LEFT FRONT DAMPING VALVE LOW SIDE 1 - OVERCURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **If any other DTCs are present, repair them first before continuing with this diagnostic procedure.**



[Fig. 42: Valve Damper Actuator Circuit Diagram]
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects the Left Front Damping Valve Solenoid Low Side 1 (compression stage) is overcurrent caused by an internal failure in the Damping Valve Shock Assembly.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR
(S130) LEFT FRONT DAMPER VALVE (+) CIRCUIT OPEN OR HIGH RESISTANCE
DAMPING VALVE SHOCK ASSEMBLY
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase the DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE (S130) LEFT FRONT DAMPER VALVE (+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Disconnect the Left Front Damping Valve Shock Assembly harness connector.
    2. Disconnect the ADCM C2 harness connector.
    3. Connect a jumper wire between Ground and the (S130) Left Front Damper Valve (+) circuit in the Left Front Damping Valve Shock Assembly harness connector.
    4. Using a 12-volt test light connected to B+, check the (S130) Left Front Damper Valve (+) circuit in the ADCM C2 harness connector.

    NOTE: **The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

    Does the test light illuminate brightly?

    Yes

    - Go To 4

    No

    - Repair the (S130) Left Front Damper Valve (+) circuit for an open or high resistance.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
4. **DAMPING VALVE SHOCK ASSEMBLY**
    1. Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the Engine.
    6. With the scan tool, read ADCM DTCs.

    Does the DTC remain active?

    Yes

    - Replace the Active Damping Control Module (ADCM) in accordance with the Service

Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .

- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15C3-19-LEFT FRONT DAMPING VALVE LOW SIDE 2 - OVERCURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE:	**If any other DTCs are present, repair them first before continuing with this diagnostic procedure.**

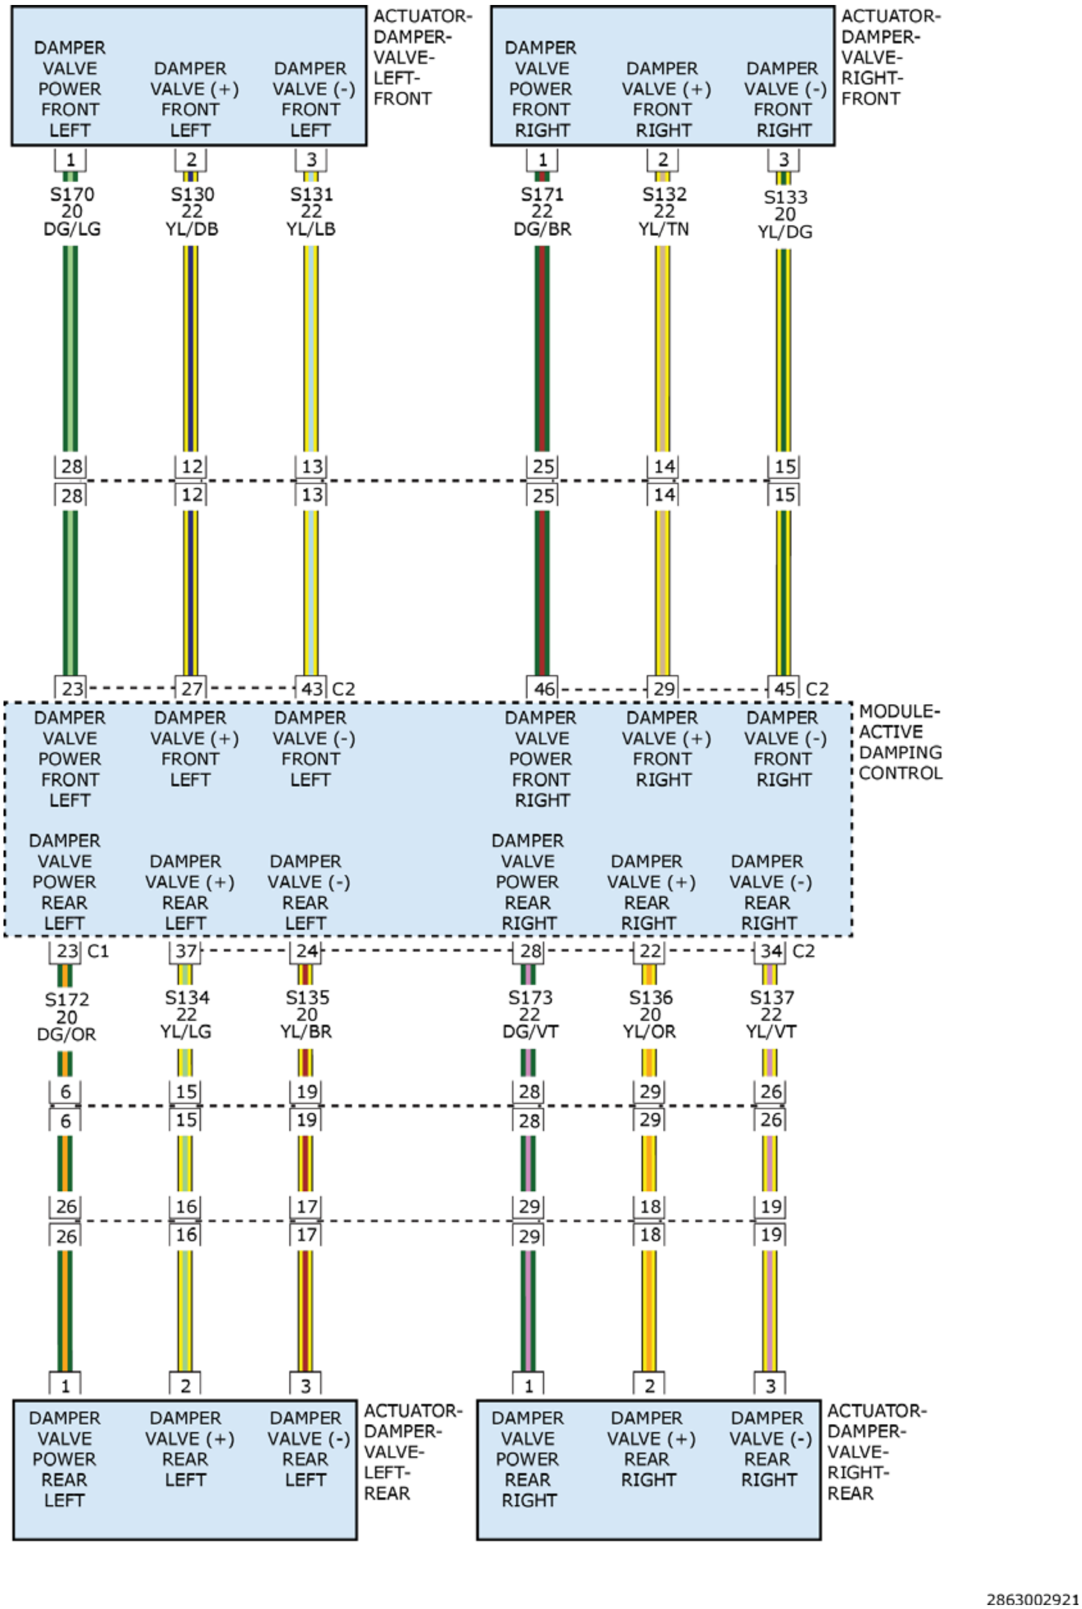


Fig. 43: Valve Damper Actuator Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects the Left Front Damping Valve Solenoid Low Side 2 (rebound stage) overcurrent caused by an internal failure in the Damping Valve Shock Assembly.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR
(S131) LEFT FRONT DAMPER VALVE (-) CIRCUIT OPEN OR HIGH RESISTANCE
DAMPING VALVE SHOCK ASSEMBLY
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, read the DTCs in the ADCM.

       Is the DTC active at this time?

       Yes

       - Go To 2

       No

       - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

       Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE (S131) LEFT FRONT DAMPER VALVE (-) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Disconnect the Left Front Damping Valve Shock Assembly harness connector.
    2. Disconnect the ADCM C2 harness connector.
    3. Connect a jumper wire between Ground and the (S131) Left Front Damper Valve (-) circuit in the Left Front Damping Valve Shock Assembly harness connector.
    4. Using a 12-volt test light connected to B+, check the (S131) Left Front Damper Valve (-) circuit in the ADCM C2 harness connector.

    NOTE: **The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

    Does the test light illuminate brightly?

    Yes

    - Go To 4

    No

    - Repair the (S131) Left Front Damper Valve (-) circuit for an open or high resistance.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
4. **DAMPING VALVE SHOCK ASSEMBLY**
    1. Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the vehicle.
    6. With the scan tool, read the DTCs in the ADCM.

    Does the DTC remain active?

    Yes

    - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15C4-19-RIGHT FRONT DAMPING VALVE LOW SIDE 1 - OVERCURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **If any other DTCs are present, repair them first before continuing with this diagnostic procedure.**

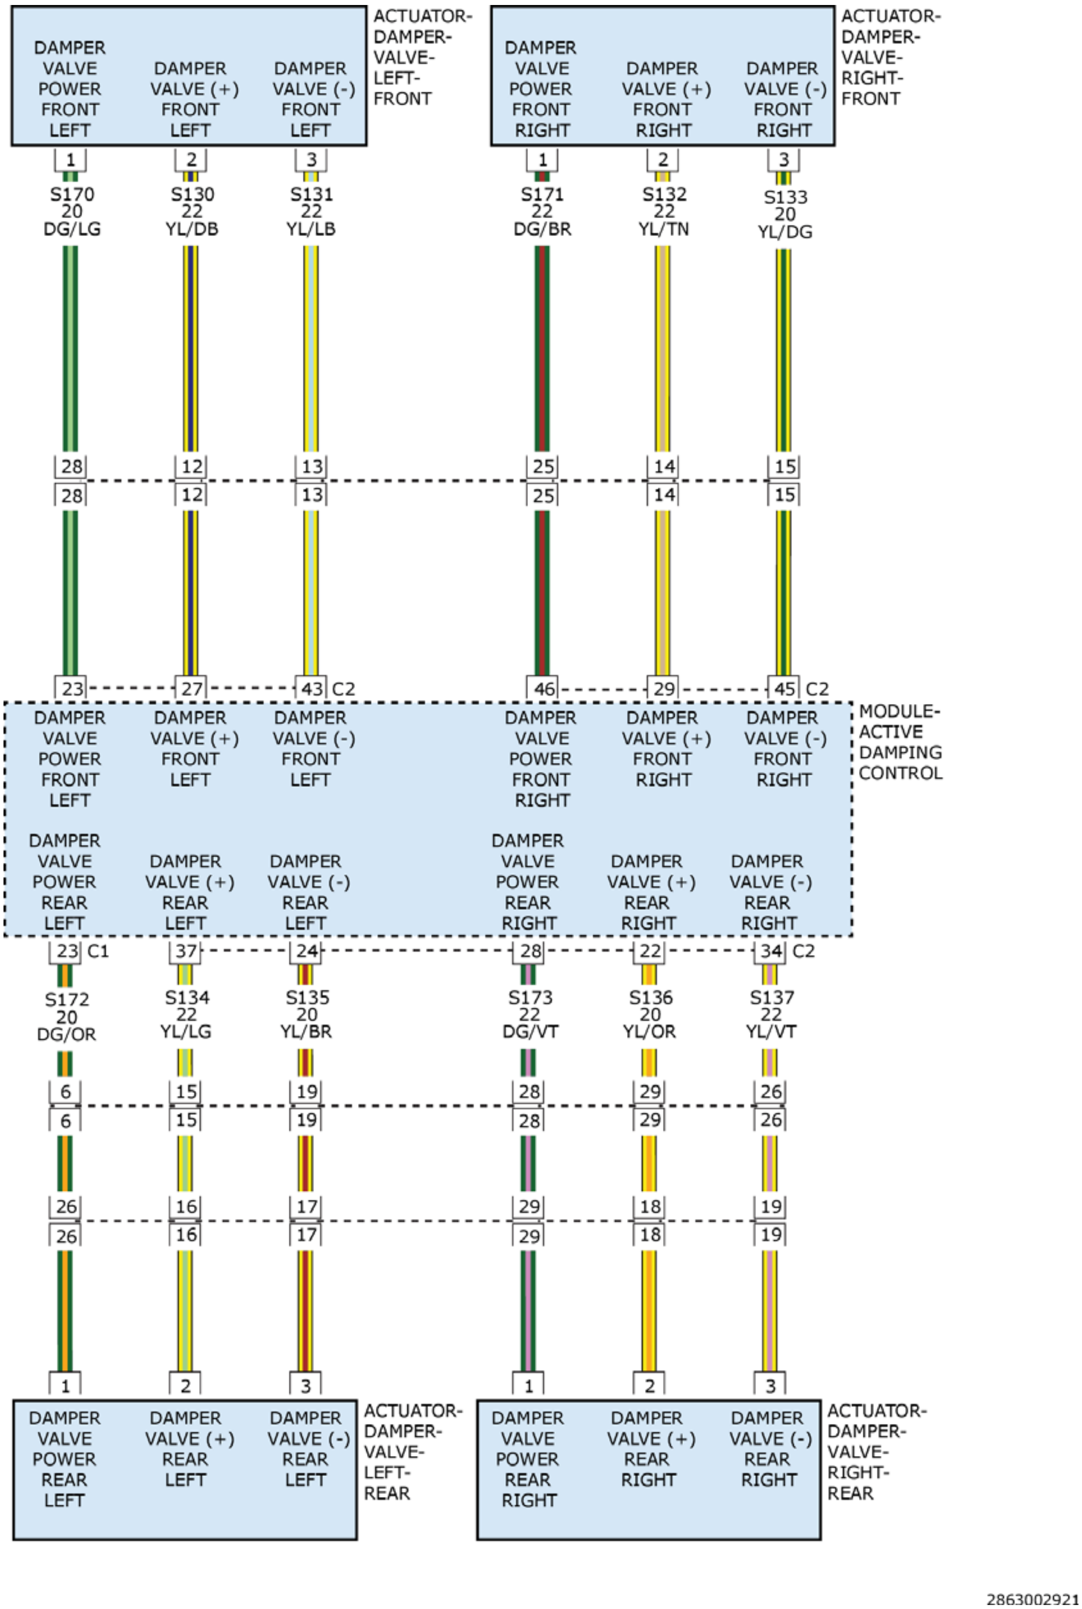

Fig. 44: Valve Damper Actuator Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects the Right Front Damping Valve Solenoid Low Side 1 (compression stage) overcurrent caused by an internal failure in the Damping Valve Shock Assembly.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR
(S132) RIGHT FRONT DAMPER VALVE (+) CIRCUIT OPEN OR HIGH RESISTANCE
DAMPING VALVE SHOCK ASSEMBLY
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase the DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE (S132) RIGHT FRONT DAMPER VALVE (+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Disconnect the Right Front Damping Valve Shock Assembly harness connector.
    2. Disconnect the ADCM C2 harness connector.
    3. Connect a jumper wire between Ground and the (S132) Right Front Damper Valve (+) circuit in the Right Front Damping Valve Shock Assembly harness connector.
    4. Using a 12-volt test light connected to B+, check the (S132) Right Front Damper Valve (+) circuit in the ADCM C2 harness connector.

    NOTE: **The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

    Does the test light illuminate brightly?

    Yes

    - Go To 4

    No

    - Repair the (S132) Right Front Damper Valve (+) circuit for an open or high resistance.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
4. **DAMPING VALVE SHOCK ASSEMBLY**
    1. Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the Engine.
    6. With the scan tool, read ADCM DTCs.

    Does the DTC remain active?

    Yes

    - Replace the Active Damping Control Module (ADCM) in accordance with the Service

Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .

- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

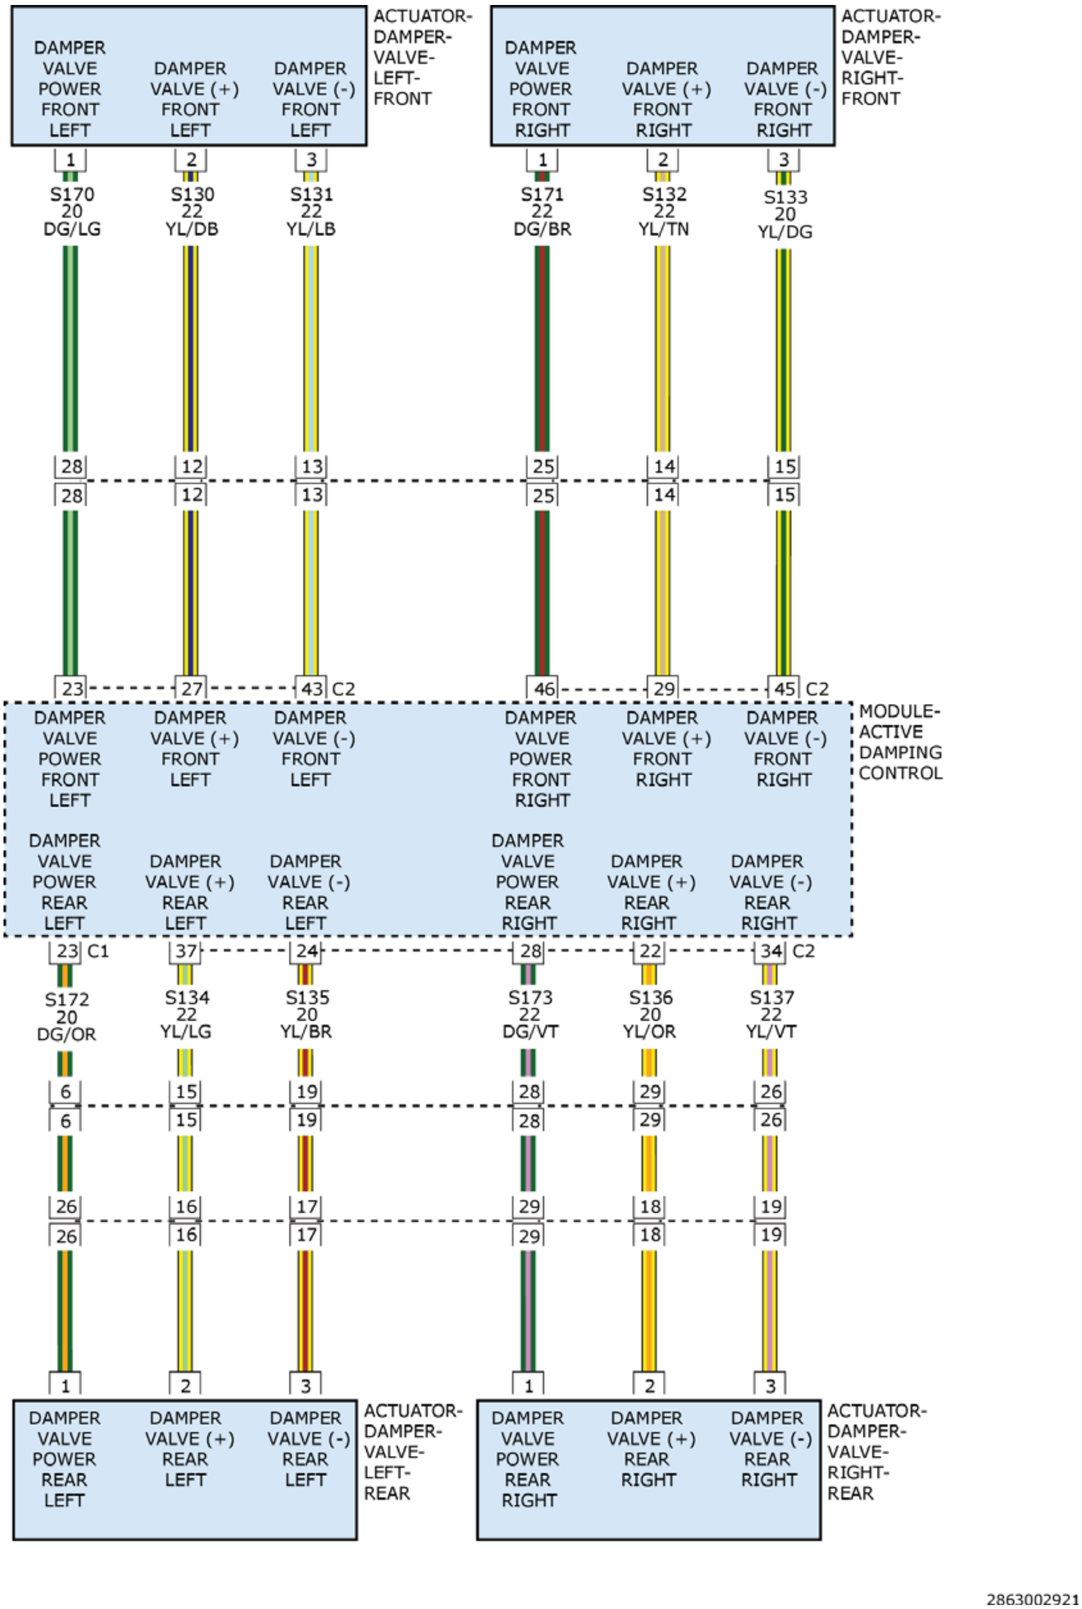
    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15C5-19-RIGHT FRONT DAMPING VALVE LOW SIDE 2 - OVERCURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **If any other DTCs are present, repair them first before continuing with this diagnostic procedure.**



[Fig. 45: Valve Damper Actuator Circuit Diagram]
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects the Right Front Damping Valve Solenoid Low Side 2 (rebound stage) overcurrent caused by an internal failure in the Damping Valve Shock Assembly.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR
(S133) RIGHT FRONT DAMPER VALVE (-) CIRCUIT OPEN OR HIGH RESISTANCE
DAMPING VALVE SHOCK ASSEMBLY
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE (S133) RIGHT FRONT DAMPER VALVE (-) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Disconnect the Right Front Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Connect a jumper wire between Ground and the (S133) Right Front Damper Valve (-) circuit in the Right Front Damping Valve Shock Assembly harness connector.
   4. Using a 12-volt test light connected to B+, check the (S133) Right Front Damper Valve (-) circuit in the ADCM C2 harness connector.

NOTE:	**The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

Does the test light illuminate brightly?

Yes

- Go To 4

No

- Repair the (S133) Right Front Damper Valve (-) circuit for an open or high resistance.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **DAMPING VALVE SHOCK ASSEMBLY**
   1. Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the Engine.
   6. With the scan tool, read ADCM DTCs.

Does the DTC remain active?

Yes

- Replace the Active Damping Control Module (ADCM) in accordance with the Service

Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .

- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15C6-19-LEFT REAR DAMPING VALVE LOW SIDE 1 - OVERCURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **If any other DTCs are present, repair them first before continuing with this diagnostic procedure.**

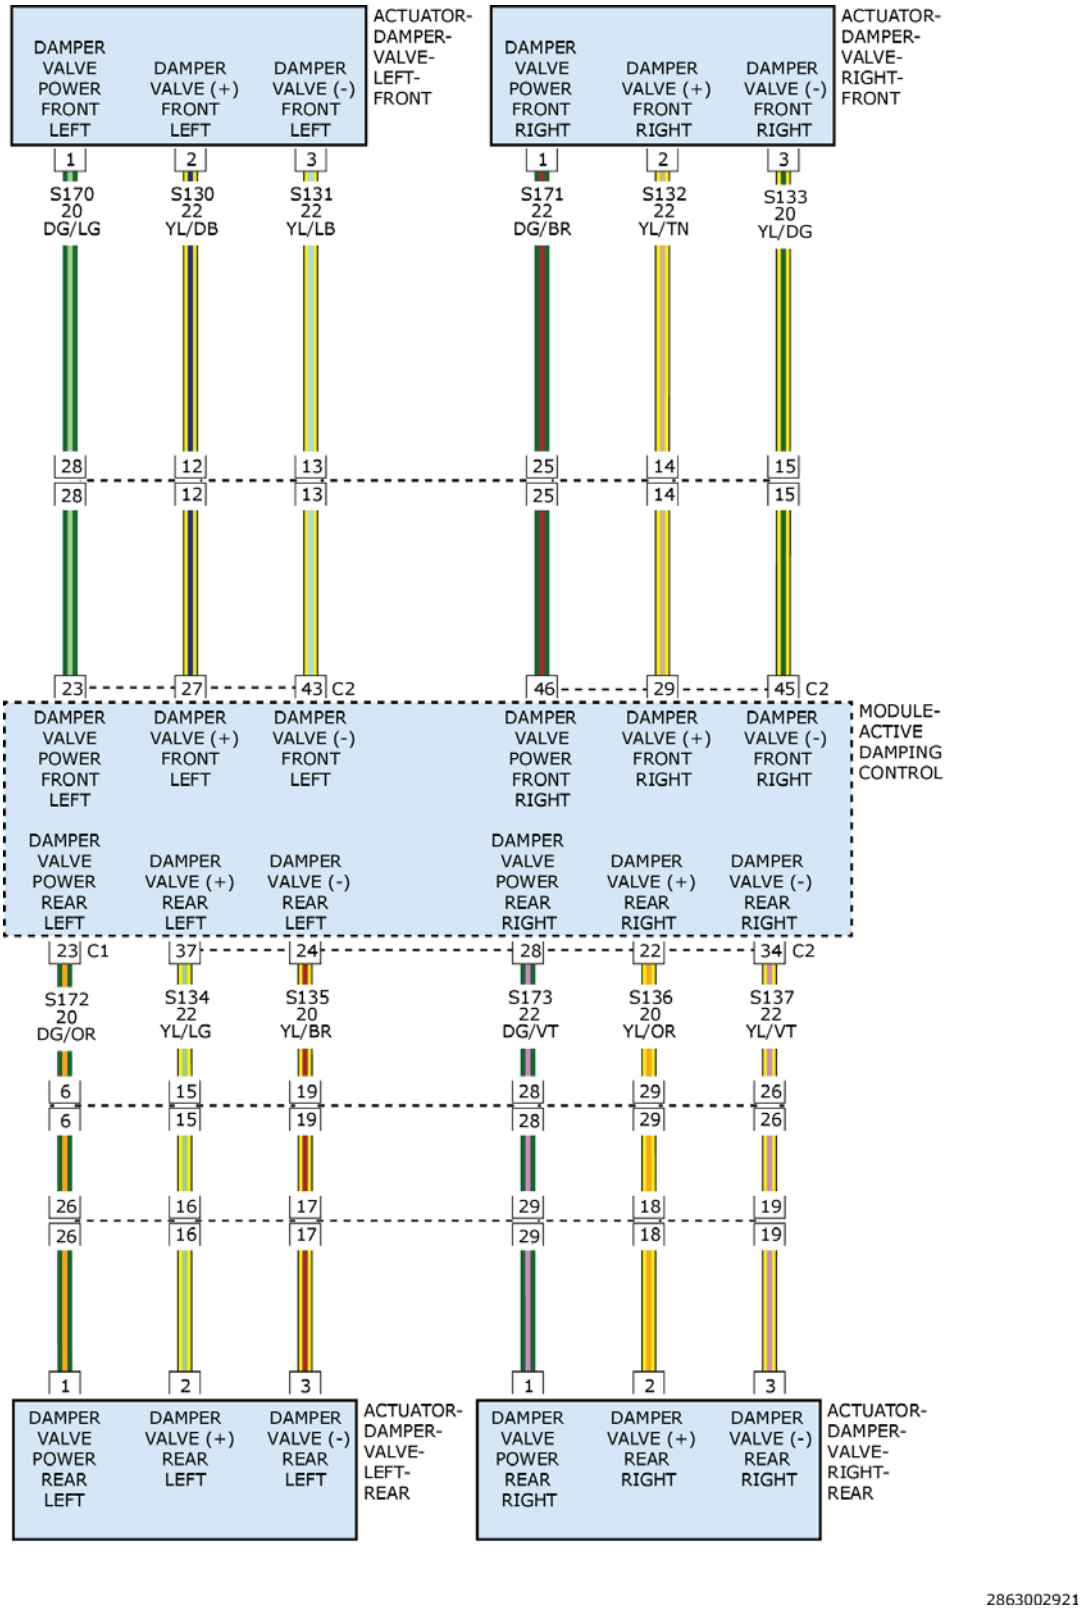


Fig. 46: Valve Damper Actuator Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects the Left Rear Damping Valve Solenoid Low Side 1 (compression stage) is overcurrent caused by an internal failure in the Damping Valve Shock Assembly.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR
(S134) LEFT REAR DAMPER VALVE (+) CIRCUIT OPEN OR HIGH RESISTANCE
DAMPING VALVE SHOCK ASSEMBLY
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase the DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: Make sure the Damping Valve Shock Assembly harness connector is connected correctly.

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE (S134) LEFT REAR DAMPER VALVE (+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Disconnect the Left Rear Damping Valve Shock Assembly harness connector.
    2. Disconnect the ADCM C2 harness connector.
    3. Connect a jumper wire between Ground and the (S134) Left Rear Damper Valve (+) circuit in the Left Rear Damping Valve Shock Assembly harness connector.
    4. Using a 12-volt test light connected to B+, check the (S134) Left Rear Damper Valve (+) circuit in the ADCM C2 harness connector.

    NOTE: **The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

    Does the test light illuminate brightly?

    Yes

    - Go To 4

    No

    - Repair the (S134) Left Rear Damper Valve (+) circuit for an open or high resistance.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
4. **DAMPING VALVE SHOCK ASSEMBLY**
    1. Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
    2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    3. Turn the ignition on.
    4. With the scan tool, erase the DTCs.
    5. Start the Engine.
    6. With the scan tool, read ADCM DTCs.

    Does the DTC remain active?

    Yes

    - Replace the Active Damping Control Module (ADCM) in accordance with the Service

Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .

- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15C7-19-LEFT REAR DAMPING VALVE LOW SIDE 2 - OVERCURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **If any other DTCs are present, repair them first before continuing with this diagnostic procedure.**

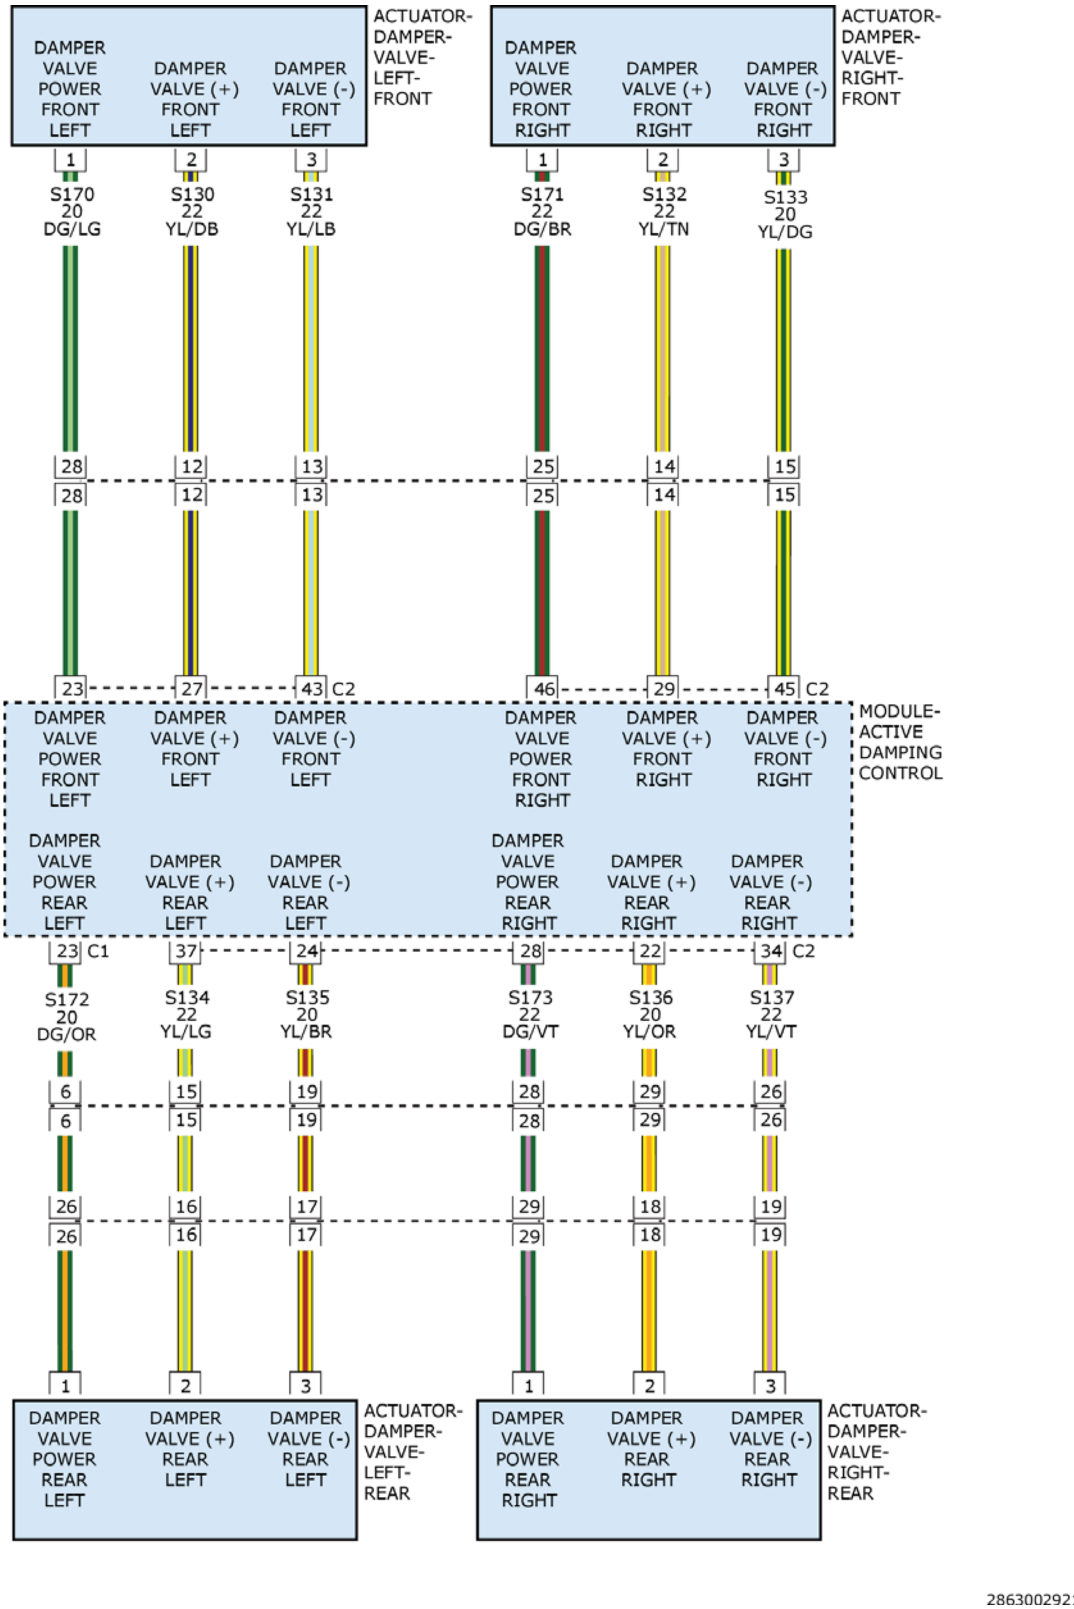

Fig. 47: Valve Damper Actuator Circuit Diagram

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects the Left Rear Damping Valve Solenoid Low Side 2 (rebound stage) is overcurrent caused by an internal failure in the Damping Valve Shock Assembly.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR
(S135) LEFT REAR DAMPER VALVE (-) CIRCUIT OPEN OR HIGH RESISTANCE
DAMPING VALVE SHOCK ASSEMBLY
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read the DTCs in the ADCM.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE (S135) LEFT REAR DAMPER VALVE (-) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Disconnect the Left Rear Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Connect a jumper wire between Ground and the (S135) Left Rear Damper Valve (-) circuit in the Left Rear Damping Valve Shock Assembly harness connector.
   4. Using a 12-volt test light connected to B+, check the (S135) Left Rear Damper Valve (-) circuit in the ADCM C2 harness connector.

   NOTE: **The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

   Does the test light illuminate brightly?

   Yes

   - Go To 4

   No

   - Repair the (S135) Left Rear Damper Valve (-) circuit for an open or high resistance.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
4. **DAMPING VALVE SHOCK ASSEMBLY**
   1. Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the vehicle.
   6. With the scan tool, read the DTCs in the ADCM.

   Does the DTC remain active?

   Yes

   - Replace the Active Damping Control Module (ADCM) in accordance with the Service

Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .

- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15C8-19-RIGHT REAR DAMPING VALVE LOW SIDE 1 - OVERCURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **If any other DTCs are present, repair them first before continuing with this diagnostic procedure.**

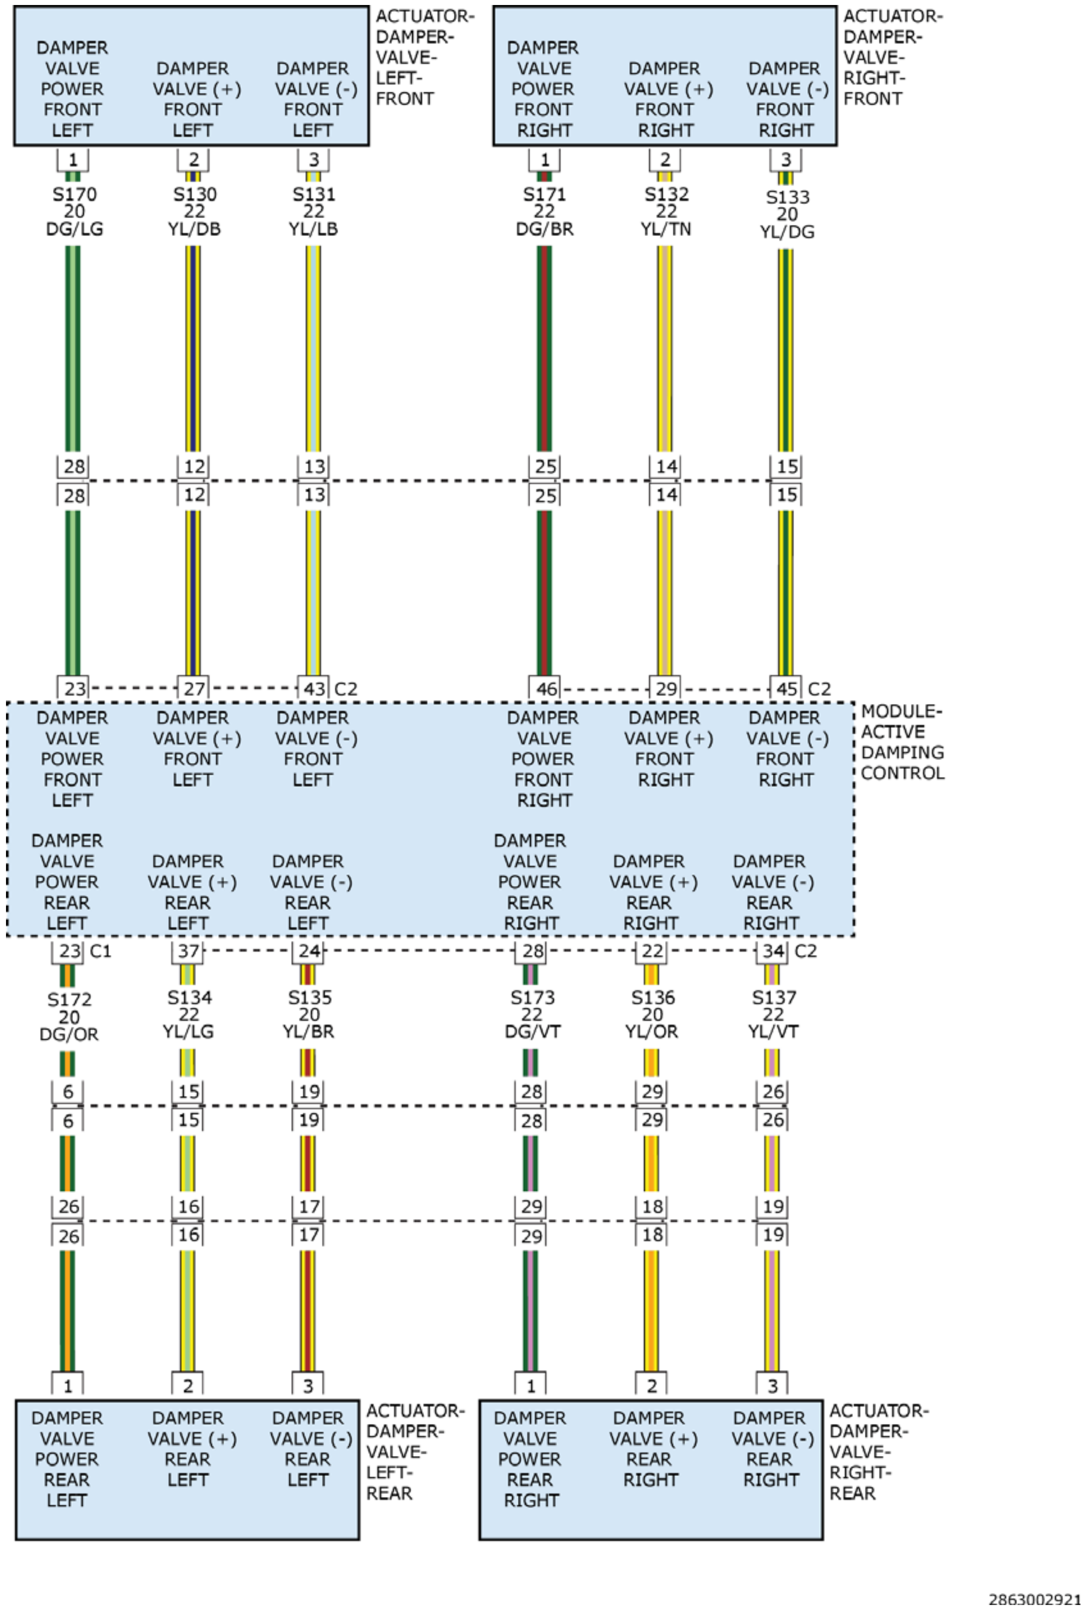

Fig. 48: Valve Damper Actuator Circuit Diagram

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects the Right Rear Damping Valve Solenoid Low Side 1 (compression stage) overcurrent caused by an internal failure in the Damping Valve Shock Assembly.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR
(S136) RIGHT REAR DAMPER VALVE (+) CIRCUIT OPEN OR HIGH RESISTANCE
DAMPING VALVE SHOCK ASSEMBLY
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase the DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE (S136) RIGHT REAR DAMPER VALVE (+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Disconnect the Right Rear Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Connect a jumper wire between Ground and the (S136) Right Rear Damper Valve (+) circuit in the Right Rear Damping Valve Shock Assembly harness connector.
   4. Using a 12-volt test light connected to B+, check the (S136) Right Rear Damper Valve (+) circuit in the ADCM C2 harness connector.

   NOTE: **The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

   Does the test light illuminate brightly?

   Yes

   - Go To 4

   No

   - Repair the (S136) Right Rear Damper Valve (+) circuit for an open or high resistance.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
4. **DAMPING VALVE SHOCK ASSEMBLY**
   1. Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the Engine.
   6. With the scan tool, read ADCM DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Active Damping Control Module (ADCM) in accordance with the Service

Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .

- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

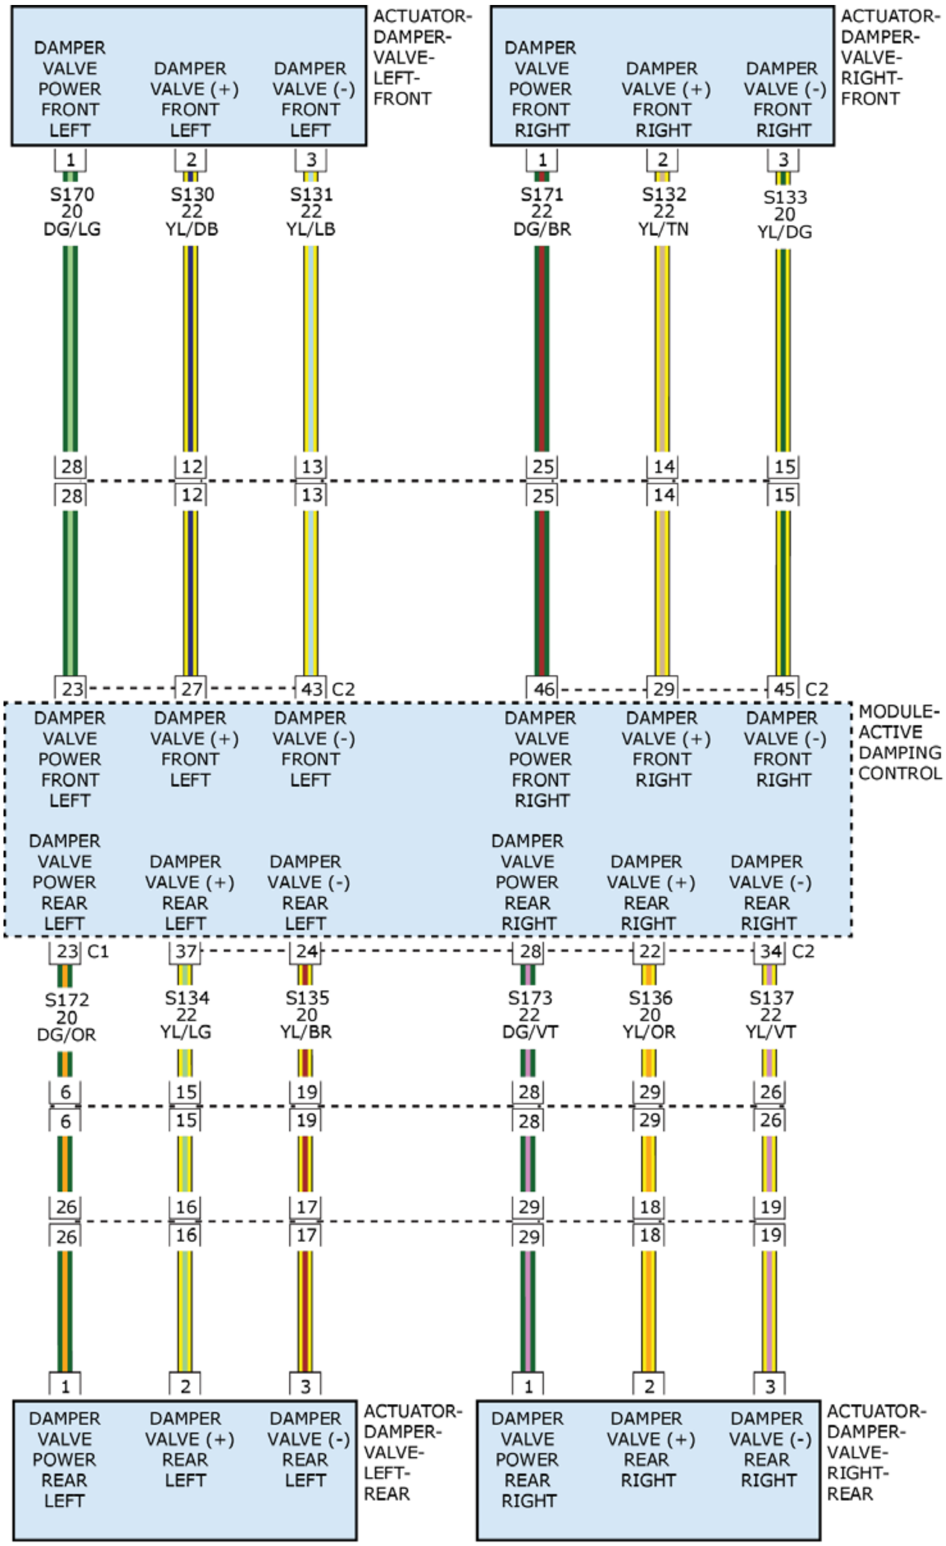
    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C15C9-19-RIGHT REAR DAMPING VALVE LOW SIDE 2 - OVERCURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE:	**If any other DTCs are present, repair them first before continuing with this diagnostic procedure.**



2863002921

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects the Right Rear Damping Valve Solenoid Low Side 2 (rebound stage) overcurrent caused by an internal failure in the Damping Valve Shock Assembly.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR
(S137) RIGHT REAR DAMPER VALVE (-) CIRCUIT OPEN OR HIGH RESISTANCE
DAMPING VALVE SHOCK ASSEMBLY
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **DAMPING VALVE SHOCK ASSEMBLY HARNESS CONNECTOR**

    NOTE: **Make sure the Damping Valve Shock Assembly harness connector is connected correctly.**

    1. Turn the ignition off.
    2. Inspect the Damping Valve Shock Assembly harness connector for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (S137) RIGHT REAR DAMPER VALVE (-) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Disconnect the Right Rear Damping Valve Shock Assembly harness connector.
   2. Disconnect the ADCM C2 harness connector.
   3. Connect a jumper wire between Ground and the (S137) Right Rear Damper Valve (-) circuit in the Right Rear Damping Valve Shock Assembly harness connector.
   4. Using a 12-volt test light connected to B+, check the (S137) Right Rear Damper Valve (-) circuit in the ADCM C2 harness connector.

   NOTE: **The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

   Does the test light illuminate brightly?

   Yes

   - Go To 4

   No

   - Repair the (S137) Right Rear Damper Valve (-) circuit for an open or high resistance.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **DAMPING VALVE SHOCK ASSEMBLY**
   1. Replace the Damping Valve Shock Assembly in accordance with the Service Information. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL** .
   2. Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Turn the ignition on.
   4. With the scan tool, erase the DTCs.
   5. Start the Engine.
   6. With the scan tool, read ADCM DTCs.

   Does the DTC remain active?

Yes

- Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C211B-92-IGNITION RUN/START INPUT CIRCUIT - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **If any other DTCs are present, repair them first before continuing with this diagnostic procedure.**

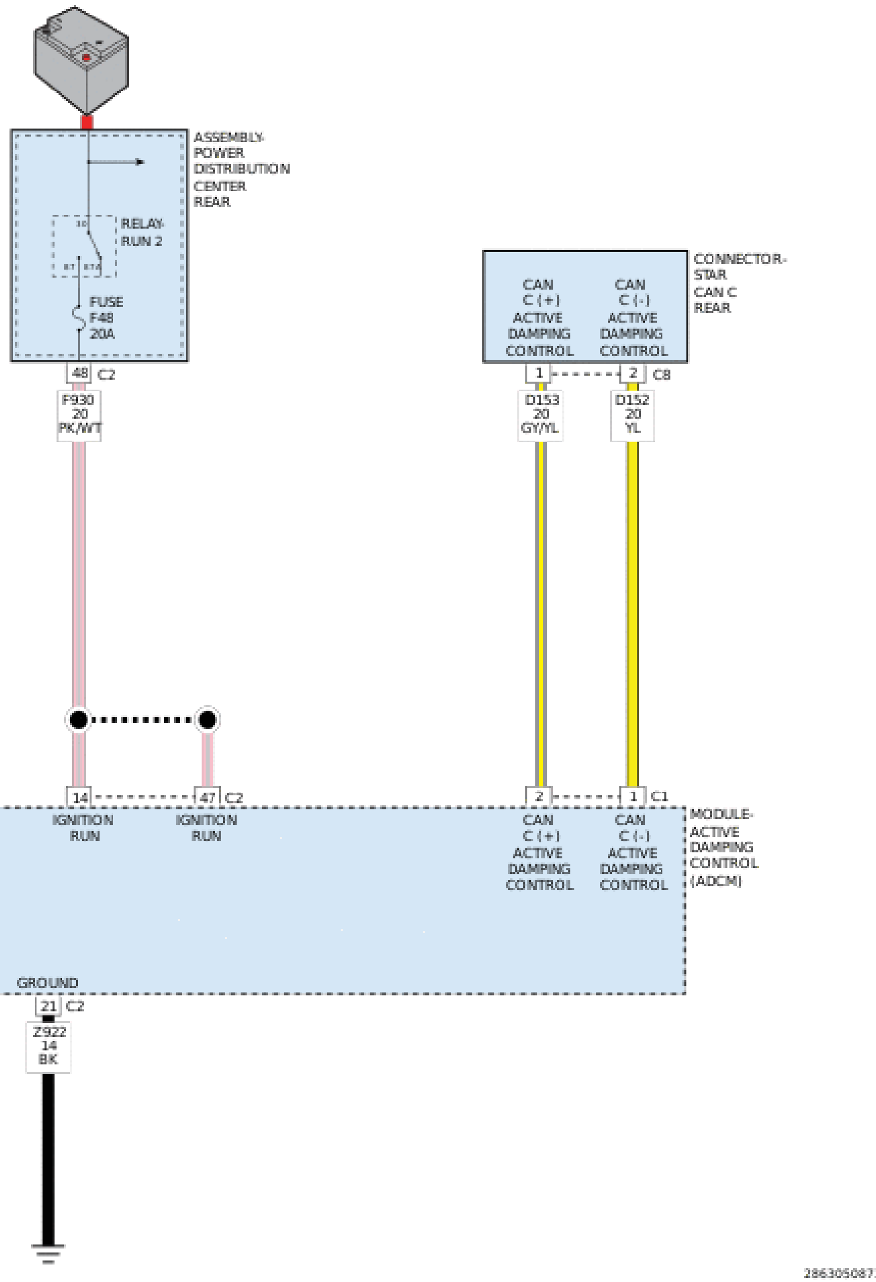

Fig. 50: Active Damping Control Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.

- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Ignition Status reported on the CAN Bus does not match the state of the Ignition Input.

POSSIBLE CAUSES

Possible Causes
FUSE F48 (20A)
(F930) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUITS SHORT TO VOLTAGE
(F930) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUITS OPEN OR HIGH RESISTANCE
(Z922) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, read ADCM DTCs and record on the repair order.
   3. With the scan tool, erase the DTCs.
   4. Start the engine.
   5. With the scan tool, read ADCM DTCs.

   Is the DTC active?

   Yes

   - Go To 2

   No

   - Go To 6
2. **CHECK THE FUSE**
   1. Turn the ignition on.
   2. Using a 12-volt test light connected to ground, check the fuse for power.

   Is the fuse good?

   Yes

   - Go To 3

No

- If the related fuse is open, check the (F930) Fused Ignition Switch Output (RUN/START) circuits for a short to ground.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **(F930) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUITS SHORT TO VOLTAGE**
    1. Turn ignition off.
    2. Disconnect the ADCM C2 harness connector.
    3. With a 12-volt test light connected to ground, check the (F930) Fused Ignition Switch Output (RUN/START) circuits in the ADCM C2 harness connector.

    NOTE: **The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

    Does the test light illuminate brightly?

    Yes

    - Repair the (F930) Fused Ignition Switch Output (RUN/START) circuits for a short to voltage.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 4
4. **(F930) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUITS FOR AN OPEN OR HIGH RESISTANCE**
    1. Turn the ignition on.
    2. With a 12-volt test light connected to ground check (F930) Fused Ignition Switch Output (RUN/START) circuits in the ADCM C2 harness connector.

    NOTE: **The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

    Does the test light illuminate brightly?

    Yes

    - Go To 5

    No

    - Repair the (F930) Fused Ignition Switch Output (RUN/START) circuits for an open or high resistance.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
5. **(Z922) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Turn the ignition off.

2. With a 12-volt test light connected to (B+) check (Z922) Ground circuit in the ADCM C2 harness connector.

NOTE: **The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

Does the test light illuminate brightly?

Yes

- Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Repair the (Z922) Ground circuit for an open or high resistance.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

Were any problems found?

Yes

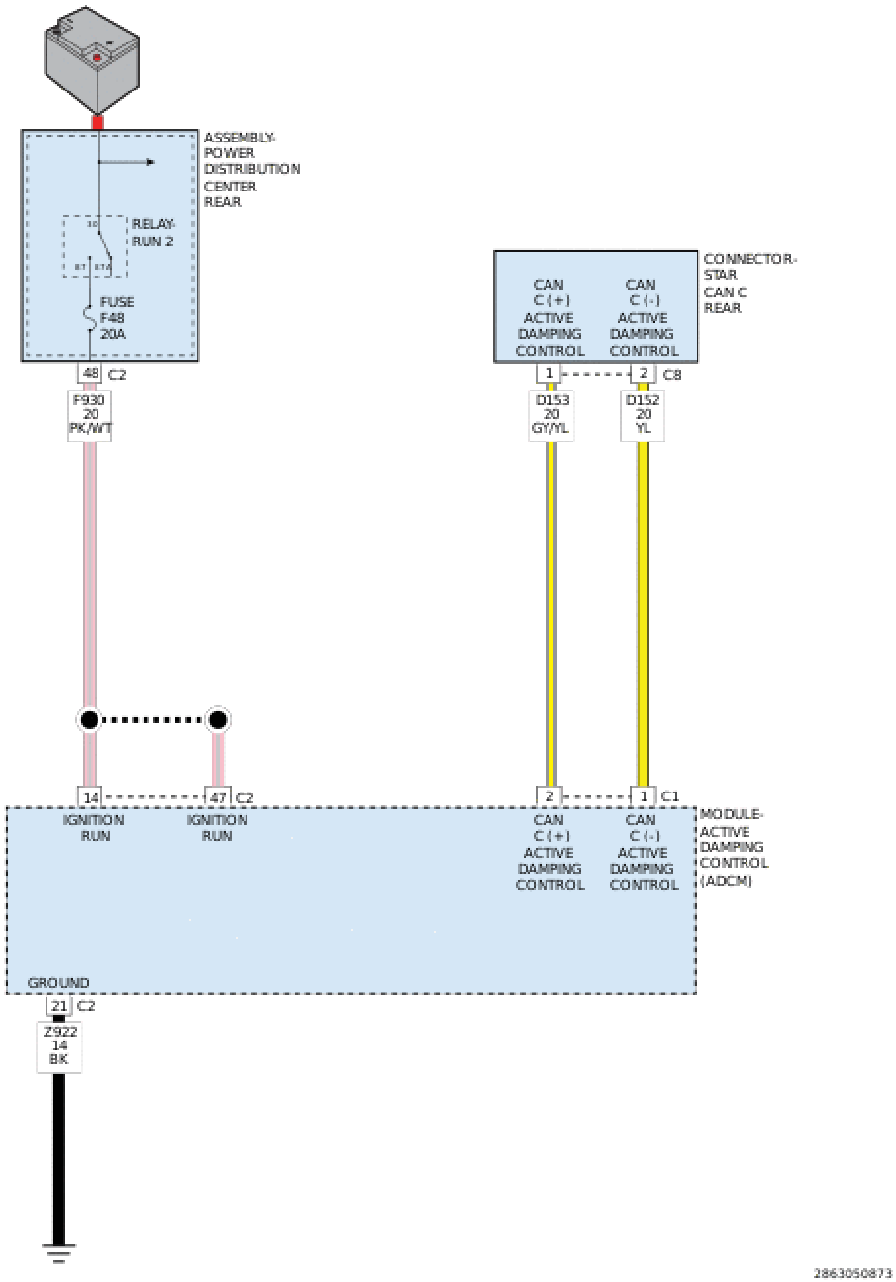
- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

C2129-16-BATTERY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .



[Fig. 51: Active Damping Control Module Circuit Diagram]
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.

- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects the battery voltage has dropped below 10 Volts for more than 15 seconds.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM DTCS PRESENT
(F930) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUITS OPEN OR HIGH RESISTANCE
(Z922) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHARGING SYSTEM DTCS PRESENT**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs in the Powertrain Control Module (PCM).

       Are there any Charging System or related voltage DTCs present?

       Yes

       - Perform the appropriate Charging System DTC diagnostic procedures before continuing with this test. Refer to **DTC INDEX** .

       No

       - Go To 2
2. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read ADCM DTCs and record on the repair order.
    2. With the scan tool, erase the DTCs.
    3. Start the Engine.
    4. With the scan tool, read ADCM DTCs.

       Is the DTC active?

       Yes

- Go To 3

No

- Go To 5

3. **(F930) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUITS FOR AN OPEN OR HIGH RESISTANCE**
    1. Turn the ignition off.
    2. Disconnect the ADCM C2 harness connector.
    3. Turn the ignition on.
    4. With a 12-volt test light connected to ground, check the (F930) Fused Ignition Switch Output (RUN/START) circuits in the ADCM C2 harness connector.

    NOTE: **The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

    Does the test light illuminate brightly?

    Yes

    - Go To 4

    No

    - Repair the (F930) Fused Ignition Switch Output (RUN/START) circuits for an open circuit or high resistance.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **(Z922) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Turn the ignition off.
    2. With a 12-volt test light connected to (B+) check (Z922) Ground circuit in the ADCM C2 harness connector.

    NOTE: **The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

    Does the test light illuminate brightly?

    Yes

    - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Repair the (Z922) Ground circuit for an open circuit or high resistance.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

       Were any problems found?

       Yes

       - Repair as necessary.
       - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C2129-17-BATTERY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects battery voltage has increased above 16 Volts for more than 15 seconds.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM DTCS PRESENT
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHARGING SYSTEM DTCS PRESENT**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs in the Powertrain Control Module (PCM).

   Are there any Charging System or related voltage DTCs present?

   Yes

   - Perform the appropriate diagnostic procedure. Refer to **DTC INDEX** .

   No

   - Go To 2
2. **CHECK FOR AN ACTIVE DTC**
   1. With the scan tool, read DTCs and record DTCs on the repair order.
   2. With the scan tool, erase the DTCs.
   3. Start the Engine.
   4. With the scan tool, read ADCM DTCs.

   Is the DTC active?

   Yes

   - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3
3. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

C212A-16-SYSTEM VOLTAGE LOW - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **Repair all other DTCs first before continuing with this test.**

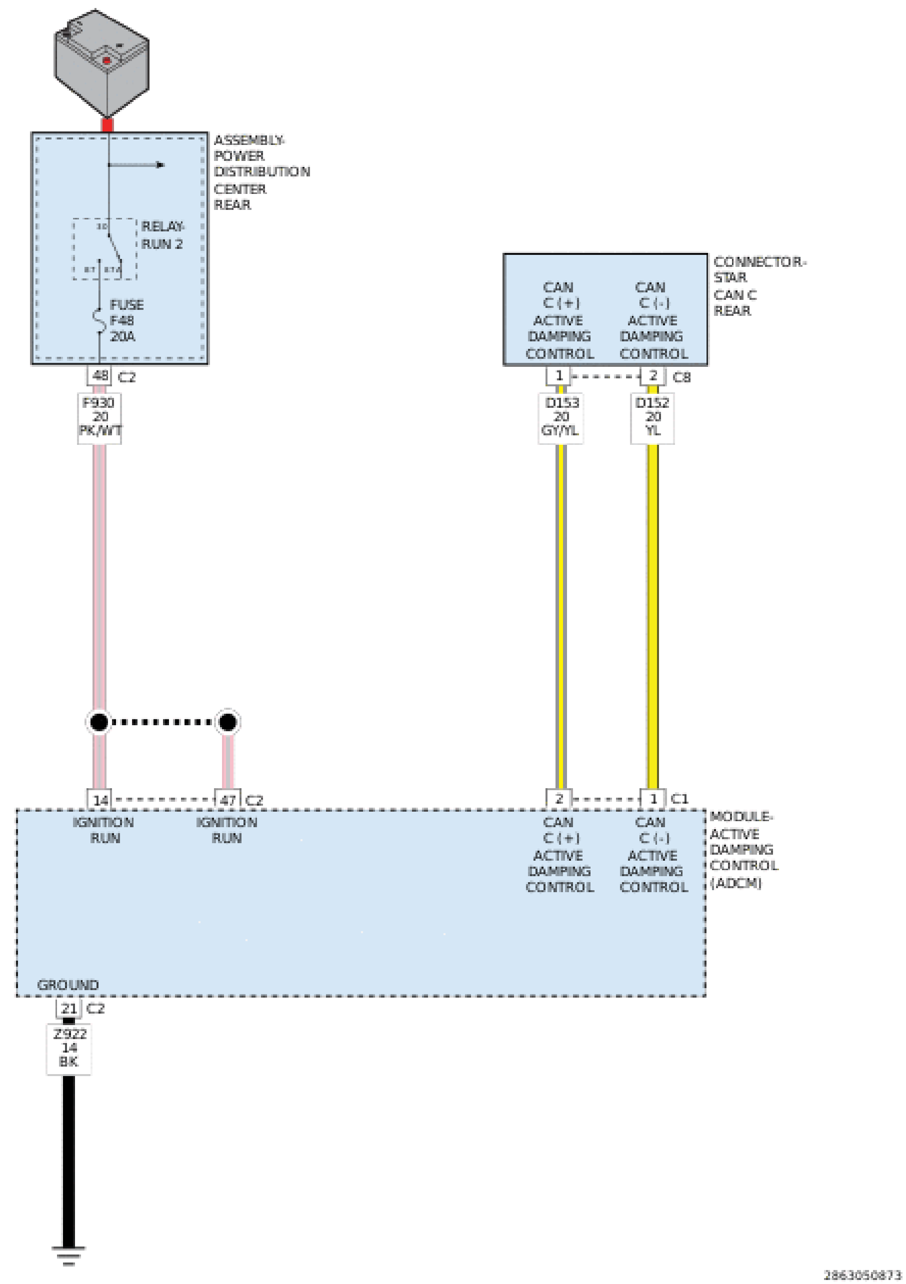


Fig. 52: Active Damping Control Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.

- Battery voltage between 10 and 16 volts.

SET CONDITION

- Active Damping Control Module (ADCM) detects the battery voltage has dropped below 10 Volts for more than 15 seconds.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.

POSSIBLE CAUSES

Possible Causes
(F930) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUITS OPEN OR HIGH RESISTANCE
(Z922) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read ADCM DTCs and record on the repair order.
    2. With the scan tool, erase the DTCs.
    3. Start the Engine.
    4. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 4
2. **(F930) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUITS FOR AN OPEN OR HIGH RESISTANCE**
    1. Turn the ignition off.
    2. Disconnect the ADCM C2 harness connector.
    3. Turn the ignition on.
    4. With a 12-volt test light connected to ground, check the (F930) Fused Ignition Switch Output (RUN/START) circuits in the ADCM C2 harness connector.

    NOTE: **The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

    Does the test light illuminate brightly?

Yes

- Go To 3

No

- Repair the (F930) Fused Ignition Switch Output (RUN/START) circuits for an open circuit or high resistance.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **(Z922) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. With a 12-volt test light connected to (B+) check (Z922) Ground circuit in the ADCM C2 harness connector.

   NOTE: **The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

   Does the test light illuminate brightly?

   Yes

   - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Repair the (Z922) Ground circuit for an open circuit or high resistance.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C212A-17-SYSTEM VOLTAGE HIGH - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **Repair all other DTCs first before continuing with this test.**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- Battery voltage between 10 and 16 volts.

SET CONDITION

- Active Damping Control Module (ADCM) detects the system voltage has increased above 16 Volts for more than 15 seconds.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM DTCS PRESENT
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHARGING SYSTEM DTCS PRESENT**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs in the Powertrain Control Module (PCM).

       Are there any Charging System or related voltage DTCs present?

       Yes

       - Perform the appropriate diagnostic procedure. Refer to **DTC INDEX** .

       No

       - Go To 2
2. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read ADCM DTCs and record on the repair order.
    2. With the scan tool, erase the DTCs.
    3. Start the Engine.
    4. With the scan tool, read ADCM DTCs.

Is the DTC active?

Yes

- Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C212C-11-SUSPENSION VALVE POWER SUPPLY VOLTAGE - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

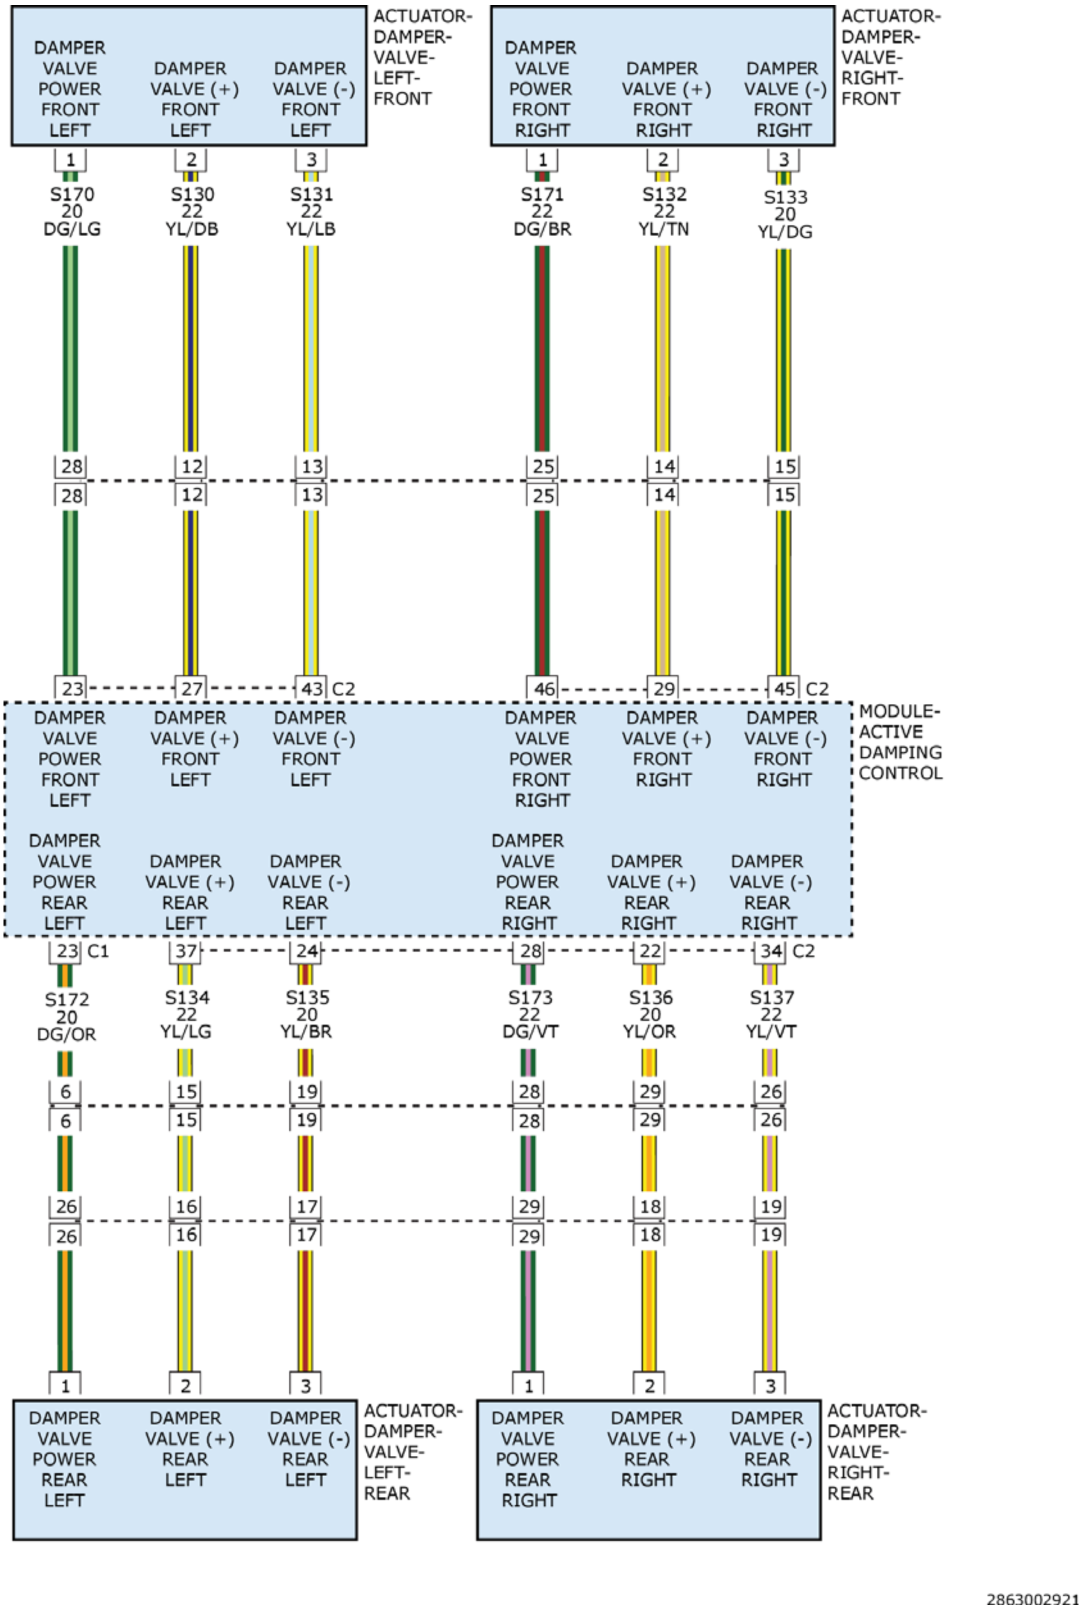

Fig. 53: Valve Damper Actuator Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects that too much current is being used when the on-board 12 volt power supply is turned on.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
(S170) LEFT FRONT DAMPER VALVE POWER SUPPLY CIRCUIT SHORTED TO GROUND
(S171) RIGHT FRONT DAMPER VALVE POWER SUPPLY CIRCUIT SHORTED TO GROUND
(S172) LEFT REAR DAMPER VALVE POWER SUPPLY CIRCUIT SHORTED TO GROUND
(S173) RIGHT REAR DAMPER VALVE POWER SUPPLY CIRCUIT SHORTED TO GROUND
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase the DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Go To 6
2. **CHECK THE (S170) LEFT FRONT DAMPER VALVE POWER SUPPLY CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the ADCM C1 harness connector.
    3. Disconnect the ADCM C2 harness connector.
    4. Disconnect the Left Front Damper Valve harness connector.

5. Measure the resistance between ground and the (S170) Left Front Damper Valve Power Supply circuit at the ADCM C2 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (S170) Left Front Damper Valve Power Supply circuit for a short to ground.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (S171) RIGHT FRONT DAMPER VALVE POWER SUPPLY CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Right Front Damper Valve harness connector.
   2. Measure the resistance between ground and the (S171) Right Front Damper Valve Power Supply circuit at the ADCM C2 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Repair the (S171) Right Front Damper Valve Power Supply circuit for a short to ground.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4
4. **CHECK THE (S172) LEFT REAR DAMPER VALVE POWER SUPPLY CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Left Rear Damper Valve harness connector.
   2. Measure the resistance between ground and the (S172) Left Rear Damper Valve Power Supply circuit at the ADCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Repair the (S172) Left Rear Damper Valve Power Supply circuit for a short to ground.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 5
5. **CHECK THE (S173) RIGHT REAR DAMPER VALVE POWER SUPPLY CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the Right Rear Damper Valve harness connector.

2. Measure the resistance between ground and the (S173) Right Rear Damper Valve Power Supply circuit at the ADCM C2 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (S173) Right Rear Damper Valve Power Supply circuit for a short to ground.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. Look for the data to change other than as expected or for the DTC to reset.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C212C-12-SUSPENSION VALVE POWER SUPPLY VOLTAGE - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

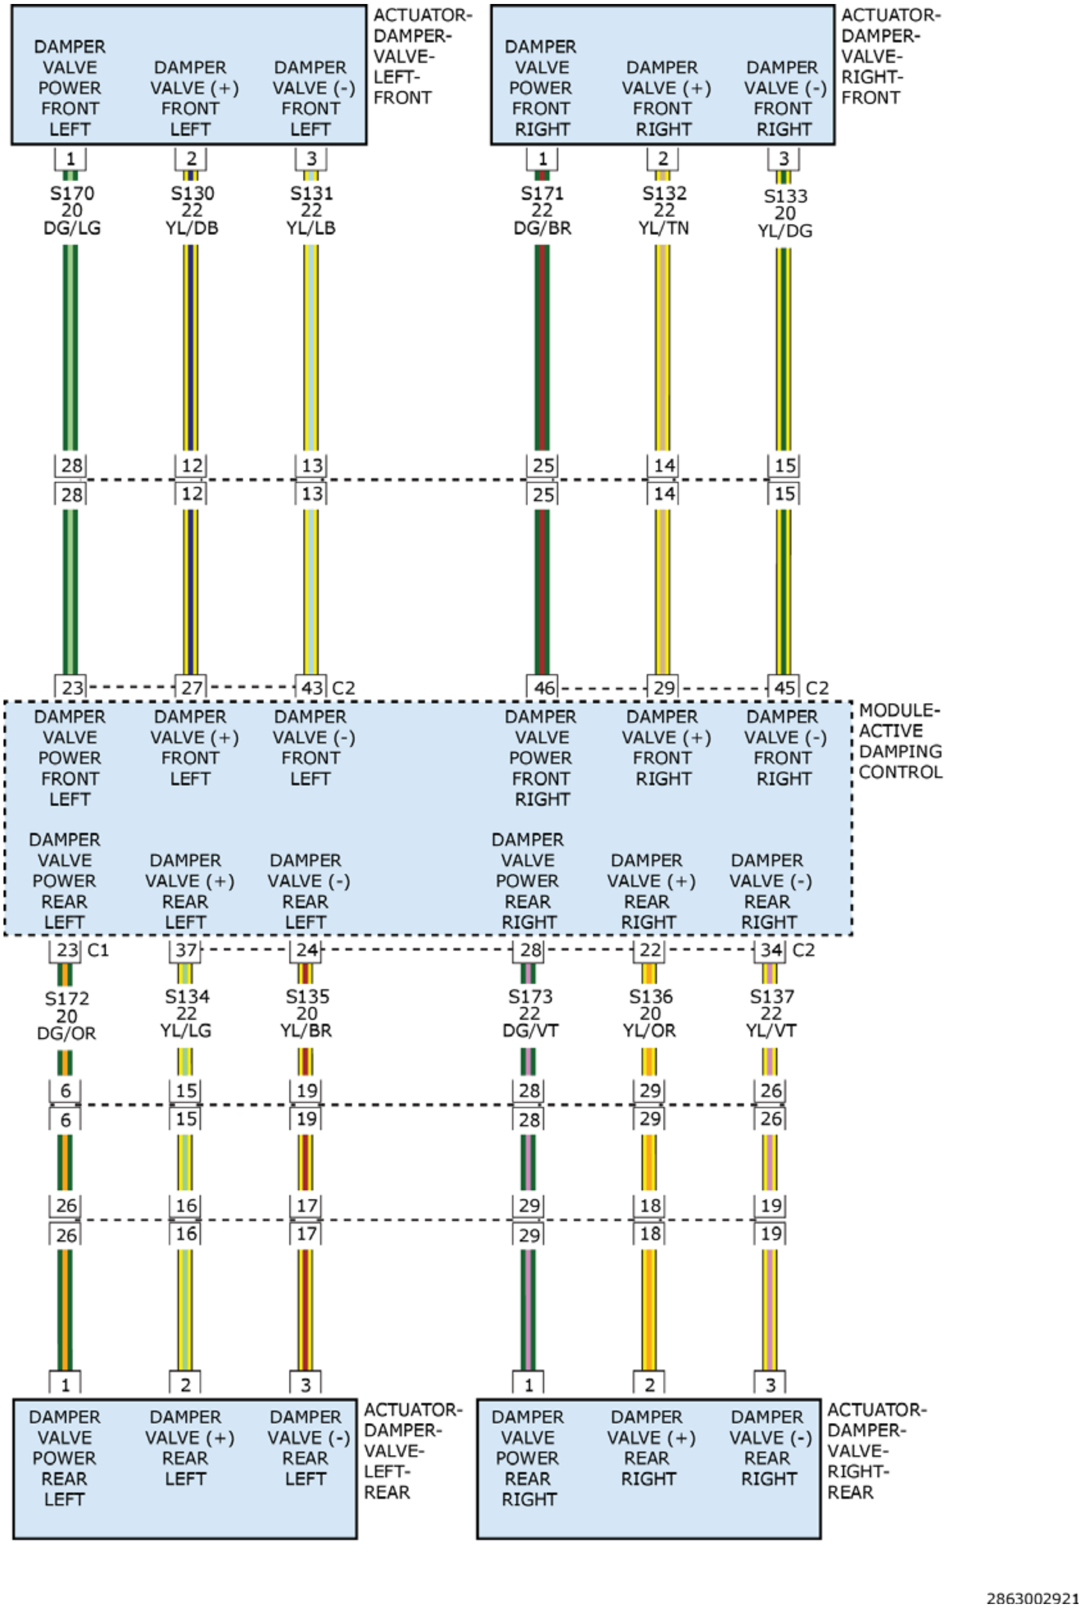

Fig. 54: Valve Damper Actuator Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Active Damping Control Module (ADCM) detects that too much current is being used when the on-board 12 volt power supply is turned on.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
(S170) LEFT FRONT DAMPER VALVE POWER SUPPLY CIRCUIT SHORTED TO GROUND
(S171) RIGHT FRONT DAMPER VALVE POWER SUPPLY CIRCUIT SHORTED TO GROUND
(S172) LEFT REAR DAMPER VALVE POWER SUPPLY CIRCUIT SHORTED TO GROUND
(S173) RIGHT REAR DAMPER VALVE POWER SUPPLY CIRCUIT SHORTED TO GROUND
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase the DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.

        Is the DTC active?

        Yes

        - Go To 2

        No

        - Go To 6
2. **CHECK THE (S170) LEFT FRONT DAMPER VALVE POWER SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the ADCM C1 harness connector.
    3. Disconnect the ADCM C2 harness connector.
    4. Disconnect the Left Front Damper Valve harness connector.

5. Turn the ignition on.
6. Measure the voltage of the (S170) Left Front Damper Valve Power Supply circuit at the ADCM C2 harness connector.

   Is there any voltage present?

   Yes

   - Repair the (S170) Left Front Damper Valve Power Supply circuit for a short to voltage.
   - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (S171) RIGHT FRONT DAMPER VALVE POWER SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Right Front Damper Valve harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (S171) Right Front Damper Valve Power Supply circuit at the ADCM C2 harness connector.

      Is there any voltage present?

      Yes

      - Repair the (S171) Right Front Damper Valve Power Supply circuit for a short to voltage.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **CHECK THE (S172) LEFT REAR DAMPER VALVE POWER SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Left Rear Damper Valve harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (S172) Left Rear Damper Valve Power Supply circuit at the ADCM C1 harness connector.

      Is there any voltage present?

      Yes

      - Repair the (S172) Left Rear Damper Valve Power Supply circuit for a short to voltage.
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **CHECK THE (S173) RIGHT REAR DAMPER VALVE POWER SUPPLY CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the Right Rear Damper Valve harness connector.
    3. Turn the ignition on.
    4. Measure the voltage of the (S173) Right Rear Damper Valve Power Supply circuit at the ADCM C2 harness connector.

    Is there any voltage present?

    Yes

    - Repair the (S173) Right Rear Damper Valve Power Supply circuit for a short to voltage.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Replace the Active Damping Control Module (ADCM) at accordance with the Service formation. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
6. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C2202-00-ORIGINAL VIN MISMATCH / MISSING

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Active Damping Control Module (ADCM) continuously monitors the vehicle's VIN (from the CAN bus) and compares it to the VIN which is internally stored within the ADCM when the vehicle was first assembled. When they do not match this fault sets.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- The vehicle's Vehicle Identification Number (VIN) (being transmitted on the CAN bus) does not match the current VIN stored within the Active Damping Control Module (ADCM).

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
COMMUNICATIONS DTC(S) PRESENT
POWERTRAIN CONTROL MODULE (PCM)
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ADCM DTCs and record on the repair order.
    3. With the scan tool, erase the DTCs.
    4. Start the Engine.
    5. With the scan tool, read ADCM DTCs.
    6. With the scan tool, read DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

- Go To 3

2. **WRONG VIN PROGRAMMED IN PCM**
    1. Turn the ignition on.
    2. With the scan tool, read the VIN in the PCM.
    3. Compare VIN in the PCM to the vehicle VIN.

    Is the correct VIN programmed in the PCM?

    Yes

    - Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Replace the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
    - Perform the PCM VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

3. **COMMUNICATION DTCS PRESENT**
    1. Turn the ignition off.
    2. With the scan tool, read DTCs in all other modules. If any communications DTCs are present, perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .
    3. Perform any Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

C2206-00-VEHICLE CONFIGURATION MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **If the BCM has been serviced make sure that the Restore Vehicle Configuration is performed before continuing with this diagnostic procedure.**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- Battery voltage between 10 and 16 volts.

SET CONDITION

- Any of the learned Vehicle Configuration data from the CAN Bus has changed.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) CAN BUS DTCS
POWERTRAIN CONTROL MODULE (PCM) DTCS
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

1. **BODY CONTROL MODULE (BCM) CAN BUS DTCS ARE PRESENT**
    1. With the scan tool, read BCM DTCs and record on the repair order.

        Are there any BCM CAN BUS DTCs present?

        Yes

        - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

        No

        - Go To 2
2. **POWERTRAIN CONTROL MODULE (PCM) DTCS ARE PRESENT**
    1. With the scan tool, read PCM DTCs and record on the repair order.

        Are there any PCM DTCs present?

        Yes

        - Perform the appropriate diagnostic procedure. Refer to **DTC INDEX** .

        No

        - Using the schematics as a guide, check the ADCM pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Active Damping Control Module (ADCM) Module in accordance with the Service Information. Refer to **MODULE, ACTIVE**

DAMPING CONTROL, REMOVAL .

- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C220C-00-ACTIVE SUSPENSION MODULE INTERNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Active Damping Control Module (ADCM) continuously monitors internal hardware circuitry for defects. The Service Active Damping System Message will be displayed on the cluster when this fault is first active.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.

SET CONDITION

- Detection of RAM, ROM, EEPROM, Watchdog, no current calibration, or high side switch defect recognized.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
ACTIVE DAMPING CONTROL MODULE (ADCM)

DIAGNOSTIC TEST

ACTIVE DAMPING CONTROL MODULE (ADCM) INTERNAL CONDITION

1. The ASCM is reporting internal errors.

   NOTE: **Before continuing, check the Air Suspension Control Module (ASCM) harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

2. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.
3. Perform any Service Bulletins that may apply.

   Were there any problems found?

Yes

- Repair as necessary.
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U0001-00-CAN C BUS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- Battery voltage between 10 and 16 volts.

SET CONDITION

- Active Damping Control Module (ADCM) detects an open, short to ground or a short to voltage on the CAN C Bus circuit.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE (BCM) POWER AND GROUND
BODY CONTROL MODULE (BCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY THE DTC IS ACTIVE

NOTE: **Make sure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.**

1. Turn the ignition on.
2. With the scan tool, read active DTCs.

Is the DTC active at this time?

Yes

- **Refer to DTC INDEX** and perform the U0001-CAN C Bus diagnostic procedure.

No

- **Refer to STORED LOST COMMUNICATION DTCS** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0100-00-LOST COMMUNICATION WITH ECM/PCM

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0101-00-LOST COMMUNICATION WITH TCM

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0121-00-LOST COMMUNICATION WITH ANTI-LOCK BRAKE SYSTEM (ABS) CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0126-00-LOST COMMUNICATION WITH STEERING ANGLE SENSOR

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0155-00-LOST COMMUNICATION WITH CLUSTER-CCN

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0401-00-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- System voltage between 10 and 16 volts.
- One valid CAN message received at least once.

SET CONDITION

- Active Damping Control Module (ADCM) detects an incorrect CAN message from the Powertrain Control Module (PCM).

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
ACTIVE DAMPING CONTROL MODULE (ADCM) CAN BUS DTCS
POWERTRAIN CONTROL MODULE (PCM) CAN BUS DTCS
ACTIVE DAMPING CONTROL MODULE
POWERTRAIN CONTROL MODULE (PCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: **This DTC must be active for the results of this test to be valid.**

   1. Perform any Service Bulletins that may apply.
   2. Turn the ignition on.
   3. With the scan tool, read ADCM DTCs and record on the repair order.
   4. With the scan tool, erase the DTCs.
   5. Cycle the ignition switch from off to on.
   6. With the scan tool, read the DTCs.

      Is the DTC active?

      Yes

      - Go To 2

      No

      - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
2. **CHECK POWERTRAIN CONTROL MODULE (PCM) CAN BUS DTCS ARE PRESENT**
   1. With the scan tool, read the PCM DTCs.

      Are there any PCM CAN BUS DTCs present?

      Yes

      - Perform the appropriate diagnostic procedures. Refer to **DTC INDEX** .

      No

- Go To 3

3. **CHECK OTHER MODULES FOR CAN BUS DTCS**
    1. With the scan tool, read the DTCs.

    Are there any CAN BUS DTCs present?

    Yes

    - Using the schematics as a guide, check the Powertrain Control Module (PCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .

    No

    - Using the schematics as a guide, check the Active Damping Control Module (ADCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
    - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U0402-00-IMPLAUSIBLE DATA RECEIVED FROM TCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- System voltage between 10 and 16 volts.
- One valid CAN message received at least once.

SET CONDITION

- Active Damping Control Module (ADCM) detects an incorrect CAN message from the Transmission Control Module (TCM).

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
ACTIVE DAMPING CONTROL MODULE (ADCM) CAN BUS DTCS

Possible Causes
TRANSMISSION CONTROL MODULE (TCM) CAN BUS DTCS
ACTIVE DAMPING CONTROL MODULE
TRANSMISSION CONTROL MODULE (TCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: **This DTC must be active for the results of this test to be valid.**

   1. Perform any Service Bulletins that may apply.
   2. Turn the ignition on.
   3. With the scan tool, read ADCM DTCs and record on the repair order.
   4. With the scan tool, erase the DTCs.
   5. Cycle the ignition switch from off to on.
   6. With the scan tool, read the DTCs.

   Is the DTC active?

   Yes

   - Go To 2

   No

   - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

2. **CHECK TRANSMISSION CONTROL MODULE (TCM) CAN BUS DTCS ARE PRESENT**
   1. With the scan tool, read the TCM DTCs.

   Are there any TCM CAN BUS DTCs present?

   Yes

   - Perform the appropriate diagnostic procedures. Refer to **DTC INDEX** .

   No

   - Go To 3

3. **CHECK OTHER MODULES FOR CAN BUS DTCS**
   1. With the scan tool, read the DTCs.

   Are there any CAN BUS DTCs present?

   Yes

- Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Transmission Control Module (TCM) in accordance with the Service Information. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .

No

- Using the schematics as a guide, check the Active Damping Control Module (ADCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U0415-00-IMPLAUSIBLE DATA RECEIVED FROM ABS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No over voltage DTCs.
- One valid CAN message received at least once.
- No CAN BUS circuit error condition present.
- No lost communication with ABS condition present.

SET CONDITION

- Active Damping Control Module (ADCM) is receiving implausible data for vehicle speed, wheel speeds, brake switch status, longitudinal acceleration, yaw rate, or lateral acceleration from the Anti-lock Brake System (ABS) Module.

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
ACTIVE DAMPING CONTROL MODULE (ADCM) DTCS
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE DTCS
ACTIVE DAMPING CONTROL MODULE (ADCM)
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Perform any Service Bulletins that may apply.
   2. Turn the ignition on.
   3. With the scan tool, read ADCM DTCs and record on the repair order.
   4. With the scan tool, erase the DTCs.
   5. Cycle the ignition switch from off to on.
   6. With the scan tool, read the DTCs.

   Is the DTC active?

   Yes

   - Go To 2

   No

   - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

2. **CHECK ANTI-LOCK BRAKE SYSTEM (ABS) MODULE CAN BUS DTCS ARE PRESENT**
   1. With the scan tool, read the ABS DTCs.

   Are there any ABS CAN BUS DTCs present?

   Yes

   - Perform the appropriate diagnostic procedures. Refer to **DIAGNOSIS AND TESTING** .

   No

   - Go To 3

3. **CHECK OTHER MODULES FOR CAN BUS DTCS**
   1. With the scan tool, read the DTCs.

   Are there any CAN BUS DTCs present?

   Yes

   - Using the schematics as a guide, check the Anti-lock Brake System (ABS) Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .

No

- Using the schematics as a guide, check the Active Damping Control Module (ADCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
- Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U0422-00-IMPAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- System voltage between 10 and 16 volts.
- One valid CAN message received at least once.

SET CONDITION

- Active Damping Control Module (ADCM) detects an incorrect CAN message from the Body Control Module (BCM).

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
ACTIVE DAMPING CONTROL MODULE (ADCM) CAN BUS DTCS
BODY CONTROL MODULE (BCM) CAN BUS DTCS
ACTIVE DAMPING CONTROL MODULE
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

NOTE: **This DTC must be active for the results of this test to be valid.**

1. Perform any Service Bulletins that may apply.
2. Turn the ignition on.
3. With the scan tool, read ADCM DTCs and record on the repair order.
4. With the scan tool, erase the DTCs.

5. Cycle the ignition switch from off to on.
6. With the scan tool, read the DTCs.

   Is the DTC active?

   Yes

   - Go To 2

   No

   - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

2. **CHECK BODY CONTROL MODULE (BCM) CAN BUS DTCS ARE PRESENT**
   1. With the scan tool, read the BCM DTCs.

      Are there any BCM CAN BUS DTCs present?

      Yes

      - Perform the appropriate diagnostic procedures. Refer to **DIAGNOSTIC CODE INDEX** .

      No

      - Go To 3

3. **CHECK OTHER MODULES FOR CAN BUS DTCS**
   1. With the scan tool, read the DTCs.

      Are there any CAN BUS DTCs present?

      Yes

      - Using the schematics as a guide, check the Body Control Module (BCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .

      No

      - Using the schematics as a guide, check the Active Damping Control Module (ADCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
      - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U0429-00-IMPLAUSIBLE DATA RECEIVED FROM SCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- System voltage between 10 and 16 volts.
- One valid CAN message received at least once.

SET CONDITION

- Active Damping Control Module (ADCM) detects an incorrect CAN message from the Body Control Module (BCM).

DEFAULT ACTION

- Active Damping Suspension (ADS) in full firm mode.
- "Service ADS" displayed in Electronic Vehicle Information Center (EVIC).

POSSIBLE CAUSES

Possible Causes
ACTIVE DAMPING CONTROL MODULE (ADCM) CAN BUS DTCS
STEERING COLUMN CONTROL MODULE (SCCM) CAN BUS DTCS
ACTIVE DAMPING CONTROL MODULE
STEERING CONTROL MODULE (SCCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Perform any Service Bulletins that may apply.
   2. Turn the ignition on.
   3. With the scan tool, read ADCM DTCs and record on the repair order.
   4. With the scan tool, erase the DTCs.
   5. Cycle the ignition switch from off to on.
   6. With the scan tool, read the DTCs.

   Is the DTC active?

   Yes

   - Go To 2

   No

- Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

2. **CHECK STEERING COLUMN CONTROL MODULE (SCCM) CAN BUS DTCS ARE PRESENT**
    1. With the scan tool, read the SCCM DTCs.

        Are there any SCCM CAN BUS DTCs present?

        Yes

        - Perform the appropriate diagnostic procedures. Refer to **DIAGNOSIS AND TESTING** .

        No

        - Go To 3
3. **CHECK OTHER MODULES FOR CAN BUS DTCS**
    1. With the scan tool, read the DTCs.

        Are there any CAN BUS DTCs present?

        Yes

        - Using the schematics as a guide, check the Steering Column Control Module (SCCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN CONTROL, REMOVAL** .

        No

        - Using the schematics as a guide, check the Active Damping Control Module (ADCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Active Damping Control Module (ADCM) in accordance with the Service Information. Refer to **MODULE, ACTIVE DAMPING CONTROL, REMOVAL** .
        - Perform the ADCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

STANDARD PROCEDURE

ADCM VERIFICATION TEST

DIAGNOSTIC TEST

ADCM VERIFICATION TEST

1. Turn the ignition off.
2. Connect all previously disconnected components and connectors.
3. Verify all accessories are turned off and the battery is fully charged.

4. Verify that the ignition is on, with the scan tool, erase all Diagnostic Trouble Codes (DTCs) from All modules. Start the engine and allow it to run for two minutes and fully operate the system that was indicating the failure.
5. Turn the ignition off and wait five seconds. Turn the ignition on and using the scan tool, read DTCs from all modules.
6. If any Diagnostic Trouble Codes are present, and perform the diagnostic procedure. Refer to **DIAGNOSIS AND TESTING**.
7. If there are no DTCs present after turning ignition on, road test the vehicle for at least five minutes.
   - Test drive the vehicle by turning the vehicle left or right in a curving manner at a speed above 25 km/h (15 mph).
8. Again, with the scan tool read DTCs. If any DTCs are present, refer to **DIAGNOSIS AND TESTING** for the diagnostic procedure and troubleshoot the new or recurring DTC.
9. If there are no Diagnostic Trouble Codes (DTCs) present, and the customer's concern can no longer be duplicated, the repair is complete.

   Are any DTCs present or is the original concern still present?

   Yes

   - Repair is not complete, perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING**.

   No

   - Repair is complete.

.

Article GUID: A00735880

DIAGNOSTIC CODE INDEX

DIAGNOSTIC CODE INDEX

DTC	Description
B1783-01	STOP LAMP CONTROL - GENERAL ELECTRICAL FAILURE
C0020-01	ABS PUMP MOTOR CONTROL - GENERAL ELECTRICAL FAILURE
C0020-16	ABS PUMP MOTOR CONTROL - CIRCUIT VOLTAGE BELOW THRESHOLD
C0020-1C	ABS PUMP MOTOR CONTROL - CIRCUIT VOLTAGE OUT OF RANGE
C0020-35	ABS PUMP MOTOR CONTROL - SIGNAL HIGH TIME>MAXIMUM
C0021-02	BRAKE BOOSTER - GENERAL SIGNAL FAILURE
C0030-02	LEFT FRONT TONE WHEEL - GENERAL SIGNAL FAILURE
C0031-1D	LEFT FRONT WHEEL SPEED SENSOR - CIRCUIT CURRENT OUT OF RANGE
C0031-2F	LEFT FRONT WHEEL SPEED SENSOR - SIGNAL ERRATIC
C0031-4A	LEFT FRONT WHEEL SPEED SENSOR - INCORRECT COMPONENT INSTALLED
C0031-62	LEFT FRONT WHEEL SPEED SENSOR - SIGNAL COMPARE FAILURE
C0033-02	RIGHT FRONT TONE WHEEL - GENERAL SIGNAL FAILURE
C0034-1D	RIGHT FRONT WHEEL SPEED SENSOR - CIRCUIT CURRENT OUT OF RANGE
C0034-2F	RIGHT FRONT WHEEL SPEED SENSOR - SIGNAL ERRATIC
C0034-4A	RIGHT FRONT WHEEL SPEED SENSOR - INCORRECT COMPONENT INSTALLED
C0034-62	RIGHT FRONT WHEEL SPEED SENSOR - SIGNAL COMPARE FAILURE
C0036-02	LEFT REAR TONE WHEEL - GENERAL SIGNAL FAILURE
C0037-1D	LEFT REAR WHEEL SPEED SENSOR - CIRCUIT CURRENT OUT OF RANGE
C0037-2F	LEFT REAR WHEEL SPEED SENSOR - SIGNAL ERRATIC
C0037-4A	LEFT REAR WHEEL SPEED SENSOR - INCORRECT COMPONENT INSTALLED
C0037-62	LEFT REAR WHEEL SPEED SENSOR - SIGNAL COMPARE FAILURE
C0039-02	RIGHT REAR TONE WHEEL - GENERAL SIGNAL FAILURE
C003A-1D	RIGHT REAR WHEEL SPEED SENSOR - CIRCUIT CURRENT OUT OF RANGE
C003A-2F	RIGHT REAR WHEEL SPEED SENSOR - SIGNAL ERRATIC
C003A-4A	RIGHT REAR WHEEL SPEED SENSOR - INCORRECT COMPONENT INSTALLED
C003A-62	RIGHT REAR WHEEL SPEED SENSOR - SIGNAL COMPARE FAILURE
C0042-11	BRAKE PEDAL POSITION SENSOR - CIRCUIT SHORT TO GROUND
C0042-12	BRAKE PEDAL POSITION SENSOR - CIRCUIT SHORT TO BATTERY

DTC	Description
C0042-28	BRAKE PEDAL POSITION SENSOR - SIGNAL BIAS LEVEL OUT OF RANGE / ZERO ADJUSTMENT FAILURE
C0042-2A	BRAKE PEDAL POSITION SENSOR - STUCK
C0042-54	BRAKE PEDAL POSITION SENSOR - MISSING CALIBRATION
C0042-62	BRAKE PEDAL POSITION SENSOR - SIGNAL COMPARE FAILURE
C0044-01	BRAKE PRESSURE SENSOR 1 - GENERAL ELECTRICAL FAILURE
C0044-28	BRAKE PRESSURE SENSOR 1 - SIGNAL BIAS LEVEL OUT OF RANGE / ZERO ADJUSTMENT FAILURE
C0044-49	BRAKE PRESSURE 1 - INTERNAL ELECTRONIC FAILURE
C0044-62	BRAKE PRESSURE SENSOR 1 - SIGNAL COMPARE FAILURE
C0051-22	STEERING WHEEL POSITION SENSOR - SIGNAL AMPLITUDE > MAXIMUM
C0051-28	STEERING WHEEL POSITION SENSOR - SIGNAL BIAS LEVEL OUT OF RANGE / ZERO ADJUSTMENT FAILURE
C0051-49	STEERING WHEEL POSITION SENSOR - INTERNAL ELECTRONIC FAILURE
C0051-62	STEERING WHEEL POSITION SENSOR - SIGNAL COMPARE FAILURE
C006A-28	MULTI-AXIS ACCELERATION SENSOR - SIGNAL BIAS LEVEL OUT OF RANGE / ZERO ADJUSTMENT FAILURE
C006A-49	MULTI-AXIS ACCELERATION SENSOR - INTERNAL ELECTRONIC FAILURE
C006A-56	MULTI-AXIS ACCELERATION SENSOR- INVALID / INCOMPATIBLE CONFIGURATION
C006A-62	MULTI-AXIS ACCELERATION SENSOR - SIGNAL COMPARE FAILURE
C0078-86	TIRE DIAMETER - SIGNAL INVALID
C1046-92	LEFT FRONT WHEEL PRESSURE PHASE MONITORING - PERFORMANCE OR INCORRECT OPERATION
C1047-92	RIGHT FRONT WHEEL PRESSURE PHASE MONITORING - PERFORMANCE OR INCORRECT OPERATION
C1048-92	LEFT REAR WHEEL PRESSURE PHASE MONITORING - PERFORMANCE OR INCORRECT OPERATION
C1049-92	RIGHT REAR WHEEL PRESSURE PHASE MONITORING - PERFORMANCE OR INCORRECT OPERATION
C1082-01	VACUUM PRESSURE SENSOR - GENERAL ELECTRICAL FAILURE
C1082-02	VACUUM PRESSURE SENSOR - GENERAL SIGNAL FAILURE
C1082-2F	VACUUM PRESSURE SENSOR - SIGNAL ERRATIC
C121A-09	STEERING ANGLE SENSOR NOT INITIALIZED - COMPONENT FAILURES
C121C-00	TORQUE REQUEST SIGNAL DENIED
C1239-00	EMISSION ROLLS TEST ACTIVE
C123B-4B	ESP SYSTEM CONTROL TOO LONG - OVER TEMPERATURE
C1246-1C	VACUUM PRESSURE SENSOR SUPPLY - CIRCUIT VOLTAGE OUT OF RANGE

DTC	Description
C124F-00	ESP REQUEST DENIED FROM ACC
C1252-92	VACUUM PUMP CONTROL CIRCUIT - PERFORMANCE OR INCORRECT OPERATION
C2100-16	BATTERY VOLTAGE LOW - CIRCUIT VOLTAGE BELOW THRESHOLD
C2101-17	BATTERY VOLTAGE HIGH - CIRCUIT VOLTAGE ABOVE THRESHOLD
C2114-16	DYNAMICS SENSOR SUPPLY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD
C2114-17	DYNAMICS SENSOR SUPPLY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD
C211B-92	IGNITION RUN/START INPUT CIRCUIT - PERFORMANCE OR INCORRECT OPERATION
C212A-16	SYSTEM VOLTAGE LOW - CIRCUIT VOLTAGE BELOW THRESHOLD
C212A-17	SYSTEM VOLTAGE HIGH - CIRCUIT VOLTAGE ABOVE THRESHOLD
C2200-41	ANTI-LOCK BRAKE MODULE INTERNAL - GENERAL CHECKSUM FAILURE
C2200-44	ANTI-LOCK BRAKE MODULE INTERNAL - DATA MEMORY FAILURE
C2200-45	ANTI-LOCK BRAKE MODULE INTERNAL - PROGRAM MEMORY FAILURE
C2200-46	ANTI-LOCK BRAKE MODULE INTERNAL - CALIBRATION / PARAMETER MEMORY FAILURE
C2200-47	ANTI-LOCK BRAKE MODULE INTERNAL - WATCHDOG / SAFETY AuC FAILURE
C2200-48	ANTI-LOCK BRAKE MODULE INTERNAL - SUPERVISION SOFTWARE FAILURE
C2200-49	ANTI-LOCK BRAKE MODULE INTERNAL - INTERNAL ELECTRONIC FAILURE
C2202-00	ORIGINAL VIN MISMATCH / MISSING
C2206-00	VEHICLE CONFIGURATION MISMATCH
C220B-00	ABS ACC NOT CALIBRATED
U0002-88	CAN C BUS OFF PERFORMANCE - BUS OFF
U0100-00	LOST COMMUNICATION WITH ECM/PCM
U0101-00	LOST COMMUNICATION WITH TCM
U0104-00	LOST COMMUNICATION WITH CRUISE CONTROL MODULE
U0125-00	LOST COMMUNICATION WITH DYNAMICS SENSOR
U0126-00	LOST COMMUNICATION WITH STEERING ANGLE SENSOR
U0140-00	LOST COMMUNICATION WITH BODY CONTROL MODULE
U0401-00	IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM
U0402-00	IMPLAUSIBLE DATA RECEIVED FROM TCM
U0405-00	INVALID DATA RECEIVED CRUISE CONTROL MODULE
U0422-00	IMPLAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE
U0429-00	IMPLAUSIBLE DATA RECEIVED FROM SCM
U0432-00	INVALID DATA RECEIVED FROM MULTI-AXIS ACCELERATION SENSOR MODULE

DTC	Description
U1003-88	ESP CAN C BUS PERFORMANCE - BUS OFF
U140E-00	IMPLAUSIBLE VEHICLE CONFIGURATION DATA RECEIVED

DTC TROUBLESHOOTING

B1783-01-STOP LAMP CONTROL - GENERAL ELECTRICAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

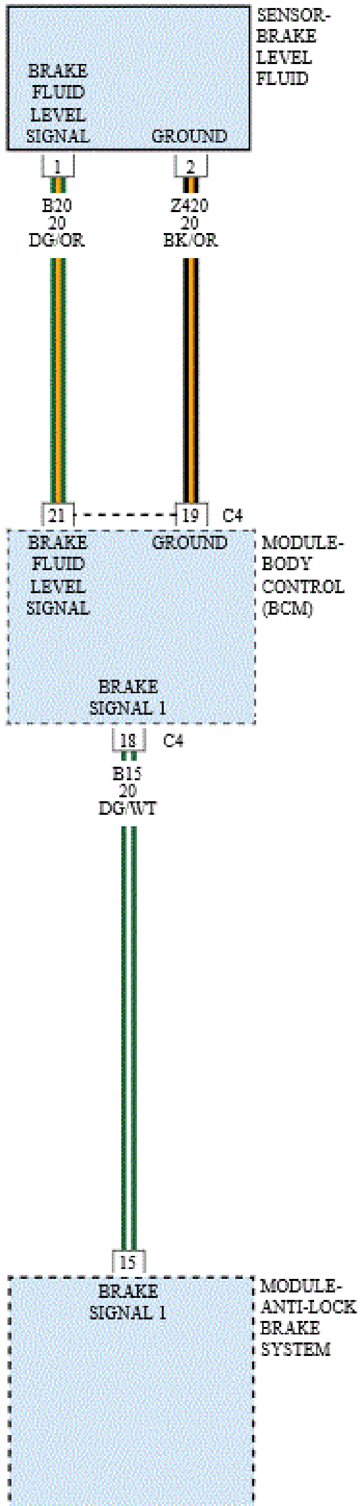

Fig. 1: Brake Level Fluid Sensor & Brake Lamp Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module has detected an improper voltage level at the brake lamp signal.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
BRAKE SIGNAL 1 SHORTED TO VOLTAGE
BRAKE SIGNAL 1 SHORTED TO GROUND
BRAKE SIGNAL 1 OPEN OR HIGH RESISTANCE
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, read ABS DTCs and record on the repair order.
   3. With the scan tool, read and record the Environmental Data to help identify the conditions in which the DTC was set.
   4. With the scan tool, erase the DTCs.
   5. Start the engine.
   6. Press and release the brake pedal.
   7. With the scan tool, read ABS DTCs.

      Is the DTC active?

      Yes

      - Go To 2

      No

      - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.
2. **CHECK THE (B15) BRAKE SIGNAL 1 FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Body Control Module (BCM) C4 harness connector.

3. Disconnect the Anti-lock Brake System (ABS) Module harness connector.
4. Turn the ignition on.
5. Measure the voltage between ground and the (B15) Brake Signal 1 circuit at the ABS Module harness connector.

   Is there any voltage present?

   Yes

   - Repair the (B15) Brake Signal circuit for a short to voltage.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (B15) BRAKE SIGNAL 1 FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Check for continuity between ground and the (B15) Brake Signal 1 circuit at the ABS Module harness connector.

      Is there continuity between ground and the ABS Module circuit?

      Yes

      - Go To 4

      No

      - Repair the (B15) Brake Signal 1 circuit for a short to ground.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
4. **CHECK THE (B15) BRAKE SIGNAL FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (B15) Brake Signal 1 circuit between the BCM harness connector and the ABS Module harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Repair the (B15) Brake Signal 1 circuit for an open circuit or high resistance.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C0020-01-ABS PUMP MOTOR CONTROL - GENERAL ELECTRICAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **If DTC C0020-16 or C0020-35 are present, refer to the diagnostics for these DTCs before continuing with this procedure.**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs set.

SET CONDITION

- Anti-lock Brake System (ABS) Module has detected improper voltage level when the motor is not running or is not seeing the proper response when the motor is running.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE
HYDRAULIC CONTROL UNIT (HCU)

DIAGNOSTIC TEST

ANTI-LOCK BRAKE SYSTEM (ABS)

1. Perform any Technical Service Bulletins (TSBs) that may apply.
2. Turn the ignition off.
3. Inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
4. Inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   NOTE: **For this failure it is necessary to replace both the ABS Module and the HCU as a complete unit.**

   - Replace the Integrated Control Unit (ICU) in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** and **HYDRAULIC CONTROL**

UNIT (HCU), REMOVAL .

- Perform the ABS VERIFICATION TEST. Refer to STANDARD PROCEDURE.

C0020-16-ABS PUMP MOTOR CONTROL - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

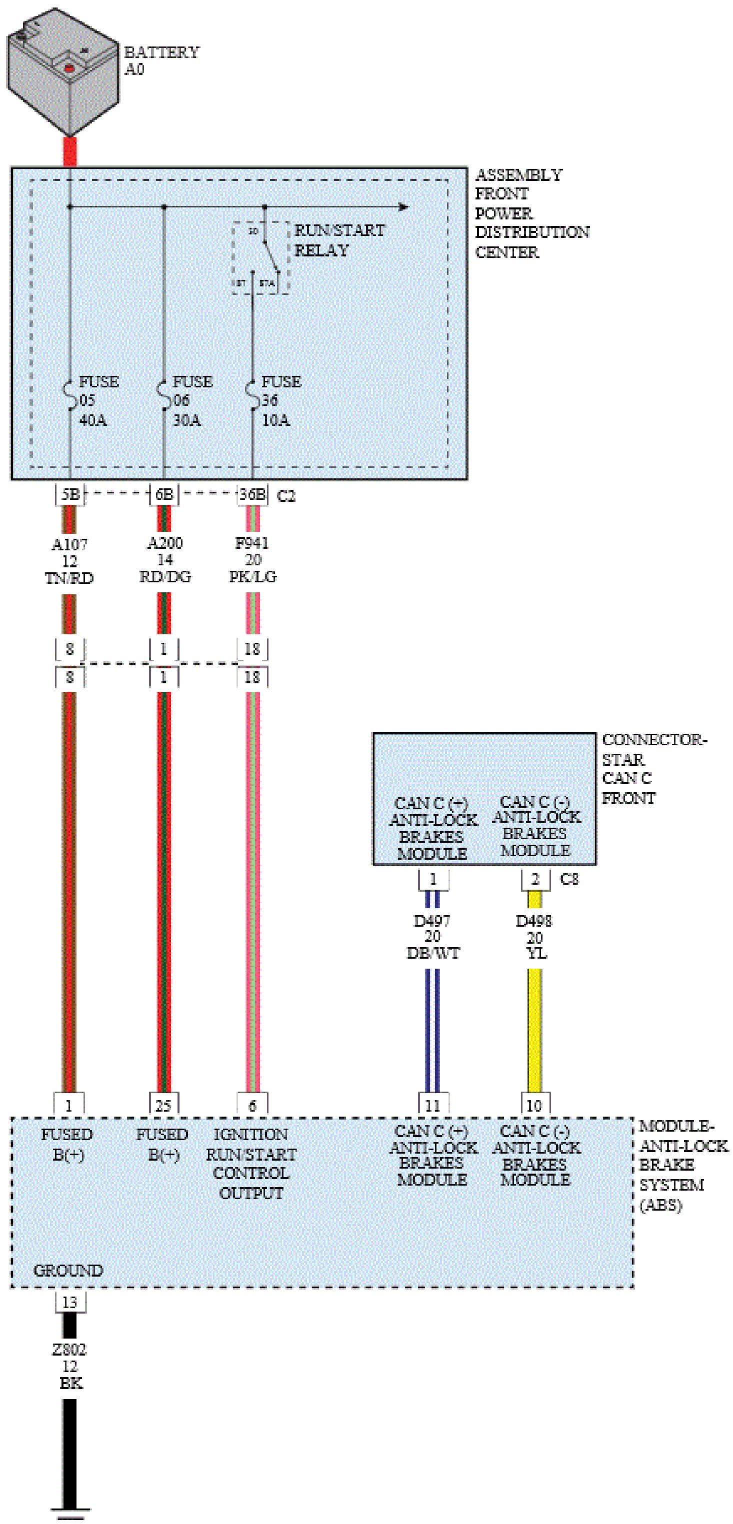

Fig. 2: Anti-Lock Brake System Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Motor voltage supplied to the Anti-lock Brake System (ABS) Module is 50 percent of ignition voltage.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
FUSE 5 (40A)
(A107) FUSED B+ CIRCUIT SHORTED TO GROUND
(A107) FUSED B+ CIRCUIT OPEN OR HIGH RESISTANCE
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE
HYDRAULIC CONTROL UNIT (HCU)

DIAGNOSTIC TEST

1. **CHECK THE FUSE**
    1. Turn the ignition on.
    2. Using a 12-volt test light connected to ground, check the fuse for power.

       Is the fuse good?

       Yes

       - Go To 3

       No

       - Go To 2
2. **(A107) FUSED B+ CIRCUIT SHORTED TO GROUND**
    1. Turn the ignition off.
    2. Remove the Fuse.
    3. Disconnect the ABS Module harness connector.
    4. Check for continuity between ground and the (A107) Fused B+ Circuit in the ABS Module harness connector.

Is there continuity between ground and the (A107) Fused B+ circuit?

Yes

- Repair the (A107) Fused B+ circuit for a short to ground.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **ABS PUMP MOTOR**
   1. Install the Fuse.
   2. Turn the ignition on.
   3. With the scan tool, read and record the DTCs.
   4. With the scan tool, actuate the ABS pump motor.

   Did the Pump Motor operate correctly when actuated with out blowing the fuse?

   Yes

   - Go To 4

   No

   - Go To 5

4. **(A107) FUSED B+ CIRCUIT OPEN OR HIGH RESISTANCE**

   NOTE: **The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

   1. Using a 12-volt test light connected to ground, check the (A107) Fused B+ circuit at the ABS harness connector.

   Is the test light illuminated and bright?

   Yes

   - Go To 5

   No

   - Repair the (A107) Fused B+ circuit for an open or high resistance.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**
   1. Turn the ignition off.
   2. Inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded

terminals.

4. Perform any Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C0020-1C-ABS PUMP MOTOR CONTROL - CIRCUIT VOLTAGE OUT OF RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

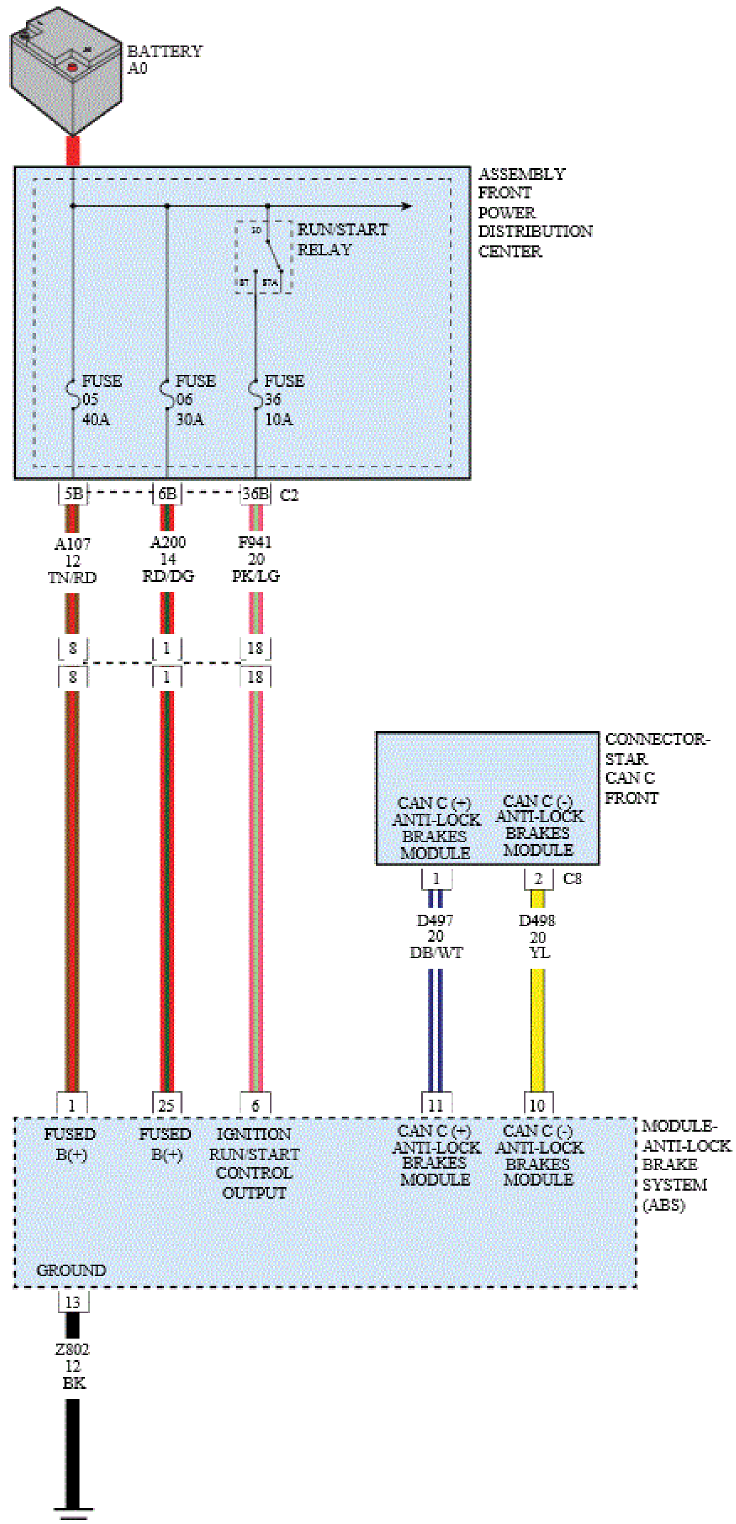

Fig. 3: Anti-Lock Brake System Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects that the pump motor has a poor ground.
- ABS has internal pump motor driver shorted.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
(Z802) GROUND CIRCUITS OPEN OR HIGH RESISTANCE
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE
HYDRAULIC CONTROL UNIT (HCU)
INTEGRATED CONTROL UNIT (ICU)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: **This DTC must be active for the results of this test to be valid.**

   1. Ignition on.
   2. With the scan tool, read and record the DTCs.
   3. With the scan tool, read and record the Environmental Data to help identify the conditions in which the DTC was set.
   4. With the scan tool, erase the DTCs.
   5. Start the engine.
   6. With the scan tool, read and record the DTCs.

      Is the DTC active at this time?

      Yes

      - Go To 2

      No

      - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **(Z802) GROUND CIRCUIT OPEN OR HIGH RESISTANCE**

   NOTE: **The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

1. Using a 12-volt test light connected to 12-volts, check the (Z802) Ground circuits.

   Does the test light illuminate brightly?

   Yes

   - Go To 3

   No

   - Repair the (Z802) Ground circuit(s) for an open circuit or high resistance.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **INTEGRATED CONTROL UNIT (ICU)**
   1. Turn the ignition off.
   2. Inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.
   4. Perform any Service Bulletins that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      NOTE: **For this failure it is necessary to replace both the ABS Module and the HCU as a complete unit.**

      - Replace the Integrated Control Unit (ICU) in accordance with the Service Information. Refer to **HYDRAULIC CONTROL UNIT (HCU), REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C0020-35-ABS PUMP MOTOR CONTROL - SIGNAL HIGH TIME>MAXIMUM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

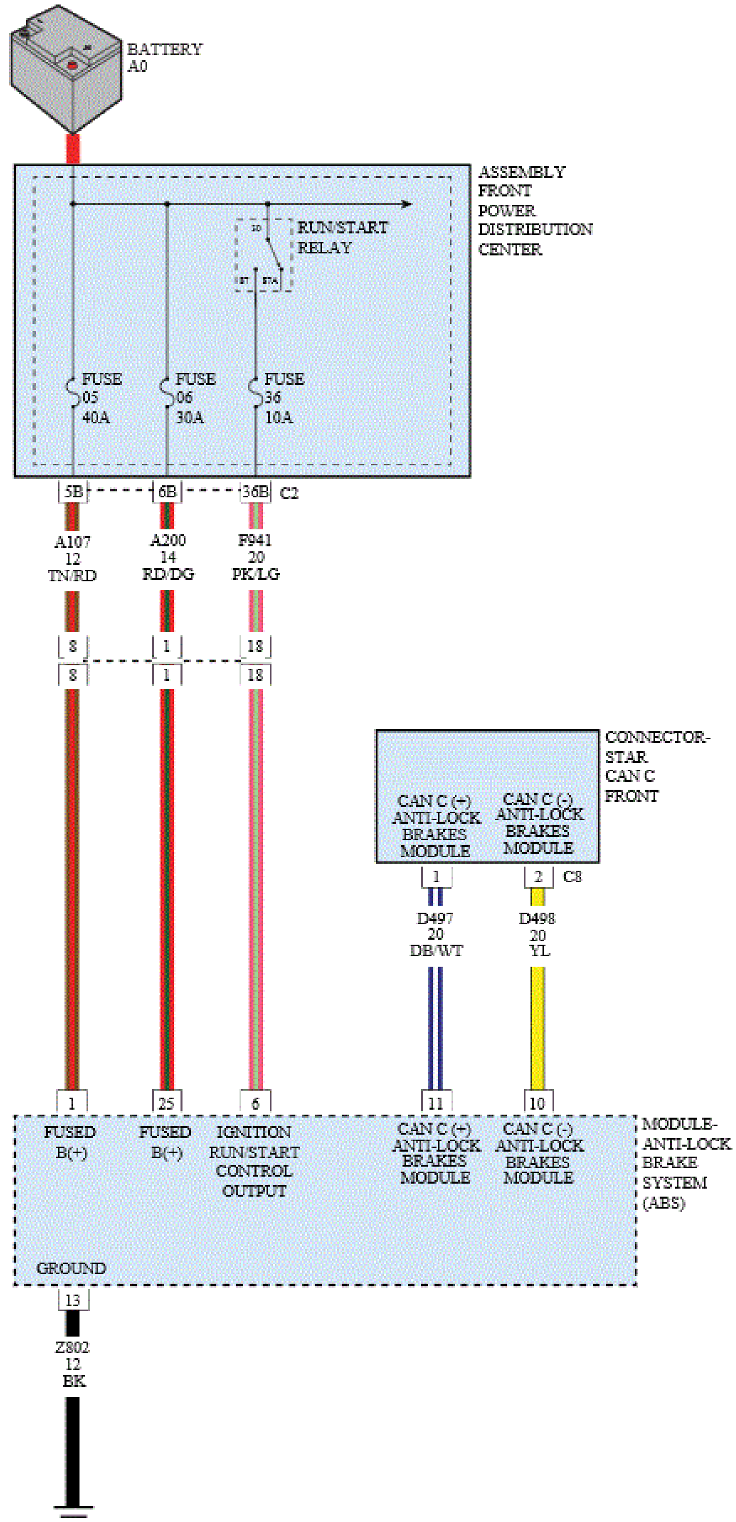

Fig. 4: Anti-Lock Brake System Module Circuit Diagram

Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects that the pump motor has a poor ground.
- ABS has internal pump motor driver shorted.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
(Z901) GROUND CIRCUITS OPEN OR HIGH RESISTANCE
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE
HYDRAULIC CONTROL UNIT (HCU)
HYDRAULIC CONTROL UNIT (HCU)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, read and record the DTCs.
   3. With the scan tool, read and record the Environmental Data to help identify the conditions in which the DTC was set.
   4. With the scan tool, erase the DTCs.
   5. Start the engine.
   6. With the scan tool, read and record the DTCs.

      Is the DTC active at this time?

      Yes

      - Go To 2

      No

      - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **(Z802) GROUND CIRCUIT OPEN OR HIGH RESISTANCE**

   NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

1. Using a 12-volt test light connected to 12-volts, check the (Z802) Ground circuit.

   Does the test light illuminate brightly?

   Yes

   - Go To 3

   No

   - Repair the (Z802) Ground circuit for an open circuit or high resistance.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**
   1. Turn the ignition off.
   2. Inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.
   4. Perform any Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   NOTE: For this failure it is necessary to replace both the ABS Module and the HCU as a complete unit.

   - Replace the Integrated Control Unit (ICU) in accordance with the Service Information. Refer to **HYDRAULIC CONTROL UNIT (HCU), REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C0021-02-BRAKE BOOSTER - GENERAL SIGNAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: If DTC C1252-92 is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.

THEORY OF OPERATION

When the Vacuum Pressure Sensor indicates a failure in the Vacuum Booster. After the cold start phase (i.e. 3 min after engine is running) and if the engine is running above 600 RPM there should be at least -135 mbar (-1.96 psi) of differential pressure in the vacuum-chamber for boosting the pedal force. If the pressure remains below this value for more than two minutes. Timer resets if the pressure remains above 220 mbar (3.19 psi) for

10 seconds or engine off vehicle speed present and low booster vacuum present.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Vacuum Pressure Sensor indicates a failure in the Vacuum Booster.
- Engine off vehicle speed present.
- Low booster vacuum present.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
ENGINE STALLED WHILE ROLLING IN NEUTRAL
PINCHED, CUT OR OPEN VACUUM SUPPLY LINE
BRAKE BOOSTER
VACUUM PRESSURE SENSOR

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, read and record the DTCs.
    3. With the scan tool, read and record Environmental Data to help identify the conditions in which the DTC was set.
    4. With the scan tool, erase the DTCs.
    5. Start the engine.
    6. Press and release the brake pedal.
    7. Wait five minutes or until red brake lamp illuminates.

    WARNING: To avoid possible serious or fatal injury, check brake capability is available before road testing.

    8. Test drive the vehicle at speeds above 10 km/h (6 mph).
    9. With the scan tool, read and record the DTCs.

    Is the DTC Active at this time?

    Yes

- Go To 2

No

- Check the vacuum supply line to brake booster for a pinched, cut, loose or cracked vacuum hose which could cause an intermittent condition.
- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK VACUUM SUPPLY LINE**
    1. Turn the ignition off.
    2. Check the vacuum supply line to brake booster for a pinched, cut, loose or open vacuum hose.
    3. Disconnect the booster vacuum supply line and attach a vacuum pressure gauge.
    4. Start the engine.

    Does the vacuum fluctuate with RPM change?

    Yes

    - Repair as necessary.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 3
3. **CHECK FOR VACUUM PRESSURE SIGNAL CHANGE**
    1. Turn the ignition on.
    2. Remove the Vacuum Pressure Sensor from the Booster.
    3. Block off the vacuum feed port.
    4. Connect a vacuum pump to the Vacuum Pressure Sensor.
    5. Apply vacuum to the Vacuum Pressure Sensor.
    6. Using the scan tool, and a pressure gauge watch for the signal change.
    7. Using the scan tool, watch for signal change.

    Is the signal changing and does it compare to the pressure gauge reading?

    Yes

    - Go To 4

    No

    - Replace the Vacuum Pressure Sensor in accordance with the Service Information. Refer to **BOOSTER, POWER BRAKE, REMOVAL** .
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
4. **CHECK BRAKE BOOSTER CHECK VALVE**

1. Remove the Brake Booster Check Valve.
2. Apply vacuum to the booster side of the check valve.

   Is the Brake Booster Check Valve holding vacuum?

   Yes

   - Replace the Brake Booster in accordance with the Service Information. Refer to **BOOSTER, POWER BRAKE, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace Brake Booster Check Valve in accordance with the Service Information. Refer to **BOOSTER, POWER BRAKE, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C0030-02-LEFT FRONT TONE WHEEL - GENERAL SIGNAL FAILURE

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- Vehicle speed.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects periodic drops of a Wheel Speed Sensor (WSS) signal.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT TONE WHEEL/ BEARING DAMAGE
IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES
DEBRIS IN TONE WHEEL/BEARING/SENSOR OR DAMAGED

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

NOTE: **This DTC must be active for the results of this test to be valid. If DTC C0030-1D is present it must be repaired before continuing.**

1. Turn the ignition on.
2. With the scan tool, read DTCs.
3. With the scan tool, read and record Environmental Data to help identify the conditions in which the DTC was set.
4. With the scan tool, erase DTCs.
5. Cycle the ignition switch off then on.

   CAUTION: Ensure brake capability is available before road testing.

6. Test drive the vehicle in a straight line to 40 km/h (25 mph).

   NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be meet.

7. With the scan tool, read DTCs.

   Is the DTC active?

   Yes

   - Go To 3

   No

   - Go To 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
   1. Turn the ignition on.
   2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

      NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

   3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

      Is the Left Front WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

      Yes

      - Go To 3

      No

      - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

3. **CHECK FOR IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES**
   1. Turn the ignition off.

2. Check and adjust the Left Front Tire pressure.
3. Check and adjust all other tire pressures.
4. Inspect for mismatched tires on vehicle.

Is the Left Front Tire improperly inflated or mismatched tires on vehicle?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 4

4. **CHECK THE LEFT FRONT TONE WHEEL/BEARING FOR DAMAGE**

NOTE: **Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.**

1. Check the Left Front Tone Wheel for damage.
2. Inspect the Left Front Tone Wheel for debris.

Was there debris on the tone wheel?

Yes

- Clean tone wheel and sensor. Clear codes and retest.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Replace the Left Front Tone Wheel/Bearing in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C0031-1D-LEFT FRONT WHEEL SPEED SENSOR - CIRCUIT CURRENT OUT OF RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

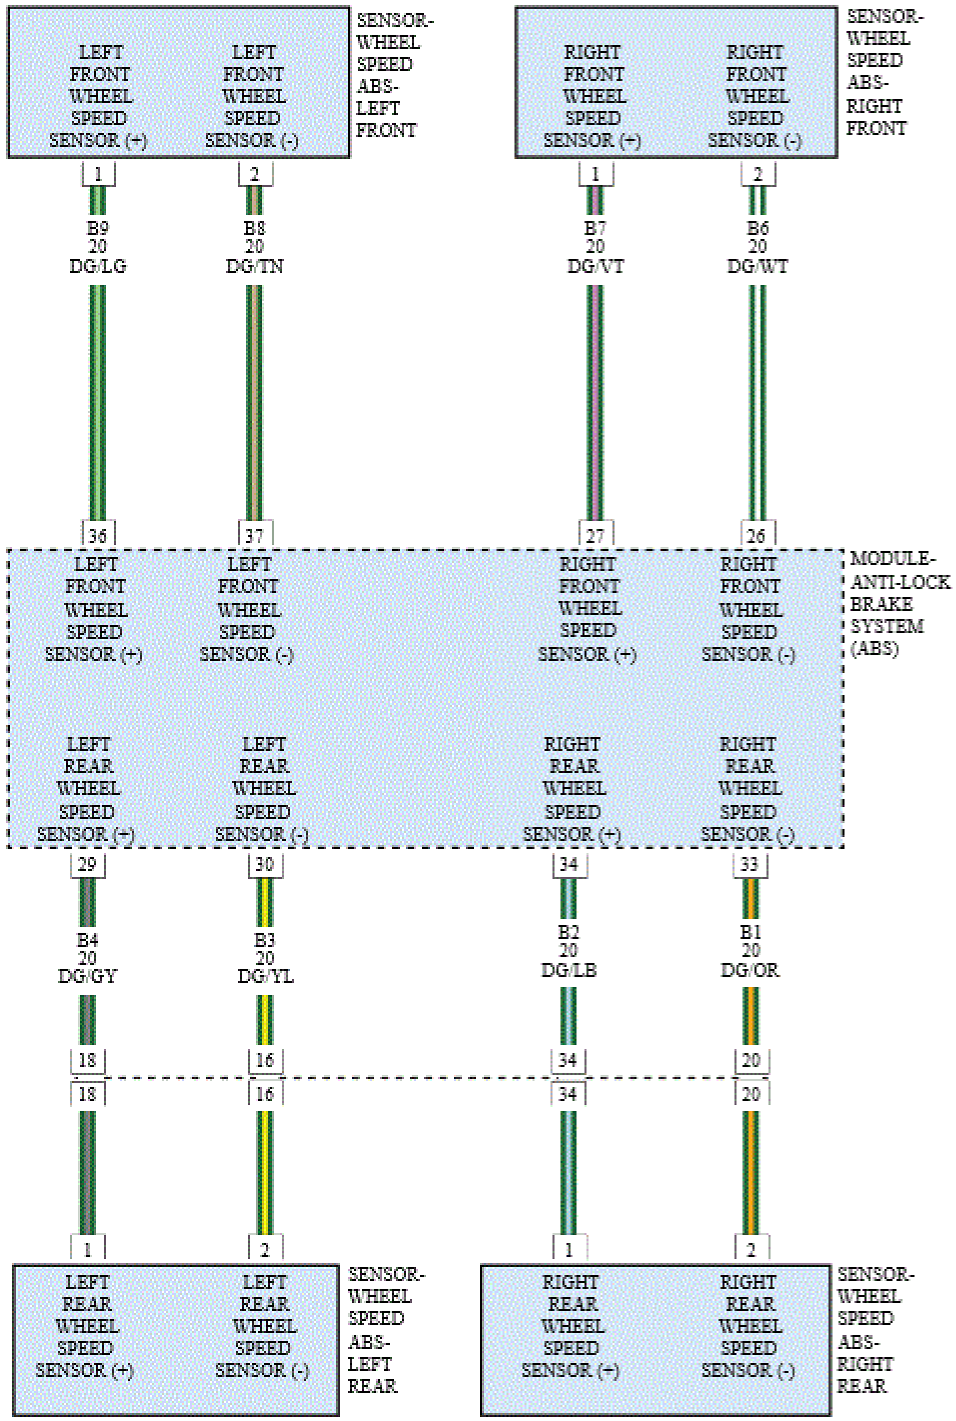

Fig. 5: Wheel Speed Sensor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects Left Front Wheel Speed Sensor (WSS) circuit failure.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
CONNECTOR/TERMINAL DAMAGE
(B8) LEFT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(B9) LEFT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE
(B8) LEFT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(B9) LEFT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO GROUND
(B8) LEFT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT OPEN
(B9) LEFT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT OPEN
(B9) LEFT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO THE (B8) LEFT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT
LEFT FRONT WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. Cycle the ignition switch from off to on.
    4. With the scan tool, read DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
    - Perform the ABS INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.
2. **CHECK CONNECTOR/TERMINAL FOR DAMAGE**

NOTE: **Check all terminals for broken, bent, pushed out, or corroded terminals.**

1. Turn the ignition off.
2. Inspect the Wheel Speed Sensor harness and connector.
3. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

   Were any problems found?

   Yes

   - Repair as necessary in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK (B9) LEFT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT VOLTAGE**
   1. Disconnect the Left Front Wheel Speed Sensor harness connector.
   2. Turn the ignition on.
   3. Measure the voltage between the (B9) Left Front Wheel Speed Sensor Supply circuit and ground.

      Is the voltage above 10 volts?

      Yes

      - Go To 6

      No

      - Go To 4

4. **(B9) LEFT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the ABS Module harness connector.
   3. Measure the resistance between the (B9) Left Front Wheel Speed Sensor Supply circuit and ground.

      Is the resistance below 5.0 Ohms?

      Yes

      - Repair the (B9) Left Front Wheel Speed Sensor Supply circuit for a short to ground.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 5

5. **(B9) LEFT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT OPEN**
   1. Measure the resistance of the (B9) Left Front Wheel Speed Sensor Supply circuit between the Left Front Wheel Speed Sensor harness connector and the ABS Module harness connector.

Is the resistance below 5 Ohms?

Yes

- Go To 6

No

- Repair the open (B9) Left Front Wheel Speed Sensor Supply circuit.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **(B8) LEFT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE**
    1. Turn the ignition on.
    2. Measure the voltage of the (B8) Left Front Wheel Speed Sensor Signal circuit at the Left Front Wheel Speed Sensor harness connector.

    Is there any voltage present?

    Yes

    - Repair the (B8) Left Front Wheel Speed Sensor Signal circuit for a short to voltage.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 7
7. **(B8) LEFT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO GROUND**
    1. Turn the ignition off.
    2. Measure the resistance between the (B8) Left Front Wheel Speed Sensor Signal circuit and ground.

    Is the resistance below 5.0 Ohms?

    Yes

    - Repair the (B8) Left Front Wheel Speed Sensor Signal circuit for a short to ground.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 8
8. **(B8) LEFT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT OPEN**
    1. Measure the resistance of the (B8) Left Front Wheel Speed Sensor Signal circuit between the Left Front Wheel Speed Sensor harness connector and the ABS Module harness connector.

    Is the resistance below 5 Ohms?

    Yes

    - Go To 9

No

- Repair the open (B8) Left Front Wheel Speed Sensor Signal circuit.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

9. **(B9) LEFT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO THE (B8) LEFT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT**
   1. Turn the ignition off.
   2. Measure the resistance between the (B9) Left Front Wheel Speed Sensor Supply circuit and the (B8) Left Front Wheel Speed Sensor Signal circuit at the ABS Module harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Repair (B9) Left Front Wheel Speed Sensor Supply circuit for a short to the (B8) Left Front Wheel Speed Sensor Signal circuit.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 10

10. **LEFT FRONT WHEEL SPEED SENSOR**
    1. Replace the Left Front Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
    2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       CAUTION: Make sure braking capability is available before road testing.

    3. Road test the vehicle over 40 km/h (25 mph).

       NOTE: Vehicle must be driven for several minutes above 40 km/h (25 mph) for set conditions to be meet.

    4. With the scan tool, read ABS DTCs.

       Does the DTC remain active?

       Yes

       - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
       - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Test complete.

C0031-2F-LEFT FRONT WHEEL SPEED SENSOR - SIGNAL ERRATIC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

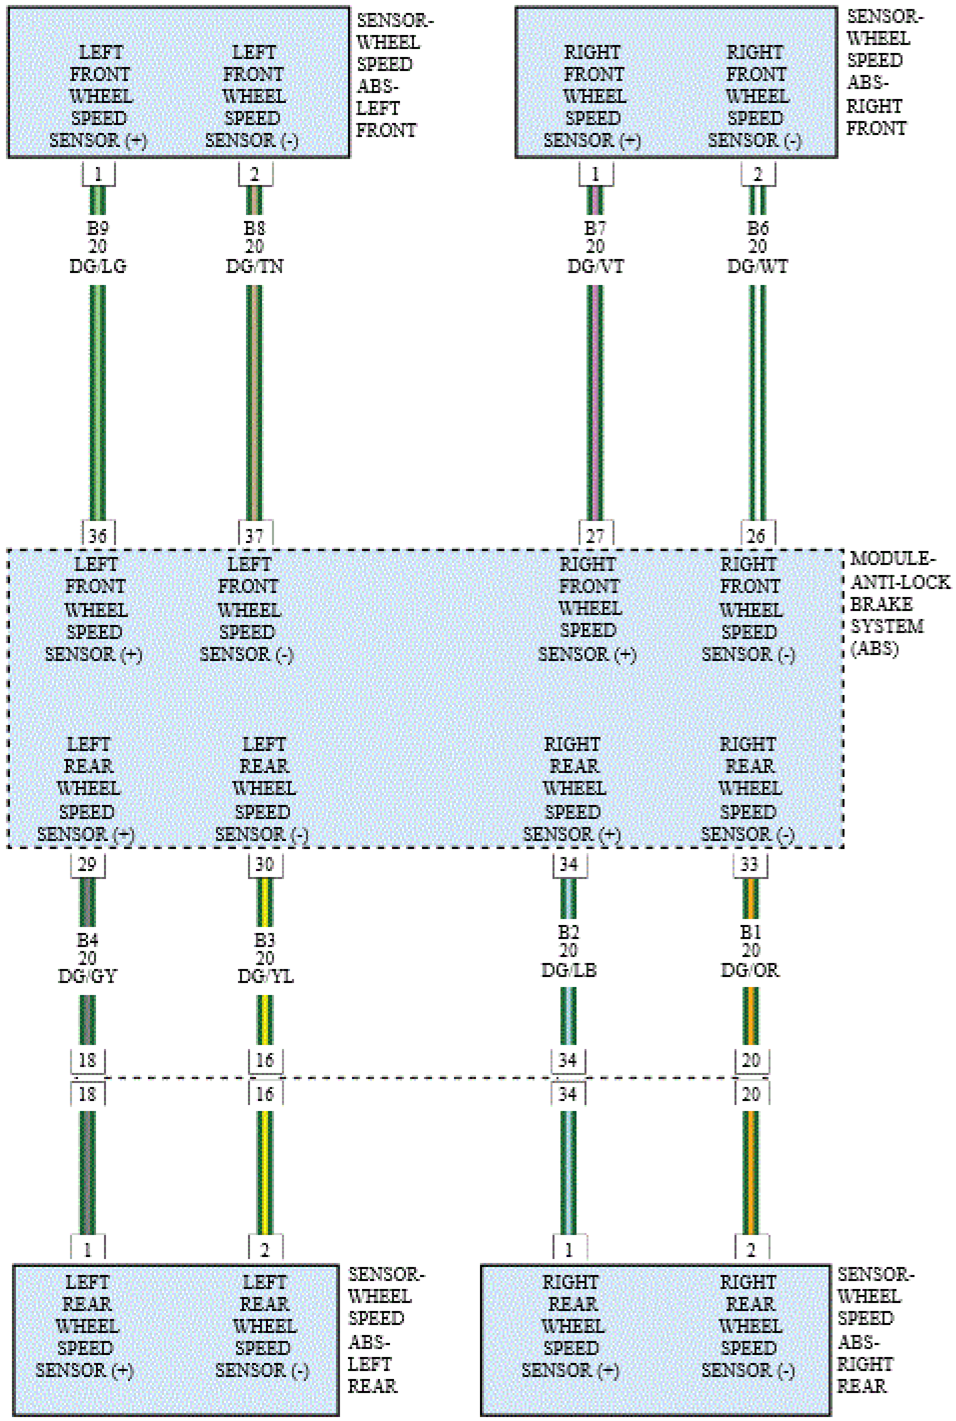

Fig. 6: Wheel Speed Sensor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.

- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects multiple drastic changes in Left Front Wheel Speed Sensor (WSS) signals.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
CHECK LEFT FRONT WHEEL SPEED SENSOR FOR LOOSENESS
INSPECT CIRCUITS/CONNECTOR/TERMINALS FOR DAMAGE
LEFT FRONT WHEEL BEARING AND HUB OR ENCODER FOR DAMAGE
LEFT FRONT WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

    NOTE: **If DTC C0032-01 is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.**

    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.

        CAUTION: **Make sure braking capability is available before road testing.**

    3. Road test the vehicle over 40 km/h (25 mph).

        NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.**

    4. With the scan tool, read DTCs.

        Is the DTC active?

        Yes

        - Go To 3

        No

        - Go To 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
    1. Turn the ignition on.

2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: **If graph shows periodic dropouts pay close attention to the tone wheel.**

3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Left Front WSS speed showing 0 km/h (0 mph), not matching other wheels, or showing erratic behavior?

Yes

- Go To 3

No

- Perform ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

3. **CHECK LEFT FRONT WSS FOR LOOSENESS, INSPECT CIRCUITS/CONNECTORS /TERMINALS FOR DAMAGE**

NOTE: **Check all terminals for broken, bent, pushed out, or corroded terminals.**

1. Turn the ignition off.
2. Inspect the ABS Module harness connector and the Left Front WSS harness connector.
3. Check the Left Front WSS for looseness, excessive corrosion and not properly fastened.
4. Inspect the (B8) Left Front WSS Signal and (B9) Left Front WSS Supply circuits between the Left Front WSS and Anti-Lock Brake Module for damage.

Is the Left Front WSS loose or any of the wiring/connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 4

4. **CHECK LEFT FRONT WHEEL SPEED SENSOR FOR DAMAGE**

1. Remove the Left Front Wheel Speed Sensor.
2. Inspect the Wheel Speed Sensor for proper mounting.
3. Inspect the Wheel Speed Sensor harness and connector.
4. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

Is the Left Front Wheel Speed Sensor damaged?

Yes

- Replace the Left Front Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **CHECK LEFT FRONT WHEEL BEARING AND HUB OR ENCODER FOR DAMAGE**
   1. Inspect the Left Front wheel bearing, hub and Encoder for excessive runout, clearance or damage.

      NOTE: **Refer to the appropriate service information, if necessary, for procedures or specifications.**

      Is the Left Front Wheel Bearing, Hub or Encoder Damaged?

      Yes

      - Replace the Hub and Wheel Bearing in accordance with the Service Information. Refer to **HUB AND BEARING, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 6

6. **LEFT FRONT WHEEL SPEED SENSOR**
   1. Replace the Left Front Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
   2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.**

   4. With the scan tool, read ABS DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test Complete.

C0031-4A-LEFT FRONT WHEEL SPEED SENSOR - INCORRECT COMPONENT INSTALLED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects that the wrong component is installed.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: **If DTC C0031-1D is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.**

   NOTE: **This vehicle uses directional front wheel speed sensors and non-directional rear wheel speed sensors.**

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. With the scan tool, read DTCs.

      Is the DTC active?

      Yes

      - Go To 2

      No

      - Test Complete.
2. **LEFT FRONT WHEEL SPEED SENSOR**

NOTE: **This vehicle uses a directional front wheel speed sensor, make sure the correct wheel speed sensor is installed on the vehicle.**

1. Replace the Left Front Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** . Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   CAUTION: **Make sure braking capability is available before road testing.**

2. Road test the vehicle over 40 km/h (25 mph).
3. With the scan tool, read DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

C0031-62-LEFT FRONT WHEEL SPEED SENSOR - SIGNAL COMPARE FAILURE

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

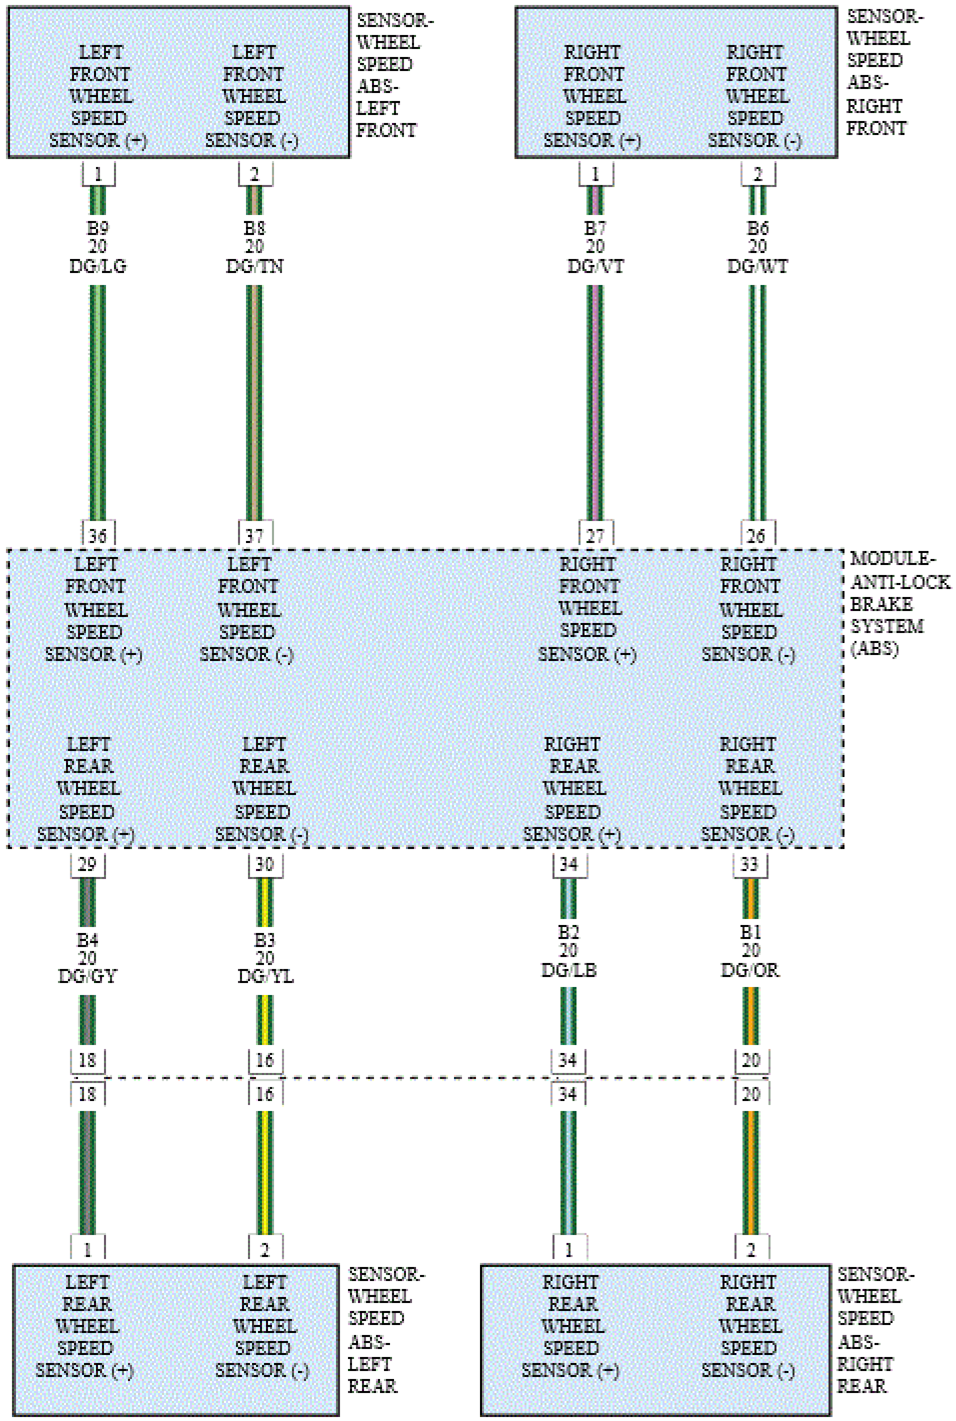

Fig. 7: Wheel Speed Sensor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects if the wheel speed signal is 0 km/h (0 mph) or very low when compared to the other wheel speed signals.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES
CHECK LEFT FRONT WHEEL SPEED SENSOR FOR LOOSENESS
INSPECT CIRCUITS/CONNECTOR/TERMINALS FOR DAMAGE
LEFT FRONT HUB AND WHEEL BEARING
LEFT FRONT WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: **If DTC C0031-1D is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.**

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.

      CAUTION: **Make sure braking capability is available before road testing.**

   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.**

   4. With the scan tool, read DTCs.

      Is the DTC active?

      Yes

      - Go To 3

      No

      - Go To 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
   1. Turn the ignition on.

2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

   NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

   Is the Left Front WSS speed showing 0 km/h (0 mph), not matching other wheels, or showing erratic behavior?

   Yes

   - Go To 3

   No

   - Perform ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

3. **CHECK FOR IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES**
   1. Turn the ignition off.
   2. Check and adjust the Left Front Tire pressure.
   3. Check and adjust all other tire pressures.
   4. Inspect for mismatched tires on vehicle.

   Is the Left Front Tire improperly inflated or mismatched tires on vehicle?

   Yes

   - Repair as necessary
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **CHECK LEFT FRONT WSS FOR LOOSENESS, INSPECT CIRCUITS/CONNECTORS /TERMINALS FOR DAMAGE**

   NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

   1. Turn the ignition off.
   2. Inspect the ABS Module harness connector and the Left Front WSS harness connector.
   3. Check the Left Front WSS for looseness, excessive corrosion and not properly fastened.
   4. Inspect the (B8) Left Front WSS Signal and (B9) Left Front WSS Supply circuits between the Left Front WSS and Anti-Lock Brake Module for damage.

   Is the Left Front WSS loose or any of the wiring/connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **CHECK LEFT FRONT WHEEL SPEED SENSOR FOR DAMAGE**
    1. Remove the Left Front Wheel Speed Sensor.
    2. Inspect the Wheel Speed Sensor for proper mounting.
    3. Inspect the Wheel Speed Sensor harness and connector.
    4. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

    Is the Left Front Wheel Speed Sensor damaged?

    Yes

    - Replace the Left Front Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 6

6. **CHECK LEFT FRONT WHEEL BEARING AND HUB OR ENCODER FOR DAMAGE**
    1. Inspect the Left Front wheel bearing, hub and Encoder for excessive runout, clearance or damage.

    NOTE: **Refer to the appropriate service information, if necessary, for procedures or specifications.**

    Is the Left Front Wheel Bearing, Hub or Encoder Damaged?

    Yes

    - Replace the Hub and Wheel Bearing in accordance with the Service Information. Refer to **HUB AND BEARING, REMOVAL** .
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 7

7. **LEFT FRONT WHEEL SPEED SENSOR**
    1. Replace the Left Front Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
    2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    3. Road test the vehicle over 40 km/h (25 mph).

NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.**

4. With the scan tool, read ABS DTCs.

Does the DTC remain active?

Yes

- Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test Complete.

C0033-02-RIGHT FRONT TONE WHEEL - GENERAL SIGNAL FAILURE

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- Vehicle speed.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects periodic drops of a Wheel Speed Sensor (WSS) signal.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT TONE WHEEL/BEARING DAMAGE
IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES
DIRTY TONE WHEEL/SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

NOTE: **This DTC must be active for the results of this test to be valid. If DTC C0033-1D is present it must be repaired before continuing.**

1. Turn the ignition on.

2. With the scan tool, read DTCs.
3. With the scan tool, read and record Environmental Data to help identify the conditions in which the DTC was set.
4. With the scan tool, erase DTCs.
5. Cycle the ignition switch off then on.

CAUTION: Ensure brake capability is available before road testing.

6. Test drive the vehicle in a straight line to 25 mph (40 km/h).

NOTE: Vehicle must be driven above 25 mph (40 km/h) for set conditions to be meet.

7. With the scan tool, read DTCs.

   Is the DTC active?

   Yes

   - Go To 3

   No

   - Go To 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
   1. Turn the ignition on.
   2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

   NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

   3. Slowly accelerate as straight as possible from a stop to 25 mph (40 km/h).

      Is the Right Front WSS speed showing 0 mph (0 km/h) or not matching other wheels or showing erratic behavior?

      Yes

      - Go To 3

      No

      - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

3. **CHECK FOR IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES**
   1. Turn the ignition off.
   2. Check and adjust the Right Front Tire pressure.

3. Check and adjust all other tire pressures.
4. Inspect for mismatched tires on vehicle.

   Is the Right Front Tire improperly inflated or mismatched tires on vehicle?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **CHECK THE RIGHT FRONT TONE WHEEL/BEARING FOR DAMAGE**

NOTE: **Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.**

1. Check the Right Front Tone Wheel for damage.
2. Inspect the Right Front Tone Wheel for debris.

   Was there debris on the tone wheel?

   Yes

   - Clean tone wheel and sensor. Clear codes and retest.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Right Front Tone Wheel/Bearing in accordance with the Service Information.
   - Perform ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C0034-1D-RIGHT FRONT WHEEL SPEED SENSOR - CIRCUIT CURRENT OUT OF RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

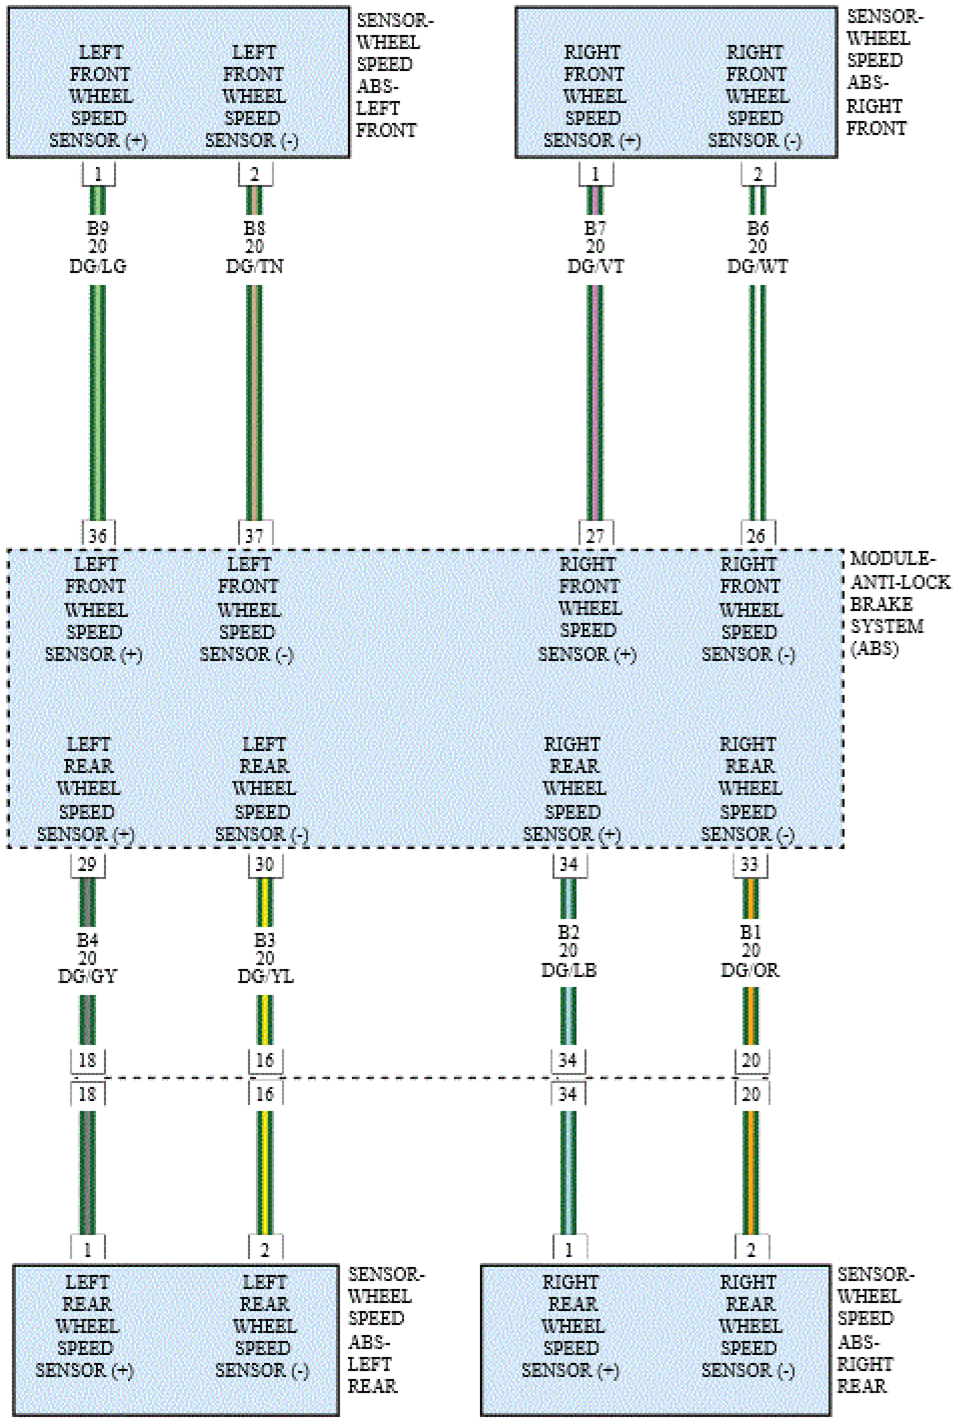

Fig. 8: Wheel Speed Sensor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects Right Front Wheel Speed Sensor (WSS) circuit failure.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
CONNECTOR/TERMINAL DAMAGE
(B6) RIGHT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(B7) RIGHT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE
(B6) RIGHT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(B7) RIGHT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO GROUND
(B6) RIGHT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT OPEN
(B7) RIGHT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT OPEN
(B7) RIGHT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO THE (B6) RIGHT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT
RIGHT FRONT WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. Cycle the ignition switch from off to on.
    4. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
    - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.
2. **CHECK CONNECTOR/TERMINAL FOR DAMAGE**

NOTE: **Check all terminals for broken, bent, pushed out, or corroded terminals.**

1. Turn the ignition off.
2. Inspect the Wheel Speed Sensor harness and connector.
3. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

Were any problems found?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK (B7) RIGHT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT VOLTAGE**
    1. Disconnect the Right Front Wheel Speed Sensor harness connector.
    2. Turn the ignition on.
    3. Measure the voltage between the (B7) Right Front Wheel Speed Sensor Supply circuit and ground.

    Is the voltage above 10 volts?

    Yes

    - Go To 6

    No

    - Go To 4

4. **(B7) RIGHT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the ABS Module harness connector.
    3. Measure the resistance between the (B7) Right Front Wheel Speed Sensor Supply circuit and ground.

    Is the resistance below 5.0 Ohms?

    Yes

    - Repair the (B7) Right Front Wheel Speed Sensor Supply circuit for a short to ground.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 5

5. **(B7) RIGHT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT OPEN**
    1. Measure the resistance of the (B7) Right Front Wheel Speed Sensor Supply circuit between the Right Front Wheel Speed Sensor harness connector and the ABS Module harness connector.

Is the resistance below 5 Ohms?

Yes

- Go To 6

No

- Repair the open (B7) Right Front Wheel Speed Sensor Supply circuit.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **(B6) RIGHT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE**
   1. Turn the ignition on.
   2. Measure the voltage of the (B6) Right Front Wheel Speed Sensor Signal circuit at the Right Front Wheel Speed Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (B6) Right Front Wheel Speed Sensor Signal circuit for a short to voltage.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 7

7. **(B6) RIGHT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO GROUND**
   1. Turn the ignition off.
   2. Measure the resistance between the (B6) Right Front Wheel Speed Sensor Signal circuit and ground.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (B6) Right Front Wheel Speed Sensor Signal circuit for a short to ground.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 8

8. **(B6) RIGHT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT OPEN**
   1. Measure the resistance of the (B6) Right Front Wheel Speed Sensor Signal circuit between the Right Front Wheel Speed Sensor harness connector and the ABS Module harness connector.

   Is the resistance below 5 Ohms?

   Yes

- Go To 9

No

- Repair the open (B6) Right Front Wheel Speed Sensor Signal circuit.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

9. **(B7) RIGHT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO THE (B6) RIGHT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT**
    1. Turn the ignition off.
    2. Measure the resistance between the (B7) Right Front Wheel Speed Sensor Supply circuit and the (B6) Right Front Wheel Speed Sensor Signal circuit at the ABS Module harness connector.

       Is the resistance below 5.0 Ohms?

       Yes

       - Repair (B7) Right Front Wheel Speed Sensor Supply circuit for a short to the (B6) Right Front Wheel Speed Sensor Signal circuit.
       - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 10

10. **RIGHT FRONT WHEEL SPEED SENSOR**
    1. Replace the Right Front Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
    2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       CAUTION: Make sure braking capability is available before road testing.

    3. Road test the vehicle over 40 km/h (25 mph).

       NOTE: Vehicle must be driven for several minutes above 40 km/h (25 mph) for set conditions to be meet.

    4. With the scan tool, read ABS DTCs.

       Does the DTC remain active?

       Yes

       - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
       - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Test complete.

C0034-2F-RIGHT FRONT WHEEL SPEED SENSOR - SIGNAL ERRATIC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

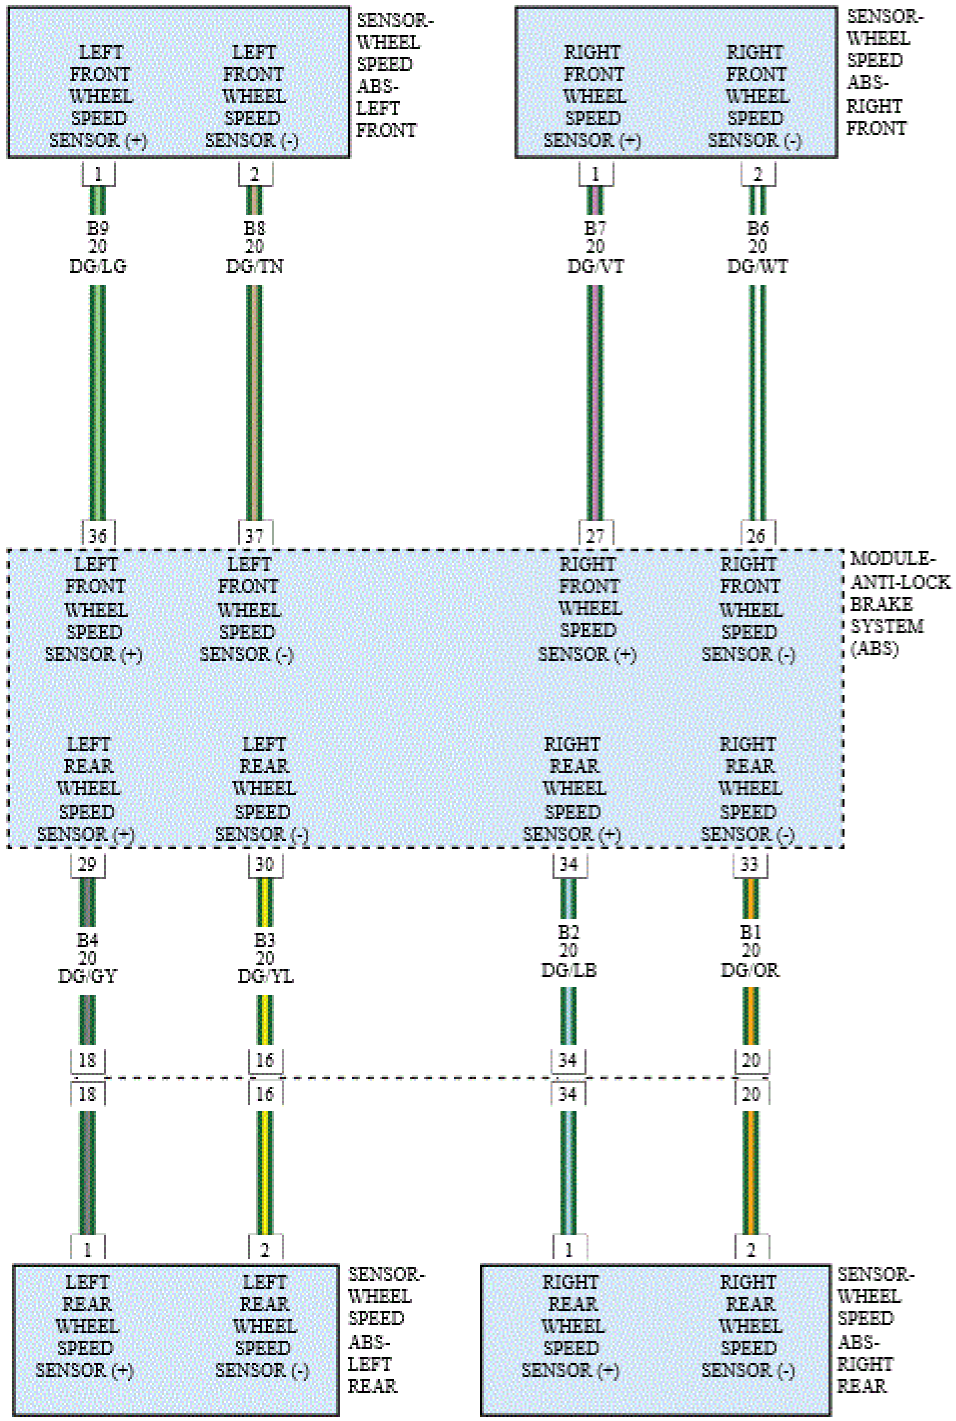

Fig. 9: Wheel Speed Sensor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects multiple drastic changes in Right Front Wheel Speed Sensor (WSS) signals.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
CHECK RIGHT FRONT WHEEL SPEED SENSOR FOR LOOSENESS
INSPECT CIRCUITS/CONNECTOR/TERMINALS FOR DAMAGE
RIGHT FRONT WHEEL BEARING AND HUB OR ENCODER FOR DAMAGE
RIGHT FRONT WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: **If DTC C0035-01 is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.**

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.

      CAUTION: **Make sure braking capability is available before road testing.**

   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.**

   4. With the scan tool, read DTCs.

      Is the DTC active?

      Yes

      - Go To 3

      No

      - Go To 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**

1. Turn the ignition on.
2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: **If graph shows periodic dropouts pay close attention to the tone wheel.**

3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

   Is the Right Front WSS speed showing 0 km/h (0 mph), not matching other wheels, or showing erratic behavior?

   Yes

   - Go To 3

   No

   - Perform ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

3. **CHECK RIGHT FRONT WSS FOR LOOSENESS, INSPECT CIRCUITS/CONNECTORS /TERMINALS FOR DAMAGE**

   NOTE: **Check all terminals for broken, bent, pushed out, or corroded terminals.**

   1. Turn the ignition off.
   2. Inspect the ABS Module harness connector and the Right Front WSS harness connector.
   3. Check the Right Front WSS for looseness, excessive corrosion and not properly fastened.
   4. Inspect the (B6) Right Front WSS Signal and (B7) Right Front WSS Supply circuits between the Right Front WSS and Anti-Lock Brake Module for damage.

   Is the Right Front WSS loose or any of the wiring/connectors/terminals damaged?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **CHECK RIGHT FRONT WHEEL SPEED SENSOR FOR DAMAGE**
   1. Remove the Right Front Wheel Speed Sensor.
   2. Inspect the Wheel Speed Sensor for proper mounting.
   3. Inspect the Wheel Speed Sensor harness and connector.
   4. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

Is the Right Front Wheel Speed Sensor damaged?

Yes

- Replace the Right Front Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **CHECK RIGHT FRONT WHEEL BEARING AND HUB OR ENCODER FOR DAMAGE**
   1. Inspect the Right Front wheel bearing, hub and Encoder for excessive runout, clearance or damage.

   NOTE: **Refer to the appropriate service information, if necessary, for procedures or specifications.**

   Is the Right Front Wheel Bearing, Hub or Encoder Damaged?

   Yes

   - Replace the Hub and Wheel Bearing in accordance with the Service Information. Refer to **HUB AND BEARING, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 6

6. **RIGHT FRONT WHEEL SPEED SENSOR**
   1. Replace the Right Front Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
   2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Road test the vehicle over 40 km/h (25 mph).

   NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.**

   4. With the scan tool, read ABS DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Anti-Lock Brakes Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

- Test Complete.

C0034-4A-RIGHT FRONT WHEEL SPEED SENSOR - INCORRECT COMPONENT INSTALLED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects that the wrong component is installed.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: **If DTC C0034-1D is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.**

   NOTE: **This vehicle uses directional front wheel speed sensors and non-directional rear wheel speed sensors.**

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. With the scan tool, read DTCs.

   Is the DTC active?

   Yes

   - Go To 2

   No

   - Test Complete.
2. **RIGHT FRONT WHEEL SPEED SENSOR**

NOTE: This vehicle uses a directional front wheel speed sensor, make sure the correct wheel speed sensor is installed on the vehicle.

1. Replace the Right Front Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** . Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

CAUTION: Make sure braking capability is available before road testing.

2. Road test the vehicle over 40 km/h (25 mph).
3. With the scan tool, read DTCs.

Does the DTC remain active?

Yes

- Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

C0034-62-RIGHT FRONT WHEEL SPEED SENSOR - SIGNAL COMPARE FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

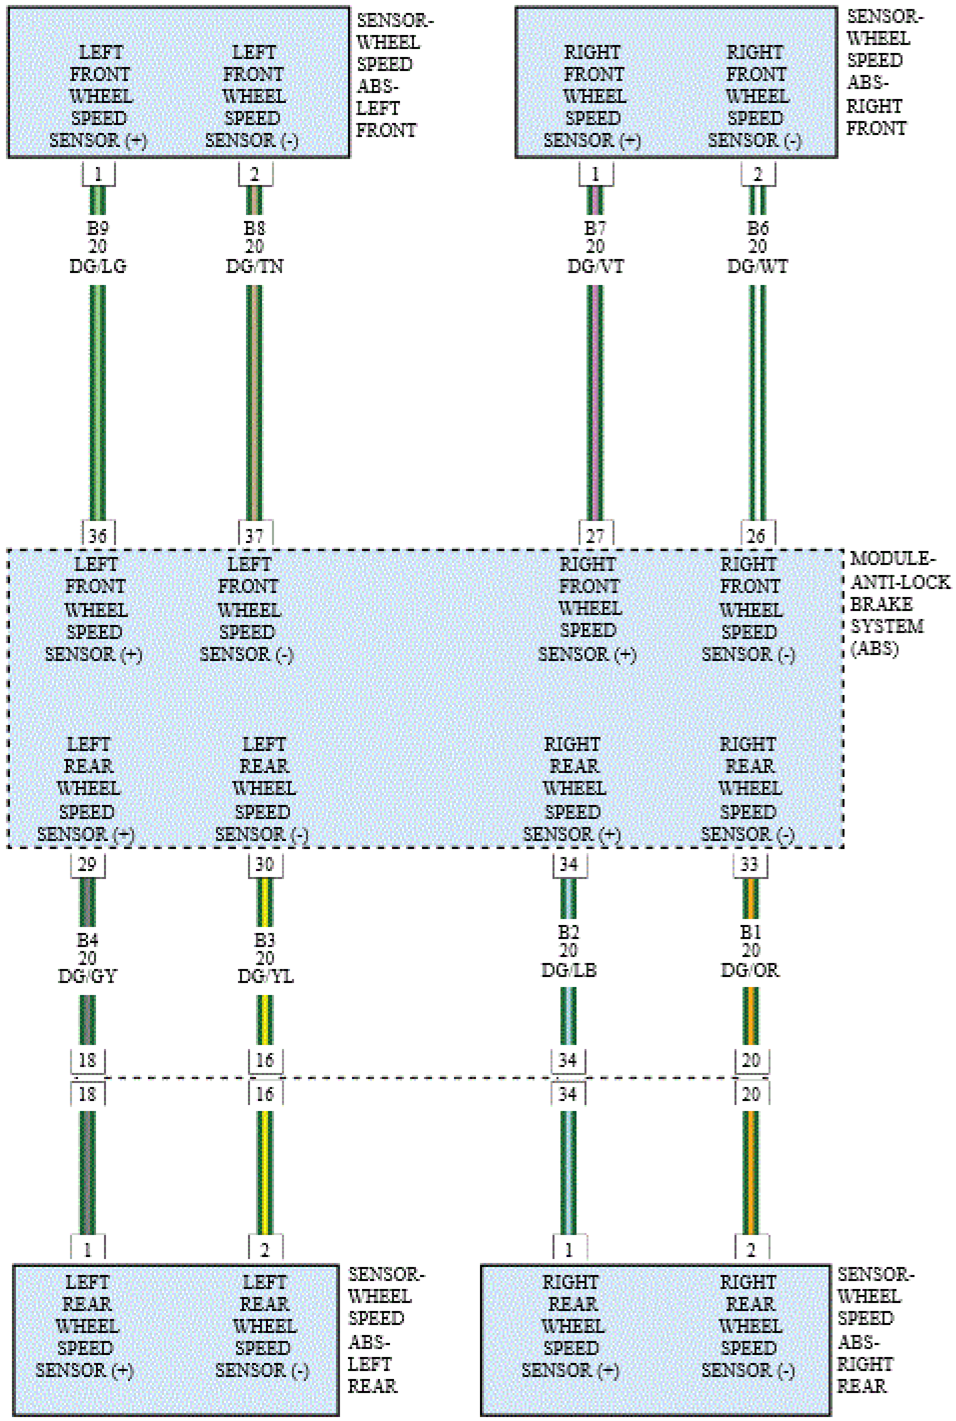

Fig. 10: Wheel Speed Sensor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects if the wheel speed signal is 0 km/h (0 mph) or very low when compared to the other wheel speed signals.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES
CHECK RIGHT FRONT WHEEL SPEED SENSOR FOR LOOSENESS
INSPECT CIRCUITS/CONNECTOR/TERMINALS FOR DAMAGE
RIGHT FRONT WHEEL BEARING AND HUB OR ENCODER FOR DAMAGE
RIGHT FRONT WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: **If DTC C0034-1D is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.**

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.

      CAUTION: **Make sure braking capability is available before road testing.**

   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.**

   4. With the scan tool, read DTCs.

      Is the DTC active?

      Yes

      - Go To 3

      No

      - Go To 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
   1. Turn the ignition on.

2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: **If graph shows periodic dropouts pay close attention to the tone wheel.**

3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Right Front WSS speed showing 0 km/h (0 mph), not matching other wheels, or showing erratic behavior?

Yes

- Go To 3

No

- Perform ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

3. **CHECK FOR IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES**
   1. Turn the ignition off.
   2. Check and adjust the Right Front Tire pressure.
   3. Check and adjust all other tire pressures.
   4. Inspect for mismatched tires on vehicle.

Is the Right Front Tire improperly inflated or mismatched tires on vehicle?

Yes

- Repair as necessary
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 4

4. **CHECK RIGHT FRONT WSS FOR LOOSENESS, INSPECT CIRCUITS/CONNECTORS /TERMINALS FOR DAMAGE**

NOTE: **Check all terminals for broken, bent, pushed out, or corroded terminals.**

1. Turn the ignition off.
2. Inspect the ABS Module harness connector and the Right Front WSS harness connector.
3. Check the Right Front WSS for looseness, excessive corrosion and not properly fastened.
4. Inspect the (B6) Right Front WSS Signal and (B7) Right Front WSS Supply circuits between the Right Front WSS and Anti-Lock Brake Module for damage.

Is the Right Front WSS loose or any of the wiring/connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **CHECK RIGHT FRONT WHEEL SPEED SENSOR FOR DAMAGE**
    1. Remove the Right Front Wheel Speed Sensor.
    2. Inspect the Wheel Speed Sensor for proper mounting.
    3. Inspect the Wheel Speed Sensor harness and connector.
    4. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

    Is the Right Front Wheel Speed Sensor damaged?

    Yes

    - Replace the Right Front Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 6

6. **CHECK RIGHT FRONT WHEEL BEARING AND HUB OR ENCODER FOR DAMAGE**
    1. Inspect the Right Front wheel bearing, hub and Encoder for excessive runout, clearance or damage.

    NOTE: **Refer to the appropriate service information, if necessary, for procedures or specifications.**

    Is the Right Front Wheel Bearing, Hub or Encoder Damaged?

    Yes

    - Replace the Hub and Wheel Bearing in accordance with the Service Information. Refer to **HUB AND BEARING, REMOVAL** .
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 7

7. **RIGHT FRONT WHEEL SPEED SENSOR**
    1. Replace the Right Front Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
    2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    3. Road test the vehicle over 40 km/h (25 mph).

NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.**

4. With the scan tool, read ABS DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test Complete.

C0036-02-LEFT REAR TONE WHEEL - GENERAL SIGNAL FAILURE

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- Vehicle speed.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects periodic drops of a Wheel Speed Sensor (WSS) signal.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
LEFT REAR TONE WHEEL/BEARING DAMAGE
IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES
AXLE SHAFT FASTENER HARDWARE
DIRTY TONE WHEEL/SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

NOTE: **This DTC must be active for the results of this test to be valid. If DTC C0036 -1D is present it must be repaired before continuing.**

1. Turn the ignition on.
2. With the scan tool, read DTCs.
3. With the scan tool, read and record Environmental Data to help identify the conditions in which the DTC was set.
4. With the scan tool, erase DTCs.
5. Cycle the ignition switch off then on.

CAUTION: Ensure brake capability is available before road testing.

6. Test drive the vehicle in a straight line to 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be meet.

7. With the scan tool, read DTCs.

Is the DTC active?

Yes

- Go To 3

No

- Go To 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
    1. Turn the ignition on.
    2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

    NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

    3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

    Is the Left Rear WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

    Yes

    - Go To 3

    No

    - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

3. **CHECK FOR IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES**
    1. Turn the ignition off.

2. Check and adjust the Left Rear Tire pressure.
3. Check and adjust all other tire pressures.
4. Inspect for mismatched tires on vehicle.

   Is the Left Rear Tire improperly inflated or mismatched tires on vehicle?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **CHECK AXLE SHAFT FASTENER HARDWARE FOR LOOSENESS**
   1. Inspect the axle shaft fastener for looseness, and not properly fastened. Tighten fastener to proper specification as required.

      Was the Axle Shaft fastener loose?

      Yes

      - Repair as necessary.

      No

      - Go To 5

5. **CHECK THE LEFT REAR TONE WHEEL FOR DAMAGE**

   NOTE: **Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.**

   1. Check the Left Rear Tone Wheel for damage.
   2. Inspect the Left Rear Tone Wheel for debris.

      Was there debris on the tone wheel?

      Yes

      - Clean tone wheel and sensor. Clear codes and retest.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Replace the Left Rear Tone Wheel in accordance with the Service Information.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C0037-1D-LEFT REAR WHEEL SPEED SENSOR - CIRCUIT CURRENT OUT OF RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

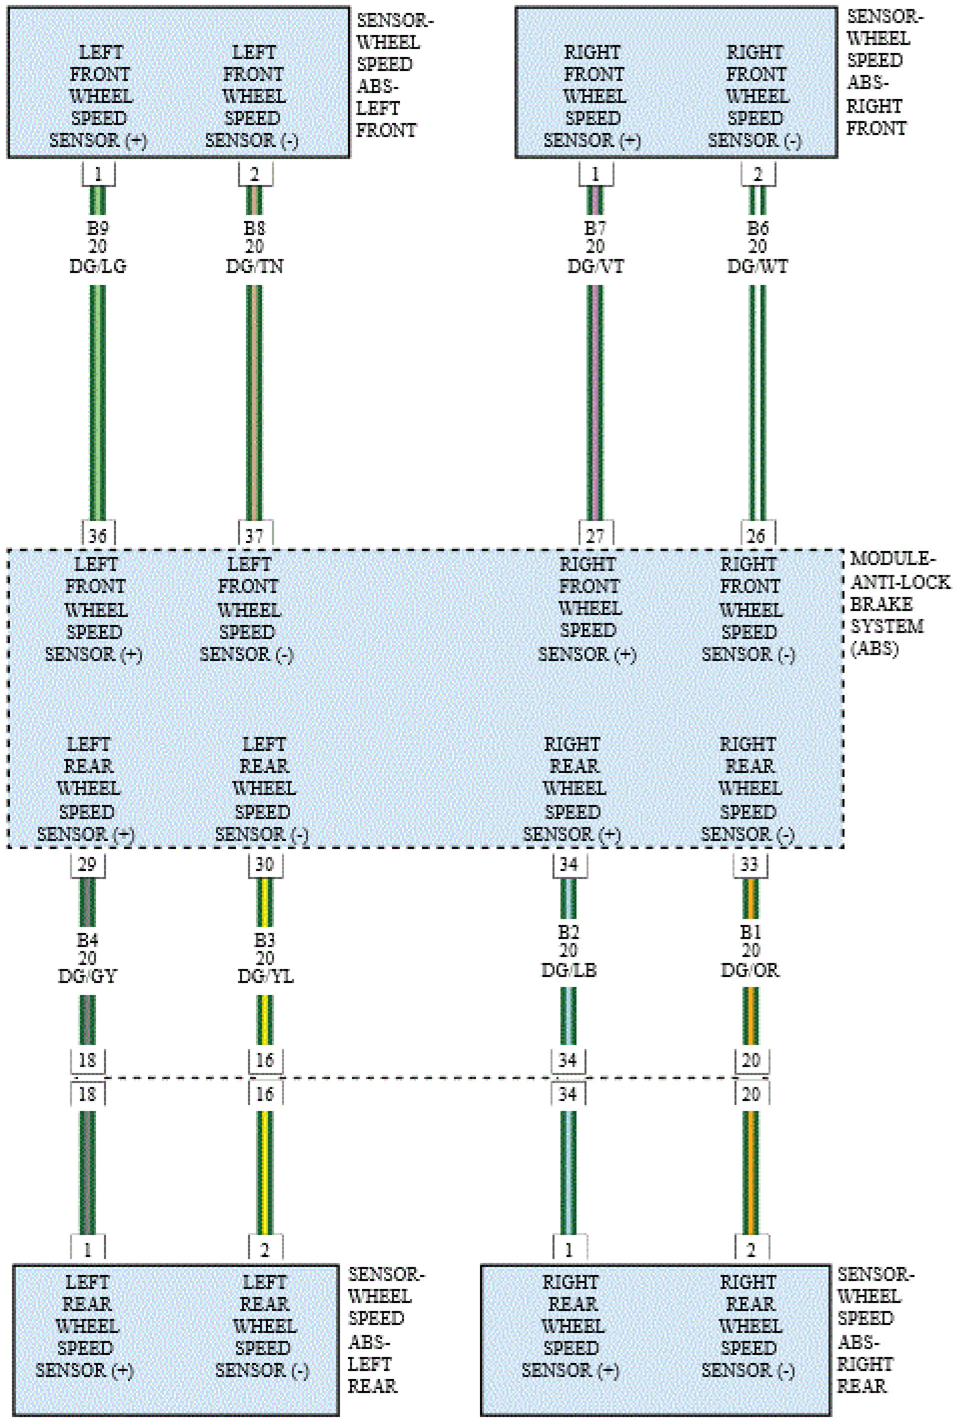

Fig. 11: Wheel Speed Sensor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.

- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects Left Rear Wheel Speed Sensor (WSS) circuit failure.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
CONNECTOR/TERMINAL DAMAGE
(B3) LEFT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(B4) LEFT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE
(B3) LEFT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(B4) LEFT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO GROUND
(B3) LEFT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT OPEN
(B4) LEFT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT OPEN
(B4) LEFT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO THE (B3) LEFT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT
LEFT REAR WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. Cycle the ignition switch from off to on.
    4. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
    - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.
2. **CHECK CONNECTOR/TERMINAL FOR DAMAGE**

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

1. Turn the ignition off.
2. Inspect the Wheel Speed Sensor harness and connector.
3. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

   Were any problems found?

   Yes

   - Repair as necessary in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK (B4) LEFT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT VOLTAGE**
   1. Disconnect the Left Rear Wheel Speed Sensor harness connector.
   2. Turn the ignition on.
   3. Measure the voltage between the (B4) Left Rear Wheel Speed Sensor Supply circuit and ground.

      Is the voltage above 10 volts?

      Yes

      - Go To 6

      No

      - Go To 4

4. **(B4) LEFT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the ABS Module harness connector.
   3. Measure the resistance between the (B4) Left Rear Wheel Speed Sensor Supply circuit and ground.

      Is the resistance below 5.0 Ohms?

      Yes

      - Repair the (B4) Left Rear Wheel Speed Sensor Supply circuit for a short to ground.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 5

5. **(B4) LEFT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT OPEN**
   1. Measure the resistance of the (B4) Left Rear Wheel Speed Sensor Supply circuit between the Left

Rear Wheel Speed Sensor harness connector and the ABS Module harness connector.

Is the resistance below 5 Ohms?

Yes

- Go To 6

No

- Repair the open (B4) Left Rear Wheel Speed Sensor Supply circuit.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **(B3) LEFT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE**
    1. Turn the ignition on.
    2. Measure the voltage of the (B3) Left Rear Wheel Speed Sensor Signal circuit at the Left Rear Wheel Speed Sensor harness connector.

    Is there any voltage present?

    Yes

    - Repair the (B3) Left Rear Wheel Speed Sensor Signal circuit for a short to voltage.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 7

7. **(B3) LEFT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO GROUND**
    1. Turn the ignition off.
    2. Measure the resistance between the (B3) Left Rear Wheel Speed Sensor Signal circuit and ground.

    Is the resistance below 5.0 Ohms?

    Yes

    - Repair the (B3) Left Rear Wheel Speed Sensor Signal circuit for a short to ground.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 8

8. **(B3) LEFT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT OPEN**
    1. Measure the resistance of the (B3) Left Rear Wheel Speed Sensor Signal circuit between the Left Rear Wheel Speed Sensor harness connector and the ABS Module harness connector.

    Is the resistance below 5 Ohms?

    Yes

- Go To 9

No

- Repair the open (B3) Left Rear Wheel Speed Sensor Signal circuit.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

9. **(B4) LEFT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO THE (B3) LEFT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT**
   1. Turn the ignition off to the lock position.
   2. Measure the resistance between the (B4) Left Rear Wheel Speed Sensor Supply circuit and the (B3) Left Rear Wheel Speed Sensor Signal circuit at the ABS Module harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Repair (B4) Left Rear Wheel Speed Sensor Supply circuit for a short to the (B3) Left Rear Wheel Speed Sensor Signal circuit.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 10
10. **LEFT REAR WHEEL SPEED SENSOR**
    1. Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
    2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       CAUTION: Make sure braking capability is available before road testing.

    3. Road test the vehicle over 40 km/h (25 mph).

       NOTE: Vehicle must be driven for several minutes above 40 km/h (25 mph) for set conditions to be meet.

    4. With the scan tool, read ABS DTCs.

       Does the DTC remain active?

       Yes

       - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
       - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Test complete.

C0037-2F-LEFT REAR WHEEL SPEED SENSOR - SIGNAL ERRATIC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

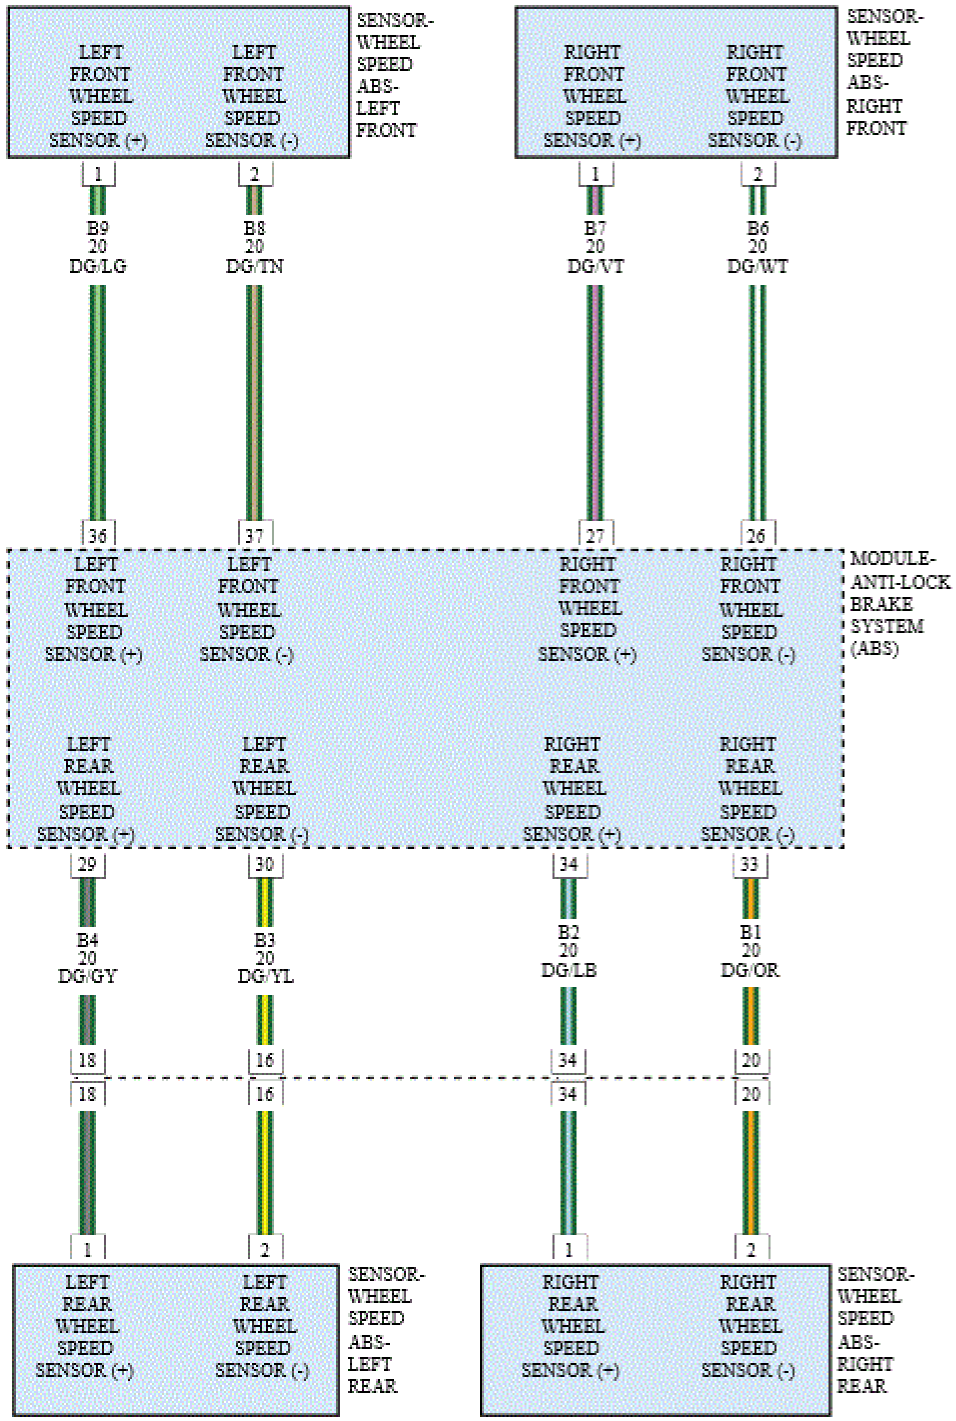

Fig. 12: Wheel Speed Sensor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects multiple drastic changes in Left Rear Wheel Speed Sensor (WSS) signals.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
CHECK LEFT REAR WHEEL SPEED SENSOR FOR LOOSENESS
INSPECT CIRCUITS/CONNECTOR/TERMINALS FOR DAMAGE
LEFT REAR TONE WHEEL DAMAGED/MISSING
LEFT REAR WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: **If DTC C0038-01 is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.**

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.

      CAUTION: **Make sure braking capability is available before road testing.**

   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.**

   4. With the scan tool, read DTCs.

      Is the DTC active?

      Yes

      - Go To 3

      No

      - Go To 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**

1. Turn the ignition on.
2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: **If graph shows periodic dropouts pay close attention to the tone wheel.**

3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

   Is the Left Rear WSS speed showing 0 km/h (0 mph), not matching other wheels, or showing erratic behavior?

   Yes

   - Go To 3

   No

   - Perform ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

3. **CHECK LEFT REAR WSS FOR LOOSENESS, INSPECT CIRCUITS/CONNECTORS /TERMINALS FOR DAMAGE**

   NOTE: **Check all terminals for broken, bent, pushed out, or corroded terminals.**

   1. Turn the ignition off.
   2. Inspect the ABS Module harness connector and the Left Rear WSS harness connector.
   3. Check the Left Rear WSS for looseness, excessive corrosion and not properly fastened.
   4. Inspect the (B3) Left Rear WSS Signal and (B4) Left Rear WSS Supply circuits between the Left Rear WSS and Anti-Lock Brake Module for damage.

   Is the Left Rear WSS loose or any of the wiring/connectors/terminals damaged?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **CHECK LEFT REAR WHEEL SPEED SENSOR FOR DAMAGE**
   1. Remove the Left Rear Wheel Speed Sensor.
   2. Inspect the Wheel Speed Sensor for proper mounting.
   3. Inspect the Wheel Speed Sensor harness and connector.
   4. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

Is the Left Rear Wheel Speed Sensor damaged?

Yes

- Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **CHECK THE LEFT REAR TONE WHEEL DAMAGED/MISSING**
    1. Inspect the Left Rear Tone Wheel for excessive runout, clearance or damage.

NOTE: **Refer to the appropriate service information, if necessary, for procedures or specifications.**

Is the Left Rear Tone Wheel Damaged?

Yes

- Replace the Tone Wheel in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 6

6. **LEFT REAR WHEEL SPEED SENSOR**
    1. Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
    2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    3. Road test the vehicle over 40 km/h (25 mph).

NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.**

4. With the scan tool, read ABS DTCs.

Does the DTC remain active?

Yes

- Replace the Anti-Lock Brakes Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test Complete.

C0037-4A-LEFT REAR WHEEL SPEED SENSOR - INCORRECT COMPONENT INSTALLED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects that the wrong component is installed.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
LEFT REAR WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: **If DTC C0037-1D is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.**

   NOTE: **This vehicle uses directional front wheel speed sensors and non-directional rear wheel speed sensors.**

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. With the scan tool, read DTCs.

   Is the DTC active?

   Yes

   - Go To 2

   No

   - Test Complete.
2. **LEFT REAR WHEEL SPEED SENSOR**

NOTE: This vehicle uses a non-directional rear wheel speed sensor, make sure the correct wheel speed sensor is installed on the vehicle.

1. Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** . Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   CAUTION: Make sure braking capability is available before road testing.

2. Road test the vehicle over 40 km/h (25 mph).
3. With the scan tool, read DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

C0037-62-LEFT REAR WHEEL SPEED SENSOR - SIGNAL COMPARE FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

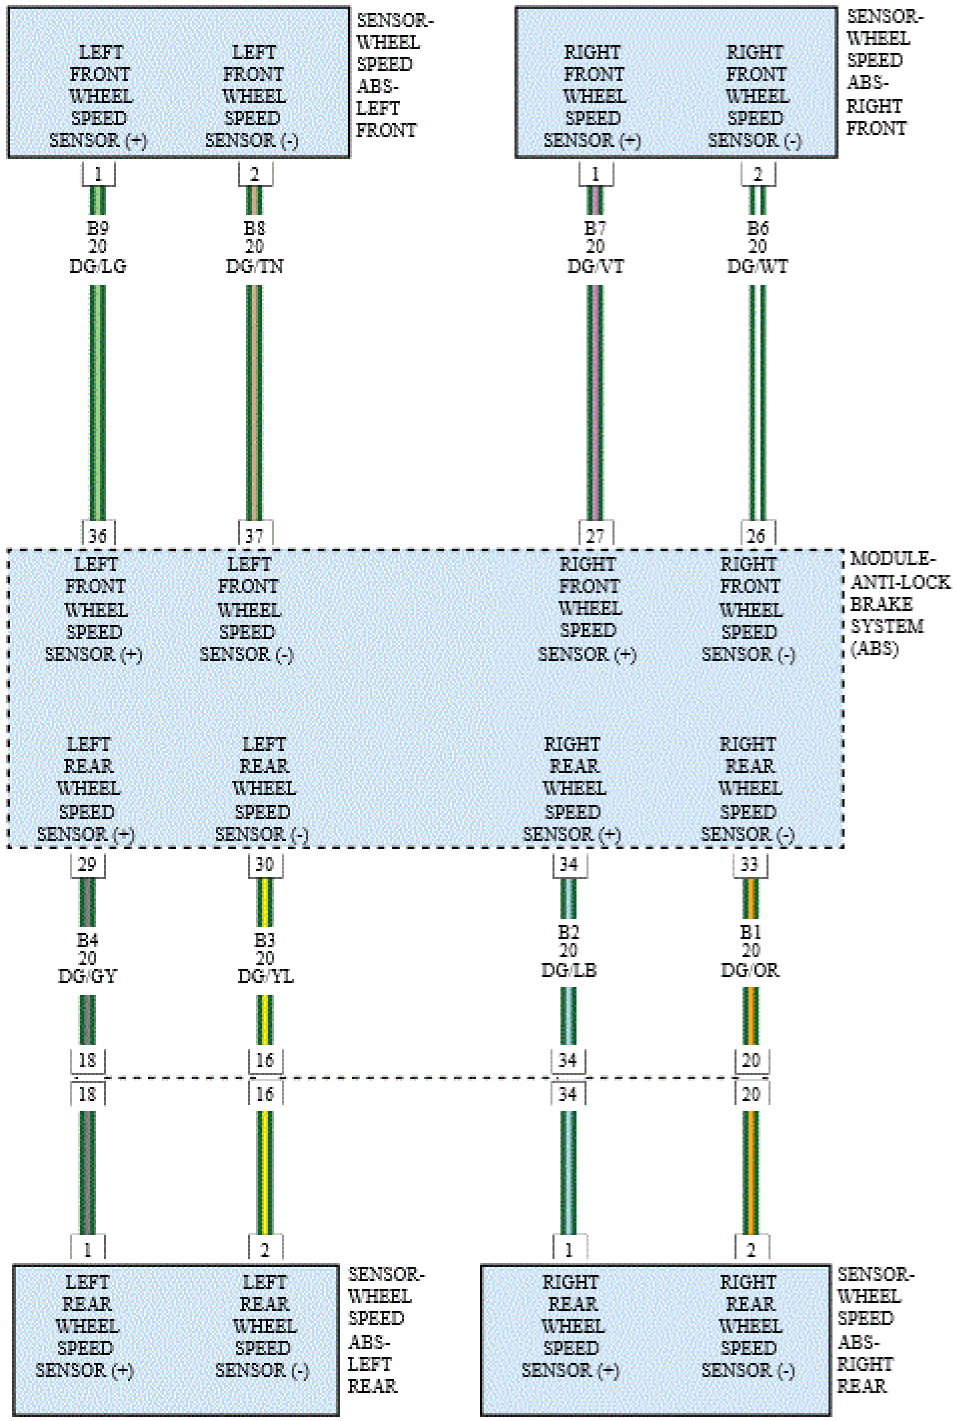

Fig. 13: Wheel Speed Sensor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects if the wheel speed signal is 0 km/h (0 mph) or very low when compared to the other wheel speed signals.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES
CHECK LEFT REAR WHEEL SPEED SENSOR FOR LOOSENESS
INSPECT CIRCUITS/CONNECTOR/TERMINALS FOR DAMAGE
LEFT REAR TONE WHEEL DAMAGED/MISSING
LEFT REAR WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: **If DTC C0037-1D is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.**

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.

      CAUTION: **Make sure braking capability is available before road testing.**

   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.**

   4. With the scan tool, read DTCs.

      Is the DTC active?

      Yes

      - Go To 3

      No

      - Go To 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
   1. Turn the ignition on.

2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: **If graph shows periodic dropouts pay close attention to the tone wheel.**

3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Left Rear WSS speed showing 0 km/h (0 mph), not matching other wheels, or showing erratic behavior?

Yes

- Go To 3

No

- Perform ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

3. **CHECK FOR IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES**
   1. Turn the ignition off.
   2. Check and adjust the Left Rear Tire pressure.
   3. Check and adjust all other tire pressures.
   4. Inspect for mismatched tires on vehicle.

Is the Left Rear Tire improperly inflated or mismatched tires on vehicle?

Yes

- Repair as necessary
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 4

4. **CHECK LEFT REAR WSS FOR LOOSENESS, INSPECT CIRCUITS/CONNECTORS /TERMINALS FOR DAMAGE**

NOTE: **Check all terminals for broken, bent, pushed out, or corroded terminals.**

1. Turn the ignition off.
2. Inspect the ABS Module harness connector and the Left Rear WSS harness connector.
3. Check the Left Rear WSS for looseness, excessive corrosion and not properly fastened.
4. Inspect the (B3) Left Rear WSS Signal and (B4) Left Rear WSS Supply circuits between the Left Rear WSS and Anti-Lock Brake Module for damage.

Is the Left Rear WSS loose or any of the wiring/connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **CHECK LEFT REAR WHEEL SPEED SENSOR FOR DAMAGE**
    1. Remove the Left Rear Wheel Speed Sensor.
    2. Inspect the Wheel Speed Sensor for proper mounting.
    3. Inspect the Wheel Speed Sensor harness and connector.
    4. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

    Is the Left Rear Wheel Speed Sensor damaged?

    Yes

    - Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 6

6. **CHECK THE LEFT REAR TONE WHEEL DAMAGED/MISSING**
    1. Inspect the Left Rear Tone Wheel for excessive runout, clearance or damage.

    NOTE: **Refer to the appropriate service information, if necessary, for procedures or specifications.**

    Is the Left Rear Tone Wheel Damaged?

    Yes

    - Replace the Tone Wheel in accordance with the Service Information.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 7

7. **LEFT REAR WHEEL SPEED SENSOR**
    1. Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
    2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    3. Road test the vehicle over 40 km/h (25 mph).

NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.**

4. With the scan tool, read ABS DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test Complete.

C0039-02-RIGHT REAR TONE WHEEL - GENERAL SIGNAL FAILURE

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- Vehicle speed.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects periodic drops of a Wheel Speed Sensor (WSS) signal.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
RIGHT REAR TONE WHEEL/BEARING DAMAGE
IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES
AXLE SHAFT FASTENER HARDWARE
DIRTY TONE WHEEL/SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

NOTE: **This DTC must be active for the results of this test to be valid. If DTC C0039-1D is present it must be repaired before continuing.**

1. Turn the ignition on.
2. With the scan tool, read DTCs.
3. Record DTC and Freeze Frame information.
4. With the scan tool, erase DTCs.
5. Cycle the ignition switch off then on.

CAUTION: Ensure brake capability is available before road testing.

6. Test drive the vehicle in a straight line to 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be meet.

7. With the scan tool, read DTCs.

Is the DTC active?

Yes

- Go To 3

No

- Go To 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
   1. Turn the ignition on.
   2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

   3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Right Rear WSS speed showing 0 km/h (0 mph) or not matching other wheels or showing erratic behavior?

Yes

- Go To 3

No

- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

3. **CHECK FOR IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES**
   1. Turn the ignition off.

2. Check and adjust the Right Rear Tire pressure.
3. Check and adjust all other tire pressures.
4. Inspect for mismatched tires on vehicle.

Is the Right Rear Tire improperly inflated or mismatched tires on vehicle?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 4

4. **CHECK AXLE SHAFT FASTENER HARDWARE FOR LOOSENESS**
    1. Inspect the axle shaft fastener for looseness, and not properly fastened. Tighten fastener to proper specification as required.

    Was the Axle Shaft fastener loose?

    Yes

    - Repair as necessary.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 5

5. **CHECK THE RIGHT REAR TONE WHEEL FOR DAMAGE**

NOTE: Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

1. Check the Right Rear Tone Wheel for damage.
2. Inspect the Right Rear Tone Wheel for debris.

Was there debris on the tone wheel?

Yes

- Clean tone wheel and sensor. Clear codes and retest.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Replace the Right Rear Tone Wheel in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C003A-1D-RIGHT REAR WHEEL SPEED SENSOR - CIRCUIT CURRENT OUT OF RANGE

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

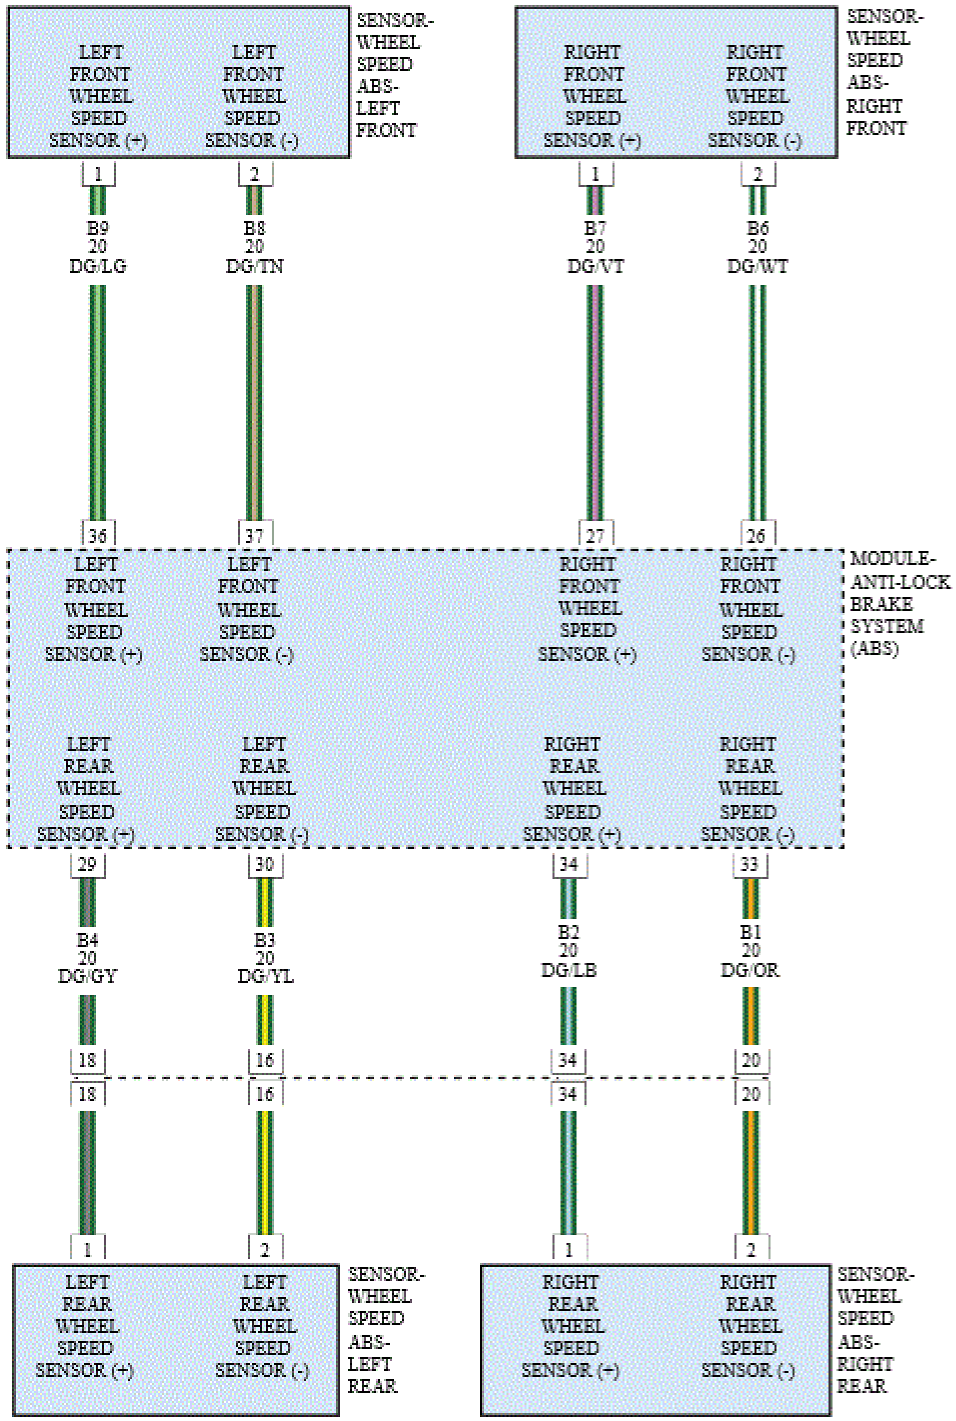

Fig. 14: Wheel Speed Sensor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects Right Rear Wheel Speed Sensor (WSS) circuit failure.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
CONNECTOR/TERMINAL DAMAGE
(B1) RIGHT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(B2) RIGHT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE
(B1) RIGHT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(B2) RIGHT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO GROUND
(B1) RIGHT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT OPEN
(B2) RIGHT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT OPEN
(B2) RIGHT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO THE (B1) RIGHT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT
RIGHT REAR WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Cycle the ignition switch from off to on.
   4. With the scan tool, read DTCs.

      Is the DTC active at this time?

      Yes

      - Go To 2

      No

      - The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
      - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK CONNECTOR/TERMINAL FOR DAMAGE**

NOTE: **Check all terminals for broken, bent, pushed out, or corroded terminals.**

1. Turn the ignition off.
2. Inspect the Wheel Speed Sensor harness and connector.
3. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

Were any problems found?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK (B2) RIGHT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT VOLTAGE**
   1. Disconnect the Right Rear Wheel Speed Sensor harness connector.
   2. Turn the ignition on.
   3. Measure the voltage between the (B2) Right Rear Wheel Speed Sensor Supply circuit and ground.

Is the voltage above 10 volts?

Yes

- Go To 6

No

- Go To 4

4. **(B2) RIGHT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the ABS Module harness connector.
   3. Measure the resistance between the (B2) Right Rear Wheel Speed Sensor Supply circuit and ground.

Is the resistance below 5.0 Ohms?

Yes

- Repair the (B2) Right Rear Wheel Speed Sensor Supply circuit for a short to ground.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **(B2) RIGHT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT OPEN**
    1. Measure the resistance of the (B2) Right Rear Wheel Speed Sensor Supply circuit between the Right Rear Wheel Speed Sensor harness connector and the ABS harness connector.

       Is the resistance below 5 Ohms?

       Yes

       - Go To 6

       No

       - Repair the open (B2) Right Rear Wheel Speed Sensor Supply circuit.
       - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
6. **(B1) RIGHT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE**
    1. Turn the ignition on.
    2. Measure the voltage of the (B1) Right Rear Wheel Speed Sensor Signal circuit at the Right Rear Wheel Speed Sensor harness connector.

       Is there any voltage present?

       Yes

       - Repair the (B1) Right Rear Wheel Speed Sensor Signal circuit for a short to voltage.
       - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 7
7. **(B1) RIGHT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO GROUND**
    1. Turn the ignition off.
    2. Measure the resistance between the (B1) Right Rear Wheel Speed Sensor Signal circuit and ground.

       Is the resistance below 5.0 Ohms?

       Yes

       - Repair the (B1) Right Rear Wheel Speed Sensor Signal circuit for a short to ground.
       - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 8
8. **(B1) RIGHT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT OPEN**
    1. Measure the resistance of the (B1) Right Rear Wheel Speed Sensor Signal circuit between the Right Rear Wheel Speed Sensor harness connector and the ABS Module harness connector.

Is the resistance below 5 Ohms?

Yes

- Go To 9

No

- Repair the open (B1) Right Rear Wheel Speed Sensor Signal circuit.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

9. **(B2) RIGHT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO THE (B1) RIGHT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT**
    1. Turn the ignition off.
    2. Measure the resistance between the (B2) Right Rear Wheel Speed Sensor Supply circuit and the (B1) Right Rear Wheel Speed Sensor Signal circuit at the ABS Module harness connector.

       Is the resistance below 5.0 Ohms?

       Yes

       - Repair (B2) Right Rear Wheel Speed Sensor Supply circuit for a short to the (B1) Right Rear Wheel Speed Sensor Signal circuit.
       - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 10

10. **RIGHT REAR WHEEL SPEED SENSOR**
    1. Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
    2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       CAUTION: Make sure braking capability is available before road testing.

    3. Road test the vehicle over 40 km/h (25 mph).

       NOTE: Vehicle must be driven for several minutes above 40 km/h (25 mph) for set conditions to be meet.

    4. With the scan tool, read ABS DTCs.

       Does the DTC remain active?

       Yes

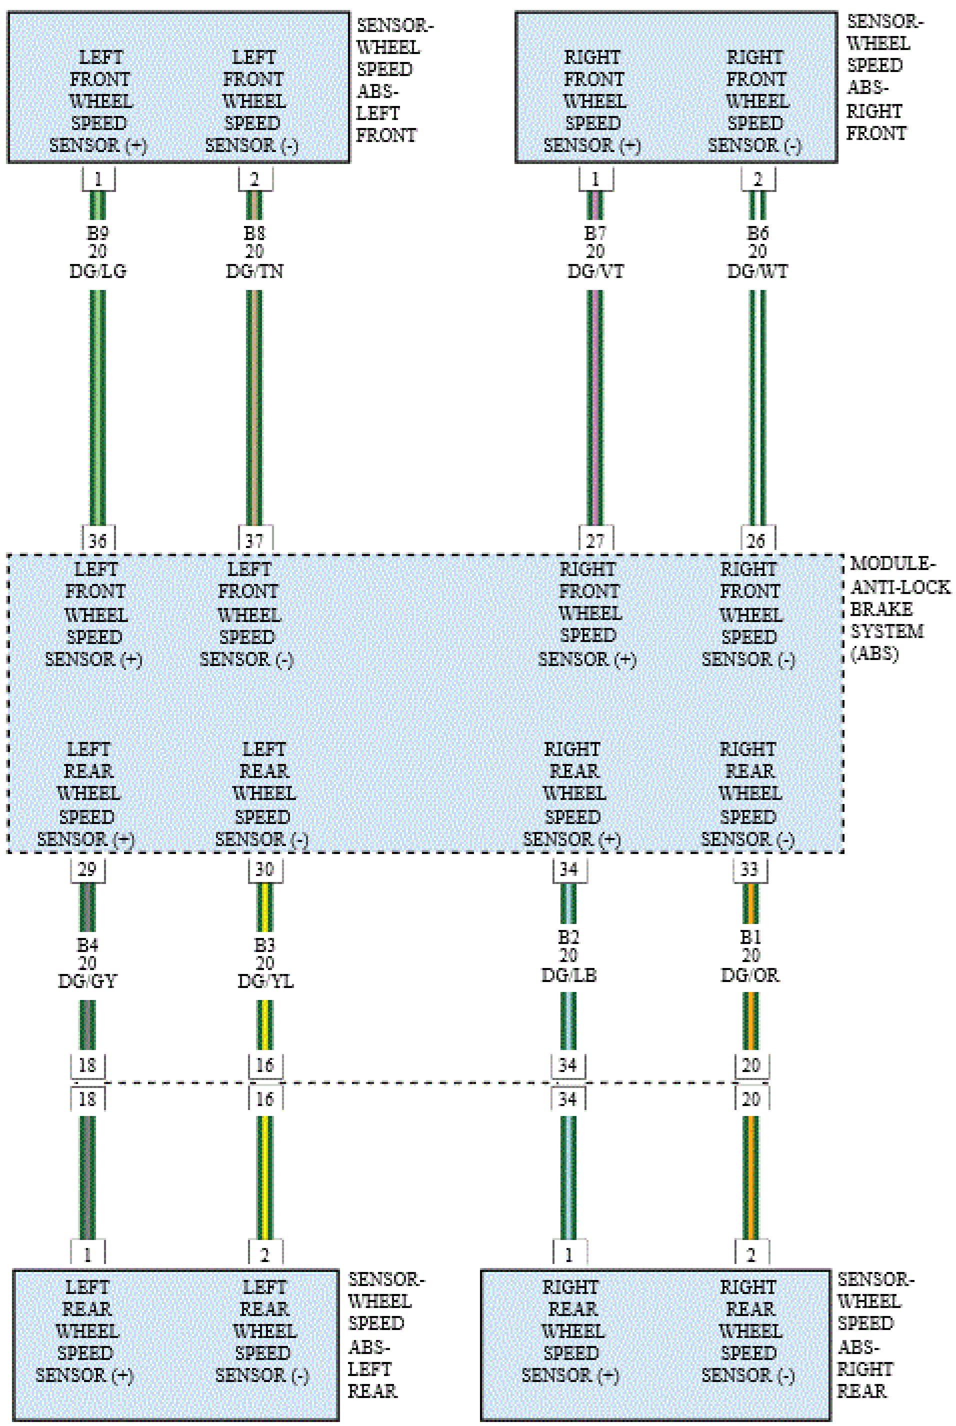
       - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
       - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

C003A-2F-RIGHT REAR WHEEL SPEED SENSOR - SIGNAL ERRATIC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .



[Fig. 15: Wheel Speed Sensor - Circuit Diagram]

Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects multiple drastic changes in Right Rear Wheel Speed Sensor (WSS) signals.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
CHECK RIGHT REAR WHEEL SPEED SENSOR FOR LOOSENESS
INSPECT CIRCUITS/CONNECTOR/TERMINALS FOR DAMAGE
RIGHT REAR TONE WHEEL DAMAGED/MISSING
RIGHT REAR WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: **If DTC C003B-01 is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.**

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.

      CAUTION: **Make sure braking capability is available before road testing.**

   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.**

   4. With the scan tool, read DTCs.

      Is the DTC active?

      Yes

      - Go To 3

No

- Go To 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
    1. Turn the ignition on.
    2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

    NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

    3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

    Is the Right Rear WSS speed showing 0 km/h (0 mph), not matching other wheels, or showing erratic behavior?

    Yes

    - Go To 3

    No

    - Perform ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

3. **CHECK RIGHT REAR WSS FOR LOOSENESS, INSPECT CIRCUITS/CONNECTORS /TERMINALS FOR DAMAGE**

    NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

    1. Turn the ignition off.
    2. Inspect the ABS Module harness connector and the Right Rear WSS harness connector.
    3. Check the Right Rear WSS for looseness, excessive corrosion and not properly fastened.
    4. Inspect the (B1) Right Rear WSS Signal and (B2) Right Rear WSS Supply circuits between the Right Rear WSS and Anti-Lock Brake Module for damage.

    Is the Right Rear WSS loose or any of the wiring/connectors/terminals damaged?

    Yes

    - Repair as necessary.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 4

4. **CHECK RIGHT REAR WHEEL SPEED SENSOR FOR DAMAGE**
    1. Remove the Right Rear Wheel Speed Sensor.

2. Inspect the Wheel Speed Sensor for proper mounting.
3. Inspect the Wheel Speed Sensor harness and connector.
4. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

   Is the Right Rear Wheel Speed Sensor damaged?

   Yes

   - Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 5

5. **CHECK THE RIGHT REAR TONE WHEEL DAMAGED/MISSING**
   1. Inspect the Right Rear Tone Wheel for excessive runout, clearance or damage.

   NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

   Is the Right Rear Tone Wheel Damaged?

   Yes

   - Replace the Tone Wheel in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 6

6. **RIGHT REAR WHEEL SPEED SENSOR**
   1. Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
   2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Road test the vehicle over 40 km/h (25 mph).

   NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

   4. With the scan tool, read ABS DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Anti-Lock Brakes Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .

- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test Complete.

C003A-4A-RIGHT REAR WHEEL SPEED SENSOR - INCORRECT COMPONENT INSTALLED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects that the wrong component is installed.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
RIGHT REAR WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

NOTE: **If DTC C003A-1D is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.**

NOTE: **This vehicle uses directional front wheel speed sensors and non-directional rear wheel speed sensors.**

1. Turn the ignition on.
2. With the scan tool, record and erase DTCs.
3. With the scan tool, read DTCs.

Is the DTC active?

Yes

- Go To 2

No

- Test Complete.

2. **RIGHT REAR WHEEL SPEED SENSOR**

NOTE: **This vehicle uses a non-directional rear wheel speed sensor, make sure the correct wheel speed sensor is installed on the vehicle.**

1. Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** . Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

CAUTION: **Make sure braking capability is available before road testing.**

2. Road test the vehicle over 40 km/h (25 mph).
3. With the scan tool, read DTCs.

Does the DTC remain active?

Yes

- Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

C003A-62-RIGHT REAR WHEEL SPEED SENSOR - SIGNAL COMPARE FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

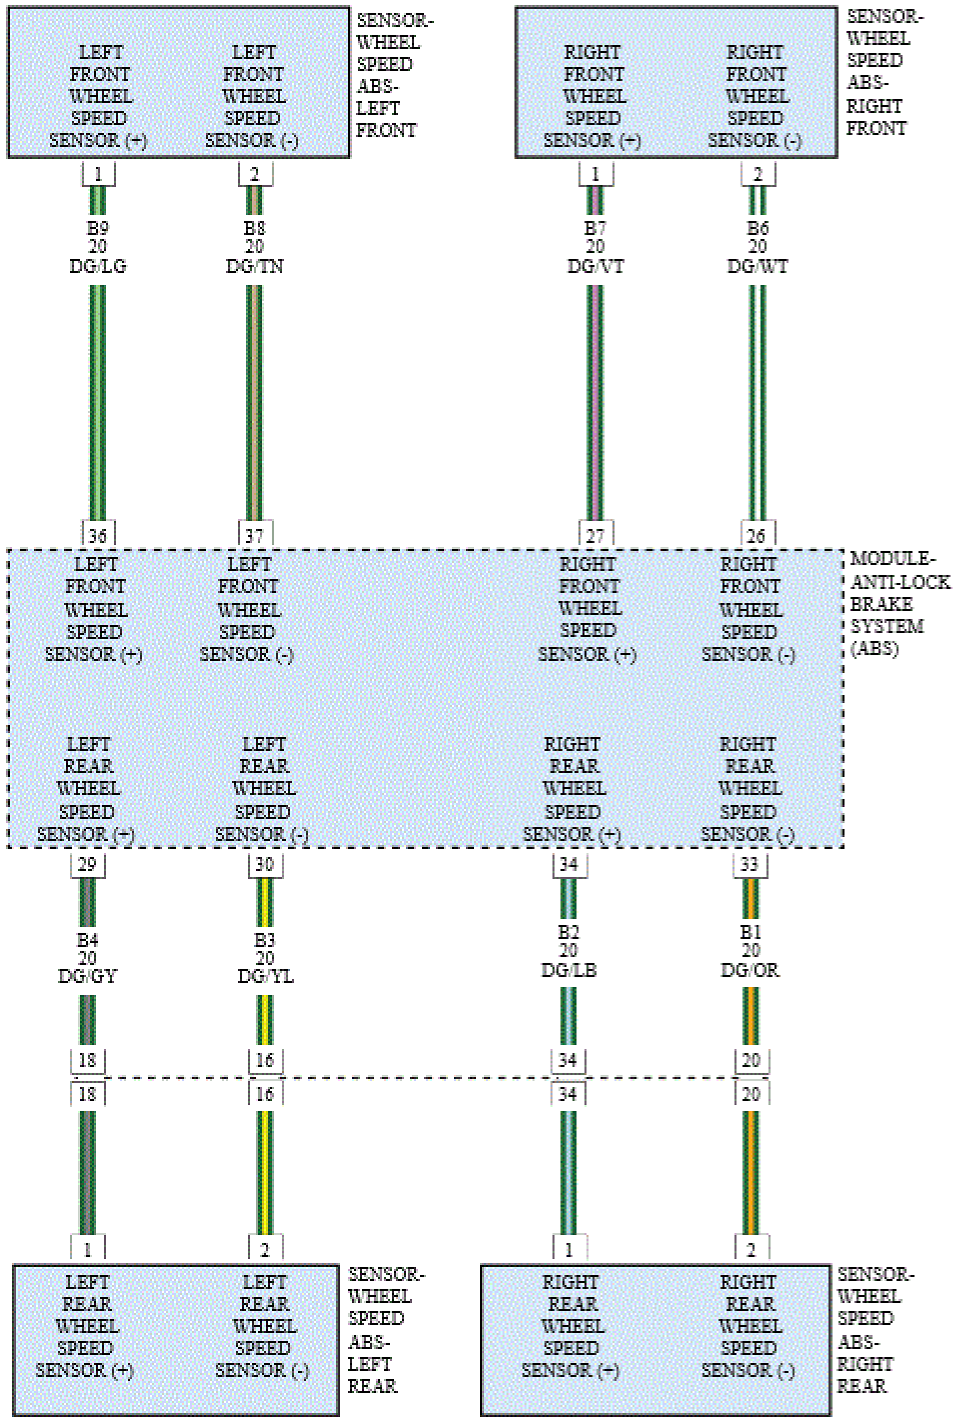


Fig. 16: Wheel Speed Sensor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects if the wheel speed signal is 0 km/h (0 mph) or very low when compared to the other wheel speed signals.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES
CHECK RIGHT REAR WHEEL SPEED SENSOR FOR LOOSENESS
INSPECT CIRCUITS/CONNECTOR/TERMINALS FOR DAMAGE
RIGHT REAR TONE WHEEL DAMAGED/MISSING
RIGHT REAR WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: **If DTC C003A-1D is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.**

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.

      CAUTION: **Make sure braking capability is available before road testing.**

   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.**

   4. With the scan tool, read DTCs.

      Is the DTC active?

      Yes

      - Go To 3

      No

      - Go To 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
   1. Turn the ignition on.

2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: **If graph shows periodic dropouts pay close attention to the tone wheel.**

3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Right Rear WSS speed showing 0 km/h (0 mph), not matching other wheels, or showing erratic behavior?

Yes

- Go To 3

No

- Perform ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

3. **CHECK FOR IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES**
   1. Turn the ignition off.
   2. Check and adjust the Right Rear Tire pressure.
   3. Check and adjust all other tire pressures.
   4. Inspect for mismatched tires on vehicle.

Is the Right Rear Tire improperly inflated or mismatched tires on vehicle?

Yes

- Repair as necessary
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 4

4. **CHECK RIGHT REAR WSS FOR LOOSENESS, INSPECT CIRCUITS/CONNECTORS /TERMINALS FOR DAMAGE**

NOTE: **Check all terminals for broken, bent, pushed out, or corroded terminals.**

1. Turn the ignition off.
2. Inspect the ABS Module harness connector and the Right Rear WSS harness connector.
3. Check the Right Rear WSS for looseness, excessive corrosion and not properly fastened.
4. Inspect the (B1) Right Rear WSS Signal and (B2) Right Rear WSS Supply circuits between the Right Rear WSS and Anti-Lock Brake Module for damage.

Is the Right Rear WSS loose or any of the wiring/connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **CHECK RIGHT REAR WHEEL SPEED SENSOR FOR DAMAGE**
    1. Remove the Right Rear Wheel Speed Sensor.
    2. Inspect the Wheel Speed Sensor for proper mounting.
    3. Inspect the Wheel Speed Sensor harness and connector.
    4. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

    Is the Right Rear Wheel Speed Sensor damaged?

    Yes

    - Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 6

6. **CHECK THE RIGHT REAR TONE WHEEL DAMAGED/MISSING**
    1. Inspect the Right Rear Tone Wheel for excessive runout, clearance or damage.

    NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

    Is the Right Rear Tone Wheel Damaged?

    Yes

    - Replace the Tone Wheel in accordance with the Service Information.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 7

7. **RIGHT REAR WHEEL SPEED SENSOR**
    1. Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
    2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    3. Road test the vehicle over 40 km/h (25 mph).

NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.**

4. With the scan tool, read ABS DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test Complete.

C0042-11-BRAKE PEDAL POSITION SENSOR - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

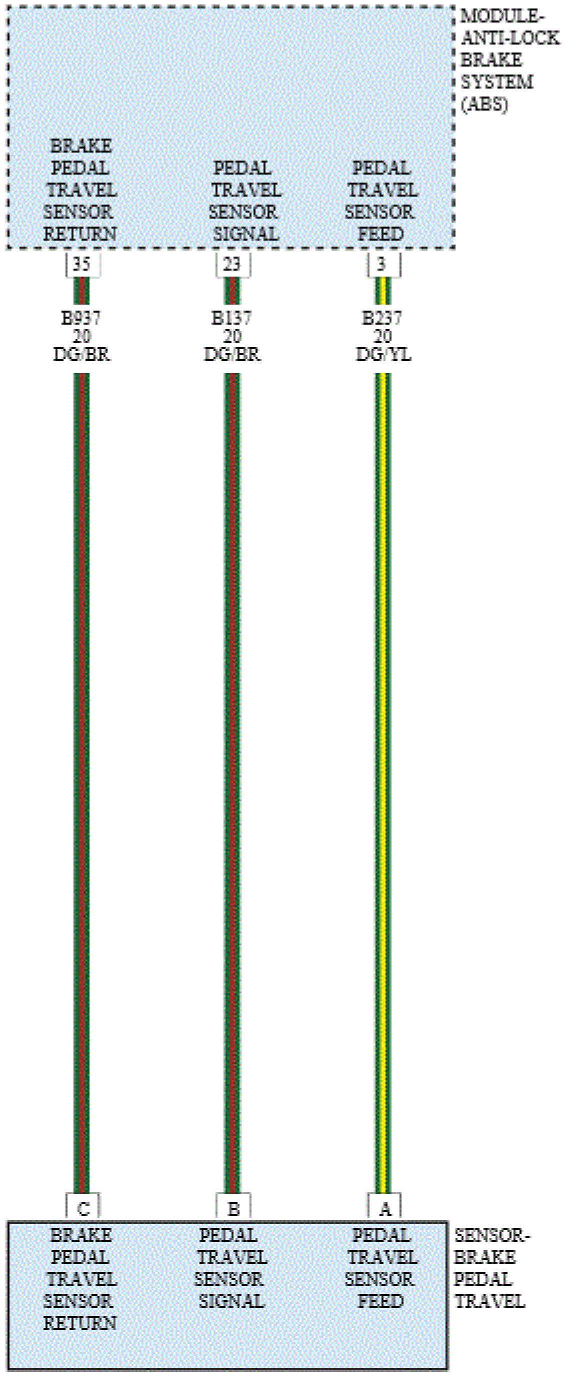

Fig. 17: Brake Pedal Position Sensor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects a short from the Brake Pedal Position (BPP) Sensor.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
BRAKE PEDAL POSITION (BPP) SENSOR IMPROPERLY INSTALLED, DAMAGE OR MECHANICAL FAILURE
(B237) BPP SENSOR SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(B137) BPP SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(B137) BPP SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(B137) BPP SENSOR SIGNAL CIRCUIT SHORTED TO (B937) BPP SENSOR RETURN CIRCUIT
BRAKE PEDAL POSITION (BPP) SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

NOTE: **If DTC C1246-1C is present, perform the diagnostics for this DTC first before continuing with this diagnostic procedure.**

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ABS DTCs and record on the repair order.
    3. With the scan tool, read and record the Environmental Data to help identify the conditions in which the DTC was set.
    4. With the scan tool, erase the DTCs.
    5. Start the engine.
    6. Slowly press the brake pedal and release.
    7. With the scan tool, read ABS DTCs and record on the repair order.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to STANDARD PROCEDURE.
2. **INSPECT THE BRAKE PEDAL POSITION (BPP) SENSOR FOR INCORRECT INSTALLATION, DAMAGE OR MECHANICAL FAILURE**
    1. Turn the ignition off.

2. Visually inspect the BPP Sensor for Improper installation, damage or mechanical failure. Refer to **SENSOR, STOP LAMP, INSTALLATION** .

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **(B237) BPP SENSOR FEED CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Disconnect the ABS Module harness connector.
   2. Disconnect the Brake Pedal Position (BPP) Sensor harness connector.
   3. Measure the resistance of the (B237) BPP Sensor Feed circuit between the BPP Sensor harness connector and the ABS Module harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (B237) BPP Sensor Feed circuit for an open circuit or high resistance.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
4. **(B137) BPP SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (B137) BPP Sensor Signal circuit between the BPP Sensor harness connector and the ABS Module harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 5

      No

      - Repair the (B137) BPP Sensor Signal circuit for an open circuit or high resistance.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
5. **(B137) BPP SENSOR SIGNAL CIRCUIT SHORTED TO GROUND**
   1. Measure the resistance between ground and the (B137) BPP Sensor Signal circuit in the BPP Sensor harness connector.

      Is the resistance above 5 Ohms?

Yes

- Go To 6

No

- Repair the (B137) BPP Signal circuit for a short to ground.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **(B137) BPP SENSOR SIGNAL CIRCUIT SHORTED TO THE (B937) BPP SENSOR RETURN CIRCUIT**
    1. Measure the resistance between the (B937) BPP Sensor Return circuit and the (B137) BPP Sensor Signal circuit in the BPP Sensor harness connector.

       Is the resistance above 5 Ohms?

       Yes

       - Go To 7

       No

       - Repair the (B137) BPP Sensor Signal circuit and the (B937) BPP Sensor Return circuit for a short.
       - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
7. **BRAKE PEDAL POSITION (BPP) SENSOR**
    1. Turn the ignition off.
    2. Connect the ABS Module harness connector.
    3. Turn the ignition on.
    4. Measure the voltage at the BPP Sensor harness connector between the (B237) BPP Sensor Feed and the (B937) BPP Sensor Return.

       Is the voltage above 4.75 volts?

       Yes

       - Replace the Brake Pedal Position (BPP) Sensor in accordance with the Service Information. Refer to **SENSOR, STOP LAMP, REMOVAL** .
       - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Replace the Anti-lock Brake System (ABS) Module in accordance with the service information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
       - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C0042-12-BRAKE PEDAL POSITION SENSOR - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

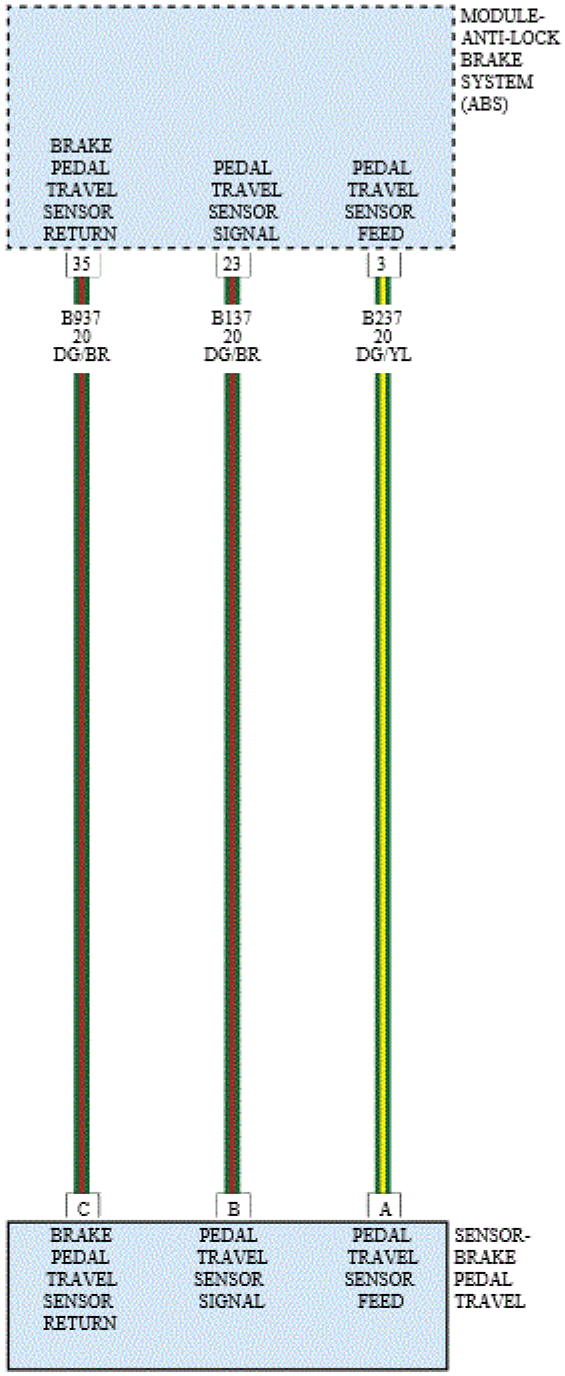

Fig. 18: Brake Pedal Position Sensor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects a short from the Brake Pedal Position (BPP) Sensor.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
BRAKE PEDAL POSITION (BPP) SENSOR IMPROPERLY INSTALLED, DAMAGE OR MECHANICAL FAILURE
(B237) BPP SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE
(B137) BPP SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(B937) BPP SENSOR RETURN CIRCUIT SHORTED TO VOLTAGE
(B937) BPP SENSOR RETURN CIRCUIT OPEN OR HIGH RESISTANCE
(B237) BPP SENSOR SUPPLY CIRCUIT SHORTED TO THE (B137) BPP SENSOR SIGNAL CIRCUIT
BRAKE PEDAL POSITION (BPP) SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

NOTE: **If DTC C1246-1C is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.**

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, read ABS DTCs and record on the repair order.
   3. With the scan tool, read and record the Environmental Data to help identify the conditions in which the DTC was set.
   4. With the scan tool, erase the DTCs.
   5. Start the engine.
   6. Slowly press the brake pedal completely.
   7. With the scan tool, read ABS DTCs and record on the repair order.

      Is the DTC active?

      Yes

      - Go To 2

      No

      - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.
2. **INSPECT THE BRAKE PEDAL POSITION (BPP) SENSOR FOR INCORRECT INSTALLATION, DAMAGE OR MECHANICAL FAILURE**

1. Turn the ignition off.
2. Visually inspect the BPP Sensor for Improper installation, damage or mechanical failure. (Refer to **INSTALLATION**).

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **(B237) BPP SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE**
   1. Disconnect the BPP Sensor harness connector.
   2. Turn the ignition on.
   3. Measure the voltage of the (B237) BPP Sensor Supply circuit in the BPP Sensor harness connector.

      Is the voltage above 5.5 volts?

      Yes

      - Repair the (B237) BPP Sensor Supply circuit for a short to voltage.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **(B137) BPP SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE**
   1. Measure the voltage of the (B137) BPP Sensor Signal circuit in the BPP Sensor harness connector.

      Is there any voltage present?

      Yes

      - Go To 5

      No

      - Repair the (B137) BPP Sensor Signal circuit for a short to voltage.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **(B937) BPP SENSOR RETURN CIRCUIT SHORTED TO VOLTAGE**
   1. Measure the voltage of the (B937) BPP Sensor Return circuit in the BPP Sensor harness connector.

      Is there any voltage present?

      Yes

- Go To 7

No

- Repair the (B937) BPP Sensor Return circuit for a short to voltage.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **(B937) BPP SENSOR RETURN SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the ABS Module harness connector.
   3. Measure the resistance of the (B937) BPP Sensor Return circuit between the BPP Sensor harness connector and the ABS Module harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 7

   No

   - Repair the (B937) BPP Sensor Signal Return circuit for an open circuit or high resistance.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
7. **(B237) BPP SENSOR SUPPLY CIRCUIT SHORTED TO THE (B137) BPP SENSOR SIGNAL CIRCUIT**
   1. Measure the resistance between ground and the (B937) BPP Sensor Return circuit and the (B137) BPP Sensor Signal circuit in the BPP Sensor harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (B237) BPP Sensor Supply circuit and the (B137) BPP Sensor Signal circuit for a short.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 8
8. **BRAKE PEDAL POSITION (BPP) SENSOR**
   1. Turn the ignition off.
   2. Connect the ABS Module harness connector.
   3. Turn the ignition on.
   4. Measure the voltage at the BPP Sensor harness connector between the (B237) BPP Sensor Feed and the (B937) BPP Sensor Return.

   Is the voltage above 4.75 volts?

Yes

- Replace the Brake Pedal Position (BPP) Sensor in accordance with the Service Information. (Refer to **REMOVAL**).
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Replace the Anti-lock Brake System (ABS) Module in accordance with the service information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C0042-28-BRAKE PEDAL POSITION SENSOR - SIGNAL BIAS LEVEL OUT OF RANGE / ZERO ADJUSTMENT FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **If any other DTCs are present, repair them first before continuing with this diagnostic procedure.**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module is sensing the latest learned brake off voltage has changed by an amount too great from the original calibrated voltage.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
BRAKE PEDAL POSITION (BPP) SENSOR IMPROPERLY INSTALLED, DAMAGE OR MECHANICAL FAILURE
BRAKE PEDAL POSITION (BPP) SENSOR NOT CALIBRATED
BRAKE PEDAL POSITION (BPP) SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, read ABS DTCs and record on the repair order.

3. With the scan tool, erase the DTCs.
4. Start the Engine.
5. Apply the brake pedal several times.
6. With the scan tool, read the ABS DTCs.

   Is the DTC active?

   Yes

   - Go To 2

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **INSPECT THE BRAKE PEDAL POSITION (BPP) SENSOR FOR INCORRECT INSTALLATION, DAMAGE OR MECHANICAL FAILURE**
   1. Turn the ignition off.
   2. Visually inspect the BPP Sensor for Improper installation, damage or mechanical failure. (Refer to **INSTALLATION**).

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **BRAKE PEDAL POSITION (BPP) SENSOR NOT APPLIED VOLTAGE**
   1. Start the engine.
   2. With the scan tool, under "Data Display" read the BPP voltage with brake pedal not pressed.
   3. Press the brake pedal several times.
   4. Lightly pull upward on the brake pedal.

   Was the brake pedal not applied BPP voltage change greater than 0.3 volt?

   Yes

   - Go To 5

   No

   - Go To 4

4. **INITIALIZE ANTI-LOCK BRAKES SYSTEM (ABS) MODULE**

1. Turn the ignition on.

WARNING: To avoid possible serious or fatal injury, check brake capability is available before road testing.

NOTE: When performing the ABS Initialization routine, the vehicle temperature must be above 10Ā°C (50Ā°F).

2. Initialize the ABS Module, Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
3. Park the vehicle.

Was the ABS Module initialization successful?

Yes

- Go To 5

No

- Perform the ABS Module Initialization routine again, if still unsuccessful.
- Replace the Anti-lock Brake System (ABS) Module in accordance with the service information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **BRAKE PEDAL POSITION SENSOR**
    1. Turn the ignition off.
    2. Replace the Brake Pedal Position Sensor in accordance with the Service Information. (Refer to **REMOVAL**).
    3. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    4. Start the engine.
    5. With the scan tool, under "Data Display" read the BPP voltage with brake pedal not pressed.
    6. Press the brake pedal several times.
    7. Lightly pull upward on the brake pedal.

    Was the brake pedal not applied BPP voltage change greater than 0.3 volt?

    Yes

    - Replace the Brake Pedal Assembly in accordance with the Service Information. Refer to **PEDAL(S), BRAKE AND/OR ACCELERATOR, REMOVAL** .
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C0042-2A-BRAKE PEDAL POSITION SENSOR - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

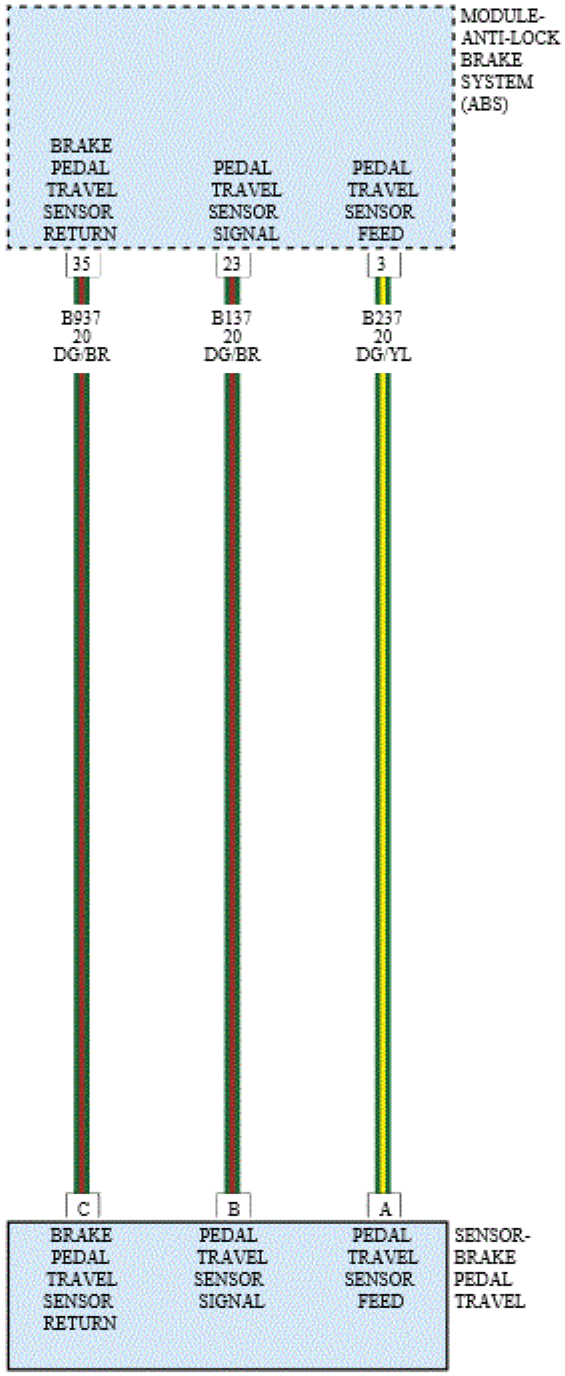

Fig. 19: Brake Pedal Position Sensor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.

- No under voltage DTCs.

SET CONDITION

- Brake Pedal Position (BPP) sensor rationality checks both failure modes of the brake pedal position sensor.
- Brake Pedal Position (BPP) sensor stuck on test checks for a high vehicle speed condition where the brake pedal position sensor is continually pressed.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
BRAKE PEDAL POSITION (BPP) SENSOR IMPROPERLY INSTALLED, DAMAGE OR MECHANICAL FAILURE
BRAKE PEDAL POSITION (BPP) SENSOR NOT CALIBRATED
BRAKE PEDAL POSITION ASSEMBLY
BRAKE PEDAL POSITION (BPP) SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

NOTE: **If any other DTCs are present, repair them first before continuing with this diagnostic procedure.**

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: **This DTC must be active for the results of this test to be valid.**

   1. Turn the ignition on.
   2. With the scan tool, read ABS DTCs and record on the repair order.
   3. With the scan tool, read and record the Environmental Data to help identify the conditions in which the DTC was set.
   4. With the scan tool, erase the DTCs.
   5. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   6. With the scan tool, read the DTCs.

   Is the DTC active?

   Yes

   - Go To 2

   No

- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **BRAKE PEDAL POSITION (BPP) SENSOR NOT APPLIED VOLTAGE**
   1. Start the engine.
   2. With the scan tool, under "Data Display" monitor the BPP voltage and Stoplamp Switch while pressing the brake pedal slowly.

      Does the voltage increase and the stoplamp switch status change when the BPP voltage changes by 0.3 volt while the brake pedal is being applied?

      Yes

      - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 3

3. **INSPECT THE BRAKE PEDAL POSITION (BPP) SENSOR FOR INCORRECT INSTALLATION, DAMAGE OR MECHANICAL FAILURE**
   1. Turn the ignition off.
   2. Visually inspect the BPP Sensor for Improper installation, damage or mechanical failure. (Refer to **INSTALLATION**).

      Were any problems found?

      Yes

      - Repair as necessary and perform the "Brake Pedal Sensor Calibration" routine.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **BRAKE PEDAL POSITION (BPP) SENSOR**
   1. Replace the Brake Pedal Position (BPP) Sensor in accordance with the Service Information.
   2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      WARNING: To avoid possible serious or fatal injury, check brake capability is available before road testing.

   3. Test drive the vehicle on mainly straight road conditions at a velocity above 20 km/h (12 mph).
   4. With the scan tool, read the DTCs.

      Does the DTC remain active?

      Yes

- Replace the Anti-lock Brake System (ABS) Module in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

C0042-54-BRAKE PEDAL POSITION SENSOR - MISSING CALIBRATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **If any other DTCs are present, repair them first before continuing with this diagnostic procedure.**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- Brake Pedal Position (BPP) Sensor calibration.

SET CONDITION

- Brake Pedal Position (BPP) Sensor calibration performed, but voltage out of allowable range.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
BRAKE PEDAL POSITION (BPP) SENSOR IMPROPERLY INSTALLED, DAMAGE OR MECHANICAL FAILURE
BRAKE PEDAL POSITION (BPP) SENSOR NOT CALIBRATED
BRAKE PEDAL POSITION (BPP) SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **BRAKE PEDAL CALIBRATION**
    1. Turn the ignition on.
    2. With the scan tool, read ABS DTCs and record on the repair order.
    3. Park the vehicle.

NOTE: **When performing the Brake Pedal Calibration routine, make sure the brake pedal is not pressed.**

4. With the scan tool, under "Miscellaneous Functions" run the Brake Pedal Calibration routine.

   Was the Brake Pedal Calibration routine successful?

   Yes

   - Test complete.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Perform the Brake Pedal Calibration routine again, if still unsuccessful.
   - Go To 2

2. **INSPECT THE BRAKE PEDAL POSITION (BPP) SENSOR FOR INCORRECT INSTALLATION, DAMAGE OR MECHANICAL FAILURE**
   1. Turn the ignition off.
   2. Visually inspect the BPP Sensor for Improper installation, damage or mechanical failure. Refer to **SENSOR, STOP LAMP, INSTALLATION** .

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 3

3. **BRAKE PEDAL POSITION (BPP) SENSOR**
   1. Turn the ignition off.
   2. Disconnect the BPP Sensor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage at the BPP Sensor harness connector between the (B237) BPP Sensor Feed and the (B937) BPP Sensor Return.

      Is the voltage above 4.75 volts?

      Yes

      - Replace the Brake Pedal Position (BPP) Sensor in accordance with the Service Information. Refer to **SENSOR, STOP LAMP, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Replace the Anti-lock Brake System (ABS) Module in accordance with the service information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .

- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C0042-62-BRAKE PEDAL POSITION SENSOR - SIGNAL COMPARE FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

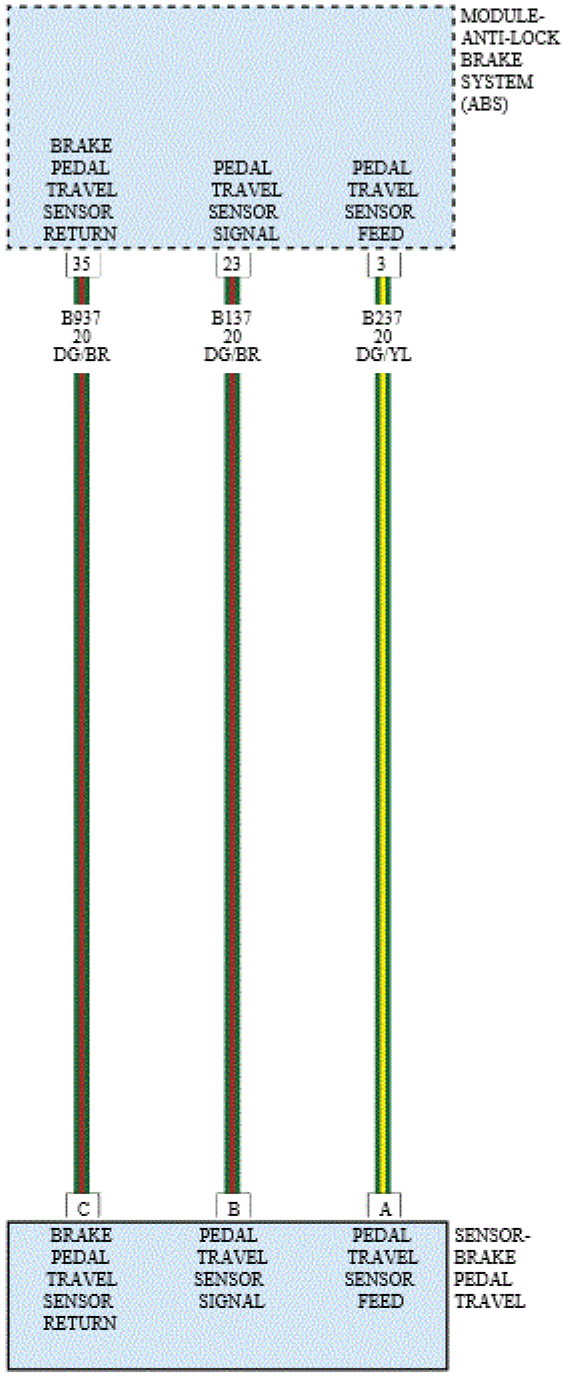

Fig. 20: Brake Pedal Position Sensor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No Anti-lock Brake System (ABS) Module system activation.

SET CONDITION

- Anti-lock Brake System (ABS) Module sees brake pressure, but no corresponding with Brake Pedal Position (BPP) Sensor voltage for one second.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
BRAKE PEDAL POSITION (BPP) SENSOR NOT CALIBRATED
BRAKE PEDAL POSITION (BPP) SENSOR IMPROPERLY INSTALLED, DAMAGE OR MECHANICAL FAILURE
BRAKE PEDAL POSITION (BPP) SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

NOTE: **If any other DTCs are present, repair them first before continuing with this diagnostic procedure.**

DIAGNOSTIC TEST

1. **INITIALIZE ANTI-LOCK BRAKES SYSTEM (ABS) MODULE**
    1. Turn the ignition on.
    2. With the scan tool, read ABS DTCs and record on the repair order.

    WARNING: **To avoid possible serious or fatal injury, check brake capability is available before road testing.**

    NOTE: **When performing the ABS Initialization routine, the vehicle temperature must be above 10Ā°C (50Ā°F).**

    3. Initialize the ABS Module, Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    4. Park the vehicle.

    Was the ABS Module initialization successful?

    Yes

    - Go To 2

    No

- Perform the ABS Module Initialization routine again, if still unsuccessful. Go To 4

2. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, erase the DTCs.
    3. Start the engine.
    4. Press the brake pedal slowly.
    5. With the scan tool, read ABS DTCs.

    Is the DTC active?

    Yes

    - Go To 3

    No

    - Test complete.

3. **INSPECT THE BRAKE PEDAL POSITION (BPP) SENSOR FOR INCORRECT INSTALLATION, DAMAGE OR MECHANICAL FAILURE**
    1. Turn the ignition off.
    2. Visually inspect the BPP Sensor for Improper installation, damage or mechanical failure. (Refer to **INSTALLATION**).

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 4

4. **BRAKE PEDAL POSITION (BPP) SENSOR**
    1. Turn the ignition off.
    2. Replace the Brake Pedal Position Sensor in accordance with the Service Information. (Refer to **INSTALLATION**).
    3. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    WARNING: To avoid possible serious or fatal injury, check brake capability is available before road testing.

    4. Test drive the vehicle by turning the vehicle left and right in a curving manner at a velocity between 15 and 35 km/h (9 and 22 mph).
    5. With the scan tool, read the DTCs.

Does the DTC remain active?

Yes

- Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

C0044-01-BRAKE PRESSURE SENSOR 1 - GENERAL ELECTRICAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module indicates that the Brake Pressure Sensor Signal is out of range.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE
HYDRAULIC CONTROL UNIT (HCU)

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

NOTE: **This DTC must be active for the results of this test to be valid.**

1. Turn the ignition on.
2. With the scan tool, read ABS DTCs and record on the repair order.
3. With the scan tool, read and record Freeze Fame information.
4. With the scan tool, erase DTCs.
5. Start the engine.
6. Press the brake pedal firmly and release.

7. With the scan tool, read ABS DTCs and record on the repair order.

   Is the DTC active?

   Yes

   - Replace the Integrated Control Unit (ICU) in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

C0044-28-BRAKE PRESSURE SENSOR 1 - SIGNAL BIAS LEVEL OUT OF RANGE / ZERO ADJUSTMENT FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **Repair all other DTC's before continuing with this diagnostic procedure.**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects brake pressure when the brake pedal has not been applied.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
BRAKE FLUID CONTAMINATION
PINCHED OR BENT BRAKE LINES
BRAKE PEDAL PRESSURE (BPP) SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE
HYDRAULIC CONTROL UNIT (HCU)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: **This DTC must be active for the results of this test to be valid.**

   1. Turn the ignition on.

2. With the scan tool, read ABS DTCs and record on the repair order.
3. With the scan tool, read and record Freeze Frame information.
4. With the scan tool, erase DTCs.
5. Start the engine.
6. Press the brake pedal firmly and release.
7. With the scan tool, read ABS DTCs.

   Is the DTC active?

   Yes

   - Go To 2

   No

   - Perform the ABS INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **MECHANICAL BRAKE SYSTEM INSPECTION**
   1. Turn the ignition off.
   2. Check the brake fluid for contaminants.
   3. Visually inspect all the brake lines for bent, damaged, or pinched restrictions.

   Where any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **PRIMARY CIRCUIT PRESSURE**
   1. Start the engine.
   2. The brake pedal released.
   3. With the scan tool, under "Data Display" read the primary circuit pressure.

   Is the primary circuit pressure below 10 bar (145 psi)?

   Yes

   - Go To 4

   No

   - Go To 5

4. **BRAKE PEDAL INSPECTION**

1. Turn the ignition off.
2. Check the brake pedal for damage or restrictions not allowing it to fully return.

   Where any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   NOTE: **For this failure it is necessary to replace both the Anti-lock Brake System (ABS) Module and the Hydraulic Control Unit (HCU) as a complete unit. This is known as the Integrated Control Unit (ICU).**

   - Replace the Integrated Control Unit (ICU) in accordance with the Service Information. Refer to **HYDRAULIC CONTROL UNIT (HCU), REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **BRAKE PEDAL POSITION (BPP) SENSOR**
   1. Start the engine.
   2. With the scan tool, under "Data Display" monitor the brake switch and the primary circuit pressure.
   3. Press the brake pedal slowly.

   Did the BP sensor indicate pressed before their was primary circuit pressure?

   Yes

   NOTE: **For this failure it is necessary to replace both the Anti-lock Brake System (ABS) Module and the Hydraulic Control Unit (HCU) as a complete unit. This is known as the Integrated Control Unit (ICU).**

   - Replace the Integrated Control Unit (ICU) in accordance with the Service Information. Refer to **HYDRAULIC CONTROL UNIT (HCU), REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Brake Pedal Position (BPP) Sensor in accordance with the Service Information. Refer to **SENSOR, STOP LAMP, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C0044-49-BRAKE PRESSURE 1 - INTERNAL ELECTRONIC FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module has detected Brake Pressure Sensor has internal failure.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
HYDRAULIC CONTROL UNIT (HCU)

DIAGNOSTIC TEST

VERIFY THE IS ACTIVE

1. Perform any Service Bulletins that may apply.
2. Turn the ignition on.
3. With the scan tool, read ABS DTCs and record on the repair order.
4. With the scan tool, read and record Environmental Data (EV Data).
5. With the scan tool, erase ABS DTCs.

WARNING: To avoid possible serious or fatal injury, check brake capability is available before road testing.

6. Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 15 and 35 km/h (9 and 22 mph).
7. Park the vehicle on level ground.
8. With the scan tool, read the ABS DTCs.

   Is the DTC active?

   Yes

   - Replace the Hydraulic Control Unit (HCU) in accordance with the Service Information. Refer to **HYDRAULIC CONTROL UNIT (HCU), REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

C0044-62-BRAKE PRESSURE SENSOR 1 - SIGNAL COMPARE FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **Repair all other DTCs first before continuing with this test.**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module indicates that the redundant brake pressure sensor elements do not agree.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE
HYDRAULIC CONTROL UNIT (HCU)

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Turn the ignition on.
2. With the scan tool, read ABS DTCs and record on the repair order.
3. With the scan tool, read and record Freeze Frame information.
4. With the scan tool, erase DTCs.
5. Start the engine.
6. Press and release the brake pedal.
7. With the scan tool, read the DTCs.

   Is the DTC active?

   Yes

   NOTE: **For this failure it is necessary to replace both the Anti-lock Brake System (ABS) Module and the Hydraulic Control Unit (HCU) as a complete unit. This is known as the Integrated Control Unit (ICU).**

   - Replace the Integrated Control Unit (ICU) in accordance with the Service Information. Refer to **HYDRAULIC CONTROL UNIT (HCU), REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Perform the ABS INTERMITTENT TEST. Refer to **STANDARD PROCEDURE**.

C0051-22-STEERING WHEEL POSITION SENSOR - SIGNAL AMPLITUDE > MAXIMUM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **Repair any Steering Control Module (SCM) or Loss of Communications DTCs first before continuing with this with this diagnostic procedure. (Refer to DIAGNOSTIC CODE INDEX).**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- No CAN time out failure is detected.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects a Steering Angle Sensor overtravel above 720 degrees.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
STEERING WHEEL ALIGNMENT
STEERING COLUMN OR INTERMEDIATE SHAFT IMPROPERLY INSTALLED OR DAMAGED
STEERING ANGLE SENSOR (SAS) LOOSE
STEERING CONTROL MODULE (SCM)
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE/INTEGRATED CONTROL UNIT (ICU)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: **This DTC must be active for the results of this test to be valid.**

   1. Perform any Service Bulletins that may apply.
   2. Turn the ignition on.
   3. With the scan tool, read ABS DTCs and record on the repair order.
   4. With the scan tool, read and record Environmental Data.
   5. With the scan tool, erase ABS DTCs.
   6. Start the engine.

7. Slowly turn the steering wheel from stop to stop.
8. With the scan tool, read ABS DTCs.

Is the DTC active?

Yes

- Go To 2

No

- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **INSPECT THE WHEEL ALIGNMENT, STEERING COLUMN AND INTERMEDIATE SHAFT FOR INCORRECT INSTALLATION OR DAMAGE**

NOTE: **If available, check the vehicle repair history for collision damage.**

1. Turn the ignition off.
2. Inspect the vehicle for proper wheel alignment.
3. Inspect the vehicle for damage causing tracking problems or steering wheel misalignment.
4. Inspect the steering column and intermediate shaft for damage.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE STEERING ANGLE**
   1. Turn steering wheel so wheels point in a straight ahead position.
   2. With scan tool, read the steering angle.

Is the Steering Angle reading within Ā±15Ā° of 0Ā°?

Yes

- Go To 4

No

- Go To 5

4. **CHECK STEERING ANGLE CHANGE**
   1. Turn steering wheel so wheels point in a straight ahead position.

2. With scan tool, graph the steering angle sensor to see if the reading ever travels above the 720Ā° while rotating the steering wheel from lock to lock.
3. Rotate steering wheel to the right and the degrees will decrease and rotating steering wheel to the left the degrees will increase.

   Did the steering angle change accordingly with no irregularities and display lower than 720Ā° from lock to lock?

   Yes

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Steering Control Module (SCCM) in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE CLOCKSPRING (SAS) INSTALLATION**

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

NOTE: **Proper Clockspring (SAS) installation is crucial for proper operation.**

1. Turn the ignition off.
2. Verify that the Clockspring (SAS) is properly installed. Refer to **CLOCKSPRING, STANDARD PROCEDURE** .

   Is the Clockspring (SAS) properly installed?

   Yes

   - Replace the Steering Column Control Module (SCCM) in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C0051-28-STEERING WHEEL POSITION SENSOR - SIGNAL BIAS LEVEL OUT OF RANGE / ZERO ADJUSTMENT FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- Driving straight.
- Speeds above 15 km/h (9 mph).

SET CONDITION

- Anti-lock Brake System (ABS) Module detects the Steering Angle Sensor (SAS) signal is above than Ā±15Ā° of 0Ā° while driving straight.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
STEERING WHEEL ALIGNMENT
STEERING COLUMN OR INTERMEDIATE SHAFT IMPROPERLY INSTALLED OR DAMAGED
STEERING ANGLE SENSOR (SAS) LOOSE
STEERING COLUMN CONTROL MODULE (SCCM)
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Perform any Service Bulletins that may apply.
   2. Turn the ignition on.
   3. With the scan tool, read ABS DTCs and record on the repair order.
   4. With the scan tool, read and record Environmental Data.
   5. With the scan tool, erase ABS DTCs.
   6. Test drive the vehicle straight with speeds above 15 km/h (9 mph).
   7. Stop the vehicle.
   8. Slowly turn the steering wheel from stop to stop.
   9. With the scan tool, read ABS DTCs.

Is the DTC active?

Yes

- Go To 2

No

- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **INSPECT THE WHEEL ALIGNMENT, STEERING COLUMN AND INTERMEDIATE SHAFT FOR INCORRECT INSTALLATION OR DAMAGE**

NOTE: If available, check the vehicle repair history for collision damage.

1. Turn the ignition off.
2. Inspect the vehicle for proper wheel alignment.
3. Inspect the vehicle for damage causing tracking problems or steering wheel misalignment.
4. Inspect the steering column and intermediate shaft for damage.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE STEERING ANGLE**

1. Test drive the vehicle straight with speeds above 15 km/h (9 mph).
2. With scan tool, read the steering angle in the SCCM.

Is the Steering Angle reading within Ā±15Ā° of 0Ā°?

Yes

- Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 4

4. **CHECK THE CLOCKSPRING (SAS)**

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable

the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: **If available, check the vehicle repair history for collision damage.**

NOTE: **Proper Clockspring (SAS) installation is crucial for proper operation.**

1. Turn the ignition off.
2. Verify that the Clockspring (SAS) is properly installed.
3. Inspect the vehicle for damage causing tracking problems or steering wheel misalignment.

   Is the Clockspring (SAS) properly installed?

   Yes

   - Replace the Steering Column Control Module (SCCM) in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to STANDARD PROCEDURE.

   No

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to STANDARD PROCEDURE.

C0051-49-STEERING WHEEL POSITION SENSOR - INTERNAL ELECTRONIC FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **Repair any Steering Angle Sensor (SAS) DTCs first before continuing with this with this diagnostic procedure. (Refer to DIAGNOSTIC CODE INDEX).**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- Vehicle speed is above 15 k/mh (9 mph).
- Yaw rate, lateral acceleration, steering angle and vehicle-speed are all valid.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects the Steering angle Sensor (SAS) has an internal failure

status.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
STEERING CONTROL MODULE (SCM)

DIAGNOSTIC TEST

STEERING WHEEL POSITION SENSOR-INTERNAL ELECTRONIC FAILURE

1. Perform any Service Bulletins that may apply.
2. The ABS Module is reporting internal errors from the SAS.

NOTE: **Before continuing, check the Steering Angle Sensor harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

3. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to STANDARD PROCEDURE.

   No

   - Replace the Steering Control Module (SCM) in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to STANDARD PROCEDURE.

C0051-62-STEERING WHEEL POSITION SENSOR - SIGNAL COMPARE FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **Repair any Steering Control Module (SCM) DTCs first before continuing with this with this diagnostic procedure. (Refer to DIAGNOSTIC CODE INDEX).**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.

- No under voltage DTCs.
- Vehicle speed is above 15 km/h (9 mph).
- Yaw rate, lateral acceleration, steering angle and vehicle-speed are all valid.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects the Electronic Stability Control (ESC) calculated Steering Angle does not match the sensor signal from the Steering Column Control Module (SCCM).

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
STEERING WHEEL ALIGNMENT
STEERING COLUMN OR INTERMEDIATE SHAFT IMPROPERLY INSTALLED OR DAMAGED
STEERING ANGLE SENSOR (SAS) LOOSE
STEERING COLUMN CONTROL MODULE (SCCM)
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Perform any Service Bulletins that may apply.
   2. Turn the ignition on.
   3. With the scan tool, read ABS DTCs and record on the repair order.
   4. With the scan tool, read and record Environmental Data.
   5. With the scan tool, erase ABS DTCs.
   6. Start the engine.
   7. Slowly turn the steering wheel from stop to stop.
   8. With the scan tool, read ABS DTCs.

      Is the DTC active?

      Yes

      - Go To 2

      No

      - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **INSPECT THE WHEEL ALIGNMENT, STEERING COLUMN AND INTERMEDIATE SHAFT**

FOR INCORRECT INSTALLATION OR DAMAGE

NOTE: If available, check the vehicle repair history for collision damage.

1. Inspect the vehicle for proper wheel alignment.
2. Inspect the vehicle for damage causing tracking problems or steering wheel misalignment.
3. Inspect the steering column and intermediate shaft for damage.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE STEERING ANGLE**
   1. Turn steering wheel so wheels point in a straight ahead position.
   2. With scan tool, read the steering angle.

   Is the Steering Angle reading within Ā±15Ā° of 0Ā°?

   Yes

   - Go To 4

   No

   - Replace the Steering Column Control Module (SCCM) in accordance with the Service Information.

4. **CHECK STEERING ANGLE CHANGE**
   1. Turn steering wheel so wheels point in a straight ahead position.
   2. With scan tool, graph the steering angle to see while rotating wheel from lock to lock.

   NOTE: Sensor damage can occur if wheel is turned over 720Ā°.

   3. Rotate steering wheel to the right and the degrees will decrease and rotating steering wheel to the left the degrees will increase.

   Did the steering angle change accordingly and display lower then 720Ā° from stop to stop with no erratic signal behavior?

   Yes

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .

- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **CHECK THE CLOCKSPRING (SAS) INSTALLATION**

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: If available, check the vehicle repair history for collision damage.

NOTE: Proper Clockspring (SAS) installation is crucial for proper operation.

1. Turn the ignition off.
2. Verify that the Clockspring (SAS) is properly installed. Refer to **CLOCKSPRING, STANDARD PROCEDURE** .

   Is the Clockspring (SAS) properly installed?

   Yes

   - Replace the Steering Control Module (SCM) in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C006A-28-MULTI-AXIS ACCELERATION SENSOR - SIGNAL BIAS LEVEL OUT OF RANGE / ZERO ADJUSTMENT FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

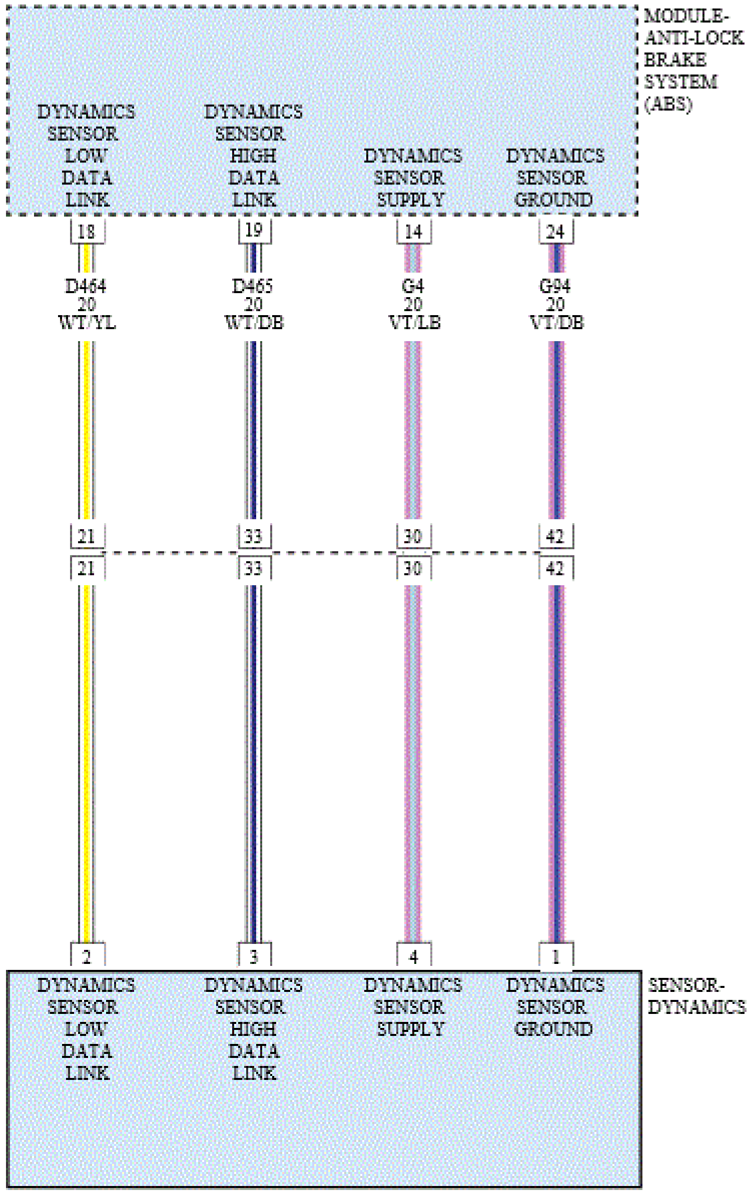

Fig. 21: Dynamics Sensor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects that one of the Dynamic Sensors offset levels are above threshold limits.

DEFAULT ACTION

- ABS is disabled.
- **Set Condition:**

  When the ABS Module detects that one of the Dynamic Sensors offset levels are above reasonable levels.

POSSIBLE CAUSES

Possible Causes
DYNAMICS SENSOR INSTALLATION
DYNAMICS SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

NOTE: **If DTC C006A-49-MULTI- AXIS ACCELERATION SENSOR - INTERNAL ELECTRONIC FAILURE is present, follow the diagnostic procedure for that DTC first before continuing with this test.**

DIAGNOSTIC TEST

1. **CHECK THE DYNAMICS SENSOR INSTALLATION**

   NOTE: **Dynamics Sensor installation and mounting bolt torque is crucial for proper operation.**

   1. Perform any Service Bulletins that may apply.
   2. Check the Dynamics Sensor for damaged, modified, and bent mounting brackets.
   3. Check the Dynamics Sensor mounting bolts for a loose or over tightened condition.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 2
2. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**
   1. Turn the ignition off.
   2. Replace the Dynamic Sensor in accordance with the Service Information. Refer to **SENSOR, DYNAMICS, REMOVAL** .
   3. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   4. Test drive the vehicle on mainly straight road conditions at a velocity between 15 and 35 km/h (9 and 22 mph).
   5. With the scan tool, read the DTCs.

      Does the DTC remain active?

Yes

- Replace the Anti-Lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

C006A-49-MULTI-AXIS ACCELERATION SENSOR - INTERNAL ELECTRONIC FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

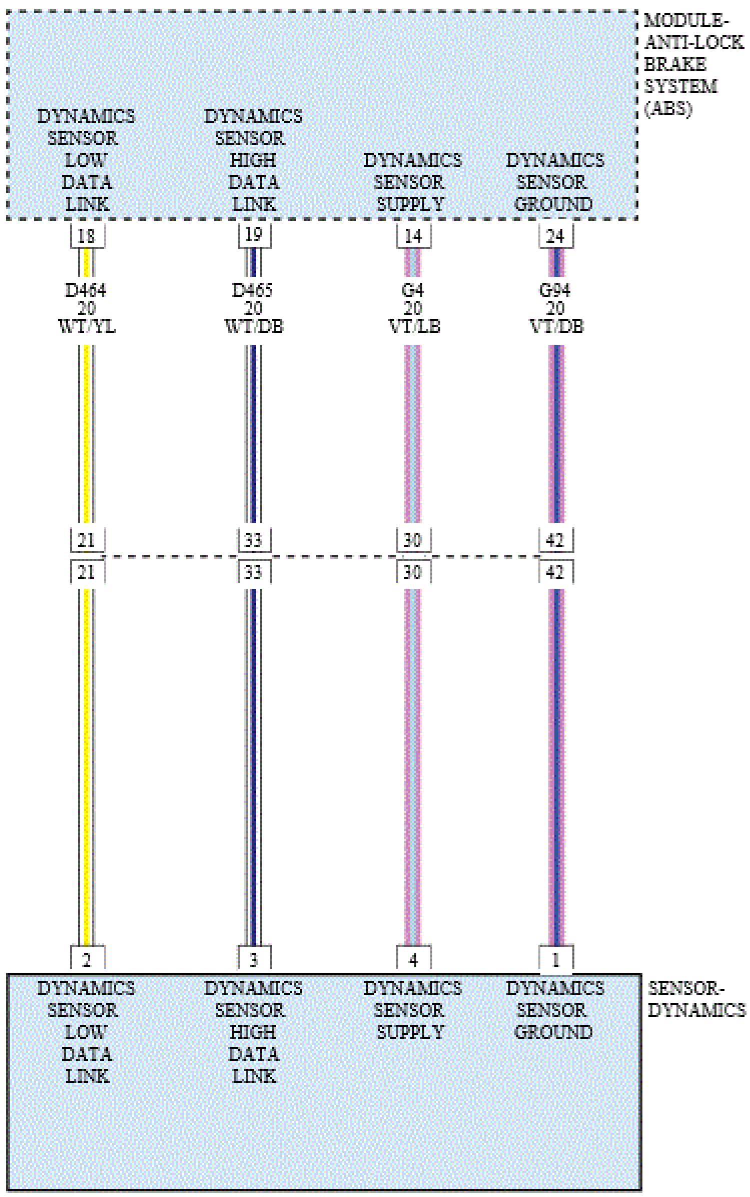

Fig. 22: Dynamics Sensor - Circuit Diagram

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects a Dynamics Sensor internal failure.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
DYNAMICS SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

NOTE: **If DTC U0126-00 or U1003-88 are present, refer to the diagnostics for these DTCs before continuing with this test.**

DIAGNOSTIC TEST

1. **VERIFY THE IS ACTIVE**
    1. Perform any Service Bulletins that may apply.
    2. Turn the ignition on.
    3. With the scan tool, read ABS DTCs and record on the repair order.
    4. With the scan tool, read and record Environmental Data (EV Data).
    5. With the scan tool, erase ABS DTCs.

    WARNING: **To avoid possible serious or fatal injury, check brake capability is available before road testing.**

    6. Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 15 and 35 km/h (9 and 22 mph).
    7. Park the vehicle on level ground.
    8. With the scan tool, read the ABS DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**
   1. Turn the ignition off.
   2. Replace the Dynamics Sensor in accordance with the Service Information. Refer to **SENSOR, DYNAMICS, REMOVAL** .
   3. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   4. Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 15 and 35 km/h (9 and 22 mph).
   5. With the scan tool, read the DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Anti-Lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C006A-56-MULTI-AXIS ACCELERATION SENSOR- INVALID / INCOMPATIBLE CONFIGURATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

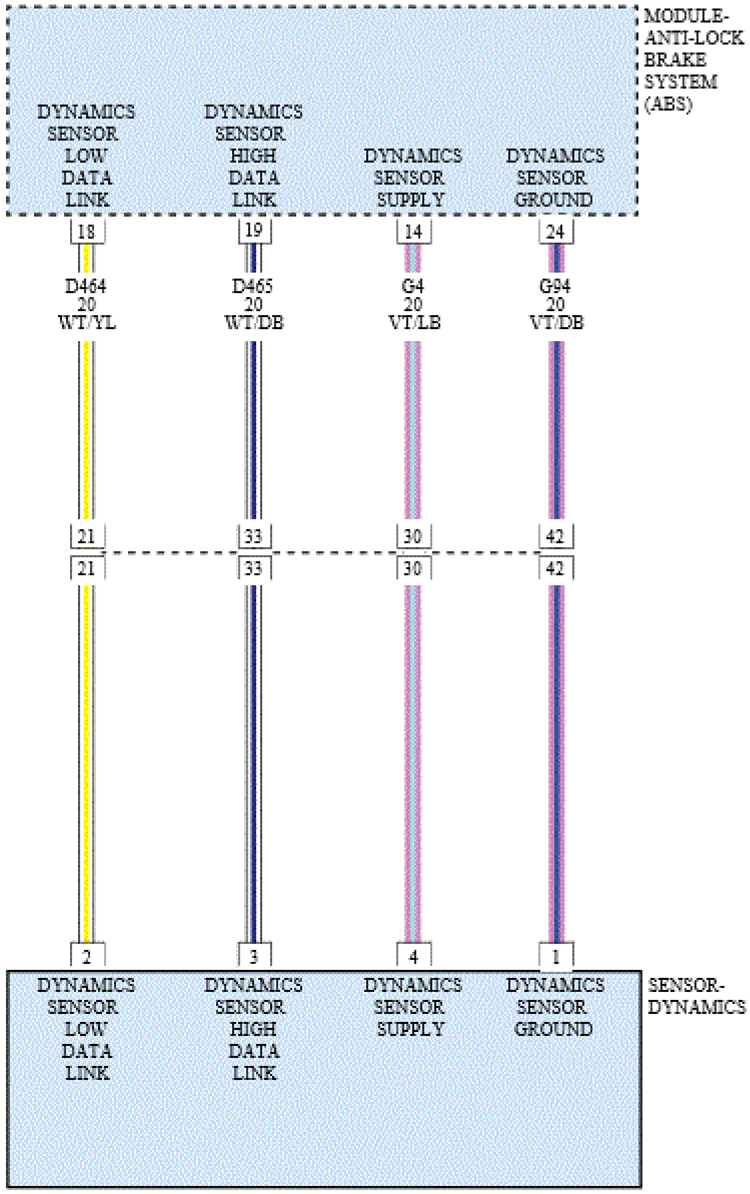

Fig. 23: Dynamics Sensor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- Speed is greater than 2 km/h (1 mph).

SET CONDITION

- Anti-lock Brake System (ABS) Module detects incorrect Dynamics Sensor installed.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
INCORRECT DYNAMICS SENSOR INSTALLED
INCORRECT ANTI-LOCK BRAKE SYSTEM (ABS) MODULE INSTALLED
DYNAMICS SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ABS DTCs and record on the repair order.
    3. With the scan tool, read and record Environmental Data (EV Data).
    4. With the scan tool, erase ABS DTCs.
    5. Cycle the ignition switch.
    6. With the scan tool, read ABS DTCs.

        Is the DTC active?

        Yes

        - Go To 2

        No

        - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.
2. **CHECK FOR CORRECT COMPONENTS INSTALLED**
    1. Turn the ignition off.
    2. Verify the correct Dynamics Sensor and ABS Module part numbers are installed on the vehicle.

        Were any problems found?

        Yes

        - Repair as necessary.
        - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

        No

        - Go To 3
3. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**
    1. Replace the Dynamics Sensor in accordance with the Service Information. Refer to **SENSOR, DYNAMICS, REMOVAL** .

2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
3. Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 20 km/h (6 and 12 mph).
4. With the scan tool, read the DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C006A-62-MULTI-AXIS ACCELERATION SENSOR - SIGNAL COMPARE FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

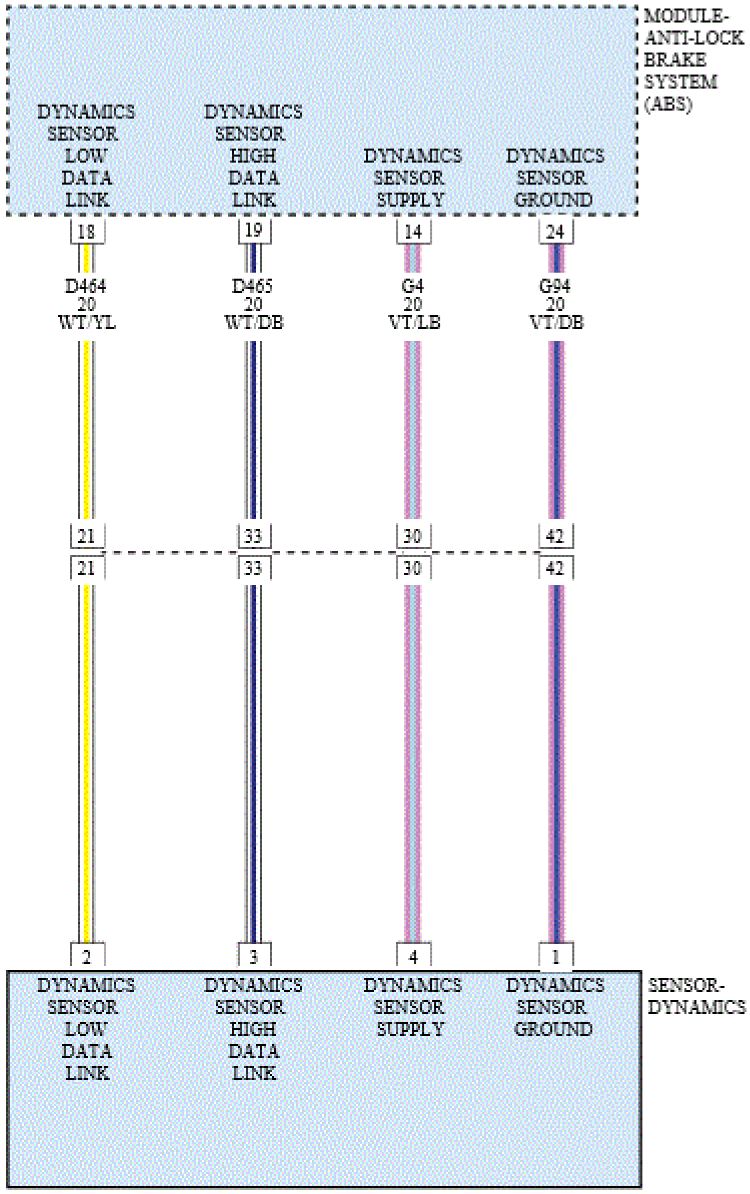

Fig. 24: Dynamics Sensor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- Vehicle speed is above 15 km/h (9 mph).

SET CONDITION

- Anti-lock Brake System (ABS) Module detects that one of the three Dynamic Sensor signals do not agree with the calculated value.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
DYNAMICS SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs and record on the repair order.
    3. With the scan tool, record and erase DTCs.

    WARNING: To avoid possible serious or fatal injury, check brake capability is available before road testing.

    4. Test drive the vehicle by turning the vehicle left and right in a curving manner at a velocity between 15 and 35 km/h (9 and 22 mph).
    5. Park the vehicle.
    6. With the scan tool, read ABS DTCs.

    Is this DTC active?

    Yes

    - Go To 2

    No

    - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.
2. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**
    1. Replace the Dynamic Sensor in accordance with the Service Information. Refer to **SENSOR, DYNAMICS, REMOVAL** .
    2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    3. Test drive the vehicle by turning the vehicle left and right in a curving manner at a velocity between 15 and 35 km/h (9 and 22 mph).
    4. With the scan tool, read the DTCs.

    Does the DTC remain still active?

    Yes

    - Replace the Anti-Lock Brake System (ABS) Module in accordance with the Service

Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .

- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

C0078-86-TIRE DIAMETER - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Stored tire size is out of range
- Tire size changed from the previous initialization.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
NEW OR INCORRECT TIRE SIZE PROGRAMMED INTO BODY CONTROL MODULE (BCM)
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **INCORRECT TIRES PROGRAMMED INTO BCM**
   1. Inspect all four tires on the vehicle and note the size of each tire.

      NOTE: **A non-production size tire cannot be programmed into the BCM. The production Powertrain, with the production size tires, is the only emissions certified configuration that is available for reprogramming.**

   2. Verify the correct Tire/wheel information is programmed in the BCM.

      Is the correct value programmed in the BCM?

      Yes

      - Go To 2

      No

- Program the correct Tire/Wheel information in the BCM.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

2. **PERFORM ABS MODULE INITIALIZATION**
   1. Turn the ignition on.
   2. With the scan tool, read and record the ABS DTCs.

   NOTE: **When performing the ABS Initialization routine, the vehicle temperature must be above 10Ā°C (50Ā°F).**

   3. With the scan tool, under "Miscellaneous Functions" perform the ABS Initialization routine. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   4. With the scan tool, read the DTCs.

   Does the DTC remain active?

   Yes

   - Perform the ABS Module Initialization routine again, if still unsuccessful.
   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

C1046-92-LEFT FRONT WHEEL PRESSURE PHASE MONITORING - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- During active ABS control.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects a pressure reduction phase and the following pressure hold phase is too long.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT TONE WHEEL/BEARING DAMAGED
WHEEL SPEED SIGNALS SWAPPED
LEFT FRONT WHEEL SPEED SENSOR (WSS)
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ABS DTCs and record on the repair order.
    3. With the scan tool, read and record Freeze Fame information.
    4. With the scan tool, erase DTCs.
    5. Start the engine.
    6. Test drive the vehicle above 40 km/h (25 mph).
    7. With the scan tool, read ABS DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Perform the ABS INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.
2. **COMPARE WHEEL SPEED SENSOR SIGNALS**

    WARNING: Make sure brake capability is available before road testing.

    1. With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle.
    2. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

    Does the Left Front WSS speed differ from the other WSS speeds by 8 km/h (5 mph) or show NO speed?

    Yes

    - Go To 4

    No

    - Go To 3
3. **CHECKING INSIDE WHEEL SPEED**
    1. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph) and perform a 90 degree turn while monitoring if inside wheel is slower than outside.

Was the inside wheel slower than outside?

Yes

- Perform the ABS INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 4

4. **INSPECT TONE WHEEL/BEARING**
    1. Turn the ignition off.
    2. Visually inspect the tone wheel and bearing for damage.
    3. Check the tone wheel teeth for missing teeth, cracks, and looseness. The teeth must be perfectly square, not bent, or nicked. Check the wheel bearing for worn/looseness.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 5
5. **CHECK WHEEL SPEED SENSOR (WSS) WIRING**
    1. Check the ABS Module and WSS harness connectors for incorrectly wired connectors.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 6
6. **LEFT FRONT WHEEL SPEED SENSOR (WSS)**
    1. Replace the Left Front Wheel Speed Sensor (WSS) in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
    2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    CAUTION: Make sure braking capability is available before road testing.

    3. Road test the vehicle over 40 km/h (25 mph).

NOTE:	Vehicle must be driven above 40 km/h (25 mph) for set conditions to be meet.

4. With the scan tool, read ABS DTCs.

NOTE:	The Anti-lock Brake System (ABS) Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Does the DTC remain active?

Yes

- Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

C1047-92-RIGHT FRONT WHEEL PRESSURE PHASE MONITORING - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- During active ABS control.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects a pressure reduction phase and the following pressure hold phase is too long.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT TONE WHEEL/BEARING DAMAGED
WHEEL SPEED SIGNALS SWAPPED
RIGHT FRONT WHEEL SPEED SENSOR (WSS)
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ABS DTCs and record on the repair order.
    3. With the scan tool, read and record Freeze Fame information.
    4. With the scan tool, erase DTCs.
    5. Start the engine.
    6. Test drive the vehicle above 40 km/h (25 mph).
    7. With the scan tool, read ABS DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Perform the ABS INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.
2. **COMPARE WHEEL SPEED SENSOR SIGNALS**

    WARNING: Make sure brake capability is available before road testing.

    1. With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle.
    2. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

    Does the Right Front WSS speed differ from the other WSS speeds by 8 km/h (5 mph) or show NO speed?

    Yes

    - Go To 4

    No

    - Go To 3
3. **CHECKING INSIDE WHEEL SPEED**
    1. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph) and perform a 90 degree turn while monitoring if inside wheel is slower than outside.

    Was the inside wheel slower than outside?

    Yes

    - Perform the ABS INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 4

4. **INSPECT TONE WHEEL/BEARING**
   1. Turn the ignition off.
   2. Visually inspect the tone wheel and bearing for damage.
   3. Check the tone wheel teeth for missing teeth, cracks, and looseness. The teeth must be perfectly square, not bent, or nicked. Check the wheel bearing for worn/looseness.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 5

5. **CHECK WHEEL SPEED SENSOR (WSS) WIRING**
   1. Check the ABS Module and WSS harness connectors for incorrectly wired connectors.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 6

6. **RIGHT FRONT WHEEL SPEED SENSOR (WSS)**
   1. Replace the Right Front Wheel Speed Sensor (WSS) in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
   2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   CAUTION: Make sure brake capability is available before road testing.

   3. Road test the vehicle over 40 km/h (25 mph).

   NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be meet.

   4. With the scan tool, read ABS DTCs.

   NOTE: The Anti-lock Brake System (ABS) Module must sense ALL 4 wheels

at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

Does the DTC remain active?

Yes

- Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

C1048-92-LEFT REAR WHEEL PRESSURE PHASE MONITORING - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- During active ABS control.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects a pressure reduction phase and the following pressure hold phase is too long.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
LEFT REAR TONE WHEEL/BEARING DAMAGED
WHEEL SPEED SIGNALS SWAPPED
LEFT REAR WHEEL SPEED SENSOR (WSS)
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ABS DTCs and record on the repair order.

3. With the scan tool, read and record Freeze Fame information.
4. With the scan tool, erase DTCs.
5. Start the engine.
6. Test drive the vehicle above 40 km/h (25 mph).
7. With the scan tool, read ABS DTCs.

   Is the DTC active?

   Yes

   - Go To 2

   No

   - Perform the ABS INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **COMPARE WHEEL SPEED SENSOR SIGNALS**

   WARNING: Make sure brake capability is available before road testing.

   1. With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle.
   2. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

   Does the Left Rear WSS speed differ from the other WSS speeds by 8 km/h (5 mph) or show NO speed?

   Yes

   - Go To 4

   No

   - Go To 3

3. **CHECKING INSIDE WHEEL SPEED**

   1. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph) and perform a 90 degree turn while monitoring if inside wheel is slower than outside.

   Was the inside wheel slower than outside?

   Yes

   - Perform the ABS INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **INSPECT TONE WHEEL/BEARING**

1. Turn the ignition off.
2. Visually inspect the tone wheel and bearing for damage.
3. Check the tone wheel teeth for missing teeth, cracks, and looseness. The teeth must be perfectly square, not bent, or nicked. Check the wheel bearing for worn/looseness.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 5

5. **CHECK WHEEL SPEED SENSOR (WSS) WIRING**
   1. Check the ABS Module and WSS harness connectors for incorrectly wired connectors.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 6

6. **LEFT REAR WHEEL SPEED SENSOR (WSS)**
   1. Replace the Left Rear Wheel Speed Sensor (WSS) in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, REAR, REMOVAL** .
   2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      CAUTION: Make sure brake capability is available before road testing.

   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be meet.

   4. With the scan tool, read ABS DTCs.

      NOTE: The Anti-lock Brake System (ABS) Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

      Does the DTC remain active?

      Yes

- Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

C1049-92-RIGHT REAR WHEEL PRESSURE PHASE MONITORING - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- During active ABS control.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects a pressure reduction phase and the following pressure hold phase is too long.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
RIGHT REAR TONE WHEEL/BEARING DAMAGED
WHEEL SPEED SIGNALS SWAPPED
RIGHT REAR WHEEL SPEED SENSOR (WSS)
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ABS DTCs and record on the repair order.
    3. With the scan tool, read and record Freeze Fame information.
    4. With the scan tool, erase DTCs.
    5. Start the engine.
    6. Test drive the vehicle above 40 km/h (25 mph).
    7. With the scan tool, read ABS DTCs.

Is the DTC active?

Yes

- Go To 2

No

- Perform the ABS INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **COMPARE WHEEL SPEED SENSOR SIGNALS**

   WARNING: Make sure brake capability is available before road testing.

   1. With the scan tool, monitor ALL the WSS speeds while an assistant drives the vehicle.
   2. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

   Does the Right Rear WSS speed differ from the other WSS speeds by 8 km/h (5 mph) or show NO speed?

   Yes

   - Go To 4

   No

   - Go To 3

3. **CHECKING INSIDE WHEEL SPEED**

   1. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph) and perform a 90 degree turn while monitoring if inside wheel is slower than outside.

   Was the inside wheel slower than outside?

   Yes

   - Perform the ABS INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **INSPECT TONE WHEEL/BEARING**

   1. Turn the ignition off.
   2. Visually inspect the tone wheel and bearing for damage.
   3. Check the tone wheel teeth for missing teeth, cracks, and looseness. The teeth must be perfectly square, not bent, or nicked. Check the wheel bearing for worn/looseness.

   Were any problems found?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **CHECK WHEEL SPEED SENSOR (WSS) WIRING**
    1. Check the ABS Module and WSS harness connectors for incorrectly wired connectors.

       Were any problems found?

       Yes

       - Repair as necessary.
       - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 6

6. **RIGHT REAR WHEEL SPEED SENSOR (WSS)**
    1. Replace the Right Rear Wheel Speed Sensor (WSS) in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
    2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       CAUTION: Make sure brake capability is available before road testing.

    3. Road test the vehicle over 40 km/h (25 mph).

       NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be meet.

    4. With the scan tool, read ABS DTCs.

       NOTE: The Anti-lock Brake System (ABS) Module must sense ALL 4 wheels at 12 km/h (7.5 mph) before it will extinguish the ABS indicators.

       Does the DTC remain active?

       Yes

       - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
       - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

- Test complete.

C1082-01-VACUUM PRESSURE SENSOR - GENERAL ELECTRICAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

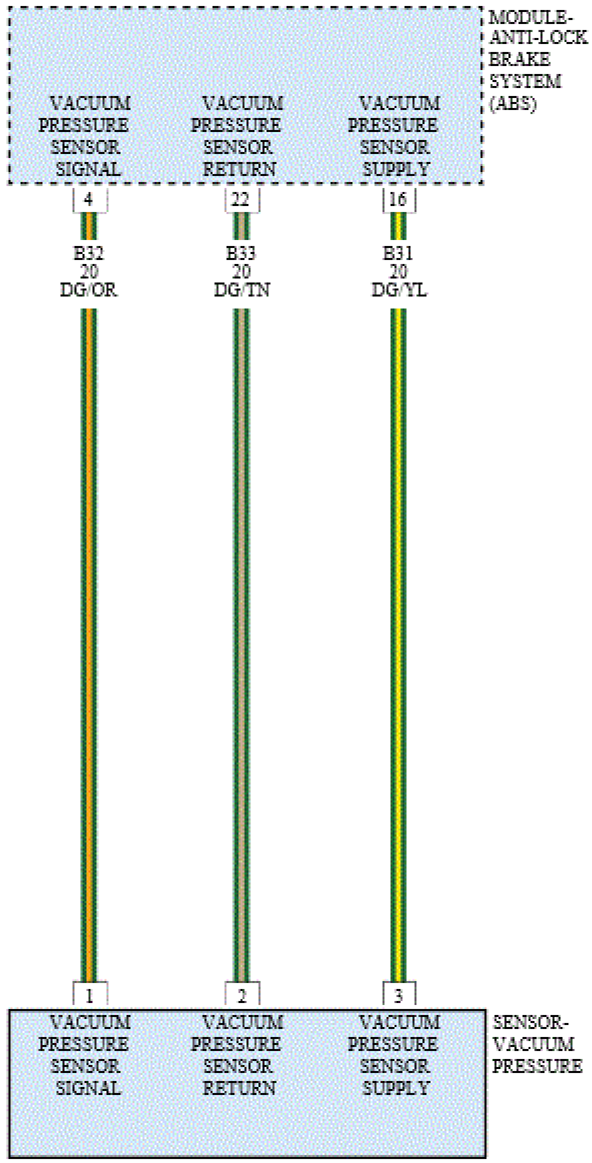

Fig. 25: Vacuum Pressure Sensor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Vacuum Sensor Signal voltage level is below 0.1 volt for 100 msec.
- Vacuum Sensor Signal indicating voltage above 3.5 volts for 100 msec.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
(B31) VACUUM PRESSURE SENSOR SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(B32) VACUUM PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(B32) VACUUM PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(B32) VACUUM PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(B33) VACUUM PRESSURE SENSOR RETURN CIRCUIT OPEN OR HIGH RESISTANCE
VACUUM PRESSURE SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. Perform any Service Bulletins that may apply.
   2. Turn the ignition on.
   3. With the scan tool, read ABS DTCs and record on the repair order.
   4. Cycle the ignition switch from off to on.
   5. With the scan tool, read ABS DTCs.

   Is the DTC active?

   Yes

   - Go To 2

   No

   - The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.
2. **(B31) VACUUM PRESSURE SENSOR SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Turn ignition off to the lock position.
   2. Disconnect the ABS Module harness connector.
   3. Measure the resistance of the (B31) Vacuum Pressure Sensor Supply circuit between the Vacuum Pressure Sensor harness connector and the ABS Module harness connector.

   Is the resistance below 5.0 Ohms?

Yes

- Go To 3

No

- Repair the (B31) Vacuum Pressure Sensor Supply circuit for an open or high resistance.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **(B32) VACUUM PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE**
   1. Turn ignition off to the lock position.
   2. Disconnect the ABS Module harness connector.
   3. Disconnect the Vacuum Pressure Sensor harness connector.
   4. Turn the ignition on.
   5. Measure the voltage between ground and the (B32) Vacuum Pressure Sensor Signal circuit at the Vacuum Pressure Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (B32) Vacuum Pressure Sensor Signal circuit for a short to ground.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **(B32) VACUUM PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND**
   1. Turn ignition off.
   2. Disconnect the ABS Module harness connector.
   3. Measure the resistance between ground and the (B32) Vacuum Pressure Sensor Signal circuit at the Vacuum Pressure Sensor harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (B32) Vacuum Pressure Sensor Signal circuit for a short to ground.
   - Perform ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 5

5. **(B32) VACUUM PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Turn ignition off to the lock position.
   2. Disconnect the ABS Module harness connector.
   3. Measure the resistance of the (B32) Vacuum Pressure Sensor Signal circuit between the Vacuum

Pressure Sensor harness connector and the ABS Module harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 6

No

- Repair the (B32) Vacuum Pressure Sensor Signal circuit for an open or high resistance.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **(B33) VACUUM PRESSURE SENSOR RETURN CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Turn ignition off to the lock position.
   2. Measure the resistance of the (B33) Vacuum Pressure Sensor Return circuit between the Vacuum Pressure Sensor harness connector and the ABS Module harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 7

   No

   - Repair the (B33) Vacuum Pressure Sensor Return circuit for an open or high resistance.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
7. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**
   1. Turn the ignition off.
   2. Replace the Vacuum Pressure Sensor.
   3. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   4. With the scan tool, read the DTCs.

   Is the DTC still active?

   Yes

   - Replace the Anti-Lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

C1082-02-VACUUM PRESSURE SENSOR - GENERAL SIGNAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

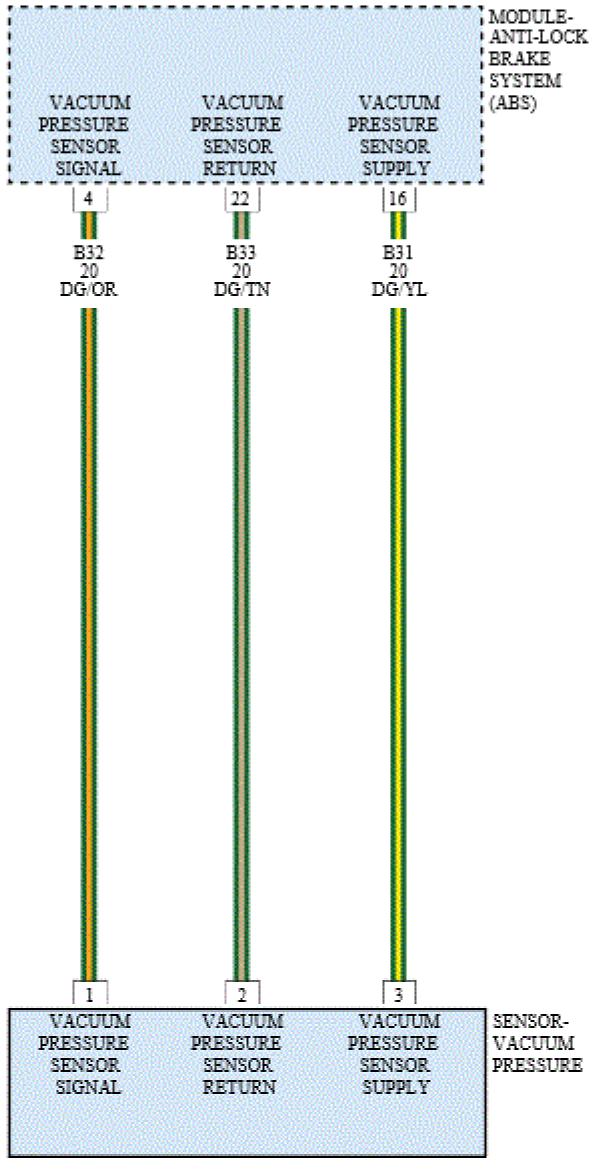

Fig. 26: Vacuum Pressure Sensor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- Engine running for 5 minutes.

SET CONDITION

- Anti-Lock Brake Module detects that the Vacuum Sensor Signal is out of range based on other vehicle conditions.
- Vacuum Sensor Signal indicating no signal change.

- Vacuum Sensor Signal indicating signal rapid change.
- Vacuum Sensor Signal indicating unexpected change.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
VACUUM PRESSURE SENSOR
BRAKE VACUUM BOOSTER
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VACUUM PRESSURE SIGNAL**
    1. Start the engine.
    2. With the scan tool, view and record the vacuum pressure signal with no brake applied.
    3. Turn the engine off.
    4. Turn the ignition on.
    5. With the scan tool, view and record the vacuum pressure with no brake applied.

    Is the vacuum pressure signal staying consistent?

    Yes

    - Go To 2

    No

    - Go To 4
2. **MEASURE THE VACUUM PRESSURE SIGNAL**
    1. Start the engine.
    2. Measure the vacuum pressure while pressing the brake pedal several times.
    3. Turn the engine off.
    4. Turn the ignition on.

    Does the vacuum drop below 14 mbar (2 psi)?

    Yes

    - Go To 3

    No

    - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

3. **CHECK FOR VACUUM PRESSURE SIGNAL CHANGE**
    1. Turn the ignition on.
    2. Remove the Vacuum Pressure Sensor from the Booster.
    3. Connect a vacuum pump to the Vacuum Pressure Sensor.
    4. Apply vacuum to the Vacuum Pressure Sensor and watch for signal change.

    Is the vacuum pressure signal changing on the scan tool as vacuum is being applied?

    Yes

    - Go To 4

    No

    - Replace the Vacuum Pressure Sensor.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
4. **CHECK BRAKE BOOSTER CHECK VALVE**
    1. Remove the Brake Booster Check Valve.
    2. Apply vacuum to the booster side of the check valve.

    Is the Brake Booster Check Valve holding vacuum?

    Yes

    - Go To 5

    No

    - Replace the Brake Booster Check Valve.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
5. **CHECK BRAKE BOOSTER**
    1. Reinstall the Brake Booster Check Valve.
    2. Using a vacuum pump apply vacuum to the Brake Booster.

    Is the Brake Booster holding vacuum?

    Yes

    - Go To 6

    No

    - Replace the Power Brake Booster in accordance with the Service Information. Refer to **BOOSTER, POWER BRAKE, REMOVAL** .
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
6. **(3.6L) ENGINE WITH ELECTRIC VACUUM PUMP**
    1. Verify vehicle is equipped with a 3.6L engine and an electric vacuum pump.

Is the vehicle is equipped with a 3.6L engine and an electric vacuum pump?

Yes

- Replace the Electric Vacuum Pump in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 7

7. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**
    1. Turn the ignition off.
    2. Replace the Vacuum Pressure Sensor.
    3. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    4. With the scan tool, read the DTCs.

    Does the DTC remain active?

    Yes

    - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C1082-2F-VACUUM PRESSURE SENSOR - SIGNAL ERRATIC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

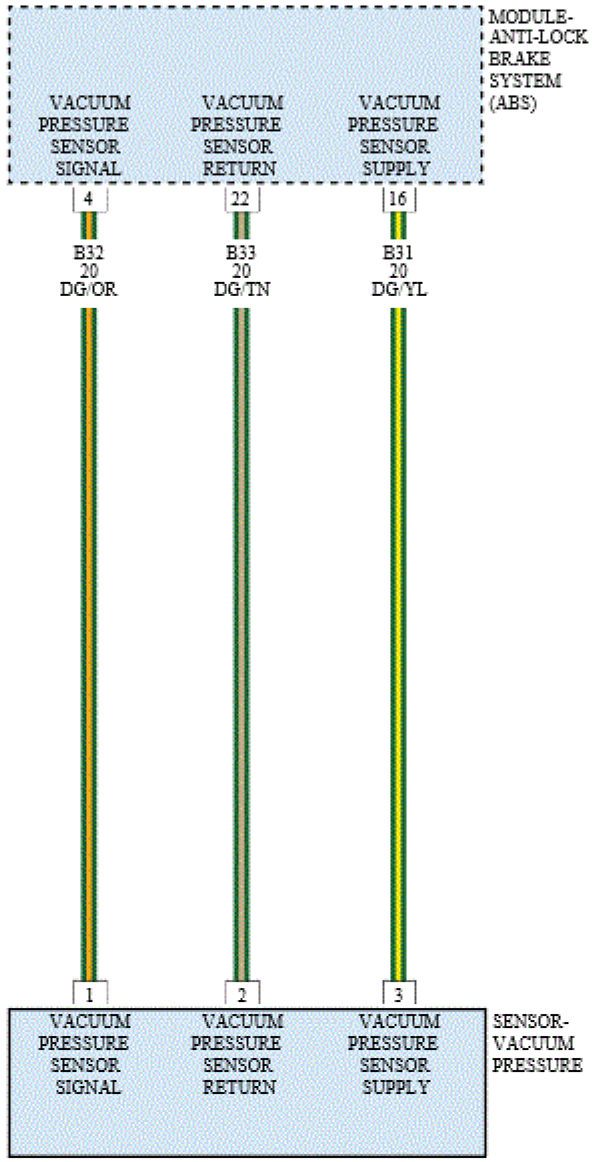

Fig. 27: Vacuum Pressure Sensor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects multiple quick voltage transitions to faulted levels.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
VACUUM PRESSURE SENSOR
POWER BRAKE BOOSTER
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

NOTE: **If any other DTCs are present, repair them first before continuing with this diagnostic procedure.**

DIAGNOSTIC TEST

1. **INSPECT RELATED WIRING HARNESS, TERMINALS, AND CONNECTORS**
    1. Perform any Service Bulletins that may apply.
    2. Review the scan tool Environmental Data (EV Data). If possible, try to duplicate the conditions under which the DTC set.
    3. Turn the ignition off.
    4. Visually inspect the related wire harness. Disconnect all the related harness connectors. Look for any chafed, pierced, pinched, partially broken wires and broken, bent, pushed out, or corroded terminals.
    5. Wiggle the wires while checking for shorts and open circuits.
    6. Inspect and clean all ABS, engine, and chassis grounds that are related to the most current DTC.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 2
2. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**
    1. Turn the ignition off.
    2. Replace the Vacuum Pressure Sensor in accordance with the Service Information.
    3. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    4. With the scan tool, read the DTCs.

    Is the DTC still active?

    Yes

    - Replace the Anti-Lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .

- Perform the ABS VERIFICATION TEST. Refer to STANDARD PROCEDURE.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

C121A-09-STEERING ANGLE SENSOR NOT INITIALIZED - COMPONENT FAILURES

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **Repair any Steering Control Module (SCM) or Loss of Communications DTCs first before continuing with this with this diagnostic procedure. (Refer to DIAGNOSTIC CODE INDEX).**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-Lock Brake Module detects a low voltage at the Steering Angle Sensor.
- Steering Angle Sensor failure.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE
CLOCKSPRING (SAS)
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **INITIALIZE ANTI-LOCK BRAKES SYSTEM (ABS) MODULE**
   1. Turn the ignition on.
   2. With the scan tool, read ABS DTCs and record on the repair order.

   WARNING: **To avoid possible serious or fatal injury, check brake capability is available before road testing.**

   NOTE: **When performing the ABS Initialization routine, the vehicle temperature must be above 10Â°C (50Â°F).**

3. Initialize the ABS Module, Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
4. Park the vehicle.

   Was the ABS Module initialization successful?

   Yes

   - Go To 2

   No

   - Perform the ABS Module Initialization routine again, if still unsuccessful. Go To 3

2. **CHECK FOR AN ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, erase the DTCs.

   WARNING: To avoid possible serious or fatal injury, check brake capability is available before road testing.

   3. Test drive the vehicle by turning the vehicle left and right in a curving manner at a velocity between 15 and 35 km/h (9 and 22 mph).
   4. Park the vehicle.
   5. With the scan tool, read ABS DTCs.

   Is the DTC active?

   Yes

   - Go To 3

   No

   - Test complete.

3. **STEERING ANGLE SENSOR**
   1. Turn the ignition off.
   2. Replace the Steering Angle Sensor in accordance with the Service Information. Refer to **COLUMN, REMOVAL** .
   3. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   WARNING: To avoid possible serious or fatal injury, check brake capability is available before road testing.

   4. Test drive the vehicle by turning the vehicle left and right in a curving manner at a velocity between 15 and 35 km/h (9 and 22 mph).
   5. With the scan tool, read the DTCs.

Does the DTC remain active?

Yes

- Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

C121C-00-TORQUE REQUEST SIGNAL DENIED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- Engine running.

SET CONDITION

- Powertrain Control Module (PCM) informed the Anti-lock Brake System (ABS) Module that it will not allow the engine torque reduction requests.
- Engine is above 360 rpm.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
EXCESSIVE LOAD ON ENGINE
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE
POWERTRAIN CONTROL MODULE (PCM)

NOTE: **If any PCM DTCs are present, perform the appropriate diagnostic procedure. Refer to DTC INDEX .**

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

NOTE: **This DTC must be active for the results of this test to be valid and this DTC may set while driving under severe load conditions.**

1. Turn the ignition on.
2. With the scan tool, read ABS DTCs and record on the repair order.
3. With the scan tool, read and record Freeze Frame information.
4. With the scan tool, erase DTCs.
5. Cycle the ignition switch from off to on.
6. Start the engine and raise the engine RPM to 2500.
7. With the scan tool, read ABS DTCs.

   Is the DTC active?

   Yes

   - Go To 2

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK ENGINE IDLE**
   1. Allow the engine to idle.

      Does the engine run rough at idle?

      Yes

      - Replace the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate article in Engine Performance Diagnosis & Testing .

      No

      - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C1239-00-EMISSION ROLLS TEST ACTIVE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- Body Control Module (BCM) has the Emissions Test Mode bit set.

SET CONDITION

- Body Control Module (BCM) has been requested to activate the Emission Rolls Test.
- Anti-lock Brake System (ABS) Module receives two messages in a row.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
EMISSION ROLLS TEST ENABLED
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool record and erase the DTCs.
    3. Turn the ignition off.
    4. Turn the ignition on.
    5. With the scan tool, read ABS DTCs.

    Is this DTC active?

    Yes

    - Go To 2

    No

    - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.
2. **EMISSION ROLLS TEST ENABLED**
    1. Turn the ignition on.
    2. Using the scan tool, under "Miscellaneous Functions" DISABLE the Emission Rolls Test in the BCM.
    3. With the scan tool, erase the DTCs.
    4. Turn the ignition off and wait ten seconds.
    5. Turn the ignition on.
    6. Using the scan tool, the read DTCs in ABS.

    Is the DTC active?

    Yes

- Go To 3

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

3. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**
    1. Turn the ignition off.
    2. Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
    3. Turn the ignition on.
    4. With the scan tool, read ABS DTCs in the ABS.

    Is the DTC still remain active?

    Yes

    - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .

    No

    - Test complete.

C123B-4B-ESP SYSTEM CONTROL TOO LONG - OVER TEMPERATURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **If any other DTCs are present, repair them first before continuing with this diagnostic procedure.**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-Lock Brake System (ABS) Module indicates excessive valve control.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
AGGRESSIVE DRIVING MANEUVERS, MISMATCHED TIRES, FRONT END ALIGNMENT

Possible Causes
TCS, ESP CONTROL TOO LONG OR TO FREQUENT
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

ANTI-LOCK BRAKE SYSTEM (ABS)

NOTE: **Check with customer for unusual driving terrain (e.g. mud, snow, ice) or aggressive driving maneuvers at the time of set condition.**

1. Perform any related Service Bulletins for this DTC.
2. Check for mismatched tires.
3. Visually inspect the ABS Module wiring.
4. Visually inspect the braking system.
5. Check the alignment.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

C1246-1C-VACUUM PRESSURE SENSOR SUPPLY - CIRCUIT VOLTAGE OUT OF RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

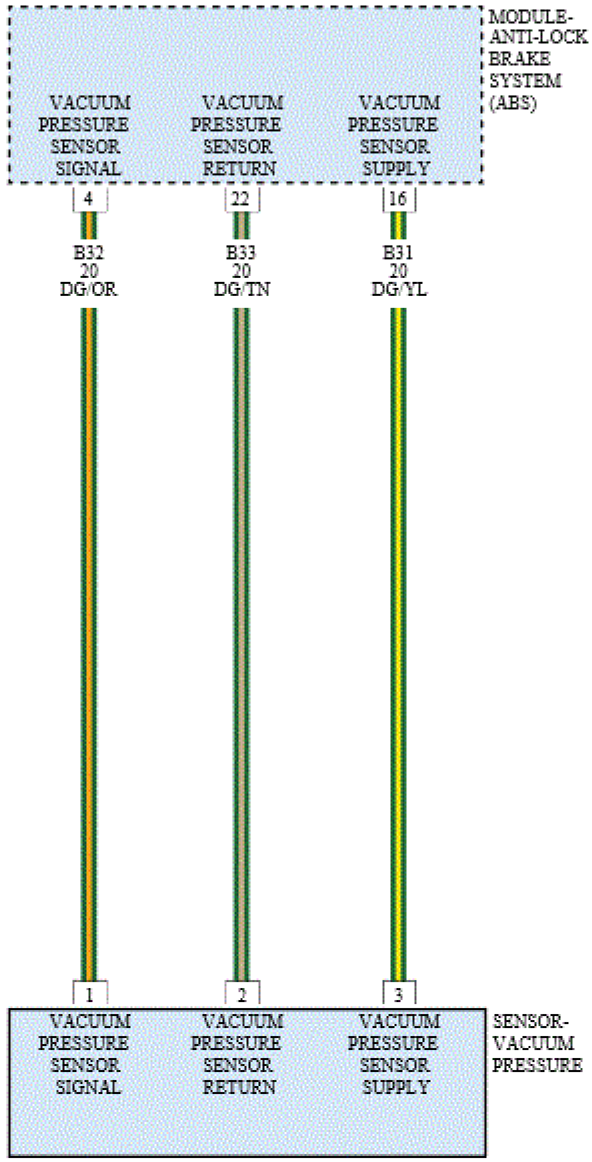

Fig. 28: Vacuum Pressure Sensor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Vacuum Sensor Supply circuit voltage feedback level is below 4.75 volts for more than 50msec.
- Vacuum Sensor Supply circuit voltage feedback level is above 5.25 volts for more than 50msec.

DEFAULT ACTION

- Anti-lock Brake System (ABS) amber light is illuminated.
- Anti-lock Brake System (ABS) is disabled.

POSSIBLE CAUSES

Possible Causes
(B31) VACUUM PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE
(B31) VACUUM PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO GROUND
VACUUM PRESSURE SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ABS DTCs and record on the repair order.
    3. Cycle the ignition switch from off to on.
    4. With the scan tool, read the DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - The condition that caused this DTC to set is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
    - Perform the ABS INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.
2. **(B31) VACUUM PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the ABS Module harness connector.
    3. Disconnect the Vacuum Pressure Sensor harness connector.
    4. Turn the ignition on.
    5. Measure the voltage of the (B31) Vacuum Pressure Sensor Supply circuit in the Vacuum Pressure Sensor harness connector.

    Is the voltage above 5.25 volts?

    Yes

    - Repair the (B31) Vacuum Pressure Sensor Supply circuit for a short to voltage.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **(B31) VACUUM PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO GROUND**
    1. Turn the ignition off.
    2. Measure the resistance between ground and the (B31) Vacuum Pressure Sensor Supply circuit at the Vacuum Pressure Sensor harness connector.

    Is the resistance below 5.0 Ohms?

    Yes

    - Repair the (B31) Vacuum Pressure Sensor Supply circuit for a short to ground.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 4

4. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**
    1. Turn the ignition off.
    2. Replace the Vacuum Pressure Sensor.
    3. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    4. With the scan tool, read the DTCs.

    Does the DTC remain active?

    Yes

    - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

C124F-00-ESP REQUEST DENIED FROM ACC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **If any PCM DTCs are present, repair them first before continuing with this diagnostic procedure.**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Turn the ignition on.

- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module has determined that there is a disagreement between what the Powertrain Control Module (PCM) is requesting and what ESP thinks it should be requesting.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
POWERTRAIN CONTROL MODULE (PCM)
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, read ABS DTCs and record on the repair order.
   3. Cycle the ignition switch from off to on.
   4. With the scan tool, read DTCs.

   Is the DTC active?

   Yes

   - Go To 2

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK FOR ANY CRUISE CONTROL DTCs**
   1. Turn the ignition on.
   2. With the scan tool, read ABS DTCs and record on the repair order in the PCM.
   3. Cycle the ignition switch from off to on.
   4. With the scan tool, read DTCs in the PCM.

   Are there any cruise control DTCs?

   Yes

   - Perform the appropriate diagnostic procedure. Refer to **DTC INDEX** .

No

- Using the schematics as a guide, check the Anti-lock Brake System (ABS) Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C1252-92-VACUUM PUMP CONTROL CIRCUIT - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **If any PCM DTCs are present, repair them first before continuing with this diagnostic procedure.**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Powertrain Control (PCM) has indicated there is a Vacuum Pump failure.

DEFAULT ACTION

- None.

POSSIBLE CAUSES

Possible Causes
ELECTRIC VACUUM PUMP (3.6L)
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE
POWERTRAIN CONTROL MODULE (PCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

NOTE: **This DTC must be active for the results of this test to be valid.**

1. Perform any Service Bulletins that may apply.
2. Turn the ignition on.
3. With the scan tool, read ABS DTCs and record on the repair order.
4. With the scan tool, read and record Environmental Data.
5. With the scan tool, erase ABS DTCs.

6. Start the engine.
7. Slowly turn the steering wheel from stop to stop.
8. With the scan tool, read ABS DTCs.

   Is the DTC active?

   Yes

   - Go To 2

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK FOR ANY ENGINE DTCs**
   1. Turn the ignition on.
   2. With the scan tool, read ABS DTCs and record on the repair order in the PCM.
   3. Cycle the ignition switch from off to on.
   4. With the scan tool, read DTCs in the PCM.

   Are there any PCM DTCs?

   Yes

   - Perform the appropriate diagnostic procedure. Refer to **DTC INDEX** .

   No

   - Using the schematics as a guide, check the Anti-lock Brake System (ABS) Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-lock Brake Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C2100-16-BATTERY VOLTAGE LOW - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

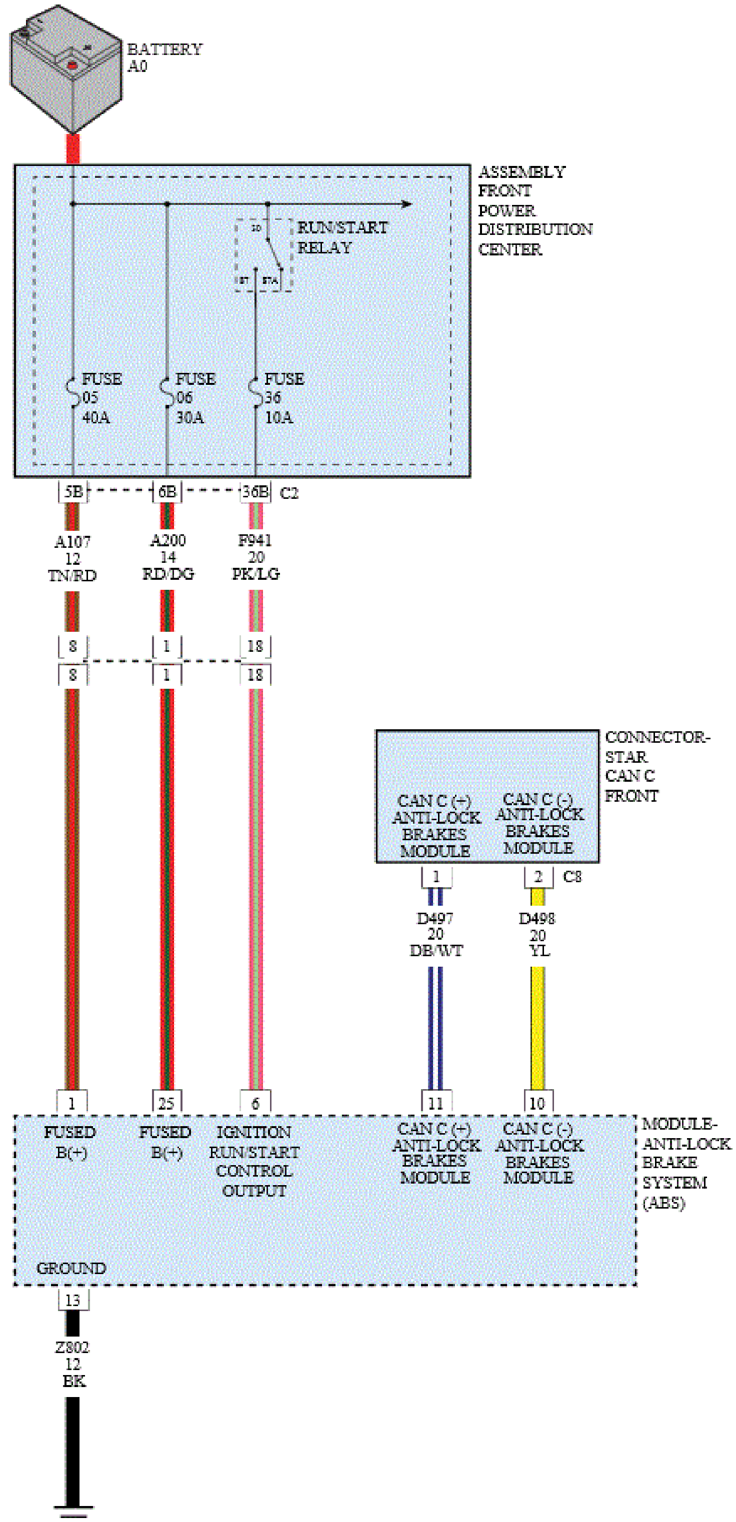

Fig. 29: Anti-Lock Brake System Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.

SET CONDITION

- Battery voltage is below 7.5 volts with ignition on.
- Sensed ignition voltage drops below 9 volts with vehicle speed above 6 km/h (4 mph).

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM
POWER CIRCUITS OPEN OR HIGH RESISTANCE
GROUND CIRCUITS OPEN OR HIGH RESISTANCE
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: Diagnose and repair any Powertrain Charging system DTCs before continuing with this procedure.

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ABS DTCs and record on the repair order.
   3. Turn the ignition off.
   4. Start the engine.
   5. With the scan tool, read DTCs.

      Is the DTC active?

      Yes

      - Go To 2

      No

      - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **POWER CIRCUITS FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the ABS Module harness connector.
   3. Turn the ignition on.

NOTE: **The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

4. With a 12-volt test light connected to ground, check the (A107) Fused B+, (A200) Fused B+ and (F941) Fused Ignition Switch Output circuits at the ABS harness connector.

   Does the test light illuminate brightly?

   Yes

   - Go To 3

   No

   - Repair the Power circuits for an open or high resistance.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **GROUND CIRCUITS OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. With a test light connected to B+ check the (Z802) Ground circuits at the ABS harness connector.

      Does the test light illuminate brightly?

      Yes

      - Replace the Anti-lock Brake System (ABS) Module in accordance with the service information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Repair the Ground circuits for an open or high resistance.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C2101-17-BATTERY VOLTAGE HIGH - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.

SET CONDITION

- Battery voltage is above 16.5 volts with ignition on.
- Sensed ignition voltage is above 18 volts with vehicle speed above 6 km/h (4 mph).

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
POWERTRAIN CONTROL MODULE (PCM) CHARGING SYSTEM DTCS PRESENT
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHARGING SYSTEM DTCS PRESENT**

   NOTE: Disconnect battery charger before continuing.

   1. Start the engine.
   2. With the scan tool, read DTCs in the PCM.

   Are there any Charging System or related voltage DTCs present?

   Yes

   - Perform the appropriate Charging System DTC diagnostic procedures before continuing with this test. Refer to **DTC INDEX** .

   No

   - Go To 2

2. **VERIFY THE DTC IS ACTIVE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Ignition on, engine not running.
   2. With the scan tool, record and erase DTCs.
   3. Turn ignition off to the lock position.
   4. Start the engine.
   5. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Replace the Anit-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Perform the ABS-INTERMITTENT TEST. Refer to **STANDARD PROCEDURE**.

C2114-16-DYNAMICS SENSOR SUPPLY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

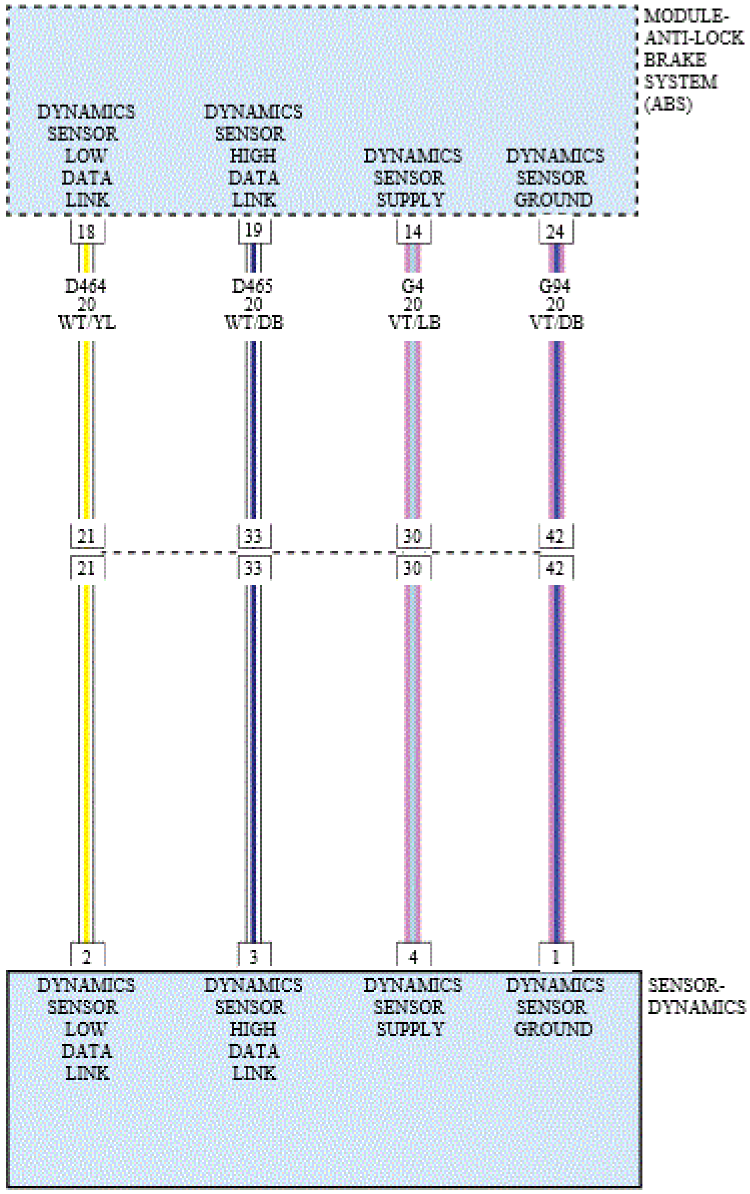

Fig. 30: Dynamics Sensor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detected that the Dynamic Sensor Voltage is below 6.5 volts.

- Dynamic Sensor Voltage is below 6.5 volts.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(G4) DYNAMICS SENSOR SUPPLY CIRCUIT VOLTAGE
(G4) DYNAMICS SENSOR SUPPLY CIRCUIT SHORTED TO GROUND
(G4) DYNAMICS SENSOR SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(G94) DYNAMICS SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
DYNAMICS SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ABS DTCs and record on the repair order.
    3. With the scan tool, read and record the Environmental Data to help identify the conditions in which the DTC was set.
    4. With the scan tool, erase the DTCs.
    5. Start the engine.
    6. With the scan tool, read ABS DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.
2. **(G4) DYNAMICS SENSOR SUPPLY CIRCUIT FOR VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the Dynamics Sensor harness connector.
    3. Turn the ignition on.
    4. Measure the voltage of the (G4) Dynamics Sensor Supply Circuit in the Dynamics Sensor harness connector.

    Is the voltage below 10 volts?

Yes

- Go To 3

No

- Go To 5

3. **(G4) DYNAMICS SENSOR SUPPLY CIRCUIT SHORTED TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the ABS Module harness connector.
    3. Measure the resistance between ground and the (G4) Dynamics Sensor Supply circuit at the Dynamics Sensor harness connector.

    Is the resistance above 5 Ohms?

    Yes

    - Go To 4

    No

    - Repair the (G4) Dynamics Sensor Supply circuit for an open or high resistance.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **(G4) DYNAMICS SENSOR SUPPLY CIRCUIT FOR OPEN OR HIGH RESISTANCE**
    1. Measure the resistance of the (G4) Dynamics Sensor Supply circuit between the ABS Module harness connector and the Dynamics Sensor harness connector.

    Is the resistance above 5 Ohms?

    Yes

    - Repair the (G4) Dynamics Sensor Supply circuit for an open or high resistance.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK (G94) DYNAMICS SENSOR GROUND CIRCUIT FOR OPEN OR HIGH RESISTANCE**
    1. Turn the ignition off.
    2. Using a 12-volt test light connected to B+, check the (G94) Ground Circuit in the Dynamics Sensor harness connector.

    NOTE: **The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

Does the test light illuminate brightly?

Yes

- Replace the Dynamic Sensor in accordance with the Service Information. Refer to **SENSOR, DYNAMICS, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Repair the (G94) Dynamics Sensor Ground circuit for an open or high resistance.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C2114-17-DYNAMICS SENSOR SUPPLY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

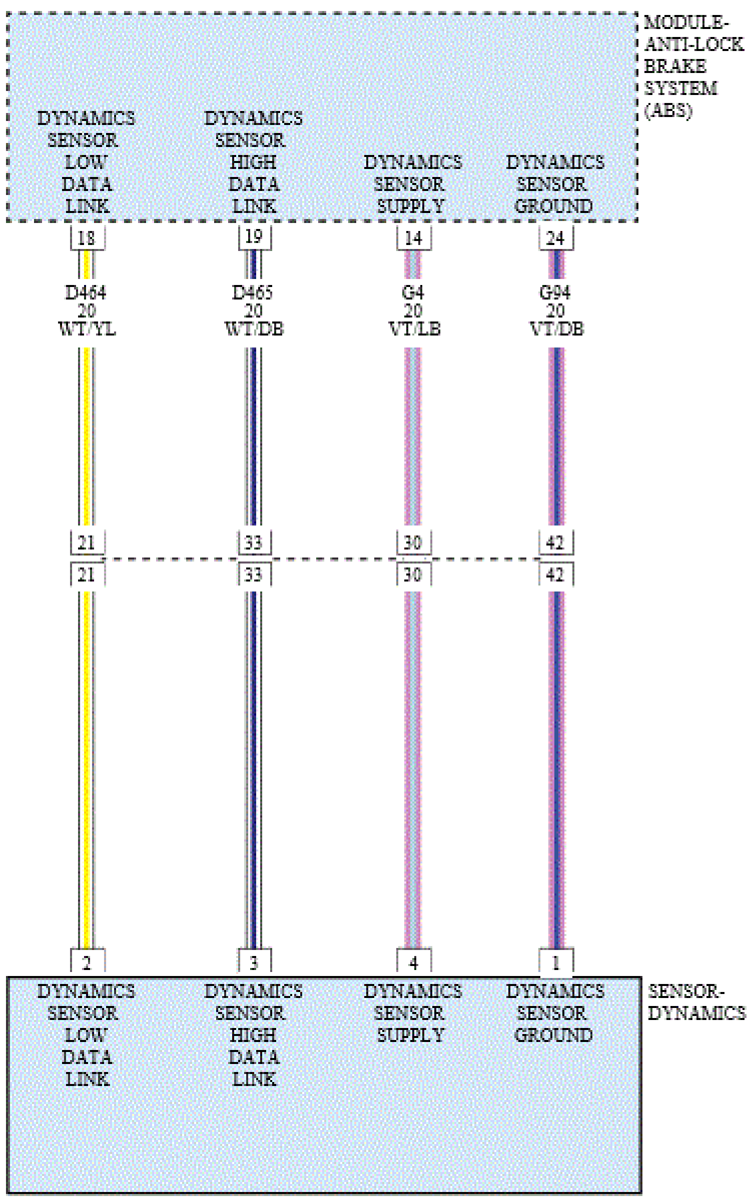

Fig. 31: Dynamics Sensor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.
- Dynamics Sensor Supply circuit power on.

SET CONDITION

- Dynamic Sensor has reported an event where voltage went above 18 volts.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
(G4) DYNAMICS SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE
DYNAMICS SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ABS DTCs and record on the repair order.
    3. With the scan tool, read and record the Environmental Data to help identify the conditions in which the DTC was set.
    4. With the scan tool, erase the DTCs.
    5. Start the engine.
    6. With the scan tool, read ABS DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.
2. **(G4) DYNAMICS SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE**

1. Disconnect the Dynamic Sensor harness connector.
2. Disconnect the ABS Module harness connector.
3. Turn the ignition on.
4. Measure the voltage between ground and the (G4) Dynamics Sensor Supply circuit in the Dynamics Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (G4) Dynamics Sensor Supply circuit for a short.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **DYNAMIC SENSOR**
   1. Replace the Dynamic Sensor in accordance with the Service Information. Refer to **SENSOR, DYNAMICS, REMOVAL** .
   2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. With the scan tool, read the DTCs.

      Is this DTC still active?

      Yes

      - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

C211B-92-IGNITION RUN/START INPUT CIRCUIT - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

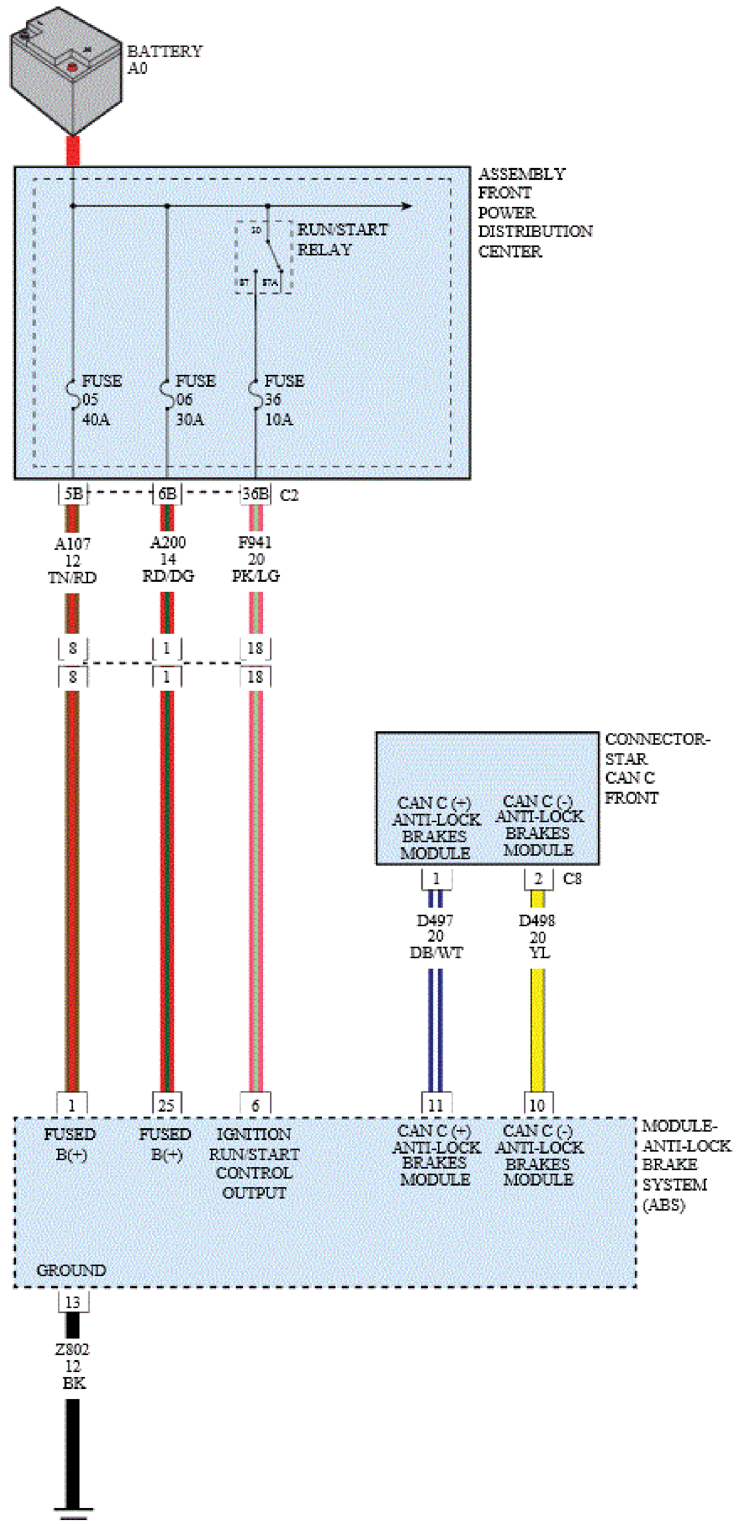

Fig. 32: Anti-Lock Brake System Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Ignition Status reported over the CAN Bus does not match the state of the Ignition Input.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
FUSE
(F941) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT SHORT TO VOLTAGE
POWER CIRCUITS OPEN OR HIGH RESISTANCE
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

NOTE: **If any other DTCs are present, repair them first before continuing with this diagnostic procedure.**

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: **This DTC must be active for the results of this test to be valid.**

   1. Turn the ignition on.
   2. With the scan tool, read ABS DTCs and record on the repair order.
   3. With the scan tool, erase the DTCs.
   4. Start the engine.
   5. With the scan tool, read ABS DTCs.

   Is the DTC active?

   Yes

   - Go To 2

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK THE FUSE**
   1. Turn the ignition on.
   2. Using a 12-volt test light connected to ground, check the fuse for power.

Is the fuse good?

Yes

- Go To 3

No

- If the related fuse is open, check the (F941) Fused Ignition Switch Output (RUN/START) circuit for a short to ground.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **(F941) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT SHORT TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the ABS Module harness connector.
    3. With a 12-volt test light connected to ground, check the (F941) Fused Ignition Switch Output (RUN/START) circuit at the ABS harness connector.

    NOTE: **The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

    Does the test light illuminate brightly?

    Yes

    - Repair the (F941) Fused Ignition Switch Output (RUN/START) circuit for a short to voltage.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 4

4. **POWER CIRCUITS FOR AN OPEN OR HIGH RESISTANCE**
    1. Turn the ignition on.
    2. With a test light connected to ground check (A901) Fused B+, (A902) Fused B+ and (F941) Fused Ignition Switch Output (RUN/START) circuits at the ABS harness connector.

    NOTE: **The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

    Does the test light illuminate brightly?

    Yes

    - Replace the Anti-lock System Brake (ABS) Module in accordance with the service information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

- Repair the Power circuits for an open or high resistance.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C212A-16-SYSTEM VOLTAGE LOW - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module has detected a low voltage system error.
- Body Control Module (BCM) battery voltage CAN message indicates a low voltage condition.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM DTCS PRESENT
BATTERY
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHARGING SYSTEM DTCS PRESENT**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs in the Powertrain Control Module (PCM).

      Are there any Charging System or related voltage DTCs present?

      Yes

      - Perform the appropriate Charging System DTC diagnostic procedures before continuing with this test. Refer to **DTC INDEX** .

      No

      - Go To 2
2. **BATTERY**

NOTE: **Make sure the Battery is in good condition. Using the Midtronics Battery Tester or an equivalent Battery tester, test the Battery before continuing.**

Does the Battery pass the load test for this specific application?

Yes

- Go To 3

No

- Replace the Battery in accordance with the Service Information. Refer to **BATTERY, REMOVAL** .

3. **CHECK FOR AN ACTIVE DTC**

NOTE: This DTC must be active for the results of this test to be valid.

1. Turn the ignition on.
2. With the scan tool, read ABS DTCs and record on the repair order.
3. With the scan tool, erase the DTCs.
4. Start the engine.
5. With the scan tool, read ABS DTCs.

Is the DTC active?

Yes

- Replace the Anti-lock Brake System (ABS) Module in accordance with the service information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

C212A-17-SYSTEM VOLTAGE HIGH - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.

SET CONDITION

- Anti-lock Brake System (ABS) Module has detected a high voltage system error.
- Body Control Module (BCM) battery voltage CAN message indicates a high voltage condition.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM DTCS PRESENT
BATTERY
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHARGING SYSTEM DTCS PRESENT**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs in the Powertrain Control Module (PCM).

    Are there any Charging System or related voltage DTCs present?

    Yes

    - Perform the appropriate Charging System DTC diagnostic procedures before continuing with this test. Refer to **DTC INDEX** .

    No

    - Go To 2
2. **BATTERY**

    NOTE: **Make sure the Battery is in good condition. Using the Midtronics Battery Tester or an equivalent Battery tester, test the Battery before continuing.**

    Does the Battery pass the load test for this specific application?

    Yes

    - Go To 3

    No

    - Replace the Battery in accordance with the Service Information. Refer to **BATTERY, REMOVAL** .
3. **CHECK FOR AN ACTIVE DTC**

    NOTE: **This DTC must be active for the results of this test to be valid.**

    1. Turn the ignition on.
    2. With the scan tool, read ABS DTCs and record on the repair order.
    3. With the scan tool, erase the DTCs.
    4. Start the engine.

5. With the scan tool, read ABS DTCs.

   Is the DTC active?

   Yes

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the service information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

C2200-41-ANTI-LOCK BRAKE MODULE INTERNAL - GENERAL CHECKSUM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detected an internal error.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

1. The Anti-lock Brake System (ABS) Module is reporting internal errors.

   NOTE: **Before continuing, check the Anti-lock Brake System (ABS) Module harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

2. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

3. Perform any Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C2200-44-ANTI-LOCK BRAKE MODULE INTERNAL - DATA MEMORY FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detected an internal error.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

ANTI-LOCK BRAKE SYSTEM (ABS) MODULE INTERNAL CONDITION

1. The ABS Module is reporting internal errors.

   NOTE: **Before continuing, check the Anti-lock Brake System (ABS) Module harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

2. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

3. Perform any Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C2200-45-ANTI-LOCK BRAKE MODULE INTERNAL - PROGRAM MEMORY FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detected an internal error.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

ANTI-LOCK BRAKE SYSTEM (ABS) MODULE INTERNAL CONDITION

1. The ABS Module is reporting internal errors.

   NOTE: Before continuing, check the Anti-lock Brake System (ABS) Module harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

2. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.

3. Perform any Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C2200-46-ANTI-LOCK BRAKE MODULE INTERNAL - CALIBRATION / PARAMETER MEMORY FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module has detected an internal error.
- Anti-lock Brake System (ABS) Module replaced.
- Hydraulic Control Unit (HCU) replaced.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE REPLACED
HYDRAULIC CONTROL UNIT (HCU) REPLACED

DIAGNOSTIC TEST

ANTI-LOCK BRAKE SYSTEM (ABS) MODULE INTERNAL CONDITION

1. The ABS Module is reporting internal errors.

NOTE: Before continuing, check the Anti-lock Brake System (ABS) Module harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

2. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.
3. Perform any Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C2200-47-ANTI-LOCK BRAKE MODULE INTERNAL - WATCHDOG / SAFETY AUC FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detected an internal error.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

ANTI-LOCK BRAKE SYSTEM (ABS) MODULE INTERNAL CONDITION

1. The ABS Module is reporting internal errors.

NOTE: **Before continuing, check the Anti-lock Brake System (ABS) Module harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

2. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.
3. Perform any Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C2200-48-ANTI-LOCK BRAKE MODULE INTERNAL - SUPERVISION SOFTWARE FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detected an internal error.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

ANTI-LOCK BRAKE SYSTEM (ABS) MODULE INTERNAL CONDITION

1. The ABS Module is reporting internal errors.

NOTE: **Before continuing, check the Anti-lock Brake System (ABS) Module harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

2. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.
3. Perform any Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C2200-49-ANTI-LOCK BRAKE MODULE INTERNAL - INTERNAL ELECTRONIC FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detected an internal error.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE/HYDRAULIC CONTROL UNIT DO NOT MATCH
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

ANTI-LOCK BRAKE SYSTEM (ABS) MODULE INTERNAL CONDITION

1. The ABS Module is reporting internal errors.

2. Verify that the Anti-lock Brake System (ABS) Module or the Hydraulic Control Unit (HCU) were not replaced individually from another vehicle.

NOTE: **Before continuing, check the Anti-lock Brake System (ABS) Module harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.**

3. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.
4. Perform any Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C2202-00-ORIGINAL VIN MISMATCH / MISSING

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **Diagnose and repair any Powertrain Control Module (PCM), VIN or Communication DTCs before continuing with this diagnostic procedure.**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Current Vehicle Identification Number (VIN) in Anti-lock Brake System (ABS) Module does not match the broadcast VIN.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE NOT INITIALIZED
POWERTRAIN CONTROL MODULE (PCM) VIN NOT PROGRAMMED
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE
POWERTRAIN CONTROL MODULE (PCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: **This DTC must be active for the results of this test to be valid.**

   1. Turn the ignition on.
   2. With the scan tool, erase DTCs.
   3. Turn the ignition off.
   4. Turn the ignition on.
   5. Wait ten seconds.
   6. With the scan tool, read DTCs.

      Is the DTC active?

      Yes

      - Go To 2

      No

      - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.
2. **WRONG VIN PROGRAMMED IN PCM**
   1. Turn the ignition on.
   2. With the scan tool, read the VIN in the PCM.
   3. Compare VIN in the PCM to the vehicle VIN.

      Is the correct VIN programmed in the PCM?

      Yes

      - Go To 3

      No

      - Program the correct VIN into the PCM. Follow the VIN programing procedure in the PCM/ECM reprogramming procedure. Refer to **MODULE PROGRAMMING** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
3. **INITIALIZE ABS MODULE**

1. Perform any Service Bulletins that may apply.

NOTE: When performing the ABS Initialization routine, the vehicle temperature must be above 10Ā°C (50Ā°F).

2. With the scan tool, under "Miscellaneous Functions" run the ABS Initialization routine.
3. Turn the ignition off.
4. Cycle the ignition from off to on.
5. Wait ten seconds.
6. With the scan tool, read DTCs.

Does the DTC remain active?

Yes

- Replace the Anti-lock Brake System (ABS) Module in accordance with the service information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

C2206-00-VEHICLE CONFIGURATION MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: If the BCM has been serviced make sure that the Restore Vehicle Configuration is performed before continuing with this diagnostic procedure.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- If any of the learned Vehicle Configuration data from the CAN Bus has changed.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE NOT INITIALIZED

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

INITIALIZE THE ABS MODULE

NOTE: **Diagnose and repair any Powertrain Module (PCM), VIN or Communication DTCs before continuing with this diagnostic procedure.**

NOTE: **If C2202-00-Original VIN mismatch / Missing is set along with this DTC, perform the diagnostic procedure for C2202-00 before continuing with this test.**

NOTE: **ABS initialization data will not be saved if ignition has not been off for five minutes or if battery has been disconnected.**

1. Perform any Service Bulletins that may apply.

   NOTE: **When performing the ABS Initialization routine, the vehicle temperature must be above 10Ā°C (50Ā°F).**

2. With the scan tool, under "Miscellaneous Functions" perform the ABS Initialization routine.
3. Turn the ignition off.
4. Wait five minutes.
5. Turn ignition on.
6. With the scan tool, erase DTCs.
7. With the scan tool, read DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the service information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C220B-00-ABS ACC NOT CALIBRATED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.

- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module and Hydraulic Control Unit (HCU) do not match.
- ABS analog valves are not calibrated.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE
HYDRAULIC CONTROL UNIT (HCU)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ABS DTCs and record on the repair order.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read DTCs.

    Is the DTC active?

    Yes

    - Go To 2

    No

    - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.
2. **ABS INITIALIZATION ROUTINE**

    NOTE: **When performing the ABS Initialization routine, the vehicle temperature must be above 10Ā°C (50Ā°F).**

    1. With the scan tool, under "Miscellaneous Functions" perform the ABS Initialization routine.
    2. With the scan tool, erase the DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read the DTCs.

    Does the DTC remain active?

    Yes

- Using the schematics as a guide, check the ABS Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace thee Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test Complete.

U0002-88-CAN C BUS OFF PERFORMANCE - BUS OFF

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake Module (ABS) Module detected a catastrophic failure on the CAN bus.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE (BCM) POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Turn the ignition on.
2. With the scan tool, read ABS DTCs and record on the repair order.
3. With the scan tool, erase DTCs.
4. Cycle the ignition from off to on.
5. With the scan tool, read DTCs.

Is the DTC active?

Yes

NOTE: **Diagnose the U0002-88 CAN C BUS OFF PERFORMANCE as the U0010-00-CAN INTERIOR BUS test.**

- Perform the U0010-00-CAN INTERIOR BUS diagnostic procedure. **Refer to** **DTC INDEX** .

No

- Perform the Stored Lost Communication DTCs diagnostic procedure. **Refer to** **STORED LOST COMMUNICATION DTCS** .

U0100-00-LOST COMMUNICATION WITH ECM/PCM

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0101-00-LOST COMMUNICATION WITH TCM

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0104-00- LOST COMMUNICATION WITH CRUISE CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0125-00-LOST COMMUNICATION WITH DYNAMICS SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

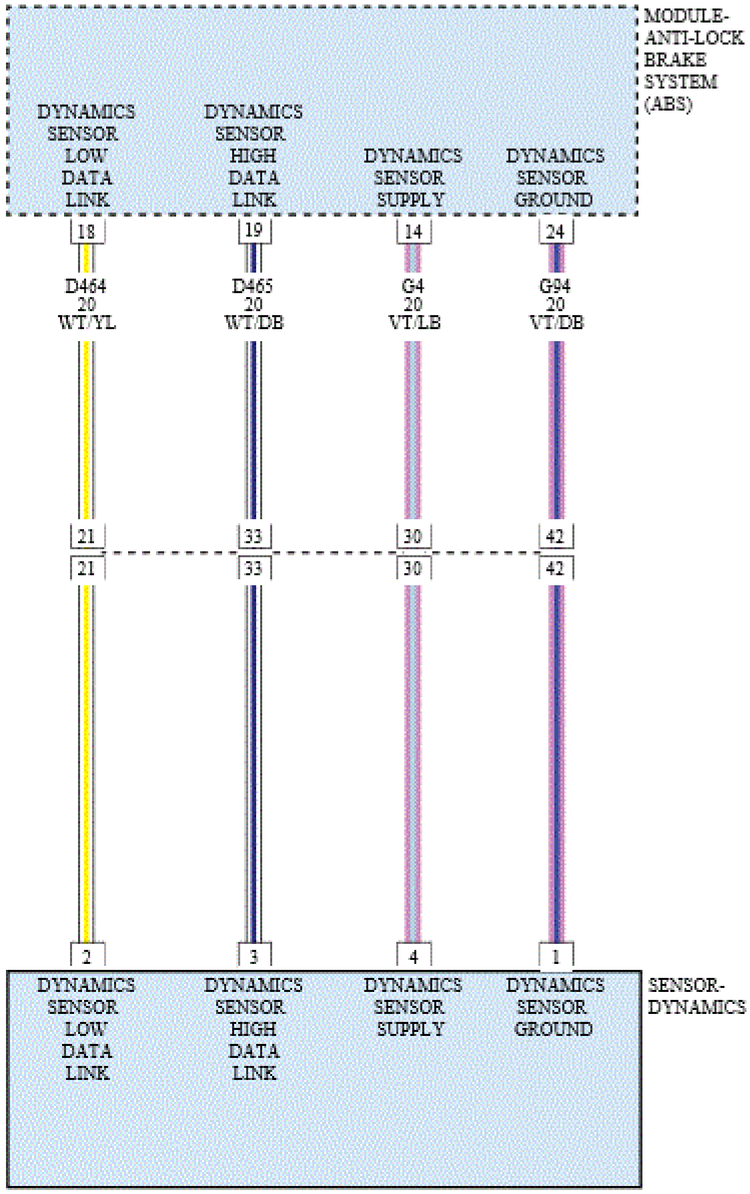

Fig. 33: Dynamics Sensor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module fails to receive bus messages from the Dynamics Sensor.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
(G4) DYNAMICS SENSOR SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(G94) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT OPEN
(D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT SHORTED TO VOLTAGE
(D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT SHORTED TO GROUND
(D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT OPEN
(D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT SHORTED TO THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT
DYNAMICS SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: **If DTC C2114-16, C2114-17 or U1003-88 are present, perform the diagnostics for these DTCs before continuing with this diagnostic procedure.**

   1. Turn the ignition on.
   2. With the scan tool, read ABS DTCs and record on the repair order.
   3. With the scan tool, read and record Environmental Data (EV Data).
   4. With the scan tool, erase ABS DTCs.
   5. Cycle the ignition switch.
   6. With the scan tool, read ABS DTCs.

      Is the DTC active?

      Yes

      - Go To 2

      No

      - Perform the ABS-INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.
2. **INSPECT RELATED WIRING HARNESS, TERMINALS, AND CONNECTORS**
   1. Turn the ignition off.

   WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner,**

impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: **Proper Steering Angle Sensor installation is crucial for proper operation.**

2. Visually inspect the related wiring harness. Look for any pinched, chafed, pierced, and partially broken wires.
3. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, and corroded terminals.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **(G4) DYNAMICS SENSOR SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Disconnect the ABS Module harness connector.
   2. Disconnect the Dynamics Sensor harness connector.
   3. Measure the resistance of the (G4) Dynamics Sensor Supply circuit between the Dynamics Sensor harness connector and the Anti-lock Brake System (ABS) Module harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (G4) Dynamics Sensor Supply circuit for an open.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
4. **(G94) GROUND CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Using a 12-volt test light connected to B+, check the (G94) Ground circuit at the Dynamics Sensor harness connector.

      NOTE: **The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.**

Does the test light illuminate brightly?

Yes

- Go To 5

No

- Repair the (G94) Ground circuit for an open or high resistance.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition on.
    2. Measure the voltage of the (D465) Dynamics Sensor High Data Link circuit.

    Is there any voltage present?

    Yes

    - Repair the (D465) Dynamics Sensor High Data Link circuit for a short to voltage.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 6

6. **CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Measure the resistance of the (D465) Dynamics Sensor High Data Link circuit between ground and the Dynamics Sensor harness connector.

    Is the resistance below 5.0 Ohms?

    Yes

    - Repair the (D465) Dynamics Sensor High Data Link circuit for a short to ground.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 7

7. **CHECK THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT FOR AN OPEN**
    1. Measure the resistance of the (D465) Dynamics Sensor High Data Link circuit between the Dynamics Sensor harness connector and the Anti-lock Brake System (ABS) Module harness connector.

    Is the resistance below 5.0 Ohms?

Yes

- Go To 8

No

- Repair the (D465) Dynamics Sensor High Data Link circuit for an open.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

8. **CHECK THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition on.
    2. Measure the voltage of the (D464) Dynamics Sensor Low Data Link circuit.

    Is there any voltage present?

    Yes

    - Repair the (D464) Dynamics Sensor Low Data Link circuit for a short to voltage.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 9
9. **CHECK THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Measure the resistance of the (D464) Dynamics Sensor Low Data Link circuit between ground and the Dynamics Sensor harness connector.

    Is the resistance below 5.0 Ohms?

    Yes

    - Repair the (D464) Dynamics Sensor Low Data Link circuit for a short to ground.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 10
10. **CHECK THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR AN OPEN**
    1. Measure the resistance of the (D464) Dynamics Sensor Low Data Link circuit between the Dynamics Sensor harness connector and the ABS Module harness connector.

    Is the resistance below 5.0 Ohms?

    Yes

    - Go To 11

No

- Repair the (D464) Dynamics Sensor Low Data Link circuit for an open.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

11. **(D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT SHORTED TO THE (D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT**
    1. Turn the ignition off.
    2. Measure the resistance between the (D465) Dynamics Sensor High Data Link circuit and the (D464) Dynamics Sensor Low Data Link circuit at the ABSModule harness connector.

       Is the resistance below 5.0 Ohms?

       Yes

       - Repair the (D464) Dynamics Sensor Low Data Link circuit for a short to (D465) Dynamics Sensor High Data Link circuit.
       - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 12
12. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**
    1. Replace the Dynamics Sensor in accordance with the Service Information. Refer to **SENSOR, DYNAMICS, REMOVAL** . Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    2. Turn the ignition on.
    3. With the scan tool, read ABS DTCs and record on the repair order.
    4. Cycle the ignition switch from off to on.
    5. With the scan tool, read DTCs.

       Does the DTC remain active?

       Yes

       - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
       - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Test complete.

U0126-00-LOST COMMUNICATION WITH STEERING ANGLE SENSOR

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to STANDARD PROCEDURE .

U0401-00-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **Check for DTCs in the associated module before continuing with this diagnostic procedure.**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- System voltage between 10.0 and 16.0 volts.
- One valid CAN message received at least once.
- No U0002-88-CAN C Bus Off Performance DTC present.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects an incorrect CAN message from the Powertrain Control Module (PCM).

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE CAN BUS DTCS
POWERTRAIN CONTROL MODULE (PCM) CAN BUS DTCS
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE
POWERTRAIN CONTROL (PCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: **This DTC must be active for the results of this test to be valid.**

   1. Perform any Service Bulletins that may apply.
   2. Turn the ignition on.
   3. With the scan tool, read ABS DTCs and record on the repair order.
   4. Cycle the ignition switch from off to on.
   5. With the scan tool, read ABS DTCs.

   Is the DTC active?

Yes

- Go To 2

No

- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK IF POWERTRAIN CONTROL MODULE DTCS ARE PRESENT**
    1. With the scan tool, read the PCM DTCs.

    Are there any PCM DTCs present?

    Yes

    - Perform the appropriate diagnostic procedures. Refer to **DTC INDEX** .

    No

    - Go To 3

3. **CHECK OTHER MODULES FOR CAN BUS DTCS**
    1. With the scan tool, read the DTCs.

    Are there any CAN BUS DTCs present?

    Yes

    - Using the schematics as a guide, check the Powertrain Control Module (PCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .

    No

    - Using the schematics as a guide, check the Anti-lock Brake System (ABS) Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U0402-00-IMPLAUSIBLE DATA RECEIVED FROM TCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE:	**Check for DTCs in the associated module before continuing with this diagnostic procedure.**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- System voltage between 10.0 and 16.0 volts.
- One valid CAN message received at least once.
- No U0002-88-CAN C Bus Off Performance DTC present.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects an incorrect CAN message from the Transmission Control Module (TCM).

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE CAN BUS DTCS
TRANSMISSION CONTROL MODULE (TCM) CAN BUS DTCS
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE
TRANSMISSION CONTROL MODULE (TCM)

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Perform any Service Bulletins that may apply.
   2. Turn the ignition on.
   3. With the scan tool, read ABS DTCs and record on the repair order.
   4. Cycle the ignition switch from off to on.
   5. With the scan tool, read the DTCs.

      Is the DTC active?

      Yes

      - Go To 2

      No

      - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.
2. **CHECK IF TRANSMISSION CONTROL MODULE (TCM) DTCS ARE PRESENT**
   1. With the scan tool, read TCM DTCs.

Are there any TCM DTCs present?

Yes

- Perform the appropriate diagnostic procedures. Refer to **DTC INDEX** .

No

- Go To 3

3. **CHECK OTHER MODULES FOR CAN BUS DTCS**
    1. With the scan tool, read the DTCs.

    Are there any CAN BUS DTCs present?

    Yes

    - Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Transmission Control Module (TCM) in accordance with the Service Information. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .

    No

    - Using the schematics as a guide, check the Anti-lock Brake System (ABS) Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U0405-00-INVALID DATA RECEIVED CRUISE CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- System voltage between 10.0 and 16.0 volts.
- One valid CAN message received at least once.
- No U0002-88-CAN C Bus Off Performance DTC present.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects an incorrect CAN message from the Adaptive Cruise Control (ACC) Module.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE CAN BUS DTCS
ADAPTIVE CRUISE CONTROL (ACC) MODULE CAN BUS DTCS
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE
ADAPTIVE CRUISE CONTROL (ACC) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: **This DTC must be active for the results of this test to be valid.**

   1. Perform any Service Bulletins that may apply.
   2. Turn the ignition on.
   3. With the scan tool, read ABS DTCs and record on the repair order.
   4. Cycle the ignition switch from off to on.
   5. With the scan tool, read the DTCs.

      Is the DTC active?

      Yes

      - Go To 2

      No

      - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.
2. **CHECK IF ACC MODULE DTCS ARE PRESENT**
   1. With the scan tool, read the ACC DTCs.

      Are there any ACC DTCs present?

      Yes

      - Perform the appropriate diagnostic procedures. Refer to **DIAGNOSIS AND TESTING** .

      No

      - Go To 3
3. **CHECK OTHER MODULES FOR CAN BUS DTCS**
   1. With the scan tool, read the DTCs.

      Are there any CAN BUS DTCs present?

Yes

- Using the schematics as a guide, check the Adaptive Cruise Control (ACC) Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Adaptive Cruise Control (ACC) Module in accordance with the Service Information. Refer to **MODULE, ADAPTIVE CRUISE CONTROL, REMOVAL** .

No

- Using the schematics as a guide, check the Anti-lock Brake System (ABS) Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U0422-00-IMPLAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **Check for DTCs in the associated module before continuing with this diagnostic procedure.**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- System voltage between 10.0 and 16.0 volts.
- One valid CAN message received at least once.
- No U0002-88-CAN C Bus Off Performance DTC present.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects an incorrect CAN message from the Body Control Module (BCM).

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE CAN BUS DTCS
BODY CONTROL MODULE (BCM) CAN BUS DTCS
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Perform any Technical Service Bulletins (TSBs) that may apply.
   2. Turn the ignition on.
   3. With the scan tool, record and erase the DTCs.
   4. Cycle the ignition switch from off to on.
   5. With the scan tool, read the DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK BODY CONTROL MODULE (BCM) CAN BUS DTCS ARE PRESENT**
   1. With the scan tool, read the BCM DTCs.

   Are there any BCM CAN BUS DTCs present?

   Yes

   - Perform the appropriate diagnostic procedures. Refer to **DIAGNOSIS AND TESTING** .

   No

   - Go To 3

3. **CHECK OTHER MODULES FOR CAN BUS DTCS**
   1. With the scan tool, read the DTCs.

   Are there any CAN BUS DTCs present?

   Yes

   - Using the schematics as a guide, check the Body Control Module (BCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .

   No

- Using the schematics as a guide, check the Anti-lock Brake System (ABS) Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U0429-00-IMPLAUSIBLE DATA RECEIVED FROM SCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **Check for DTCs in the associated module before continuing with this diagnostic procedure.**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- System voltage between 10.0 and 16.0 volts.
- One valid CAN message received at least once.
- No U0002-88-CAN C Bus Off Performance DTC present.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects an incorrect CAN message from the Steering Column Control Module (SCCM).

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE CAN BUS DTCS
STEERING COLUMN CONTROL MODULE (SCCM) CAN BUS DTCS
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE
STEERING COLUMN CONTROL MODULE (SCCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: **This DTC must be active for the results of this test to be valid.**

   1. Perform any Service Bulletins that may apply.
   2. Turn the ignition on.
   3. With the scan tool, read ABS DTCs and record on the repair order.

4. Cycle the ignition switch from off to on.
5. With the scan tool, read ABS DTCs.

Is the DTC active?

Yes

- Go To 2

No

- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK FOR STEERING COLUMN CONTROL MODULE (SCCM) DTCS PRESENT**
   1. With the scan tool, read SCCM DTCs.

   Are there any SCCM DTCs present?

   Yes

   - Perform the appropriate diagnostic procedures. (Refer to **DIAGNOSTIC CODE INDEX**).

   No

   - Go To 3

3. **CHECK OTHER MODULES FOR CAN BUS DTCS**
   1. With the scan tool, read DTCs.

   Are there any CAN BUS DTCs present?

   Yes

   - Using the schematics as a guide, check the Steering Column Control Module (SCCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Steering Column Control Module (SCCM) in accordance with the Service Information.

   No

   - Using the schematics as a guide, check the Anti-lock Brake System (ABS) Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U0432-00-INVALID DATA RECEIVED FROM MULTI-AXIS ACCELERATION SENSOR MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- System voltage between 10.0 and 16.0 volts.
- One valid CAN message received at least once.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects an incorrect CAN message from the Dynamics Sensor.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
DYNAMICS SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Perform any Service Bulletins that may apply.
   2. Turn the ignition on.
   3. With the scan tool, read ABS DTCs and record on the repair order.
   4. With the scan tool, read and record the Environmental Data to help identify the conditions in which the DTC was set.
   5. With the scan tool, erase the DTCs.
   6. Start the engine.
   7. With the scan tool, read the DTCs.

   Is the DTC active?

   Yes

   - Go To 2

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**

1. Replace the Dynamics Sensor in accordance with the Service Information. Refer to **SENSOR, DYNAMICS, REMOVAL** . Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
2. Turn the ignition on.
3. With the scan tool, read ABS DTCs.
4. Cycle the ignition switch from off to on.
5. With the scan tool, read DTCs.

   Is the DTC still active?

   Yes

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

U1003-88-ESP CAN C BUS PERFORMANCE - BUS OFF

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

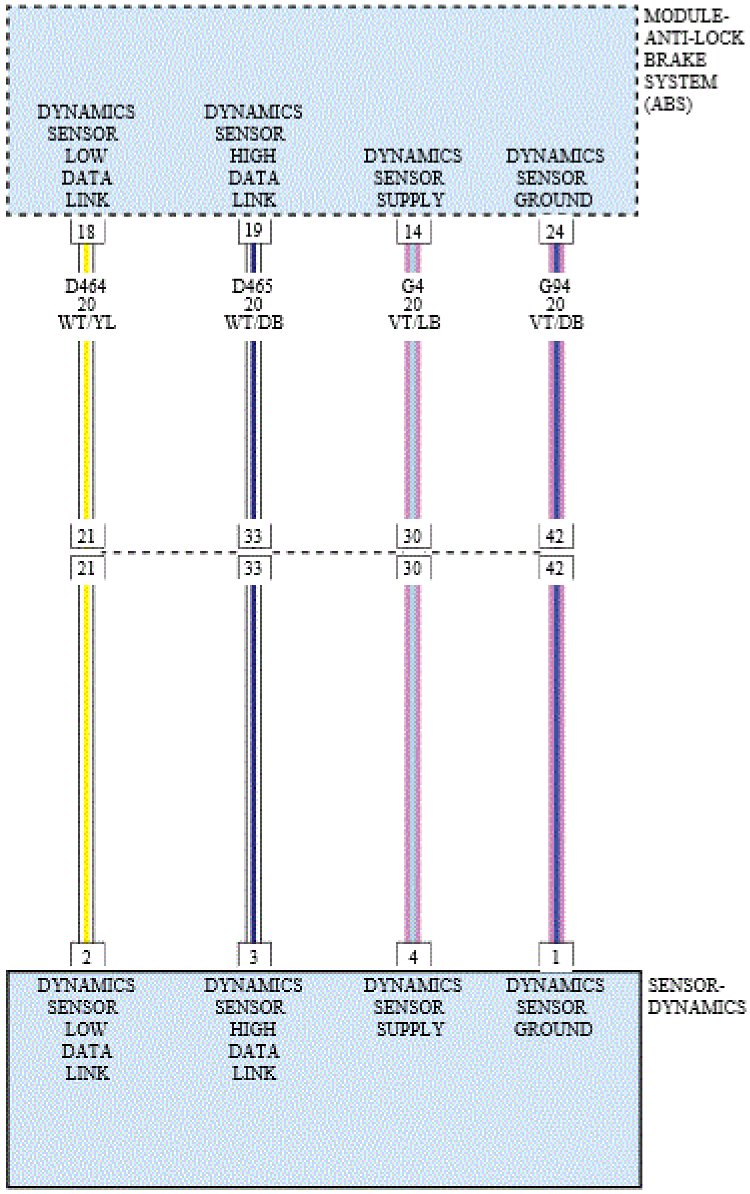

Fig. 34: Dynamics Sensor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects one CAN messages that is assigned to the basic CAN channel was missed by the CAN driver.
- ABS system to slow in responding to CAN interrupts.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
(D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT SHORTED TO VOLTAGE
(D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT SHORTED TO GROUND
(D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT OPEN
(D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT SHORTED TO VOLTAGE
(D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT SHORTED TO GROUND
(D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT OPEN
(D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT SHORTED TO THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT
DYNAMICS SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, read ABS DTCs and record on the repair order.
   3. With the scan tool, read and record the Environmental Data to help identify the conditions in which the DTC was set.
   4. With the scan tool, erase the DTCs.
   5. Start the engine.
   6. With the scan tool, read the DTCs.

      Is the DTC active?

      Yes

      - Go To 2

      No

      - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **(D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT SHORTED TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the ABS Module harness connector.
   3. Disconnect the Dynamics Sensor harness connector.

4. Turn the ignition on.
5. Measure the voltage of the (D464) Dynamics Sensor Low Data Link circuit.

   Is there any voltage present?

   Yes

   - Repair the (D464) Dynamics Sensor Low Data Link circuit for a short to voltage.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **(D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT SHORTED TO GROUND**
   1. Turn the ignition off.
   2. Measure the resistance of the (D464) Dynamics Sensor Low Data Link circuit between ground and the Dynamics Sensor harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Repair the (D464) Dynamics Sensor Low Data Link circuit for a short to ground.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **(D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (D464) Dynamics Sensor Low Data Link circuit between the Dynamics Sensor harness connector and the Anti-lock Brake System (ABS) Module harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 5

      No

      - Repair the (D464) Dynamics Sensor Low Data Link circuit for an open.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **(D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT SHORTED TO VOLTAGE**
   1. Turn the ignition on.
   2. Measure the voltage of the (D465) Dynamics Sensor High Data Link circuit.

      Is there any voltage present?

Yes

- Repair the (D465) Dynamics Sensor High Data Link circuit for a short to voltage.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 6

6. **(D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT SHORTED TO GROUND**
    1. Turn the ignition off.
    2. Measure the resistance of the (D465) Dynamics Sensor High Data Link circuit between ground and the Dynamics Sensor harness connector.

    Is the resistance below 5.0 Ohms?

    Yes

    - Repair the (D465) Dynamics Sensor High Data Link circuit for a short to ground.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 7

7. **(D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT OPEN**
    1. Measure the resistance of the (D465) Dynamics Sensor High Data Link circuit between the Dynamics Sensor harness connector and the Anti-lock Brake System (ABS) Module harness connector.

    Is the resistance below 5.0 Ohms?

    Yes

    - Go To 8

    No

    - Repair the (D465) Dynamics Sensor High Data Link circuit for an open.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

8. **(D464) DYNAMICS SENSOR LOW DATA LINK CIRCUIT SHORTED TO THE (D465) DYNAMICS SENSOR HIGH DATA LINK CIRCUIT**
    1. Measure the resistance between the (D464) Dynamics Sensor Low Data Link circuit and the (D465) Dynamics Sensor High Data Link circuit at the ABS Module harness connector.

    Is the resistance below 5.0 Ohms?

    Yes

    - Repair the (D464) Dynamics Sensor Low Data Link circuit for a short to the (D465)

Dynamics Sensor High Data Link circuit.

- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 9

9. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**
    1. Turn the ignition off.
    2. Replace the Dynamic Sensor in accordance with the Service Information. Refer to **SENSOR, DYNAMICS, REMOVAL** .
    3. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    4. With the scan tool, read the DTCs.

    Does the DTC remain active?

    Yes

    - Using the schematics as a guide, check the Anti-lock Brake System (ABS) Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

U140E-00-IMPLAUSIBLE VEHICLE CONFIGURATION DATA RECEIVED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **If any other DTCs are present, repair them first before continuing with this diagnostic procedure.**

NOTE: **If the BCM has been replaced or is not configured address this issue first before continuing with this diagnostic procedure.**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- No under voltage DTCs.

SET CONDITION

- Anti-lock Brake System (ABS) Module detects the Body Control Module (BCM) is indicating that the Vehicle Configuration data has not been programmed.

DEFAULT ACTION

- ABS is disabled.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) NOT CONFIGURED
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, read ABS DTCs and record on the repair order.
   3. With the scan tool, read and record the Environmental Data to help identify the conditions in which the DTC was set.
   4. With the scan tool, erase the DTCs.
   5. Start the engine.
   6. With the scan tool, read ABS DTCs.

      Is the DTC active?

      Yes

      - Go To 2

      No

      - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **VERIFY THE BCM IS CONFIGURED CORRECTLY**
   1. With the scan tool, under BCM enter program network configuration and program the BCM to the vehicle configuration.
   2. With the scan tool, erase the ABS DTCs.
   3. Cycle the ignition switch from off to on, leaving the ignition on for a minimum of ten seconds.
   4. With the scan tool, read the ABS DTCs.

      Does the DTC remain active?

      Yes

      - Using the schematics as a guide, check the Anti-lock Brake System (ABS) Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-lock

Brake System (ABS) Module accordance with Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .

- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

STANDARD PROCEDURE

ABS VERIFICATION TEST

DIAGNOSTIC TEST

ABS VERIFICATION TEST

WARNING: To avoid possible serious or fatal injury, check brake capability is available before road testing.

1. Connect all previously disconnected components and connectors.
2. If any of the following components were replaced, use the following table below and perform the correct routines using the scan tool under "Miscellaneous Functions":

NOTE: When performing the ABS Initialization routine, the vehicle temperature must be above 10Â°C (50Â°F).

NOTE: If the ABS is not initialized, the ABS indicator will flash continuously.

Component	Routines
Anti-lock Brake System (ABS) Module	ABS Initialization/Brake Pedal Calibration
Hydraulic Control Unit (HCU)	ABS Initialization/ABS Bleed Brakes/Brake Pedal Calibration
Integrated Control Unit (ICU)	ABS Initialization/ABS Bleed Brakes/Brake Pedal Calibration
Brake Pedal Sensor	Brake Pedal Calibration
Dynamics Sensor	ABS Initialization
Steering Column Control Module (SCCM)/Steering Angle Sensor (SAS)	ABS Initialization

NOTE: If any of the Wheel Speed Sensors were replaced, test drive the vehicle at a speed above 25 km/h (15 mph) for several minutes.

NOTE: If the ABS Module or the Dynamic Sensor was replaced, there may be a Dynamic Sensor DTC active. To initialize the ABS Module and clear offsets have the vehicle on level ground and wheels pointing straight ahead and follow the directions on the scan tool. If the Dynamics Sensor was replaced, test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between 10 and 25 km/h (6 and 15 mph).

3. Turn the ignition off.
4. Verify all accessories are turned off and the battery is fully charged.
5. Turn the ignition on.
6. With the scan tool, erase all Diagnostic Trouble Codes (DTCs) from All modules. Start the engine and allow it to run for two minutes and fully operate the system that was indicating the failure.
7. Cycle the ignition off and to ignition on.
8. With the scan tool, read DTCs in the ABS Module.
9. If any DTCs are present, perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING**.

NOTE: **For Sensor Signal Plausibility and Pump Motor faults, the ABS Module must verify that the failure conditions are no longer present in the current ignition cycle before it can turn off the failure lamp(s). This may require the vehicle to be driven for several minutes above 15 k/mh (9 mph). Once it has been determined that the failure condition is no longer present the lamp(s) will be turned off.**

10. If there are no DTCs present after turning ignition on, road test the vehicle for at least five minutes.
    - Slowly turn the steering wheel from stop to stop.
    - Test drive the vehicle by turning the vehicle left or right in a curving manner at a speeds between 10 and 25 km/h (6 and 15 mph).
    - Perform several anti-lock braking stops.
11. Again, with the scan tool read DTCs. If any DTCs are present, for the diagnostic procedure and troubleshoot the new or recurring DTC. Refer to **DIAGNOSIS AND TESTING**.
12. If there are no Diagnostic Trouble Codes (DTCs) present, and the customer's concern can no longer be duplicated, the repair is complete.

    Are any DTCs present or is the original concern still present?

    Yes

    - Repair is not complete, perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING**.

    No

    - Repair is complete.

ABS INTERMITTENT CONDITION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC TEST

PERFORM ABS INTERMITTENT CONDITION TEST

NOTE: **The conditions that set the DTC are not present at this time. The following list**

may help in identifying the intermittent condition.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

1. Perform any Service Bulletins that may apply.
2. Review the scan tool Environmental Data (EV Data). If possible, try to duplicate the conditions under which the DTC set.
3. Turn the ignition off.
4. Visually inspect the related wire harness. Disconnect all the related harness connectors. Look for any chafed, pierced, pinched, partially broken wires and broken, bent, pushed out, or corroded terminals.
5. Wiggle the wires while checking for shorts and open circuits.
6. Perform a voltage drop test on the related circuits between the suspected inoperative component and the Anti-Lock Brake System (ABS) Module.
7. Inspect and clean all PCM, ABS, engine, and chassis grounds that are related to the most current DTC.
8. If numerous trouble codes were set, use a wire schematic and look for any common ground or supply circuits.
9. For any Relay DTCs, actuate the Relay with the scan tool and wiggle the related wire harness to try to interrupt the actuation.
10. Use the scan tool to perform a System Test if one applies to failing component.
11. A co-pilot, data recorder, or lab scope should be used to help diagnose intermittent conditions.
12. Test drive the vehicle over 15 km/h (9 mph).

    Were any problems found during the above inspections?

    Yes

    - Perform the necessary repairs.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

.

Article GUID: A00735882

DESCRIPTION

DESCRIPTION

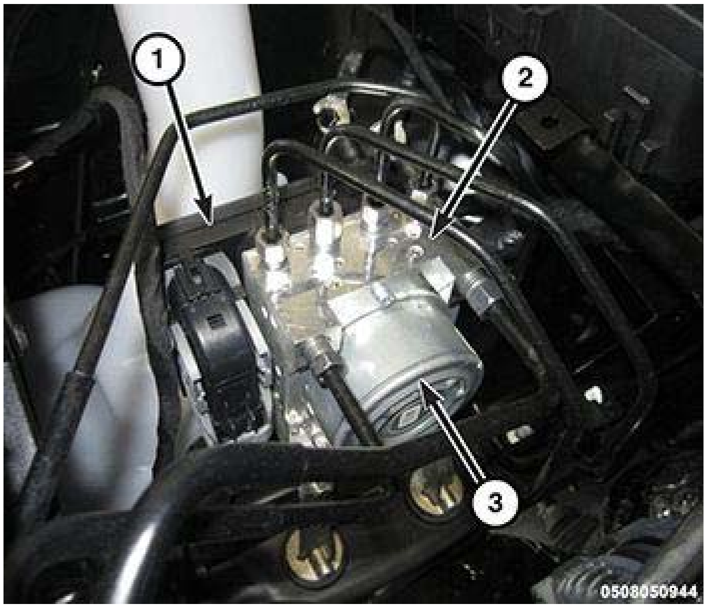

Fig. 1: Antilock Brake Module (ABM) & Hydraulic Control Unit (HCU)
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The Electronic Stability Control (ESC) may also be referred to as Electronic Stability Program (ESP) depending on the vehicle model year and configuration. Certain components may also reference ESP, ESC, or use the traction control symbol.**

This vehicle uses an electronic brake control system designated MK100. This system includes Antilock Brake System (ABS), Traction Control System (TCS), Brake Assist System (BAS), Electronic Variable Brake Proportioning (EVPB) and Electronic Stability Control (ESC). All of these systems work together to enhance vehicle stability and control in various driving conditions and are commonly referred to as ESC.

This system uses components of the base brake system, but also features the following components:

- Integrated Control Unit (ICU) - Includes Hydraulic Control Unit (HCU) (2) and Antilock Brake Module (ABM) (1).
- Wheel Speed Sensors (WSS) - Four sensors (one at each wheel).
- Dynamics Sensor - Includes a yaw rate sensor and a lateral accelerometer.
- Steering Angle Sensor (SAS) - The SAS is part of the Steering Column Control Module (SCCM).
- Brake Pressure Sensor - The brake pressure sensor is located in the HCU and is not serviceable separate from the HCU.

ABS

The purpose of the Antilock Brake System (ABS) is to prevent wheel lockup under braking conditions on virtually any type of road surface. Antilock braking is desirable because a vehicle that is stopped without locking the wheels retains directional stability and some steering capability. This allows the driver to retain greater control of the vehicle during braking.

ALL-SPEED TRACTION CONTROL

The Traction Control System (TCS) is an all-speed traction control. All-Speed Traction Control enhances mobility and prevents wheel slip when accelerating on slippery surfaces. It also provides a measure of directional stability control. Using the wheel-speed sensors, it can detect excessive yaw and help keep the car on the intended course, as for instance, when accelerating around a curve.

With rear-wheel drive, All-Speed Traction Control is effective up to 85 mph (137 km/h).

ELECTRONIC STABILITY CONTROL

The Electronic Stability Control (ESC) enhances control and stability of the vehicle under various driving conditions. ESC corrects for over/under steering of the vehicle by applying the brake of the appropriate wheel to assist in counteracting the over/under steer condition. Engine power may also be reduced to help the vehicle maintain the desired path. ESC uses sensors in the vehicle to determine the vehicle path intended by the driver and compares it to the actual path of the vehicle. When the actual path does not match the intended path, ESC applies the brake of the appropriate wheel to assist in counteracting the oversteer or understeer condition.

- Oversteer - When the vehicle is turning more that appropriate for the steering wheel position.
- Understeer - When the vehicle is turning less than appropriate for the steering wheel position.

The "ESC/TCS" indicator light located in the instrument cluster starts to flash as soon as the tires lose traction and the ESC system becomes active. The "ESC/TCS" indicator light also flashes when TCS is active.

The ESC can be turned off by using the ESC Off switch. When the ESC Off switch is depressed, it does not completely turn the system off. The ESC system shuts off engine management but retains brake activations for yaw control.

The SRT8 equipped vehicles have three-mode ESC functionality. When the ESC Off switch is depressed and quickly released, the system enters "partial" mode which has no engine management but retains brake activations for yaw control. If the switch is held down for a period of five seconds or longer before releasing, a chime will sound and the ESC system enters "full-off" mode which disables engine management as well as brake activations. The system can be returned to "normal" by briefly pressing and releasing the ESC Off switch. The system will default to full-on mode at the beginning of each ignition cycle.

BRAKE ASSIST SYSTEM

The Brake Assist System (BAS) is designed to optimize the vehicle's braking capability during emergency braking maneuvers. The system detects an emergency braking situation by sensing the rate and amount of brake application and then applies optimum pressure to the brakes. This can help reduce braking distances. The BAS complements the Antilock Brake System (ABS). Applying the brakes very quickly results in the best BAS assistance.

ELECTRONIC VARIABLE BRAKE PROPORTIONING

Electronic Variable Brake Proportioning (EVBP) is used to balance front-to-rear braking in place of a traditional rear proportioning valve. The EVBP system uses the ABS system to control the slip of the rear wheels in partial braking range. The braking force of the rear wheels is controlled electronically by using the inlet and outlet valves located in the integrated control unit (ICU).

EVBP activation is invisible to the customer since there is no pump motor noise or brake pedal feedback.

OPERATION

OPERATION

NOTE: **The Electronic Stability Control (ESC) may also be referred to as Electronic Stability Program (ESP) depending on the vehicle model year and configuration. Certain components may also reference ESP, ESC, or use the traction control symbol.**

ABS

There are a few performance characteristics of the Antilock Brake System (ABS) that may at first seem abnormal, but in fact are normal. These characteristics are described below.

NORMAL BRAKING

Under normal braking conditions, the ABS functions the same as a standard base brake system with a front/rear split master cylinder and conventional vacuum assist.

ABS BRAKING

ABS operation is available at all vehicle speeds above 3-5 mph. If a wheel locking tendency is detected during a brake application, the brake system enters the ABS mode. During ABS braking, hydraulic pressure in the four wheel circuits is modulated to prevent any wheel from locking. Each wheel circuit is designed with a set of electric solenoids to allow modulation. Wheel lockup may be perceived at the very end of an ABS stop and is considered normal.

During an ABS event, the Integrated Control Unit (ICU) regulates hydraulic pressure at all four of the vehicle's wheels.

The hydraulic pressure at each front wheel is controlled independently (relative to the amount of slip at each wheel) in order to maximize the braking force generated by the front brakes. The rear wheels are controlled such that the hydraulic pressure at either rear wheel does not exceed that of the highest slip rear wheel in order to maintain vehicle stability.

The system can build and release pressure at each wheel, depending on signals generated by the wheel speed sensors (WSS) at each wheel and received at the Antilock Brake Module (ABM).

NOISE AND BRAKE PEDAL FEEL

During ABS braking, some brake pedal movement may be felt. In addition, ABS braking will create ticking, popping, or groaning noises heard by the driver. This is normal and is due to pressurized fluid being transferred between the master cylinder and the brakes. If ABS operation occurs during hard braking, some pulsation may be felt in the vehicle body due to fore and aft movement of the suspension as brake pressures are modulated.

At the end of an ABS stop, ABS is turned off when the vehicle is slowed to a speed of 3-4 mph. There may be a slight brake pedal drop anytime that the ABS is deactivated, such as at the end of the stop when the vehicle speed is less than 3 mph or during an ABS stop where ABS is no longer required. These conditions exist when a vehicle is being stopped on a road surface with patches of ice, loose gravel, or sand on it. Also, stopping a vehicle on a bumpy road surface activates ABS because of the wheel hop caused by the bumps.

TIRE NOISE AND MARKS

Although the ABS system prevents complete wheel lockup, some wheel slip is desired in order to achieve optimum braking performance. Wheel slip is defined as follows: 0 percent slip means the wheel is rolling freely and 100 percent slip means the wheel is fully locked. During brake pressure modulation, wheel slip is allowed to reach up to 25-30 percent. This means that the wheel rolling velocity is 25-30 percent less than that of a free rolling wheel at a given vehicle speed. This slip may result in some tire chirping, depending on the road surface. This sound should not be interpreted as total wheel lockup.

Complete wheel lockup normally leaves black tire marks on dry pavement. The ABS will not leave dark black tire marks since the wheel never reaches a fully locked condition. However, tire marks may be noticeable as light patched marks.

START-UP AND DRIVE-OFF CYCLES

When the ignition is turned on, a popping sound and a slight brake pedal movement may be noticed. The ABS warning lamp will also be on for up to 5 seconds after the ignition is turned on.

When the vehicle is first driven off, a humming may be heard or felt by the driver at approximately 12-25 mph (20-40 km/h). All of these conditions are a normal function of ABS as the system is performing a diagnosis check.

PREMATURE ABS CYCLING

Symptoms of premature ABS cycling include: clicking sounds from the solenoid valves; pump/motor running; and pulsations in the brake pedal. Premature ABS cycling can occur at any braking rate of the vehicle and on any type of road surface. Neither the red BRAKE indicator lamp, nor the amber ABS indicator lamp, illuminate and no faults are stored in the ABM.

Premature ABS cycling is a condition that needs to be correctly assessed when diagnosing problems with the antilock brake system. It may be necessary to use a scan tool to detect and verify premature ABS cycling.

Check the following common causes when diagnosing premature ABS cycling: damaged wheel bearings (causing tone wheel issues); damaged wheel bearing housings where wheel speed sensors mount; and loose wheel speed sensor mounting bolts.

After diagnosing the defective component, repair or replace it as required. When the component repair or replacement is completed, test drive the vehicle to verify that premature ABS cycling has been corrected.

ALL-SPEED TRACTION CONTROL

Traction control systems sense impending wheel spin based on a model of the rate of change of wheel speed under normal traction conditions. The All-Speed Traction Control uses signals from the same wheel speed sensors as ABS to determine when to apply the brakes to one or more wheels and when to reduce engine torque output using the electronic throttle control (ETC) to prevent wheel slip during acceleration. Throttle control

makes the vehicle less reliant on brake application alone to maintain traction, increasing the operating speed range and more closely modulates speed, resulting in smoother operation. With All-Speed Traction Control reducing engine torque as well as applying the brakes, it is possible to achieve almost seamless torque application at the wheels.

If the wheel slip is severe enough to require throttle intervention, All-Speed Traction Control will reduce engine torque and sometimes upshift the transmission to avoid the condition. In milliseconds, All-Speed Traction Control interrogates the engine control system to determine the current torque output, determines how much the torque output the current conditions will allow, and signals this requirement to the engine control system, which reduces the torque by partially closing the throttle. With execution of the torque reduction, the brake system reduces brake pressure to make the transition smooth, while maintaining forward progress. By reducing engine power, braking effectiveness is maintained and the system can operate throughout the normal vehicle speed range. That is why the system is identified as providing "all-speed" traction control.

ELECTRONIC STABILITY CONTROL

To determine whether the car is responding properly to cornering commands, ESC uses steering wheel angle, yaw (turning) rate and lateral acceleration sensors (combined into Dynamics Sensor). Using signals from these sensors, in addition to individual wheel speed sensor signals, the system determines appropriate brake and throttle actions. Once initiated, ESC operates much like All-Speed Traction Control, except that the goal is directional stability. If the vehicle yaw response, or rate of turning, is inconsistent with the steering angle and vehicle speed indications, the ESC system applies the brakes and, if necessary closes the throttle, to restore control. This occurs whether the vehicle is turning too rapidly (oversteering) or not rapidly enough (understeering).

ELECTRONIC VARIABLE BRAKE PROPORTIONING

Upon entry into EVBP the inlet valve for the rear brake circuit is switched ON so that the fluid supply from the master cylinder is shut off. In order to decrease the rear brake pressure, the outlet valve for the rear brake circuit is pulsed. This allows fluid to enter the low pressure accumulator (LPA) in the Hydraulic Control Unit (HCU) resulting in a drop in fluid pressure to the rear brakes. In order to increase the rear brake pressure, the outlet valve is switched off and the inlet valve is pulsed. This increases the pressure to the rear brakes. This back-and-forth process will continue until the required slip difference is obtained. At the end of EVBP braking (brakes released) the fluid in the LPA drains back to the master cylinder by switching on the electronic shuttle valve.

The EVBP will remain functional during many ABS fault modes. If both the red BRAKE and amber ABS warning indicators are illuminated, the EVBP may not be functioning.

STANDARD PROCEDURE

STANDARD PROCEDURE - ANTILOCK BRAKE SYSTEM BLEEDING

The base brake's hydraulic system must be bled anytime air enters the hydraulic system. The Antilock Brake System (ABS) must always be bled anytime it is suspected that the HCU has ingested air.

Brake systems with ABS must be bled as two independent braking systems. The non-ABS portion of the brake system with ABS is to be bled the same as any non-ABS system.

The ABS portion of the brake system must be bled separately. Use the following procedure to properly bleed the brake hydraulic system including the ABS.

NOTE: **During the brake bleeding procedure, be sure the brake fluid level remains close to the FULL level in the master cylinder fluid reservoir. Check the fluid level periodically during the bleeding procedure and add MoparÃ® DOT 3 brake fluid as required.**

BLEEDING

When bleeding the ABS system, the following bleeding sequence must be followed to insure complete and adequate bleeding.

1. Make sure all hydraulic fluid lines are installed and properly torqued.
2. Connect the scan tool to the diagnostics connector. The diagnostic connector is located under the lower steering column cover to the left of the steering column.
3. Using the scan tool, check to make sure the ABM does not have any fault codes stored. If it does, clear them.

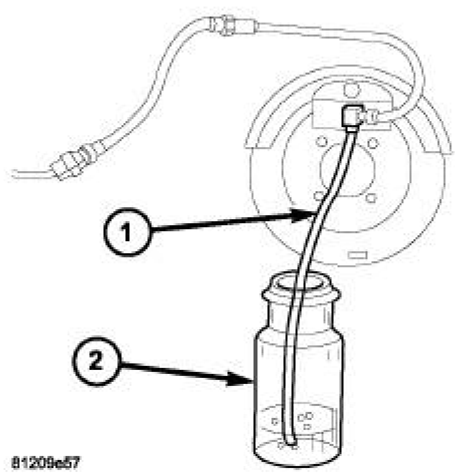

Fig. 2: Bleeding Brakes
Courtesy of CHRYSLER GROUP, LLC

WARNING: **When bleeding the brake system wear safety glasses. A clear bleed tube (1) must be attached to the bleeder screws and submerged in a clear container filled part way with clean brake fluid (2). Direct the flow of brake fluid away from yourself and the painted surfaces of the vehicle. Brake fluid at high pressure may come out of the bleeder screws when opened.**

NOTE: **Pressure bleeding is recommended to bleed the base brake system to ensure all air is removed from system. Manual bleeding may also be used, but additional time is needed to remove all air from system.**

4. Bleed the base brake system. Refer to **STANDARD PROCEDURE** .
5. Using the scan tool, select ECU VIEW, followed by ABS MISCELLANEOUS FUNCTIONS to access bleeding. Follow the instructions displayed. When finished, disconnect the scan tool and proceed.
6. Bleed the base brake system a second time. Check brake fluid level in the reservoir periodically to prevent emptying, causing air to enter the hydraulic system.

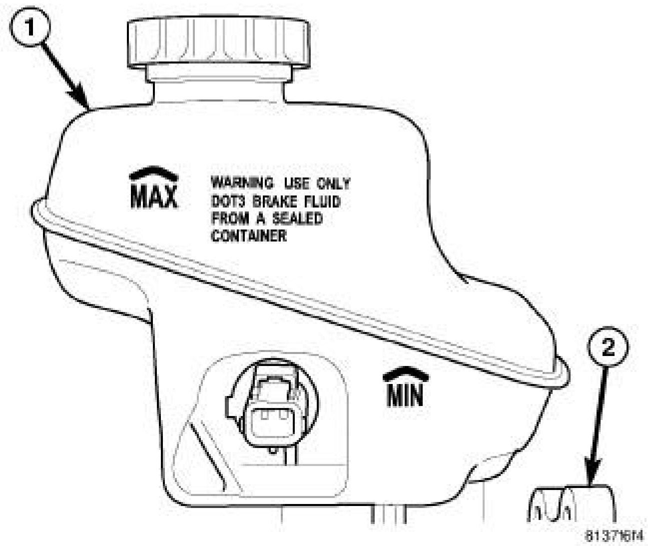

Fig. 3: Reservoir Fluid Level Markings
Courtesy of CHRYSLER GROUP, LLC

7. Fill the master cylinder fluid reservoir (1) to the MAX level.
8. Test drive the vehicle to be sure the brakes are operating correctly and that the brake pedal does not feel spongy.

SPECIFICATIONS

TORQUE SPECIFICATIONS

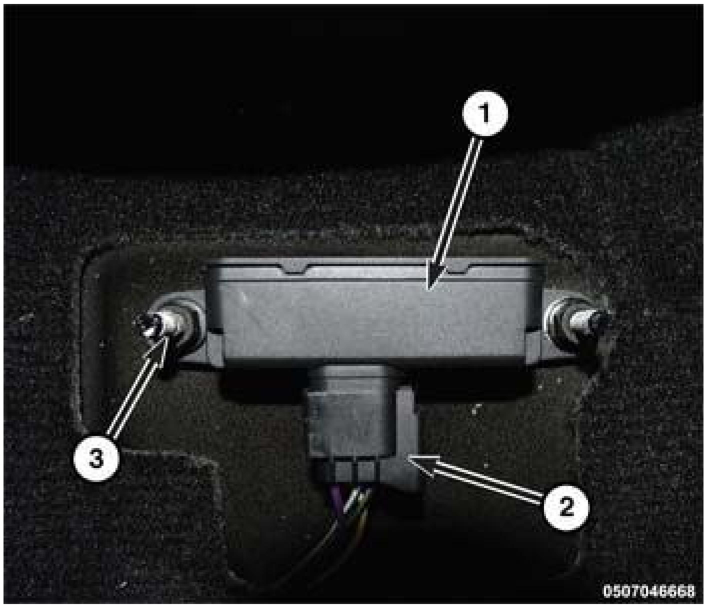
For ABS fastener torque specifications, refer to **SPECIFICATIONS** .

ELECTRICAL

SENSOR, DYNAMICS

DESCRIPTION

DESCRIPTION



[Fig. 4: Dynamics Sensor Components](#)
Courtesy of CHRYSLER GROUP, LLC

The Yaw Rate and Lateral Acceleration Sensors are housed into one unit known as the Dynamics Sensor. The sensor is used to measure side-to-side (lateral) motion and vehicle rotational sensing (how fast the vehicle is turning - yaw).

Yaw and Lateral Acceleration Sensors cannot be serviced separately. The entire Dynamics Sensor must be replaced when necessary.

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Remove floor console. Refer to **CONSOLE, FLOOR, REMOVAL** .

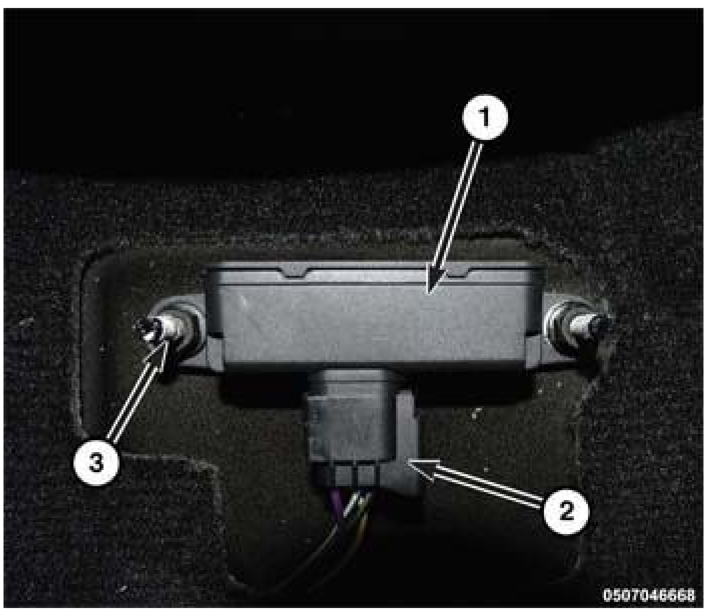


Fig. 5: Dynamics Sensor Components
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect wiring harness connector (2) at the sensor (1).
4. Remove two nuts (3) and the sensor (1).

INSTALLATION

INSTALLATION

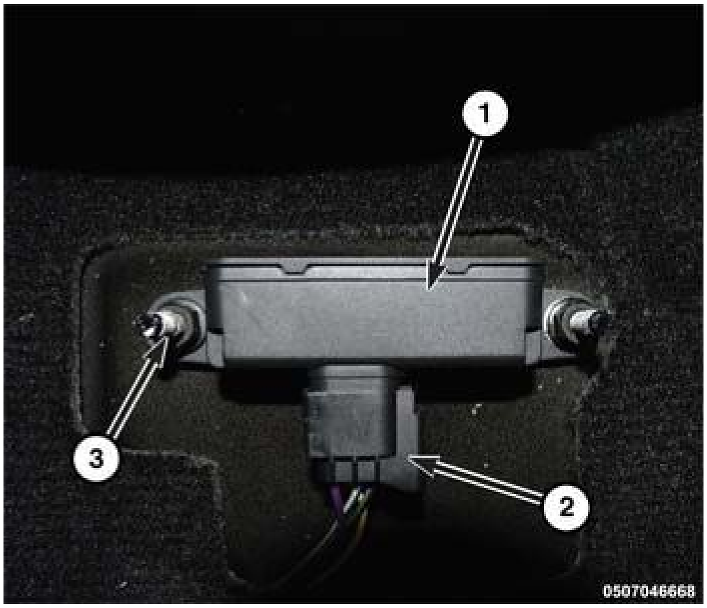

Fig. 6: Dynamics Sensor Components
Courtesy of CHRYSLER GROUP, LLC

1. Install dynamics sensor (1). Tighten the dynamic sensor nuts (3) to the proper **SPECIFICATIONS** .
2. Connect the dynamic sensor wiring harness connector (2).
3. Install floor console. Refer to **CONSOLE, FLOOR, INSTALLATION** .
4. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.
5. Perform Verification Test and clear any faults. Refer to **STANDARD PROCEDURE** .

SENSOR, STEERING WHEEL ANGLE

REMOVAL

REMOVAL

The steering angle sensor is serviced as an assembly with the steering column control module (SCCM). Refer to **MODULE, STEERING COLUMN CONTROL, REMOVAL** .

INSTALLATION

INSTALLATION

The steering angle sensor is serviced as an assembly with the steering column control module (SCCM). Refer to **MODULE, STEERING COLUMN CONTROL, INSTALLATION** .

SENSOR, WHEEL SPEED, FRONT

DESCRIPTION

DESCRIPTION

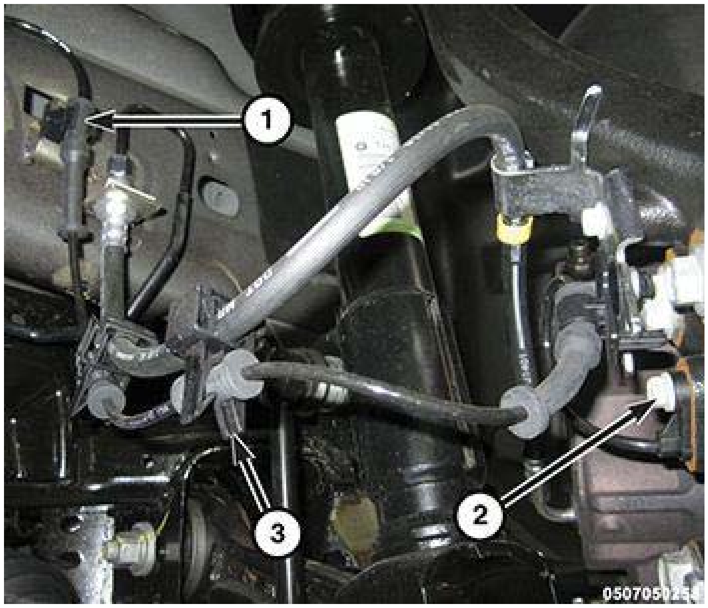

Fig. 7: Wheel Speed Sensor & Routing Clips
Courtesy of CHRYSLER GROUP, LLC

One Wheel Speed Sensor (WSS) is mounted to each knuckle. The WSS, using a tone wheel attached to the hub and bearing as a trigger mechanism, communicates with the Antilock Brake Module (ABM), informing it of that wheel's speed.

The head of the front WSS mounts to the inside of the knuckle.

REMOVAL

REMOVAL

NOTE: Removal process is the same for both sides of the vehicle.

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove wheel liner. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .

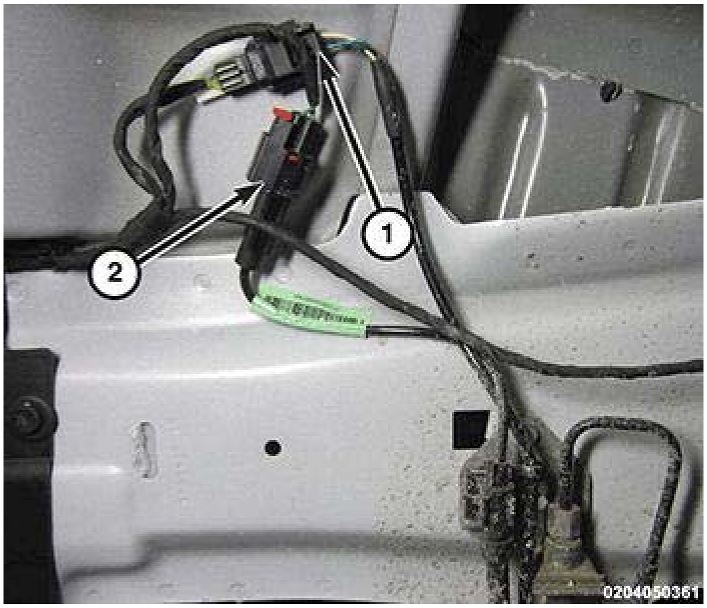

Fig. 8: Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

4. Remove the WSS harness connector from the body connector (2).

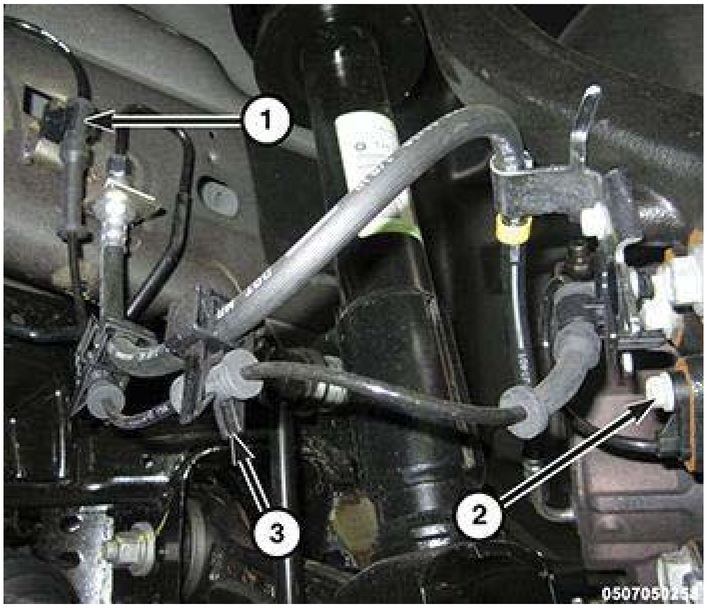

Fig. 9: Wheel Speed Sensor & Routing Clips
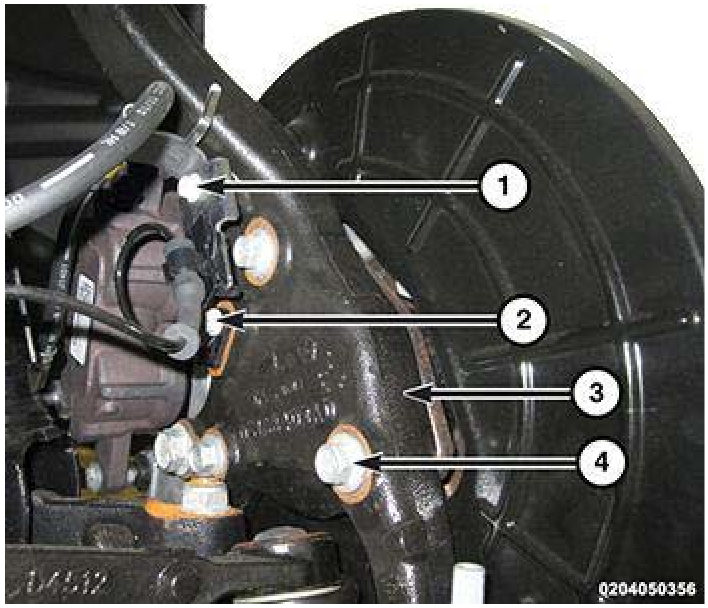
Courtesy of CHRYSLER GROUP, LLC

5. Remove the WSS from the routing clips (1 and 3).



[**Fig. 10: Front Brake Hose Support Bracket Bolt & Front Hub And Bearing To Knuckle Bolt**]

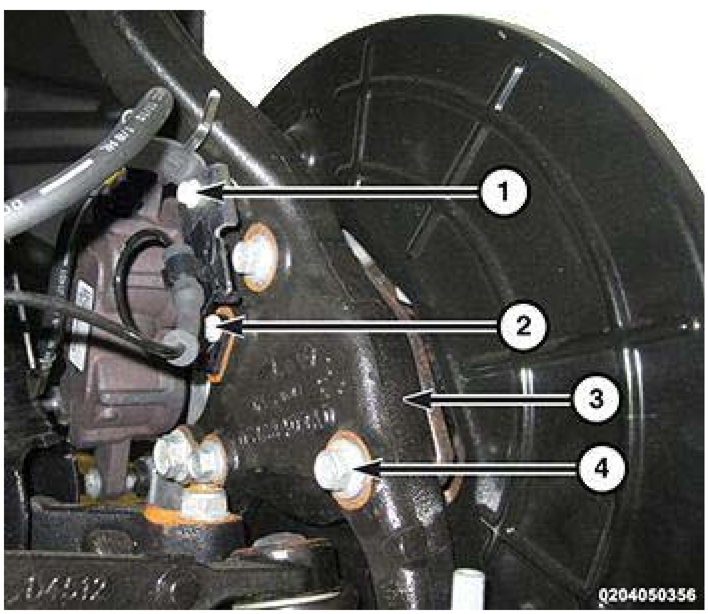
6. Remove the WSS from the brake hose routing bracket (1).
7. Remove the WSS head to knuckle bolt (2). Pull sensor head out of knuckle.

INSTALLATION

INSTALLATION

NOTE: **Installation process is the same for both sides of the vehicle.**



[**Fig. 11: Front Brake Hose Support Bracket Bolt & Front Hub And Bearing To Knuckle Bolt**]
Courtesy of CHRYSLER GROUP, LLC

1. Install the Wheel Speed Sensor (WSS). Tighten the wheel speed sensor head to knuckle bolt (2) to the proper **SPECIFICATIONS** .

2. Attach WSS to the brake hose routing bracket (1).

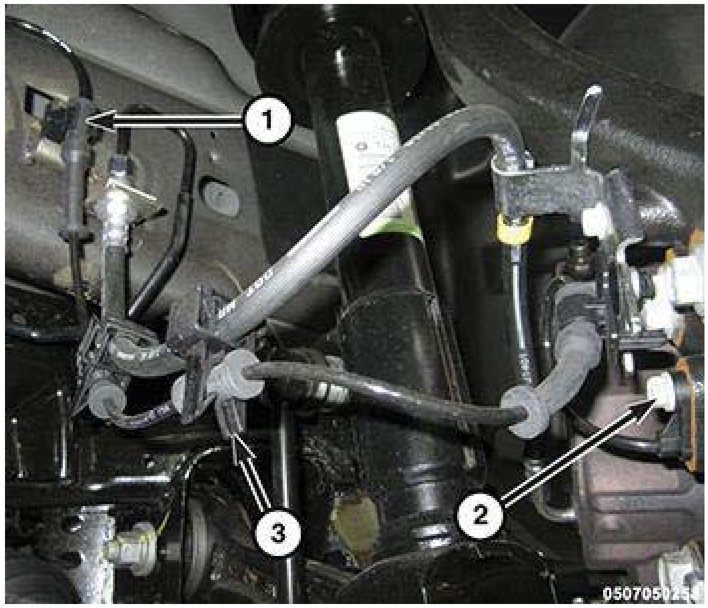


Fig. 12: Wheel Speed Sensor & Routing Clips
Courtesy of CHRYSLER GROUP, LLC

3. Install the WSS harness isolators to the routing brackets (1 and 3).

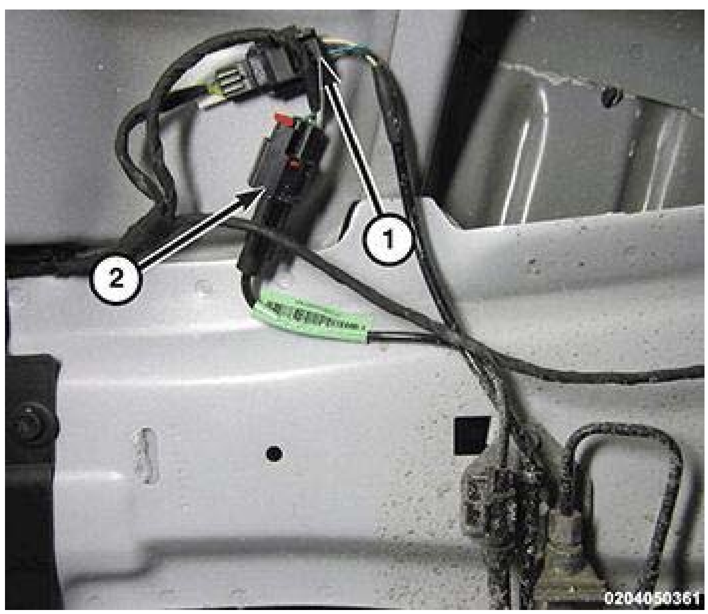

Fig. 13: Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

4. Connect the WSS harness to the body connector (2) and make sure retaining clip is properly in place and sensor connector cannot be pulled out.
5. Install wheel liner. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** .
6. Remove the support and lower the vehicle.
7. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.

8. Perform Verification Test and clear any faults. Refer to **STANDARD PROCEDURE** .

SENSOR, WHEEL SPEED, REAR

DESCRIPTION

DESCRIPTION

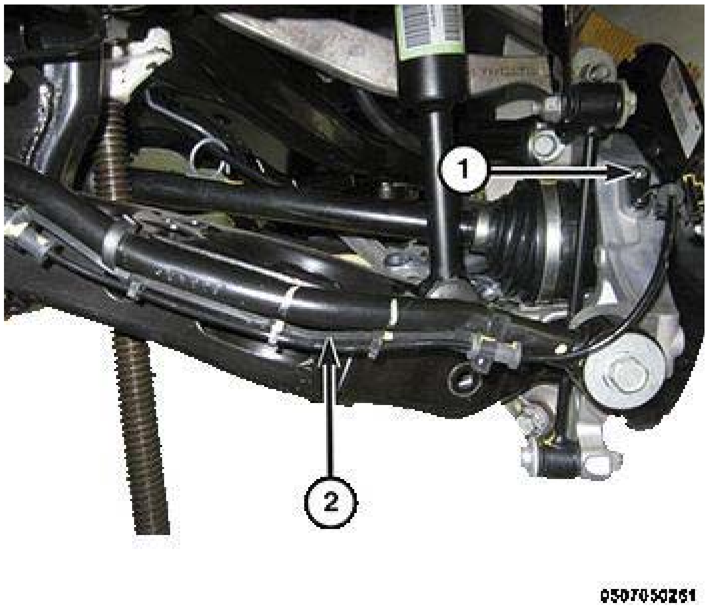

Fig. 14: Wheel Speed Sensor (WSS) & Bolt
Courtesy of CHRYSLER GROUP, LLC

One Wheel Speed Sensor (WSS) (1) is mounted to the rear of each rear knuckle. The WSS, using a tone wheel attached to the rear axle half shaft as a trigger mechanism, communicates with the Antilock Brake Module (ABM), informing it of that wheel's speed.

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

Fig. 15: Wheel Speed Sensor (WSS) Connectors
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The left Wheel Speed Sensor (WSS) connector is gray in color, the right WSS is black in color as shown**

3. Disconnect the appropriate WSS wire harness connector (1).

Courtesy of CHRYSLER GROUP, LLC

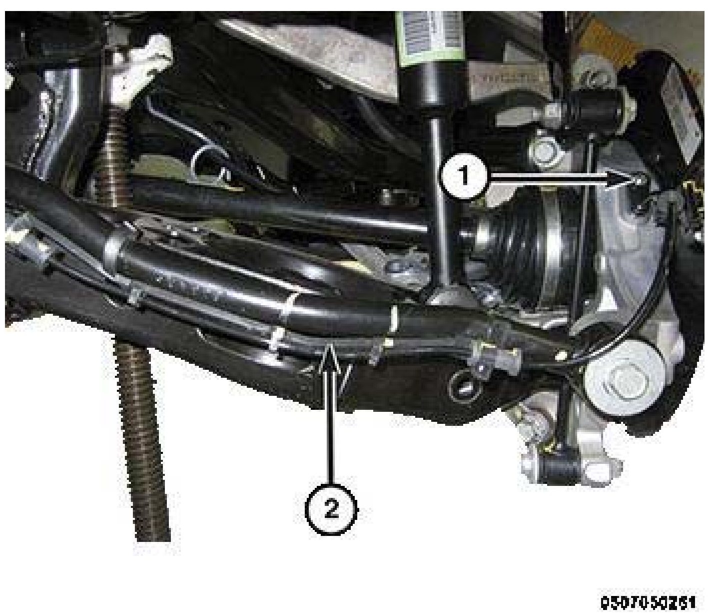
5. Remove WSS cable from routing clips (2) along toe link.
6. Disconnect WSS cable at rear brake rotor shield.
7. Remove the WSS head to knuckle bolt (1).
8. Remove WSS.

INSTALLATION

INSTALLATION



[Fig. 18: Wheel Speed Sensor (WSS) & Bolt](#)
Courtesy of CHRYSLER GROUP, LLC

1. Insert Wheel Speed Sensor (WSS) head into mounting hole in rear of knuckle.

2. Install the WSS head to knuckle bolt (1) and tighten to the proper **SPECIFICATIONS** .
3. Install the WSS cable at rear brake rotor shield.
4. Connect the WSS cable to the routing clips (2) along the toe link.

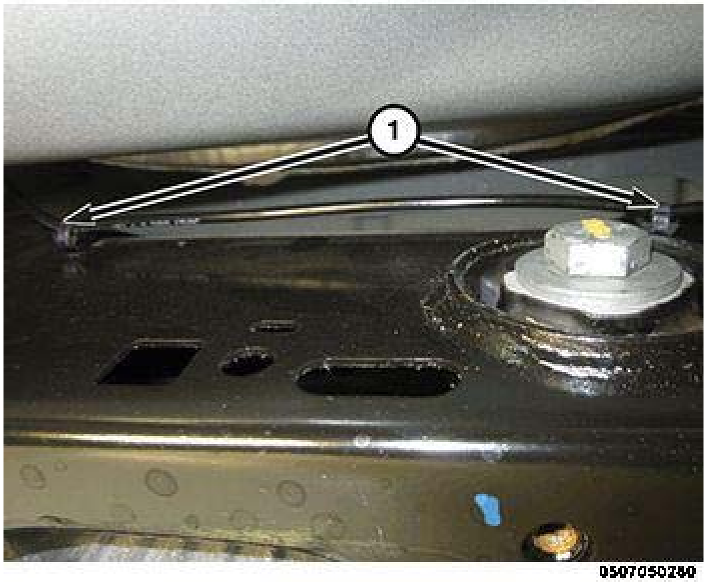


Fig. 19: Sensor Cable Retaining Clips
Courtesy of CHRYSLER GROUP, LLC

5. If installing left sensor, clip the WSS cable to the routing clips (1) along the rear of crossmember.

Fig. 20: Wheel Speed Sensor (WSS) Connectors
Courtesy of CHRYSLER GROUP, LLC

6. Connect the appropriate wheel speed sensor (1).
7. Remove the support and lower vehicle.
8. Perform Verification Test and clear any faults. Refer to **STANDARD PROCEDURE** .

SWITCH, ELECTRONIC STABILITY PROGRAM (ESP)

DESCRIPTION

DESCRIPTION

Fig. 21: ESC OFF Switch
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The Electronic Stability Control (ESC) may also be referred to as Electronic Stability Program (ESP) depending on the vehicle model year and configuration. Certain components may also reference ESP, ESC, or use the traction control symbol.**

The ESC off Switch (1) is located in the instrument panel switch pod in the center of the instrument panel. The ESC off switch turns the ESC off whenever the switch is depressed. Depressing the switch a second time turns the ESC back on. The switch resets itself each time the ignition is cycled.

When the ESC off switch is depressed and released, turning ESC off, it does not completely turn the system off. The ESC system reduces torque management to a lesser amount, but ESC function can still occur if the system perceives the need.

This vehicle has what is known as three-mode ESC. When the ESC off switch is depressed and quickly released, the system turns off ESC like any other model, but if the switch is held down for a period of five seconds or longer before releasing, the ESC system further reduces the amount of torque management provided. The system can be returned to "normal" by briefly pressing and releasing the ESC Off switch.

The ESC off switch is serviced as part of the instrument panel switch pod.

REMOVAL

REMOVAL

NOTE: **The Electronic Stability Control (ESC) may also be referred to as Electronic Stability Program (ESP) depending on the vehicle model year and configuration.**

Certain components may also reference ESP, ESC, or use the traction control symbol.

The ESC switch is serviced as an assembly with the Instrument Cluster Switch Bank Pod. Refer to **POD, SWITCH BANK, REMOVAL** .

INSTALLATION

INSTALLATION

NOTE: **The Electronic Stability Control (ESC) may also be referred to as Electronic Stability Program (ESP) depending on the vehicle model year and configuration. Certain components may also reference ESP, ESC, or use the traction control symbol.**

The ESC switch is serviced as an assembly with the Instrument Cluster Switch Bank Pod. Refer to **POD, SWITCH BANK, INSTALLATION** .

HYDRAULIC/MECHANICAL

HYDRAULIC CONTROL UNIT (HCU)

REMOVAL

REMOVAL

To remove the HCU, the ICU must be removed and disassembled. Refer to **INTEGRATED CONTROL UNIT (ICU), REMOVAL** and **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .

INSTALLATION

INSTALLATION

To install the HCU, assemble and install the ICU. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, INSTALLATION** and **INTEGRATED CONTROL UNIT (ICU), INSTALLATION** .

INTEGRATED CONTROL UNIT (ICU)

DESCRIPTION

DESCRIPTION

The Hydraulic Control Unit (HCU) (2) and the Antilock Brake Module (ABM) (1) used with this antilock brake system are combined (integrated) into one unit, which is called the Integrated Control Unit (ICU).

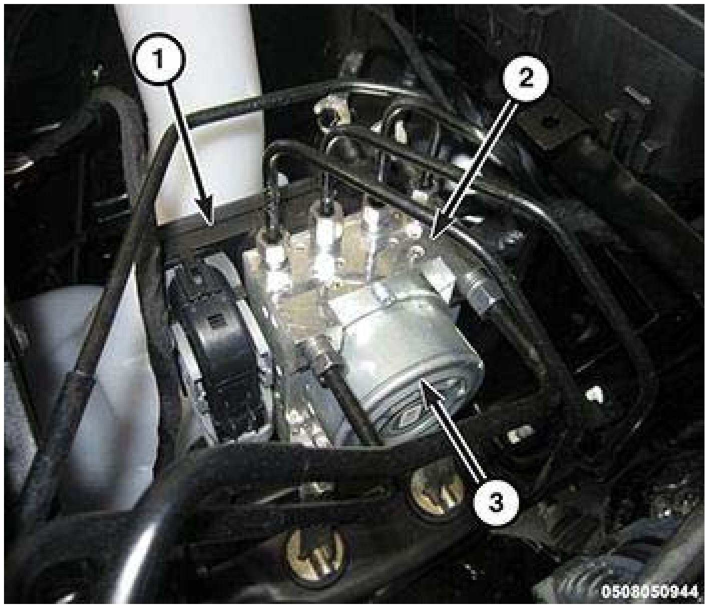

Fig. 22: Antilock Brake Module (ABM) & Hydraulic Control Unit (HCU)
Courtesy of CHRYSLER GROUP, LLC

The ICU (2) is located in the engine compartment, mounted to a bracket that is attached to the right side rail through the use of isolation grommets.

The Antilock Brake System (ABS) with traction control ICU consists of the following components: the ABM, eight (build/decay) solenoid valves (four inlet valves and four outlet valves), two traction control solenoid valves, two hydraulic shuttle valves, valve block, fluid accumulators, a pump, and an electric pump/motor.

The replaceable components of the ICU are the HCU and the ABM. No attempt should be made to service any components of the HCU or ABM. For replacement of the ABM, refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .

For additional information on the ABM, refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, DESCRIPTION** .

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to CAUTION and WARNING .

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Using a brake pedal holding tool, depress brake pedal past its first inch of travel and hold it in this position. Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open.

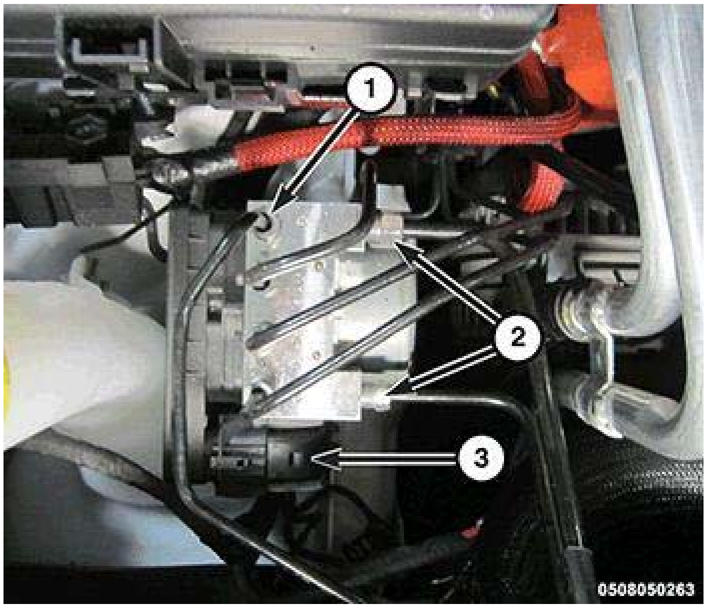

Fig. 23: Brake Tubes & Wiring Harness Connector
Courtesy of CHRYSLER GROUP, LLC

3. Remove primary and secondary brake tubes (2) at hydraulic control unit.
4. Remove remaining four brake tubes (1) at hydraulic control unit.
5. Disconnect Antilock Brake Module (ABM) wiring harness connector (3).

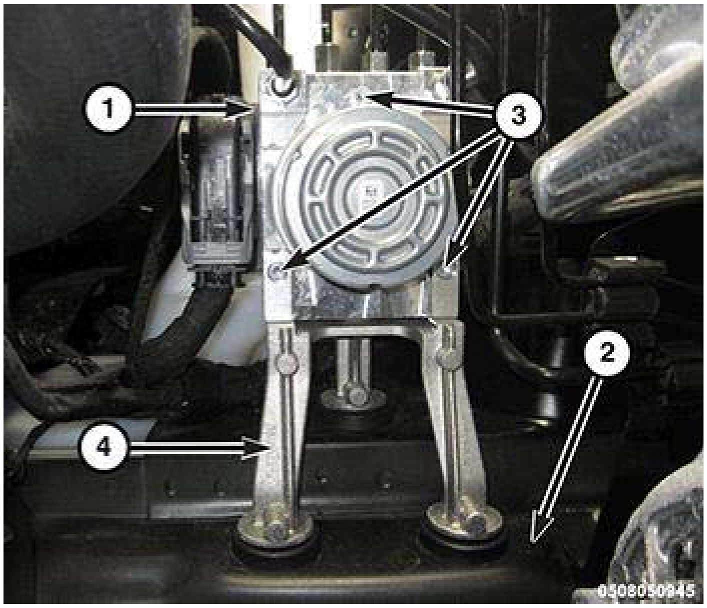

Fig. 24: Integrated Control Unit & Mounting Grommets
Courtesy of CHRYSLER GROUP, LLC

6. Pull up on unit (4) and remove from mounting grommets in body side rail (2).

INSTALLATION

INSTALLATION

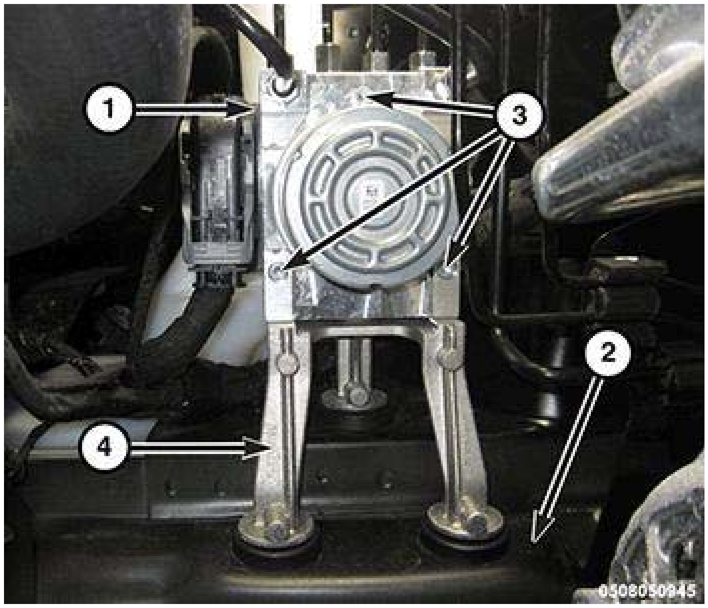

Fig. 25: Integrated Control Unit & Mounting Grommets
Courtesy of CHRYSLER GROUP, LLC

1. Install unit (4), pushing mounting bracket down into mounting grommets located in body side rail (2).

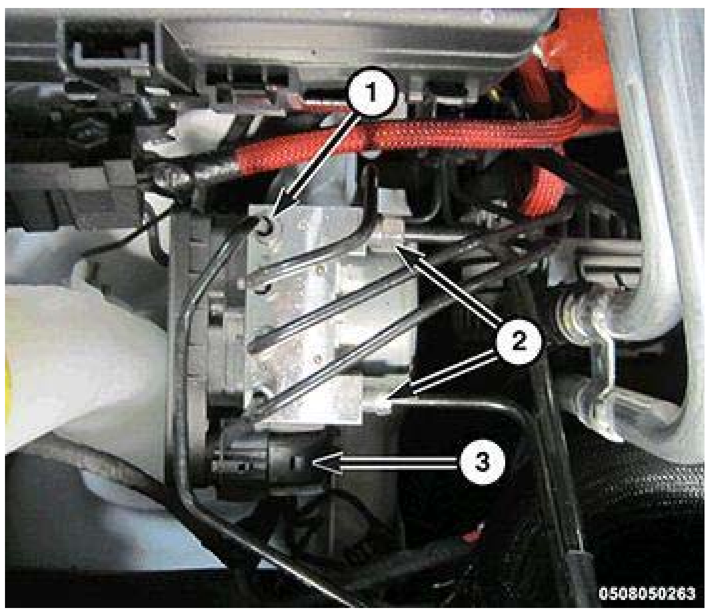

Fig. 26: Brake Tubes & Wiring Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Before installing the Antilock Brake Module (ABM) wire harness connector (3) on the ABM, be sure the seal is properly installed in the connector.**

2. Connect the ABM wire harness connector (3).
3. Install the four brake lines (1) to the top of the ICU and tighten the brake tube nuts to the proper **SPECIFICATIONS** .
4. Install primary and secondary brake lines (2) to the ICU and tighten the brake tube nuts to the proper **SPECIFICATIONS** .

5. Remove brake pedal holding tool.
6. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.
7. Fill and bleed base brake hydraulic system and ABS. Refer to **STANDARD PROCEDURE** .
8. Perform ABS Initialization and clear any faults. Refer to **STANDARD PROCEDURE** .

.

Article GUID: A00735954

ATEQ TPMS RESET PROCEDURE (NORMAL BUILD)

NOTE: **Early build vehicles are up to VIN 4R499999. Normal build vehicles are after VIN 4R499999.**

NOTE: **Tire pressure may increase from 2 to 6 psi (14 to 41 kPa) during normal driving conditions. Do NOT reduce this normal pressure build up.**

If warning light is lit continuously due to low pressure in one or more tires, adjust tire inflation to specification. The light will remain on until tire pressure is properly set. After adjusting air pressure in a tire, allow approximately two minutes for the message or indicator lamp to go out.

If warning light is flashing on/off for 60 to 75 seconds, there is a problem in the TPMS. See appropriate manufacturer service information.

NOTE: **If a tire pressure sensor has been replaced, the TPMS needs to relearn tire pressure sensor IDs.**

Using an RF signal, each sensor transmits tire pressure data approximately once every minute. Each sensor's (transmitter) broadcast is uniquely coded so that the Wireless Control Module (WCM) can monitor the state of each of the sensors on the 4 rotating road wheels. The TPMS automatically learns and stores the sensor's ID while driving after a sensor has been replaced. There is no formal retraining procedure necessary.

Drive vehicle for a minimum of 10 to 20 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time, the system will learn the new sensor ID code and will clear any DTCs automatically. If a sensor cannot be trained, see appropriate manufacturer service information.

NOTE: **On some models, the full-size spare tire could be equipped with a TPMS sensor.**

Models With Spare Tire TPMS Sensor

Model	Year
Commander	2006-08
Grand Cherokee	2005-10
Liberty	2008

Base Brakes - Service Information - Challenger

WARNING

WARNING

WARNING: **Chrysler LLC does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.**

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

CAUTION

CAUTION

CAUTION: **Use only MoparÃ® brake fluid or an equivalent from a tightly sealed container. Brake fluid must conform to DOT 3 specifications. Do not use petroleum-based fluid because seal damage in the brake system will result.**

CAUTION: **Brake fluid will damage painted surfaces. If brake fluid is spilled on any painted surfaces, wash it off immediately with water.**

CAUTION: **Never use gasoline, kerosene, alcohol, motor oil, transmission fluid, or any fluid containing mineral oil to clean system components. These fluids damage rubber cups and seals.**

CAUTION: **During service procedures, grease or any other foreign material must be kept off the caliper assembly, brake linings, brake rotor and external surfaces of the hub.**

CAUTION: **Disc brake calipers are made of aluminum. They are anodized and appear black in color. When handling the calipers or brake rotors, be careful to avoid damaging them, and avoid scratching or nicking the brake pad lining.**

STANDARD PROCEDURE

BASE BRAKE BLEEDING

CAUTION: **Before removing the master cylinder cover, wipe it clean to prevent dirt and other foreign matter from dropping into the master cylinder.**

CAUTION: **Use only MoparÃ® brake fluid or an equivalent from a fresh, tightly sealed**

container. Brake fluid must conform to DOT 3 specifications.

NOTE: **For bleeding the antilock brake hydraulic system, refer to STANDARD PROCEDURE .**

NOTE: **Do not pump the brake pedal at any time while having a bleeder screw open during the bleeding process. This will only increase the amount of air in the system and make additional bleeding necessary.**

NOTE: **Do not allow the master cylinder reservoir to run out of brake fluid while bleeding the system. An empty reservoir will allow additional air into the brake system. Check the fluid level frequently and add fluid as needed.**

The following wheel circuit sequence for bleeding the brake hydraulic system should be used to ensure adequate removal of all trapped air from the brake hydraulic system.

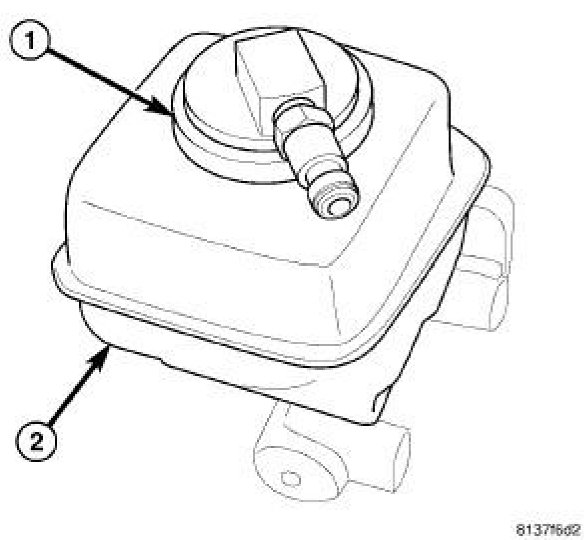
- Right rear wheel
- Left rear wheel
- Right front wheel
- Left front wheel

NOTE: **Pressure bleeding is highly recommended to bleed this brake system to ensure all air is removed from system. Manual bleeding may also be used, but additional time is needed to remove all air from system.**

The base brake system can be bled using the pressure method or the manual method. Both methods are presented in this text.

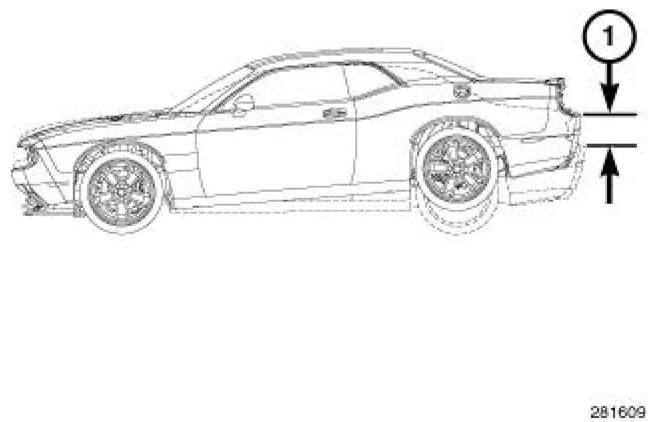
PRESSURE BLEEDING METHOD

NOTE: **Follow pressure bleeder manufacturer's instructions for use of pressure bleeding equipment.**



[Fig. 1: Fluid Reservoir & Adapter](#)
Courtesy of CHRYSLER GROUP, LLC

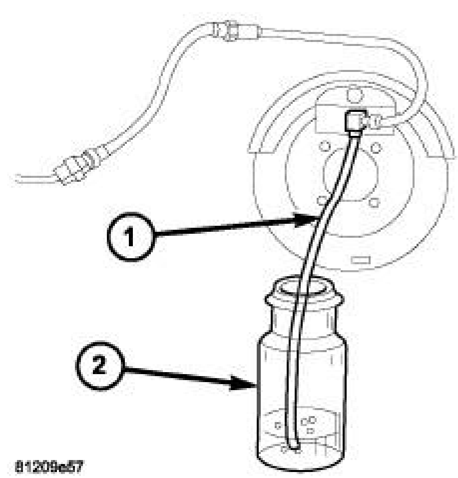
1. Remove filler cap from the top of fluid reservoir (2) on master cylinder.
2. Install Adapter (1), Special Tool (special tool #6921, Cap, Master Cylinder), in the caps place on the reservoir (2).
3. Attach Bleeder Tank, Special Tool C-3496-B, or equivalent, to Adapter (special tool #6921, Cap, Master Cylinder) (1). Pressurize the system following the pressure bleeder manufacturer's instructions.



[Fig. 2: Raising Rear Bumper](#)
Courtesy of CHRYSLER GROUP, LLC

NOTE: **To ensure all air is bled from the ICU or junction block in a timely manner, it is recommended to raise the rear of the vehicle approximately 5Ā° higher than the front or approximately 10-12 inches as measured at the rear bumper (1).**

4. Raise and support vehicle placing rear of vehicle approximately 5Ā° higher than the front or if measured at the rear bumper (1), approximately 10-12 inches above level. It will be necessary to add extra support stands under vehicle to support this angle.



[Fig. 3: Bleeding Brakes](#)
Courtesy of CHRYSLER GROUP, LLC

5. If installed, remove rubber dust caps from all four bleeder screws on calipers.
6. Starting at the first wheel circuit as listed earlier, attach a clear hose (1) to the bleeder screw at that wheels brake caliper and feed the other end of hose into a clear jar (2) containing enough fresh brake fluid to submerge the end of the hose.

CAUTION: **Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.**

7. Open bleeder screw at least one full turn or more to obtain an adequate flow of brake fluid.
8. After 4 to 8 ounces of brake fluid has been bled through the brake hydraulic circuit, and an air-free flow (no bubbles) is maintained in the clear plastic hose (1) and jar (2), close the bleeder screw.
9. Bleed the remaining wheel circuits in the same manner until all air is removed from the brake hydraulic system.
10. Check brake pedal travel. If pedal travel is excessive or has not improved, some air may still be trapped in the hydraulic system. Re-bleed the brake system as necessary.
11. If equipped with antilock brakes, the hydraulic control unit may need to be bled, then rebleed base brakes. Refer to STANDARD PROCEDURE .
12. Reinstall all 4 bleeder screw dust caps.
13. Test drive vehicle to ensure brakes are operating properly and pedal feel is correct.

MANUAL BLEEDING METHOD

NOTE: **To bleed the base brake system manually, an assistants help is required.**

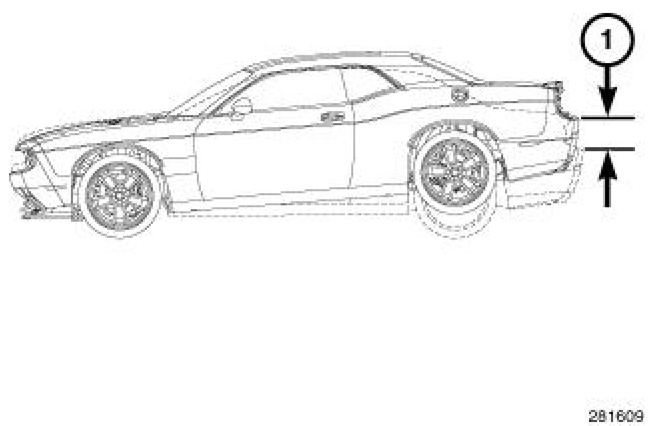


Fig. 4: Raising Rear Bumper
Courtesy of CHRYSLER GROUP, LLC

NOTE: **To ensure all air is bled from the ICU or junction block in a timely manner, it is recommended to raise the rear of the vehicle approximately 5Â° higher than the front or approximately 10-12 inches as measured at the rear bumper (1).**

1. Raise and support vehicle placing rear of vehicle approximately 5Â° higher than the front or if measured at the rear bumper (1), approximately 10-12 inches above level. It will be necessary to add extra support stands under vehicle to support this angle.

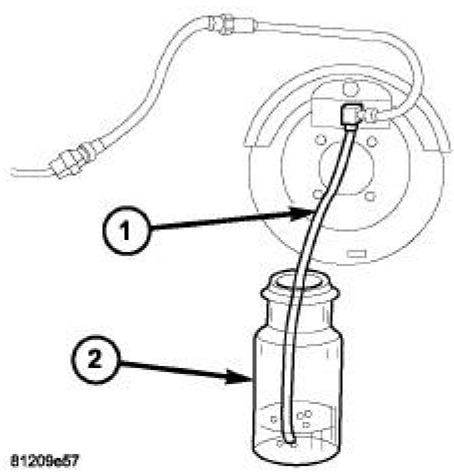

Fig. 5: Bleeding Brakes
Courtesy of CHRYSLER GROUP, LLC

2. Remove rubber duct caps from all 4 bleeder screws.
3. Attach a clear hose (1) to the bleeder screw at one wheel and feed the other end of the hose into a clear jar (2) containing fresh brake fluid.
4. Have an assistant pump the brake pedal three or four times and hold it down before the bleeder screw is opened.

CAUTION: **Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.**

5. While the pedal is being held down, open the bleeder screw at least 1 full turn. When the bleeder screw opens the brake pedal will drop all the way to the floor. Continue to hold the pedal all the way down.
6. Once the brake pedal has dropped, close the bleeder screw. The pedal can then be released.
7. Repeat steps One through Five until all trapped air is removed from that wheel circuit (usually four or five times). This should pass a sufficient amount of fluid to expel all the trapped air from the brakes hydraulic system. Be sure to monitor brake fluid level in master cylinder fluid reservoir making sure it stays at a proper level. This will ensure air does not reenter brake hydraulic system through master cylinder.

NOTE: **Monitor the brake fluid level in the fluid reservoir periodically to make sure it does not go too low. This will ensure that air does not reenter the brake hydraulic system.**

8. Bleed the remaining wheel circuits in the same manner until all air is removed from the brake hydraulic system.
9. Check brake pedal travel. If pedal travel is excessive or has not improved, some air may still be trapped in the hydraulic system. Re-bleed the brake system as necessary.
10. If equipped with antilock brakes, the hydraulic control unit may need to be bled, then rebleed base brakes. Refer to STANDARD PROCEDURE .
11. Reinstall all 4 bleeder screw dust caps.
12. Test drive vehicle to ensure brakes are operating properly and pedal feel is correct.

BASE BRAKE BLEEDING - SRT8

Use the following procedure to bleed the rear brake calipers of this vehicle. The front brake calipers may be bled using the same procedure as the standard model.

CAUTION: **Before removing the master cylinder cover, wipe it clean to prevent dirt and other foreign matter from dropping into the master cylinder.**

CAUTION: **Use only MoparÂ® brake fluid or an equivalent from a fresh, tightly sealed container. Brake fluid must conform to DOT 3 specifications.**

NOTE: **For bleeding the antilock-brake hydraulic system, refer to STANDARD PROCEDURE .**

NOTE: **Do not pump the brake pedal at any time with a bleeder screw open during the bleeding process. This only increases the amount of air in the system and makes additional bleeding necessary.**

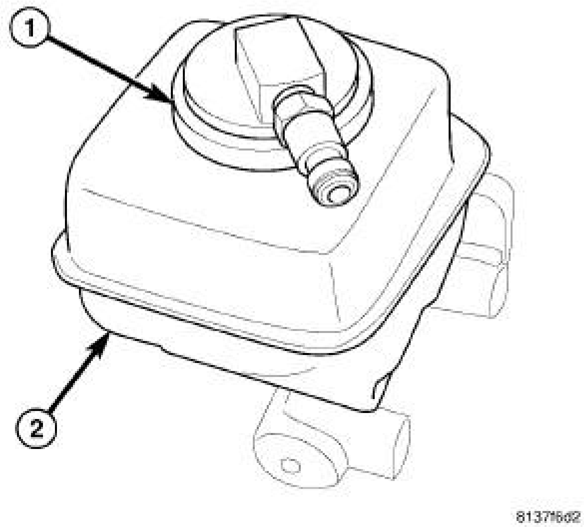
NOTE: **Do not allow the master cylinder reservoir to run out of brake fluid while bleeding the system. An empty reservoir allows additional air into the brake system. Check the fluid level frequently and add fluid as needed.**

NOTE: **Pressure bleeding is highly recommended to bleed this brake system to make sure all air is removed from system. Manual bleeding may also be used, but additional time is needed to remove all air from system.**

Although the **pressure method** is recommended for bleeding the base brake system, the manual method can also be performed. Both methods are presented in this text.

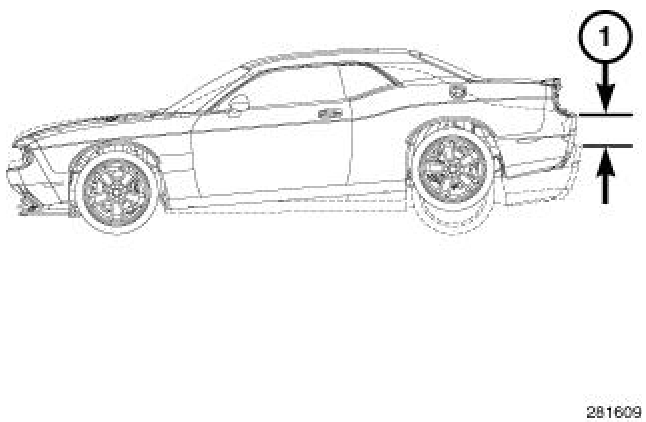
PRESSURE BLEEDING METHOD

NOTE: **Follow pressure bleeder manufacturer's instructions for use of pressure bleeding equipment.**



[Fig. 6: Fluid Reservoir & Adapter]
Courtesy of CHRYSLER GROUP, LLC

1. Remove the filler cap from the top of the fluid reservoir (2) on the master cylinder.
2. Install Adapter (1) (special tool #6921, Cap, Master Cylinder), in the caps place on the reservoir (2).
3. Attach Bleeder Tank C-3496-B, or equivalent, to Adapter (special tool #6921, Cap, Master Cylinder) (1). Pressurize the system following the pressure bleeder manufacturer's instructions.



[Fig. 7: Raising Rear Bumper]
Courtesy of CHRYSLER GROUP, LLC

NOTE: **To make sure all air is bled from the ICU or junction block in a timely manner, it is recommended to raise the rear of the vehicle approximately 5Ā° higher than the front or approximately 254-305 mm (10 -12 inches) as measured at the rear bumper (1).**

4. Raise and support vehicle placing rear of vehicle approximately 5Ā° higher than the front or if measured at the rear bumper (1), approximately 10-12 inches above level. It will be necessary to add extra support stands under vehicle to support this angle.

NOTE: **Use the following wheel circuit sequence for bleeding the brake hydraulic**

system to adequately remove all trapped air from the brake hydraulic system.

- **Right rear wheel**
- **Left rear wheel**
- **Right front wheel**
- **Left front wheel**

REAR BRAKES

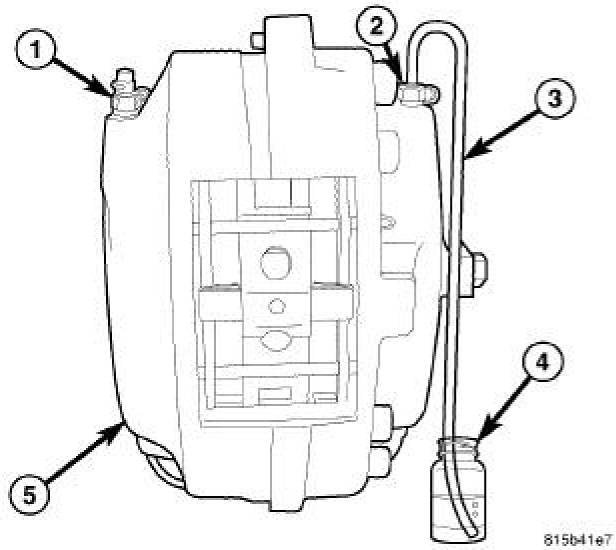


Fig. 8: Bleeding Caliper Inboard Half
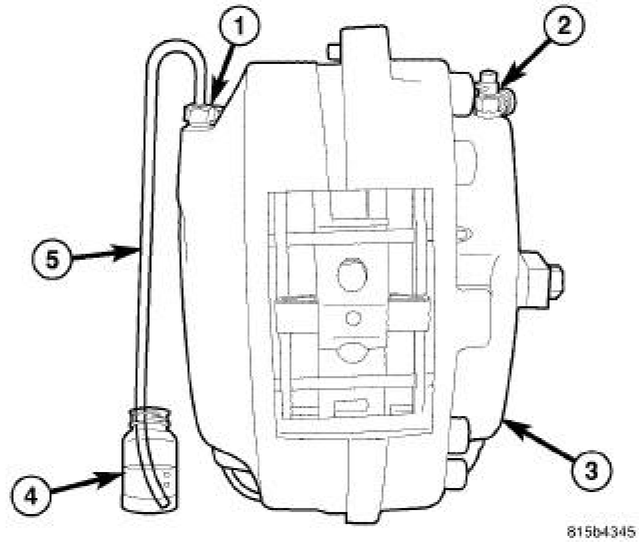
Courtesy of CHRYSLER GROUP, LLC

1. If installed, remove the rubber dust caps from both bleeder screws on each caliper.
2. Start at the first wheel circuit that needs to be bled (See list in above note). Attach a clear hose (3) to the inboard bleeder screw (2) at the wheels brake caliper and feed the other end of hose into a clear jar (4) containing enough fresh brake fluid to submerge the end of the hose.

CAUTION: Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.

3. Open the inboard bleeder screw (2) one full turn to obtain an adequate flow of brake fluid.
4. After bleeding 118-237 ml. (4-8 oz.) of brake fluid through the brake hydraulic circuit, and maintaingan air-free flow (no bubbles) is in the clear plastic hose (3) and jar (4), close the bleeder screw (2).
5. Remove the clear hose and install the bleeder screw dust cap.



[**Fig. 9: Bleeding Caliper Outboard Half**]
Courtesy of CHRYSLER GROUP, LLC

6. Attach a clear hose (5) to the outboard bleeder screw (1) at the same brake caliper and feed the other end of hose into a clear jar (4) containing enough fresh brake fluid to submerge the end of the hose.

CAUTION: Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.

7. Open the outboard bleeder screw (1) one full turn to obtain an adequate flow of brake fluid.
8. After bleeding 118-237 ml. (4-8 oz.) of brake fluid through the brake hydraulic circuit, and maintaining an air-free flow (no bubbles) is in the clear plastic hose (5) and jar (4), close the bleeder screw (1).
9. Remove the clear hose and install the bleeder screw dust cap.
10. Bleed the opposite rear brake wheel circuits as necessary in the same manner until all air is removed from the brake hydraulic system, then proceed to the front brakes.

FRONT BRAKES

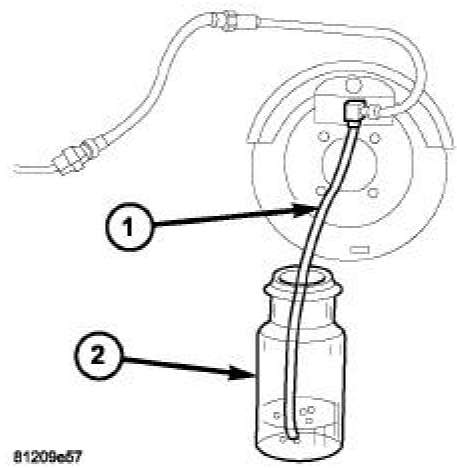


Fig. 10: Bleeding Brakes
Courtesy of CHRYSLER GROUP, LLC

1. If installed, remove the rubber dust cap from bleeder screw on each front brake caliper.
2. Start at the first wheel circuit that needs to be bled (See list in above note), attach a clear hose (1) to the bleeder screw at that wheels brake caliper and feed the other end of hose into a clear jar (2) containing enough fresh brake fluid to submerge the end of the hose.

CAUTION: Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.

3. Open bleeder screw one full turn to obtain an adequate flow of brake fluid.
4. After bleeding 118-237 ml. (4-8 oz.) of brake fluid through the brake hydraulic circuit, and maintainingan air-free flow (no bubbles) is in the clear plastic hose (1) and jar (2), close the bleeder screw.
5. Install the bleeder screw dust cap.
6. Bleed the opposite front brake wheel circuit as necessary in the same manner until all air is removed from the brake hydraulic system.
7. If equipped with anti-lock brakes, and the hydraulic control unit needs to be bled, then rebleed the base brakes. Refer to STANDARD PROCEDURE .
8. Once all brakes are bled, check brake pedal travel. If pedal travel is excessive or has not improved, some air may still be trapped in the brake hydraulic system. Re-bleed the brake system as necessary.
9. Test drive vehicle to make sure the brakes are operating properly and pedal feel is correct.

MANUAL BLEEDING METHOD

NOTE: To bleed the base brake system manually, an assistant's help is required.

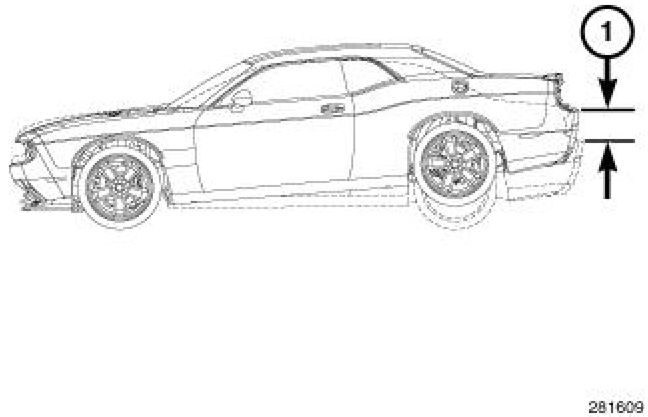

Fig. 11: Raising Rear Bumper
Courtesy of CHRYSLER GROUP, LLC

NOTE: **To make sure all air is bled from the ICU or junction block in a timely manner, it is recommended to raise the rear of the vehicle approximately 5Ā° higher than the front or approximately 254-305 mm (10-12 inches) as measured at the rear bumper (1).**

1. Raise and support vehicle placing rear of vehicle approximately 5Ā° higher than the front or if measured at the rear bumper (1), approximately 10-12 inches above level. It will be necessary to add extra support stands under vehicle to support this angle.

NOTE: **Use the following wheel circuit sequence for bleeding the brake hydraulic system to adequately remove all trapped air from the brake hydraulic system.**

- **Right rear wheel**
- **Left rear wheel**
- **Right front wheel**
- **Left front wheel**

REAR BRAKES

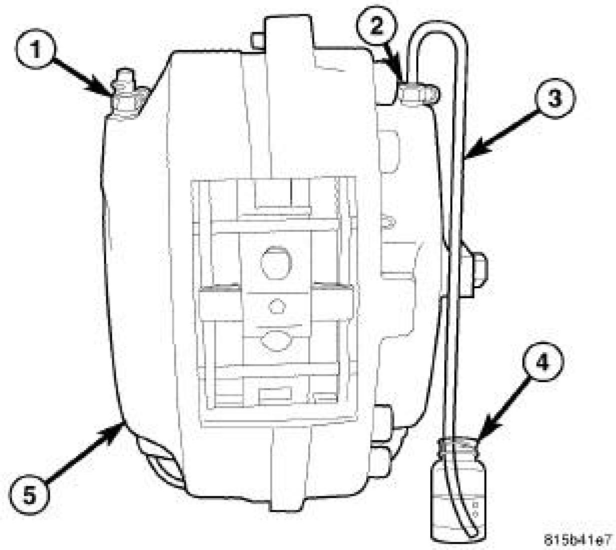

Fig. 12: Bleeding Caliper Inboard Half
Courtesy of CHRYSLER GROUP, LLC

1. If installed, remove the rubber dust caps from both bleeder screws on each caliper.
2. Start at the first wheel circuit that needs to be bled (See list in above note), attach a clear hose (3) to the inboard bleeder screw at that the brake caliper and feed the other end of hose into a clear jar (4) containing enough fresh brake fluid to submerge the end of the hose.
3. Have an assistant pump the brake pedal three or four times, then hold it down before the bleeder screw is opened.

CAUTION: **Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.**

4. While holding down the brake pedal, open the inboard bleeder screw (2) at least one full turn. When the bleeder screw opens the brake pedal will drops all the way to the floor. Continue holding the pedal all the way down.
5. Once the brake pedal drops, close the bleeder screw. Release the pedal.
6. Repeat the previous three steps until all trapped air is removed from that wheel circuit (usually four or five times). This should pass a sufficient amount of fluid to expel all the trapped air from the brake hydraulic system. **Be sure to monitor brake fluid level in master cylinder fluid reservoir making sure it stays at a proper level.** This will ensure air does not reenter brake hydraulic system through master cylinder.

NOTE: **Monitor the brake fluid level in the fluid reservoir periodically to make sure it does not go too low. This makes sure that air does not reenter the brake hydraulic system.**

7. Remove the clear hose and install the bleeder screw dust cap.

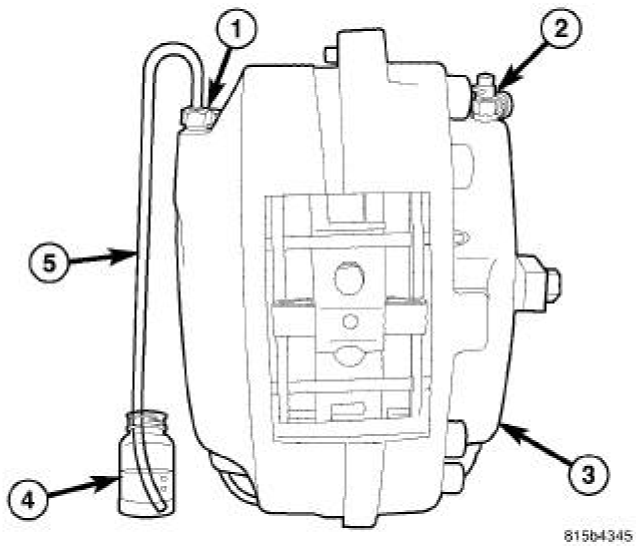

Fig. 13: Bleeding Caliper Outboard Half
Courtesy of CHRYSLER GROUP, LLC

8. Attach a clear hose (5) to the outboard bleeder screw (1) at the brake caliper and feed the other end of hose into a clear jar (4) containing enough fresh brake fluid to submerge the end of the hose.
9. Have an assistant pump the brake pedal three or four times, then hold it down before the bleeder screw is opened.

CAUTION: **Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.**

10. While holding down the brake pedal, open the outboard bleeder screw (2) at least one full turn. When the bleeder screw opens the brake pedal drops all the way to the floor. Continue holding the pedal all the way down.
11. Once the brake pedal drops, close the bleeder screw. Release the pedal.
12. Repeat the previous three steps until all trapped air is removed from that wheel circuit (usually four or five times). This passes a sufficient amount of fluid to expel all the trapped air from the brake hydraulic system. **Be sure to monitor brake fluid level in master cylinder fluid reservoir making sure it stays at a proper level.** This will ensure air does not reenter brake hydraulic system through master cylinder.

NOTE: **Monitor the brake fluid level in the fluid reservoir periodically to make sure it does not go too low. This will ensure that air does not reenter the brake hydraulic system.**

13. Remove the clear hose and install the bleeder screw dust cap.

14. Bleed the opposite rear brake wheel circuits as necessary in the same manner until all air is removed from the brake hydraulic system, then proceed to the front brakes.

FRONT BRAKES

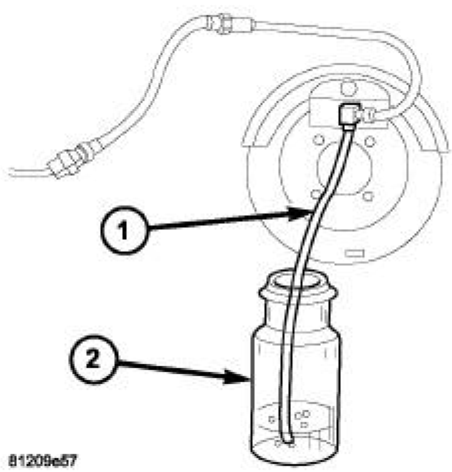

Fig. 14: Bleeding Brakes
Courtesy of CHRYSLER GROUP, LLC

1. If installed, remove the rubber dust cap from the bleeder screw on each front brake caliper.
2. Start at the first wheel circuit that needs to be bled (See list in above note), attach a clear hose (1) to the bleeder screw at that the brake caliper and feed the other end of hose into a clear jar (2) containing enough fresh brake fluid to submerge the end of the hose.
3. Have an assistant pump the brake pedal three or four times and hold it down before the bleeder screw is opened.

CAUTION: **Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.**

4. While holding down the brake pedal open the bleeder screw at least one full turn. When the bleeder screw opens the brake pedal drops all the way to the floor. Continue holding the pedal all the way down.
5. Once the brake pedal drops, close the bleeder screw. Release the pedal.
6. Repeat the previous five steps until all trapped air is removed from that wheel circuit (usually four or five times). This passes a sufficient amount of fluid to expel all the trapped air from the brake hydraulic system. Be sure to monitor brake fluid level in master cylinder fluid reservoir making sure it stays at a proper level. This will ensure air does not reenter brake hydraulic system through master cylinder.

NOTE: **Monitor the brake fluid level in the fluid reservoir periodically to make sure it does not go too low. This makes sure that air does not reenter the brake hydraulic system.**

7. Install the bleeder screw dust cap.
8. Bleed the opposite front brake wheel circuit as necessary in the same manner until all air is removed from the brake hydraulic system.
9. If equipped with anti-lock brakes, and the hydraulic control unit needs to be bled, then rebleed the base brakes. Refer to **STANDARD PROCEDURE** .
10. Once all brakes are bled, check brake pedal travel. If pedal travel is excessive or has not improved, some air may still be trapped in the brake hydraulic system. Re-bleed the brake system as necessary.
11. Test drive the vehicle to make sure the brakes are operating properly and pedal feel is correct.

	C-3919 - Gauge, Brake Shoes

	C-4171 - Driver Handle, Universal (Originally Shipped In Kit Number(s) 9202, 9202A-CAN, 9202CC, 9299, 9299CC, 9299CC, 9300A-CAN.)

ELECTRICAL

PUMP, ELECTRIC VACUUM

DESCRIPTION

DESCRIPTION

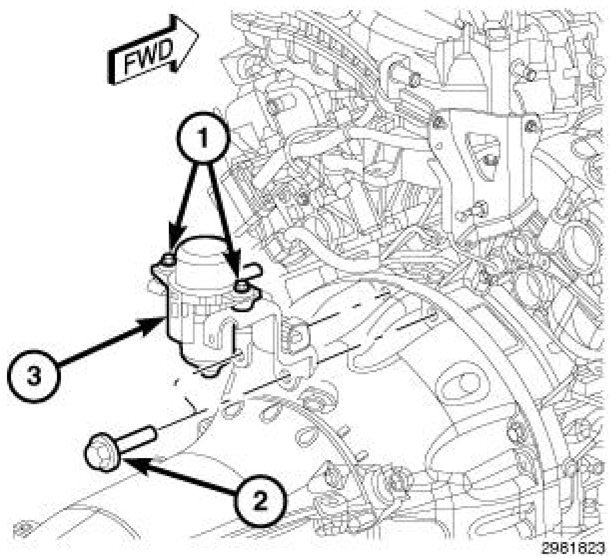

Fig. 15: Electric Vacuum Pump, Bolts & Studs
Courtesy of CHRYSLER GROUP, LLC

NOTE: Only vehicles with a 3.6L engine have an electric vacuum pump.

There is an electric vacuum pump (3) located on the back of the engine mounted to the top of the transmission. The vacuum pump (3) has one electrical connector on a pigtail connected to the mounting bracket. The vacuum pump (3) mounts to the bracket with two rubber insulated studs (1) to reduce vibration, and the bracket mounts to the transmission with two bolts (2). The vacuum hose has a quick-connect type end with a locking tab at the vacuum pump.

OPERATION

OPERATION

The Electric Vacuum Pump (EVP) system is installed to provide supplemental vacuum to the brake booster when the engine vacuum supply is low. The vacuum pump is connected to the engine and the brake booster through a series of hoses and one-way flow check valves. A pressure senor, mounted in the brake booster, provides information to the Antilock Brake System (ABS) module, then the vacuum level is sent over CAN to the Powertrain Control Module (PCM). The PCM modulates the EVP operation to maintain the brake booster vacuum within a given range. This system ensures that the customer experiences a consistent brake pedal feel under all driving conditions.

A two wire electrical connector is used to supply power and ground for the vacuum pump. Operating voltage is between 9V - 16V. Control of the vacuum pump is provided by the Powertrain Control Module (PCM) using a low side driver to a normally open relay (coil side). The relay coil side power is from a fuse in the under hood PDC. The switched power to the vacuum pump relay comes directly from the battery through an inline fuse holder located in the engine compartment.

The PCM monitors the Manifold Absolute Pressure (MAP) sensor and when the signal indicates low engine vacuum the PCM will cycle the vacuum pump as necessary to add vacuum to the power brake booster. The vacuum hoses are connected between the vacuum pump, the engine manifold (for MAP sensor signal), and the power brake booster vacuum sensor (on the brake booster). When the PCM cycles the vacuum pump on, the PCM monitors the MAP sensor and if the vacuum signal does not indicate a rising vacuum then DTCs will be set. Additionally the Antilock Brake System (ABS) module monitors the vacuum at the brake booster vacuum sensor and DTCs will also set in the ABS module.

REMOVAL

REMOVAL

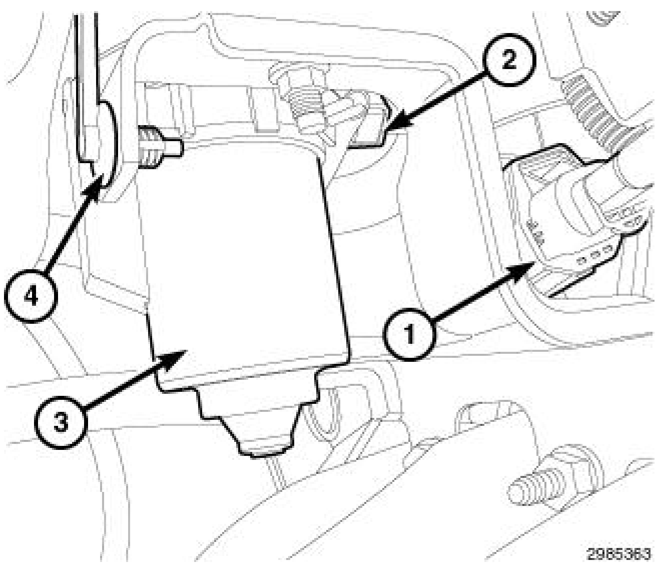

Fig. 16: Electrical Connector, Harness Connector, Hose & Vacuum Pump
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.

2. Remove the engine cover.
3. Disconnect the wire harness connector (1) and remove the harness connector (4) from the mounting bracket.
4. Release the locking tab and disconnect the quick connect vacuum hose (2) from the vacuum pump (3).

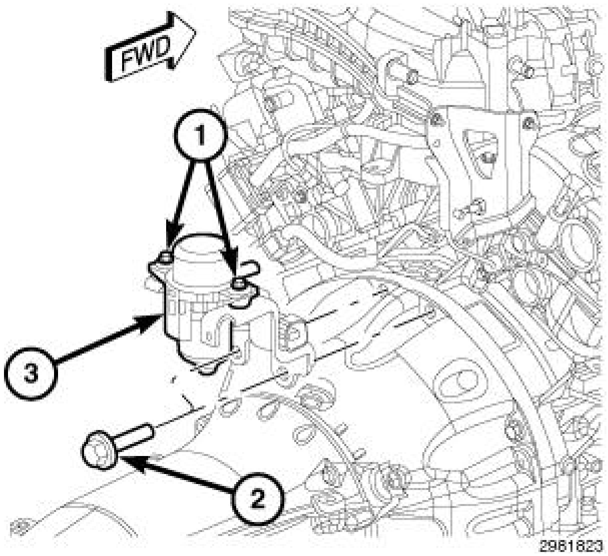

Fig. 17: Electric Vacuum Pump, Bolts & Studs
Courtesy of CHRYSLER GROUP, LLC

5. Remove the vacuum pump bracket bolts (2) and the vacuum pump assembly (3).

INSTALLATION

INSTALLATION

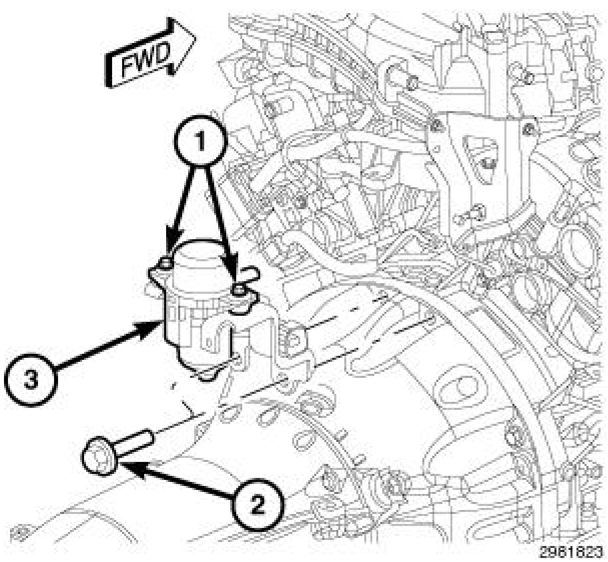

Fig. 18: Electric Vacuum Pump, Bolts & Studs
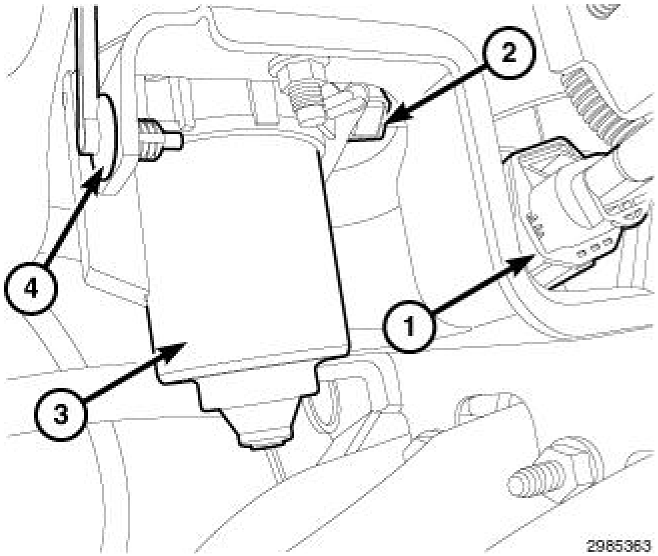
Courtesy of CHRYSLER GROUP, LLC

1. Install the Electric Vacuum Pump (EVP) to Bracket Bolts (2). Tighten bolts to the proper **SPECIFICATIONS** .



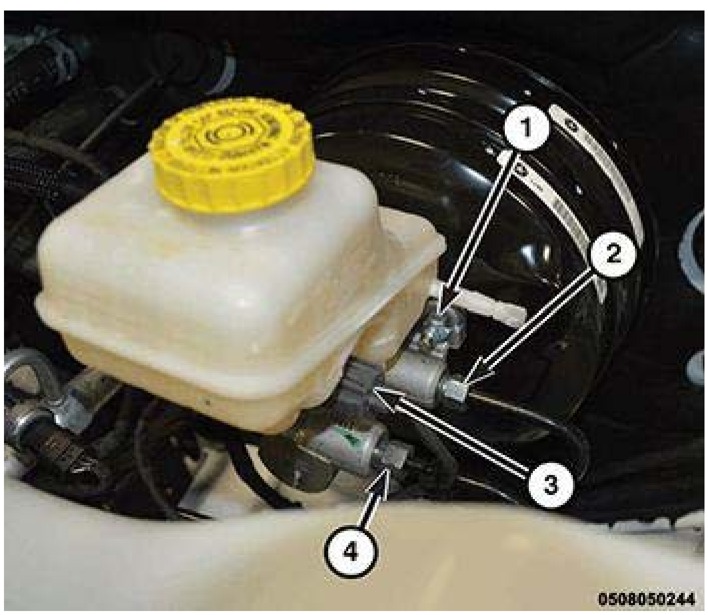
[Fig. 19: Electrical Connector, Harness Connector, Hose & Vacuum Pump]
Courtesy of CHRYSLER GROUP, LLC

2. Attach the wire harness connector to the bracket (4), and connect the electrical connector (1).
3. Connect the quick-connect vacuum hose (2) to the vacuum pump (3) and seat the locking tab.
4. Install the engine cover.

SWITCH, BRAKE FLUID LEVEL

REMOVAL

REMOVAL



[Fig. 20: Master Cylinder To Brake Booster Nut, Primary And Secondary Outlet Ports & Brake Fluid Level Sensor Wire Harness Connector]
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.

2. Remove the windshield wiper cowl. Refer to **COVER, COWL PANEL, REMOVAL** .
3. Disconnect the brake fluid level sensor wire harness connector (3).

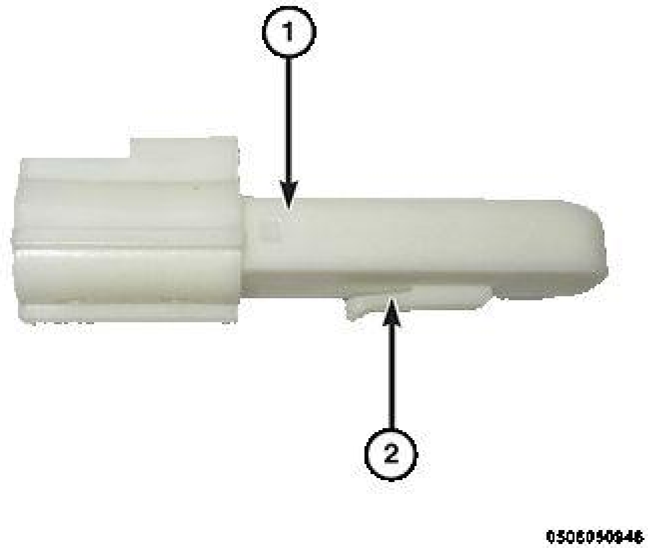


Fig. 21: Brake Fluid Level Sensor & Brake Fluid Level Sensor Retaining Clip
Courtesy of CHRYSLER GROUP, LLC

4. Remove the brake fluid level sensor (1) from the reservoir by pushing up on the brake fluid level sensor retaining clip (2) and pulling sensor outward.

INSTALLATION

INSTALLATION

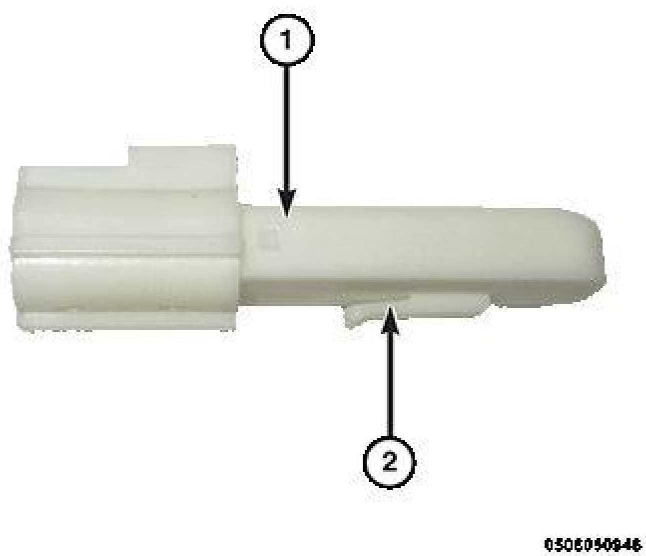

Fig. 22: Brake Fluid Level Sensor & Brake Fluid Level Sensor Retaining Clip
Courtesy of CHRYSLER GROUP, LLC

1. Install the brake fluid level sensor (1) into the fluid reservoir until the retaining clip (2) has clicked into

place.

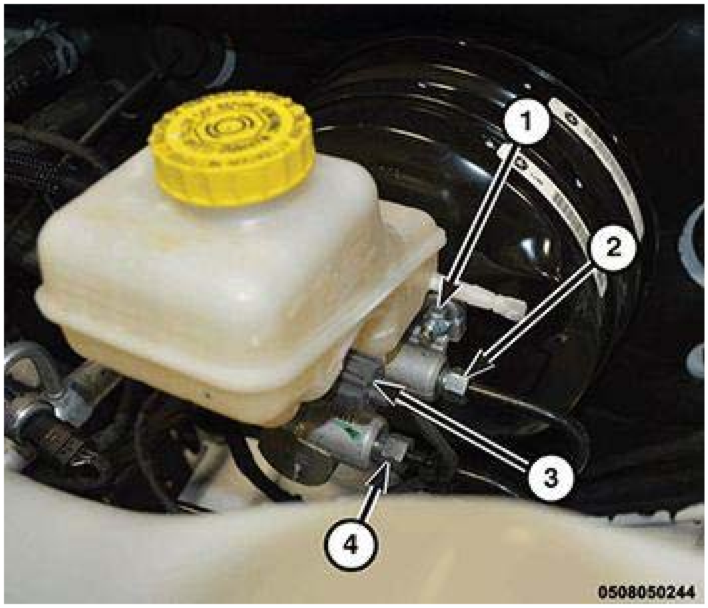

Fig. 23: Master Cylinder To Brake Booster Nut, Primary And Secondary Outlet Ports & Brake Fluid Level Sensor Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

2. Reconnect the brake fluid level sensor wire harness connector (3).
3. Install the windshield wiper cowl. Refer to **COVER, COWL PANEL, INSTALLATION** .
4. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.

HYDRAULIC/MECHANICAL

DESCRIPTION

NON SRT

The non SRT system features twin-piston aluminum calipers and vented rotors in the front and single-piston aluminum calipers with vented rotors in the rear.

SRT

SRT8 models utilize four-wheel disc brakes.

All brake rotors are the internal vented type. There are no dust shields behind the front brake rotors.

The SRT8 6.2L front brakes feature six piston calipers and a two piece rotor design.

The SRT8 6.4L front brakes feature four piston calipers and a one piece rotor design.

All SRT8 calipers mount directly to the knuckle. They do not use brake caliper adapters.

All SRT8 calipers are not serviceable. Do not attempt disassembly.

The rear brake calipers feature four piston calipers.

Each SRT8 caliper half has their own bleeder screw at the top and must be bled individually when bleeding is required.

The SRT8 rear brake rotors have integrated parking brake drums like the standard rear disc brake system.

BOOSTER, POWER BRAKE

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - MASTER CYLINDER/POWER BOOSTER

1. Start the engine and check the booster vacuum hose connections. A hissing noise indicates a vacuum leak. Correct any vacuum leaks before proceeding.
2. Stop the engine and pump the brake pedal until all vacuum reserve in the booster is depleted.
3. Press and hold the brake pedal under light foot pressure. The pedal should hold firm. If the pedal falls away, there may be an external leak or the master cylinder is faulty (internal leakage).
4. Start the engine and note pedal action. It should fall away slightly under light foot pressure, then hold firm. If no pedal action is discernible, the power booster, vacuum supply or vacuum check valve is faulty, proceed to the POWER BOOSTER VACUUM TEST.
5. If the POWER BOOSTER VACUUM TEST passes, rebuild the booster vacuum reserve as follows: Release the brake pedal. Increase engine speed to 1500 RPM, close the throttle and immediately turn off the ignition to stop the engine.
6. Wait a minimum of 90 seconds and try brake action again. The booster should provide two or more vacuum assisted pedal applications. If the vacuum assist is not provided, the booster is faulty.

POWER BOOSTER VACUUM TEST

1. Connect a vacuum gauge to the booster check valve with a short length of hose and T-fitting.
2. Start and run the engine at curb idle for one minute.
3. Observe the vacuum supply. If the vacuum supply is less that 12 inches HG (406 millibars), repair the vacuum supply.
4. Clamp the hose shut between the intake vacuum source and the check valve.
5. Stop the engine and observe the vacuum gauge.
6. If the vacuum drops more than one inch HG (33 millibars) within 15 seconds, the booster diaphragm or check valve is faulty.

POWER BOOSTER CHECK VALVE TEST

1. Remove the power booster check valve from the power booster.
2. Using a hand operated vacuum pump, apply 15-20 inches HG (508-677 millibars) vacuum at the booster side of the check valve.
3. The vacuum should hold steady. If the gauge on the pump indicates vacuum loss, the check valve is faulty and should be replaced.

REMOVAL

REMOVAL

1. Move driver seat to full rearward position.
2. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
3. Remove windshield wiper module. Refer to **LINKAGE, WIPER ARM, REMOVAL** .
4. Remove the master cylinder. Refer to **MASTER CYLINDER, BRAKE, REMOVAL**.

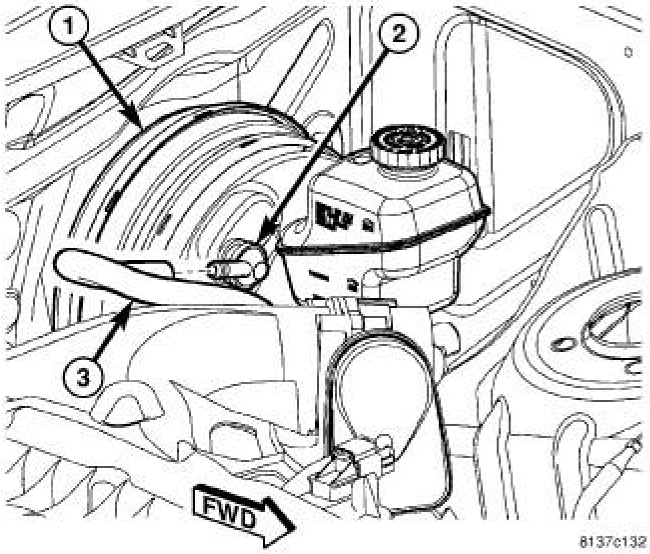

Fig. 24: Vacuum Hose Connection
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect vacuum hose (3) from check valve (2) on face of booster (1). **Do not remove check valve from booster.**

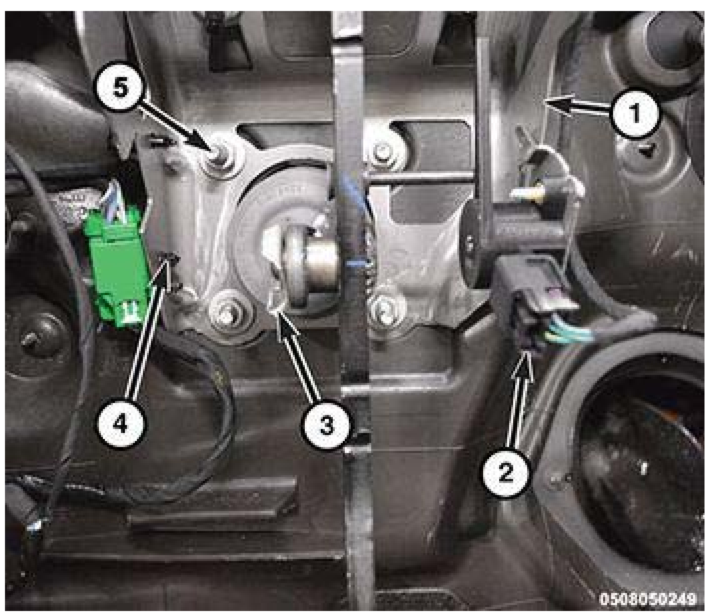

Fig. 25: Removing/Installing Stop Lamp Sensor
Courtesy of CHRYSLER GROUP, LLC

6. Remove stop lamp sensor. Refer to **SENSOR, STOP LAMP, REMOVAL** .

NOTE: **Do not discard the stop lamp switch as it can be adjusted and reinstalled.**

7. Disengage brake booster push rod to brake pedal retaining clip (3).

NOTE: **Discard retaining clip. It is not to be reused. Install NEW retaining clip when assembling.**

8. Slide booster push rod off brake pedal pin.
9. Remove the four brake booster nuts (5).
10. Slide power brake booster forward out of dash panel and remove through opening between cross-brace and windshield.

INSTALLATION

INSTALLATION

NOTE: **Make sure there is a NEW booster seal placed over push rod and mounting studs on rear of booster prior to installation. Failure to do so may result in a leak and possible premature failure of the brake booster.**

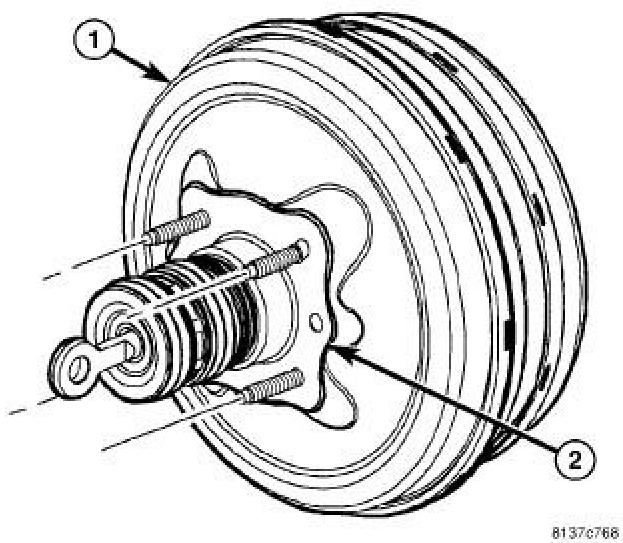

Fig. 26: Booster Seal
Courtesy of CHRYSLER GROUP, LLC

1. Install a **NEW** booster seal (2) over push rod and mounting studs on rear of booster (1).

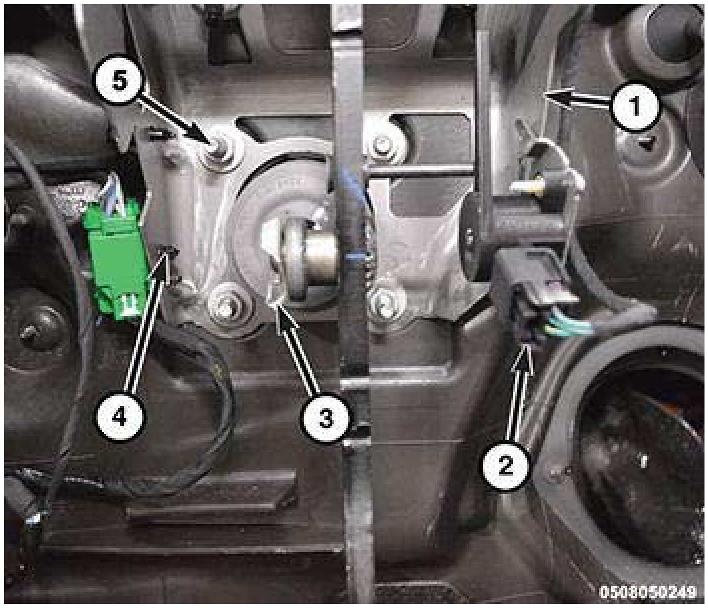

Fig. 27: Removing/Installing Stop Lamp Sensor
Courtesy of CHRYSLER GROUP, LLC

2. Install power brake booster through opening between cross-brace and windshield. Guide booster push rod and mounting studs (5) through dash panel.

NOTE: **Be sure to tighten all four booster mounting nuts to specifications or a vacuum leak can result.**

3. Install four brake booster nuts (5). Tighten to the proper **SPECIFICATIONS** .
4. Slide booster push rod onto brake pedal pin. Install **NEW** retaining clip (3) securing push rod to brake pedal.
5. Reinstall and adjust the stop lamp sensor that was set aside for reuse. Refer to **SENSOR, STOP LAMP, INSTALLATION** .

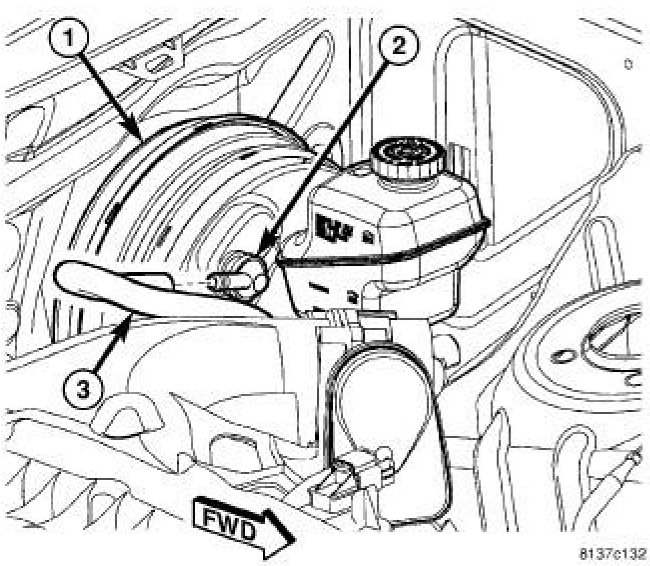

Fig. 28: Vacuum Hose Connection

Courtesy of CHRYSLER GROUP, LLC

6. Connect vacuum hose (3) to check valve (2) on face of booster (1). **Do not remove check valve from booster.**
7. Install master cylinder. Refer to **MASTER CYLINDER, BRAKE, INSTALLATION**.
8. Install windshield wiper module. Refer to **LINKAGE, WIPER ARM, INSTALLATION** .
9. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.
10. Fill and bleed brakes system as necessary. Refer to **STANDARD PROCEDURE** .

CALIPER, DISC BRAKE, FRONT

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to CAUTION and WARNING.

1. Using a brake pedal holding tool, depress brake pedal past its first inch of travel and hold it in this position. Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the tire and wheel assembly. Refer to **REMOVAL** .

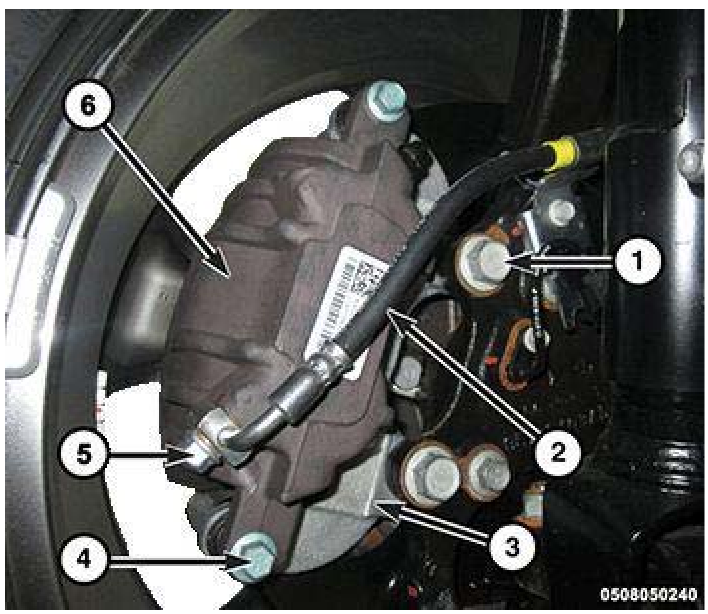

Fig. 29: Brake Caliper Components
Courtesy of CHRYSLER GROUP, LLC

4. Remove the brake hose to brake caliper banjo bolt (5). There are two sealing washers (one on each side of hose fitting) that will come off when bolt is removed. Discard these washers; install **NEW** washers on installation.
5. While holding guide pins from turning, remove the brake caliper guide pin bolts (4).
6. Remove brake caliper (6) from brake adapter (3).

DISASSEMBLY

DISASSEMBLY

NOTE: Before disassembling the brake caliper, clean and inspect it. Refer to INSPECTION and CLEANING .

WARNING: Under no condition should high pressure air ever be used to remove a piston from a caliper bore. Personal injury could result from such practice.

1. Drain brake fluid from caliper.

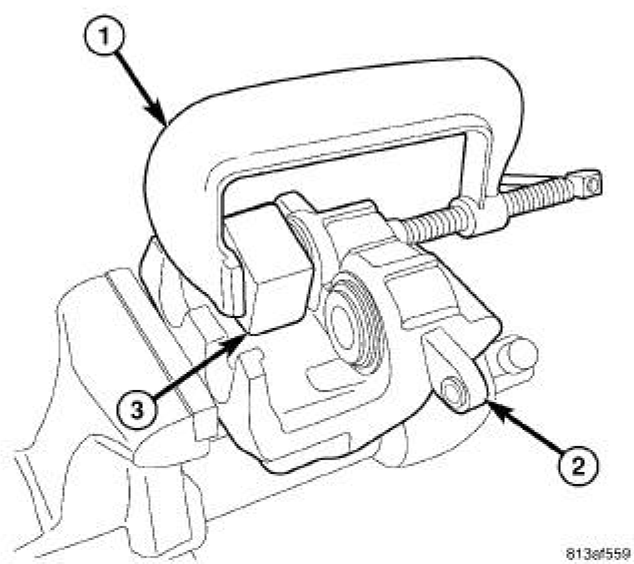

Fig. 30: C-Clamp Over Piston Number 1
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use excessive force when clamping caliper (2) in vise. Caliper housing is made of aluminum. Excessive vise pressure will cause bore distortion.

2. Mount caliper (2) in vise equipped with protective jaws.
3. C-clamp (1) a block of wood (3) over one piston.

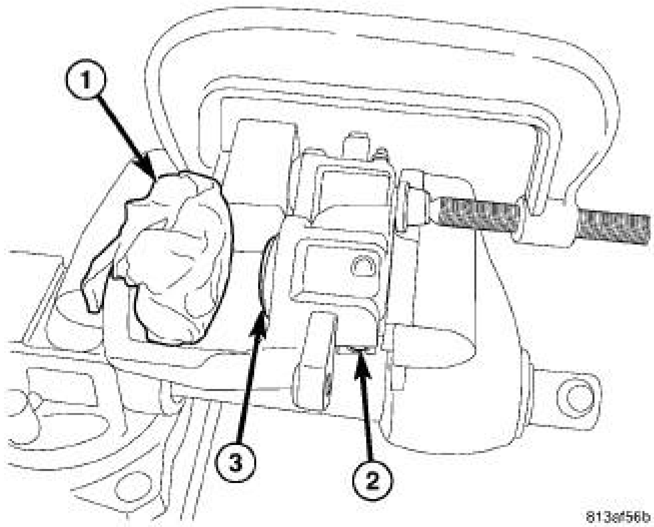

Fig. 31: Padded Block In Front Of Piston Number 2
Courtesy of CHRYSLER GROUP, LLC

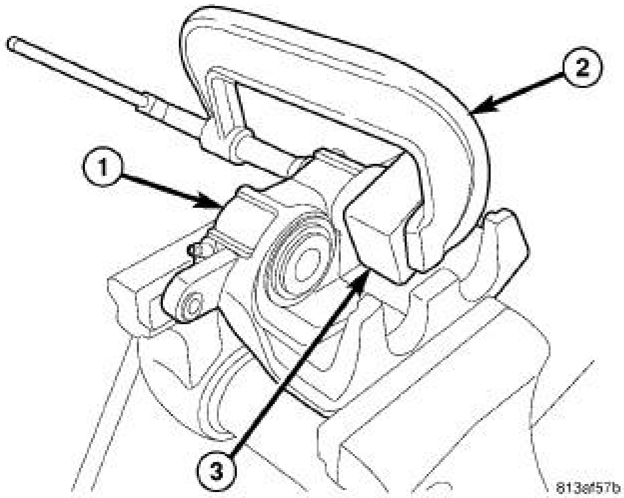
4. Take another block of wood and pad it with one-inch thickness of shop towels. Padded block should be sized to allow piston to push out of bore far enough to be removed by hand after being loosened by air pressure, yet large enough to keep piston from coming completely out.
5. Place the padded block of wood (1) in outboard shoe side of caliper (2) in front of exposed piston (3). This will cushion and protect caliper piston during removal.

WARNING: Do not place face or hands near caliper and piston if using compressed air to remove piston. Do not use high pressure.

WARNING: Never attempt to catch piston as it leaves bore. This could result in personal injury.

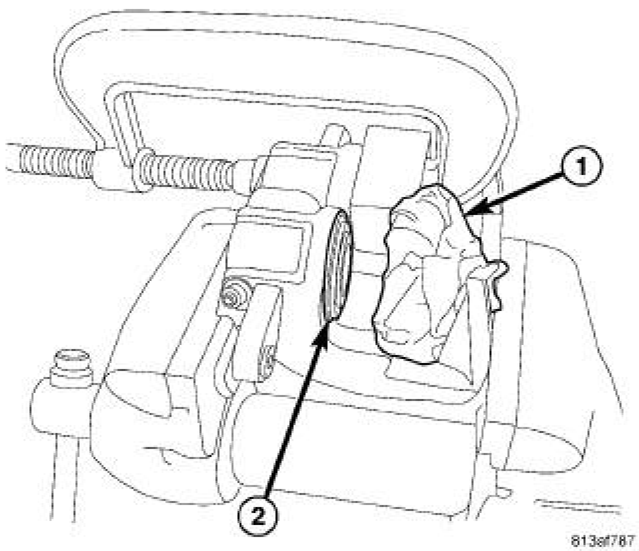
CAUTION: Do not blow piston out of bore with sustained air pressure. This could result in a cracked piston. Use only short spurts of air.

6. Apply **short spurts of low pressure air** with a rubber tipped blow gun through caliper brake hose port. Use only enough air pressure to ease piston out of bore.
7. Remove piston from caliper (2).
8. Remove C-clamp and block of wood.



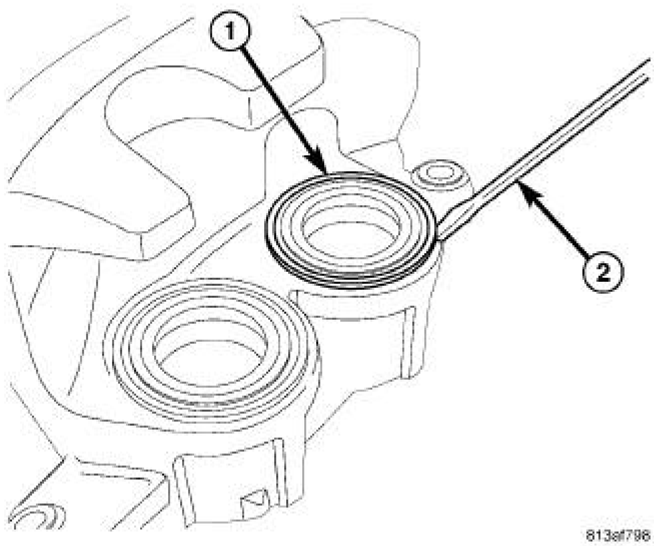
[Fig. 32: C-Clamp Over Piston Number 2 Boot](#)
Courtesy of CHRYSLER GROUP, LLC

9. C-clamp (1) the block of wood (3) over dust boot of first piston removed. This will seal empty piston bore.



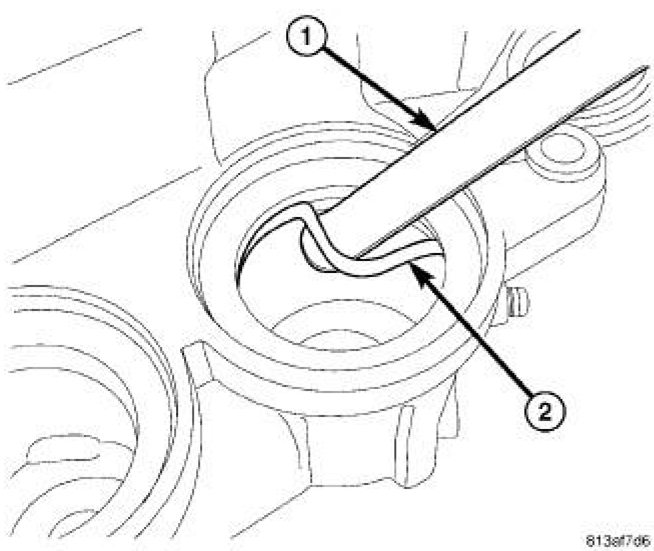
[Fig. 33: Padded Block In Front Of Piston 1](#)
Courtesy of CHRYSLER GROUP, LLC

10. Move padded piece of wood (1) in front of piston (2) yet to be removed.
11. Remove second piston using same procedure with **short spurts of low pressure air** .
12. Remove C-clamp and block of wood from caliper.



[Fig. 34: Removing Dust Boots](#)
Courtesy of CHRYSLER GROUP, LLC

13. Remove piston dust boots (1) (over each bore) with an appropriate pry tool (2). **Use care not to damage aluminum housing.**



[Fig. 35: Removing Piston Seals](#)
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Use an appropriate tool (1) to remove piston seals (2) to avoid scratching piston bore. Do not use a screwdriver or other metal tool to remove seals.

14. Using a soft tool such as a plastic trim stick (1), remove piston seals (2) from caliper bores.

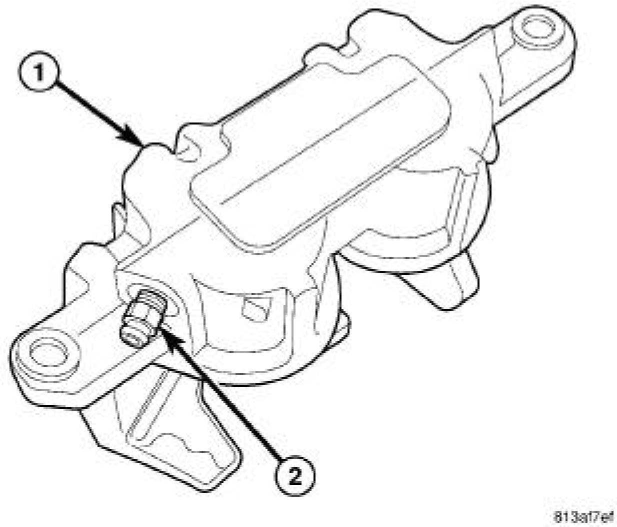


Fig. 36: Twin Piston Caliper Bleeder Screw
Courtesy of CHRYSLER GROUP, LLC

15. Remove caliper bleeder screw (2) from caliper housing (1).
16. Clean piston bore and drilled passage ways with alcohol or a suitable solvent. Wipe it dry using only a lint-free cloth.
17. Inspect both piston and bore for scoring or pitting.

NOTE: **It is not recommended to hone caliper bore. The anodized coating would be compromised.**

CLEANING

CLEANING

WARNING: **Chrysler does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.**

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

To clean or flush the internal passages of the brake caliper, use fresh brake fluid or MoparÂ® Non-Chlorinated Brake Parts Cleaner. Never use gasoline, kerosene, alcohol, oil, transmission fluid or any fluid containing mineral oil to clean the caliper. These fluids will damage rubber cups and seals.

INSPECTION

INSPECTION

Inspect the disc brake caliper for the following:

- Cracked or damaged housing

- Brake fluid leaks in and around boot area
- Ruptures, brittleness or damage to the piston dust boot

If caliper fails inspection, disassemble and recondition caliper, replacing the seals and dust boots or replace caliper.

ASSEMBLY

ASSEMBLY

CAUTION: Dirt, oil, and solvents can damage caliper seals. Ensure assembly area is clean and dry.

NOTE: Always use new, clean MoparÃ® DOT 3 Motor Vehicle Brake Fluid when assembling brake caliper.

NOTE: Never use old or used piston seals or boots for assembly.

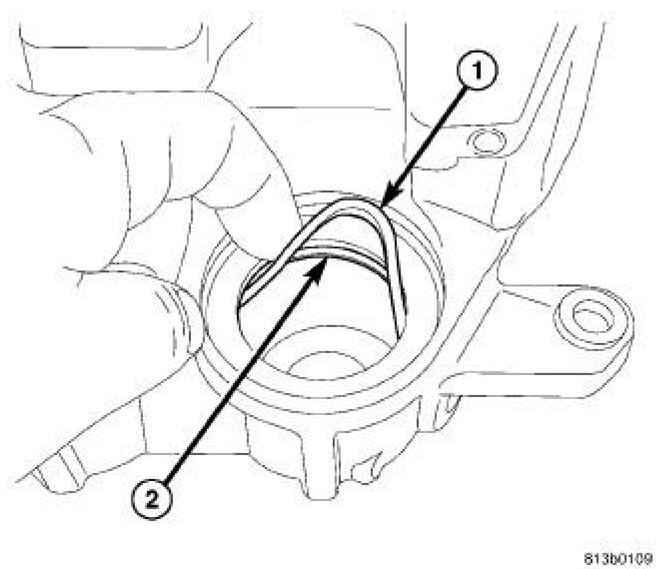

Fig. 37: Installing Piston Seals
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate caliper pistons, piston seals (1) and piston bores (2) with clean, fresh brake fluid.
2. Install NEW piston seal (1) into groove of each caliper piston bore (2).

   NOTE: Make sure seal is fully seated and not twisted in groove.

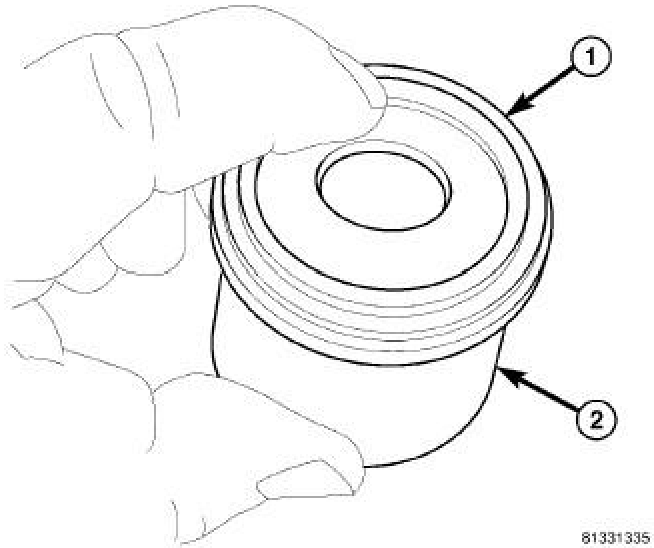

Fig. 38: Installing Boot On Caliper Piston
Courtesy of CHRYSLER GROUP, LLC

3. Install NEW boot (1) on each piston (2) and work boot lip into groove at top of piston. Stretch boot rearward straightening boot folds, then move boot forward as necessary until folds snap uniformly into place.

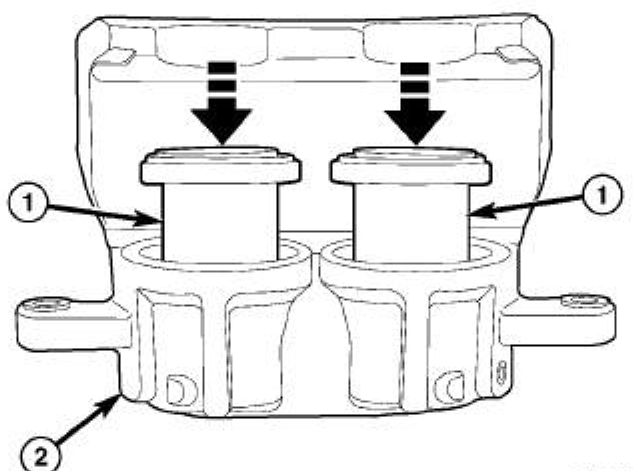

Fig. 39: Installing Pistons In Caliper
Courtesy of CHRYSLER GROUP, LLC

4. Install each piston (1), one at a time, into its caliper piston (2) bore, pressing piston down to bottom of bore using hand-pressure. Using a piece of wood or wooden hammer handle may also suffice as long as piston and boot damage is avoided.

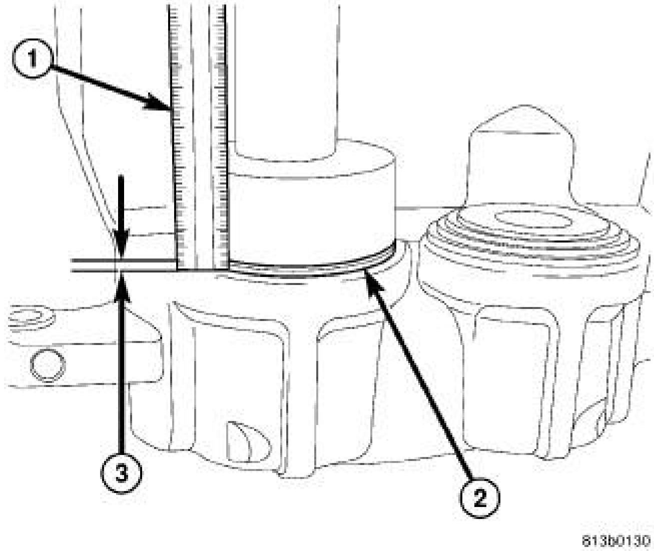

Fig. 40: Measuring Dust Boot Heights
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When seating dust boots in following step, use care not to over-install boots or damage will occur. Each boot (2) will bottom in the counterbore before the top of the boot reaches the surface of the caliper. The boot will bottom with approximately 2 mm (1/16 inch) (3) of boot still showing above caliper housing.

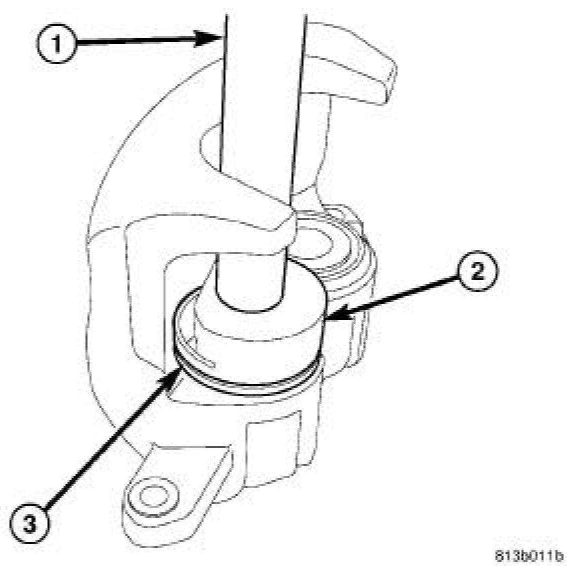

Fig. 41: Seating Boots Using Tools 9315 & C-4171
Courtesy of CHRYSLER GROUP, LLC

5. Seat dust boots (3) in caliper counterbores using Installer (special tool #9315, Installer, Dust Boot) (2) with Handle (special tool #C-4171, Driver Handle, Universal) (1). Install each dust boot until it bottoms. Do not over-seat dust boot or damage will occur.

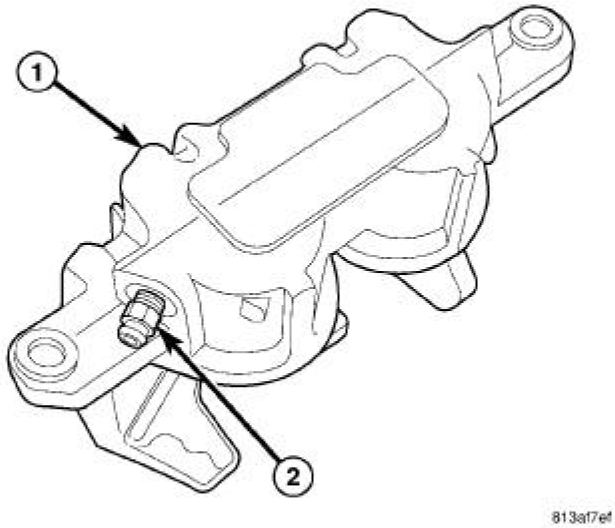

Fig. 42: Twin Piston Caliper Bleeder Screw
Courtesy of CHRYSLER GROUP, LLC

6. Install caliper bleeder screw (2) in caliper housing (1). Tighten bleeder screw to the proper **SPECIFICATIONS** .
7. Install caliper on vehicle. Refer to **CALIPER, DISC BRAKE, FRONT, INSTALLATION** .

INSTALLATION

INSTALLATION

CAUTION: Always inspect brake pads before installing disc brake caliper and replace as necessary.

CAUTION: Use care when installing caliper onto disc brake adapter to avoid damaging boots on caliper guide pins.

1. Completely retract caliper pistons back into bores of caliper. Use hand pressure or a C-clamp may also be used to retract pistons, first placing a wood block over piston before installing C-clamp to avoid damaging piston.
2. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.

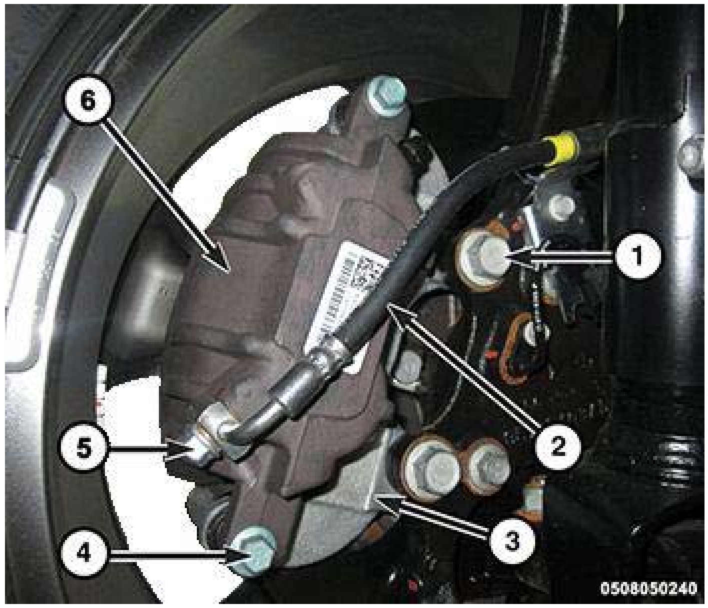

Fig. 43: Brake Caliper Components
Courtesy of CHRYSLER GROUP, LLC

CAUTION: **Extreme caution should be taken not to cross thread caliper guide pin bolts (2) when they are installed.**

3. Install the caliper (6) over brake pads and onto caliper adapter (3).
4. Align the brake caliper guide pin bolts (4) with the brake caliper adaptor. While holding guide pins from turning, tighten to the proper **SPECIFICATIONS** .
5. Install the brake hose to brake caliper banjo bolt (5). Tighten to the proper **SPECIFICATIONS** .

NOTE: **Install NEW washers on each side of hose fitting as banjo bolt (5) is placed through fitting.**

6. Install the tire and wheel assembly. Refer to **INSTALLATION** .
7. Remove support and lower the vehicle.
8. Remove brake pedal holding tool.
9. Bleed braking system. Refer to **STANDARD PROCEDURE** .
10. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake shoes.

CALIPER, DISC BRAKE, FRONT SRT8

REMOVAL

REMOVAL

NOTE: **Before proceeding, refer to CAUTION and WARNING.**

NOTE: **Six piston caliper shown, four piston caliper similar.**

1. Using a brake pedal holding tool, depress brake pedal past its first inch of travel and hold it in this position. Holding pedal in this position will isolate master cylinder from hydraulic brake system and will

not allow brake fluid to drain out of brake fluid reservoir while brake lines are open.

2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the tire and wheel assembly. Refer to **REMOVAL** .

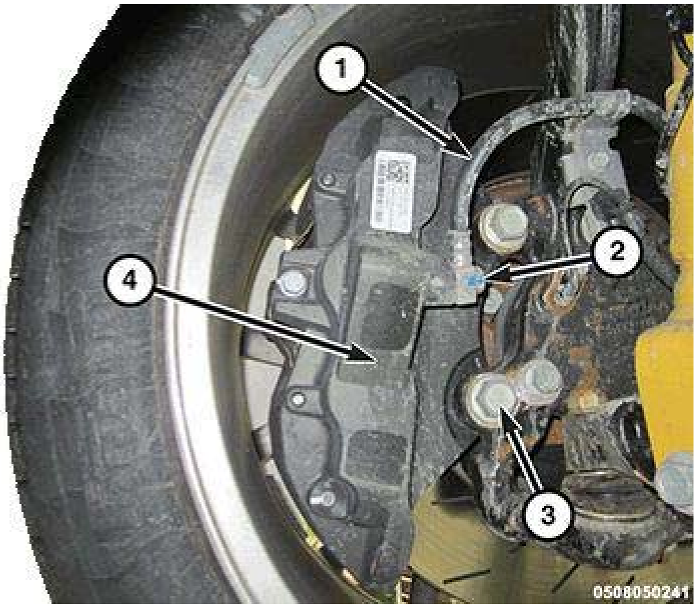

Fig. 44: Brake Caliper Components
Courtesy of CHRYSLER GROUP, LLC

4. Remove the brake hose to brake caliper banjo bolt (2). There are two sealing washers (one each side of hose fitting) that will come off when bolt is removed. Discard these washers; use **NEW** washers upon installation.

CAUTION: When pushing pistons back into caliper bores, use only a trim stick as shown or other suitable soft tool. Never use a screwdriver or other metal pry bar due to potential damage to braking surface of rotor, caliper, pistons or dust boots.

5. Using trim stick, slowly apply pressure against brake pad until the caliper pistons (on that side of caliper) are completely bottomed in bores of caliper half.

NOTE: Repeat above procedure to opposite brake pad and pistons as necessary.

6. Remove brake caliper to knuckle bolts (3).
7. Remove brake caliper (4) with pads from knuckle.
8. Remove the brake pads. Refer to **PADS, BRAKE, REMOVAL**.

NOTE: These calipers are not serviceable. Do not attempt disassembly.

INSTALLATION

INSTALLATION

CAUTION: Always inspect brake pads before installing disc brake caliper and replace as

necessary.

NOTE: **Six piston caliper shown, four piston similar.**

1. Completely retract caliper pistons back into bores of caliper. Use hand pressure or a C-clamp may also be used to retract pistons, first placing a wood block or used brake pad (not to be reused) over pistons before installing C-clamp to avoid damaging piston.
2. If brake pads need to be installed in caliper before installation. Refer to **PADS, BRAKE, INSTALLATION**.

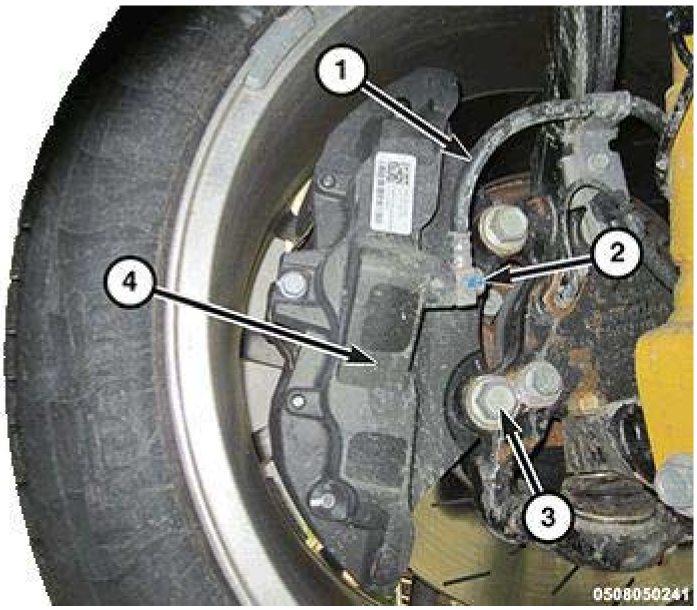

Fig. 45: Brake Caliper Components
Courtesy of CHRYSLER GROUP, LLC

3. Install the caliper with pads (4).
4. Install the brake caliper to knuckle bolts (3). Tighten to the proper **SPECIFICATIONS** .
5. Install brake hose to brake caliper banjo bolt (2). Tighten to the proper **SPECIFICATIONS** .

NOTE: **Install NEW washers on each side of hose fitting as banjo bolt (2) is placed through banjo fitting.**

6. Install the tire and wheel assembly. Refer to **INSTALLATION** .
7. Remove support and lower the vehicle.
8. Remove brake pedal holding tool.
9. Bleed the braking system. Refer to **STANDARD PROCEDURE** .
10. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake pads. If NEW brake pads are installed, they need to be properly burnished. Refer to **PADS, BRAKE, STANDARD PROCEDURE**.

CALIPER, DISC BRAKE, REAR

REMOVAL

REMOVAL

NOTE: **Before proceeding, refer to CAUTION and WARNING.**

1. Using a brake pedal holding tool, depress brake pedal past its first inch of travel and hold it in this position. Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the tire and wheel assembly. Refer to **REMOVAL** .

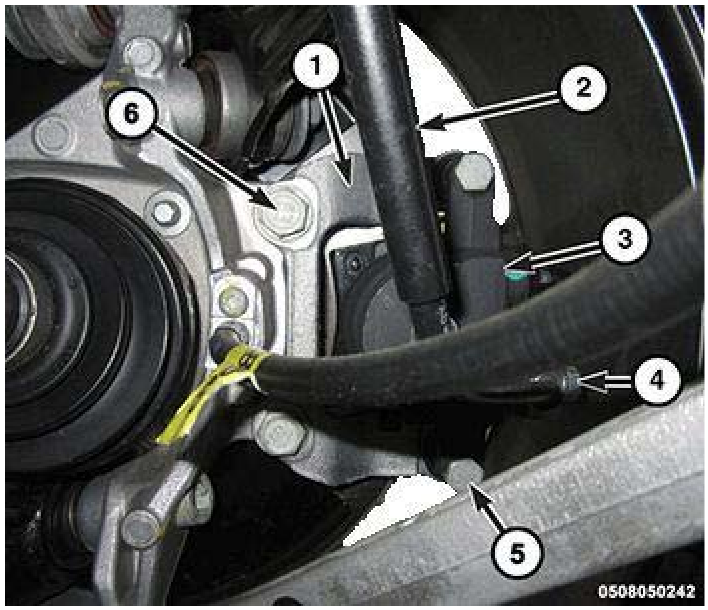

Fig. 46: Brake Caliper Components
Courtesy of CHRYSLER GROUP, LLC

4. Remove the brake hose to brake caliper banjo bolt (4). There are two sealing washers (one each side of hose fitting) that will come off when bolt is removed. Discard these washers; install **NEW** washers on installation.
5. While holding guide pins from turning, remove the brake caliper guide pin bolts (5).
6. Remove brake caliper (3) from brake adapter (1).

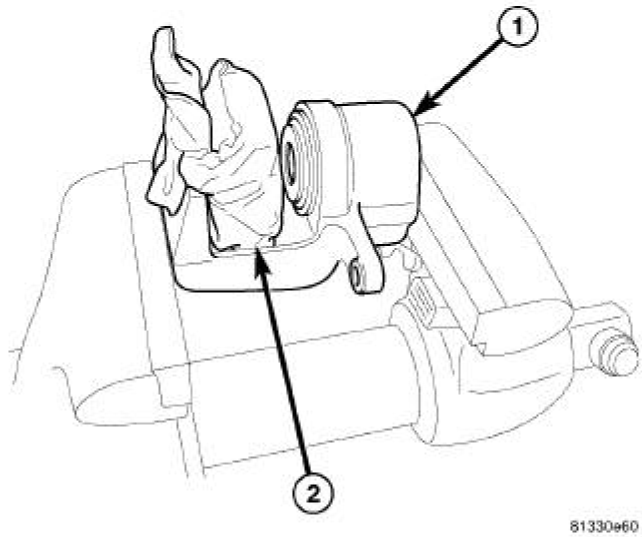
DISASSEMBLY

DISASSEMBLY

NOTE: **Before disassembling brake caliper, clean and inspect it. Refer to INSPECTION and CLEANING .**

WARNING: **Under no condition should high pressure air ever be used to remove a piston from a caliper bore. Personal injury could result from such a practice.**

CAUTION: **Do not use excessive force when clamping caliper in vise. Excessive vise pressure will cause bore distortion.**

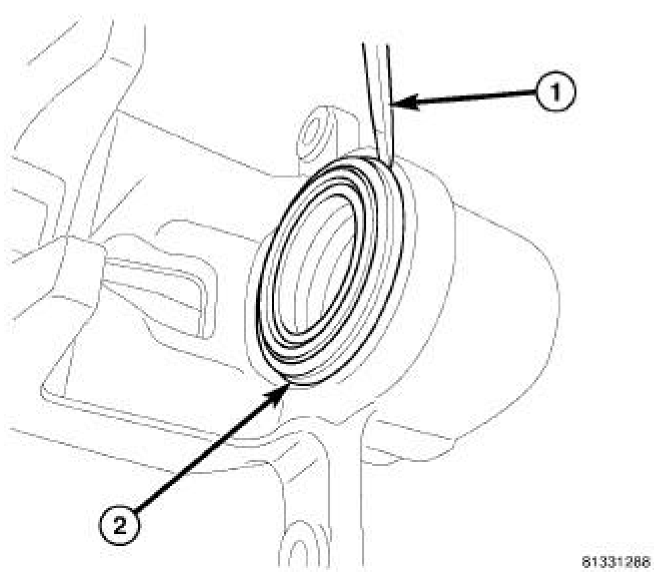


[Fig. 47: Rear Caliper In Vise](#)
Courtesy of CHRYSLER GROUP, LLC

1. Drain brake fluid from caliper.
2. Mount caliper in a vise equipped with protective jaws.
3. Place a wooden block (2) (padded with approximately one-inch thickness of shop towels) in front of caliper (1) piston as shown. Padded block should be sized to allow piston to push out of bore far enough to be removed by hand after being loosened by air pressure, yet large enough to keep piston from coming completely out. This will cushion and protect caliper piston during removal.

WARNING: Do not place face or hands near caliper and piston if using compressed air pressure to remove piston. Do not use high pressure.

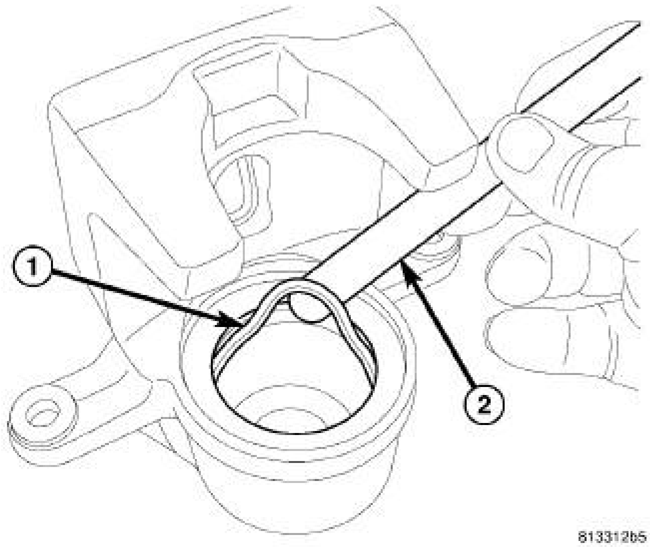
4. Apply low pressure compressed air to caliper fluid inlet in **short spurts** to ease piston out of bore.
5. Remove piston from caliper (1).



[Fig. 48: Removing Rear Caliper Dust Boot](#)
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When working on disc brake caliper, always use care and suitable tools to avoid damaging the aluminum housing.

6. Using a suitable tool (1), carefully remove dust boot (2) and discard it.



[Fig. 49: Removing Rear Caliper Piston Seal](#)
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use a screw driver or other metal tool for seal removal. Using such tools can scratch bore or leave burrs on seal groove edges.

7. Using a soft tool such as a plastic trim stick (2), work piston seal (1) out of its groove in caliper piston bore. Discard used seal.

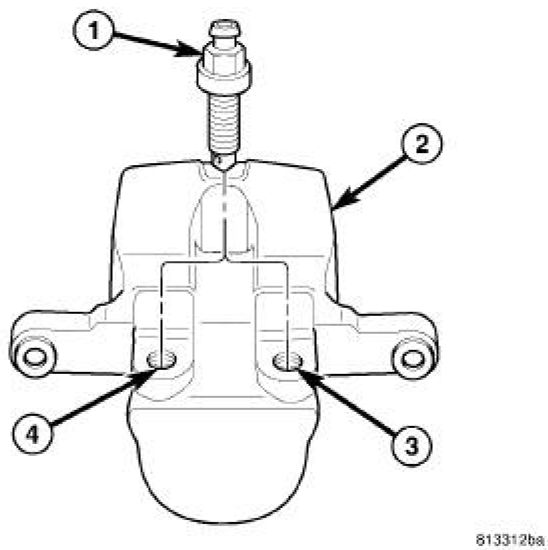


Fig. 50: Rear Caliper Bleeder Screw
Courtesy of CHRYSLER GROUP, LLC

8. Remove caliper bleeder screw (1) from caliper housing (2).
9. Clean piston bore and drilled passage ways with alcohol or a suitable solvent. Wipe it dry using only a lint-free cloth.
10. Inspect both piston and bore for scoring or pitting.

NOTE: **It is not recommended to hone caliper bore. The anodized coating would be compromised.**

CLEANING

CLEANING

WARNING: **Chrysler LLC does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.**

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

To clean or flush the internal passages of the brake caliper, use fresh brake fluid or MoparÂ® Non-Chlorinated Brake Parts Cleaner. Never use gasoline, kerosene, alcohol, oil, transmission fluid or any fluid containing mineral oil to clean the caliper. These fluids will damage rubber cups and seals.

INSPECTION

INSPECTION

Inspect the disc brake caliper for the following:

- Cracked or damaged housing
- Brake fluid leaks in and around boot area
- Ruptures, brittleness or damage to the piston dust boot

If caliper fails inspection, disassemble and recondition caliper, replacing the seals and dust boots or replace caliper.

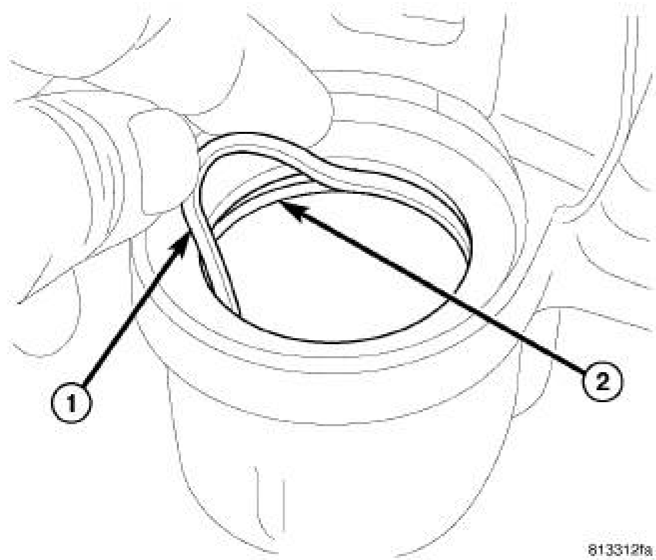
ASSEMBLY

ASSEMBLY

CAUTION: **Dirt, oil, and solvents can damage caliper seals. Ensure assembly area is clean and dry.**

NOTE: **Always use new, clean MoparÂ® DOT 3 Motor Vehicle Brake Fluid or equivalent when assembling brake caliper.**

NOTE: **Never use used or old piston seals or boots for reassembly.**



[**Fig. 51: Installing Rear Caliper Piston Seal**]
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate caliper piston, piston seal (1) and piston bore (2) with clean, fresh brake fluid.
2. Install NEW piston seal (1) in groove of caliper bore (2). Seal should be started at one area of groove and gently worked around and into the groove using only your clean fingers to seat it.

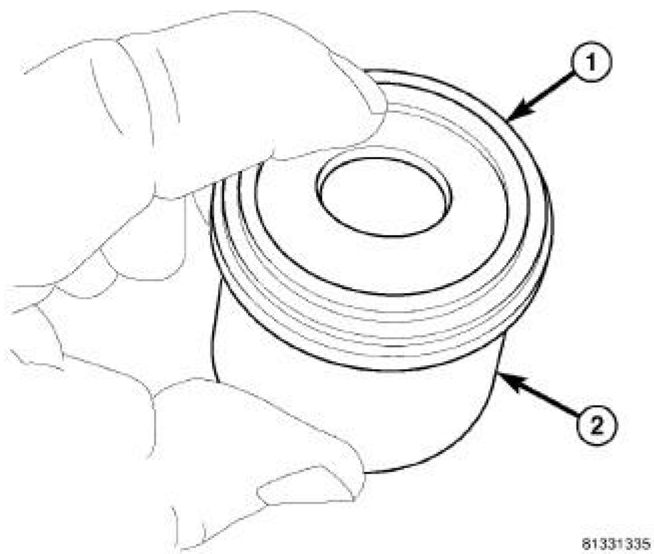


Fig. 52: Installing Boot On Caliper Piston
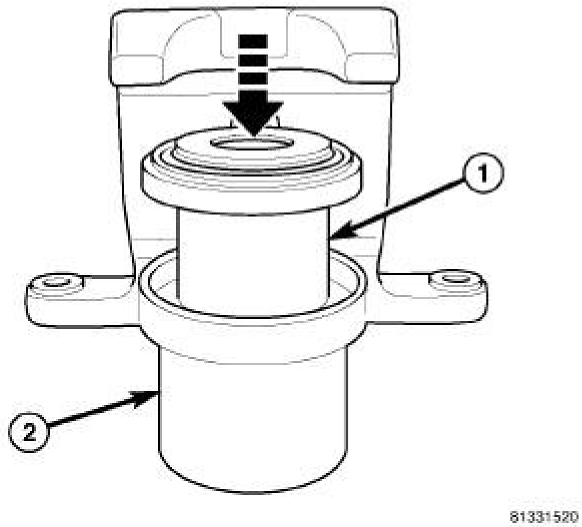
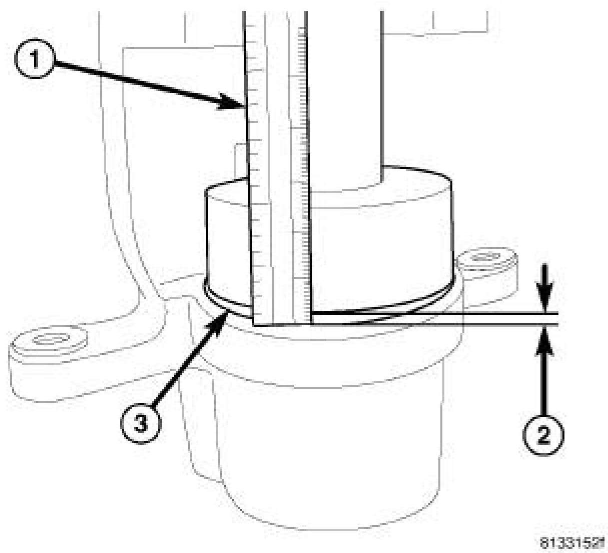
Courtesy of CHRYSLER GROUP, LLC

3. Install NEW dust boot (1) on piston (2) and work boot lip into groove at top of piston. Stretch boot downward, straightening boot folds, then move boot back upward as necessary until folds snap uniformly into place.



[Fig. 53: Installing Piston In Rear Caliper](#)
Courtesy of CHRYSLER GROUP, LLC

4. Install piston (1) into caliper piston (2) bore, pressing piston down to bottom of bore using hand-pressure. Using a piece of wood or wooden hammer handle may also suffice as long as piston and boot damage can be avoided.



[Fig. 54: Measuring Dust Boot Height](#)
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When installing dust boot in following step, use care not to over-install boot or damage will occur. The boot (3) will bottom in the counterbore before the top of the boot reaches the surface of the caliper. The boot will bottom with approximately 2 mm (1/16 inch) (2) of boot still showing above caliper housing.

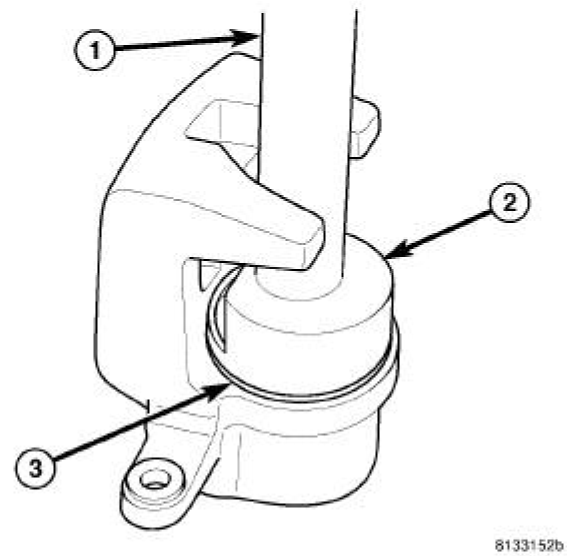


Fig. 55: Installing Dust Boot Using Tool
Courtesy of CHRYSLER GROUP, LLC

5. Seat dust boot (3) in caliper counterbore using Installer, Special Tool (special tool #9314, Installer, Dust Boot), with Handle, Special Tool (special tool #C-4171, Driver Handle, Universal). Install dust boot until it bottoms. Do not over-seat dust boot or damage will occur.

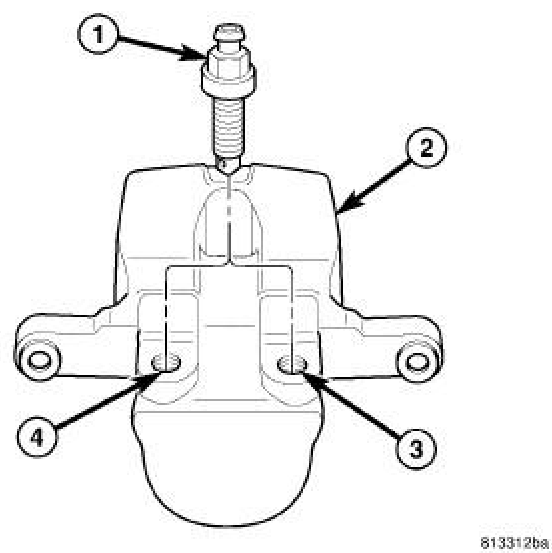

Fig. 56: Rear Caliper Bleeder Screw
Courtesy of CHRYSLER GROUP, LLC

6. Install bleeder screw in correct threaded hole. Caliper housing is not side-specific, so it is important to install bleeder screw in threaded hole that will be uppermost once caliper is installed on vehicle. Tighten bleeder screw to the proper **SPECIFICATIONS** .
7. Install caliper on vehicle. Refer to **CALIPER, DISC BRAKE, REAR, INSTALLATION** .

INSTALLATION

INSTALLATION

CAUTION: Always inspect brake pads before installing disc brake caliper and replace as necessary.

CAUTION: Use care when installing caliper onto disc brake adapter to avoid damaging boots on caliper guide pins.

1. Completely retract caliper piston back into bore of caliper. Use hand pressure or a C-clamp may be used to retract piston, first placing a wood block over piston before installing C-clamp to avoid damaging piston.
2. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.

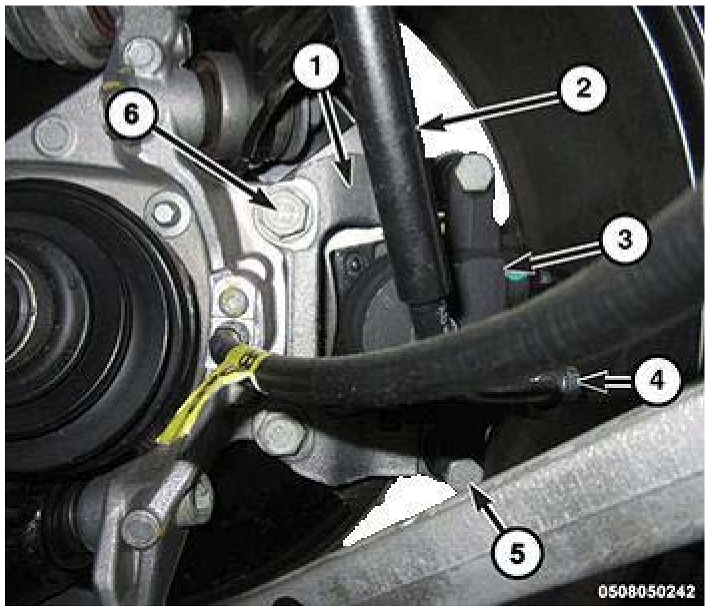

Fig. 57: Brake Caliper Components
Courtesy of CHRYSLER GROUP, LLC

3. Install the caliper (3) over brake pads and onto caliper adapter (3).

CAUTION: Extreme caution should be taken not to cross thread caliper guide pin bolts (2) when they are installed.

NOTE: Before installing the brake caliper guide pin bolts, clean guide pin bolt threads and apply MoparÂ® Lock AND Seal Adhesive or equivalent.

4. Align the brake caliper guide pin bolts (5) with the brake caliper adaptor (1). While holding guide pins from turning, tighten to the proper **SPECIFICATIONS** .
5. Install the brake hose to brake caliper banjo bolt (4) and tighten to the proper **SPECIFICATIONS** .

NOTE: Install NEW washers on each side of hose fitting as banjo bolt is placed through fitting.

6. Install the tire and wheel assembly. Refer to **INSTALLATION** .

7. Remove support and lower the vehicle.
8. Remove brake pedal holding tool.
9. Bleed the braking system. Refer to STANDARD PROCEDURE .
10. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake shoes.

CALIPER, DISC BRAKE, REAR SRT8

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to CAUTION and WARNING.

1. Using a brake pedal holding tool, depress brake pedal past its first inch of travel and hold it in this position. Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open.
2. Raise and support the vehicle. Refer to HOISTING, STANDARD PROCEDURE .
3. Remove the tire and wheel assembly. Refer to REMOVAL .

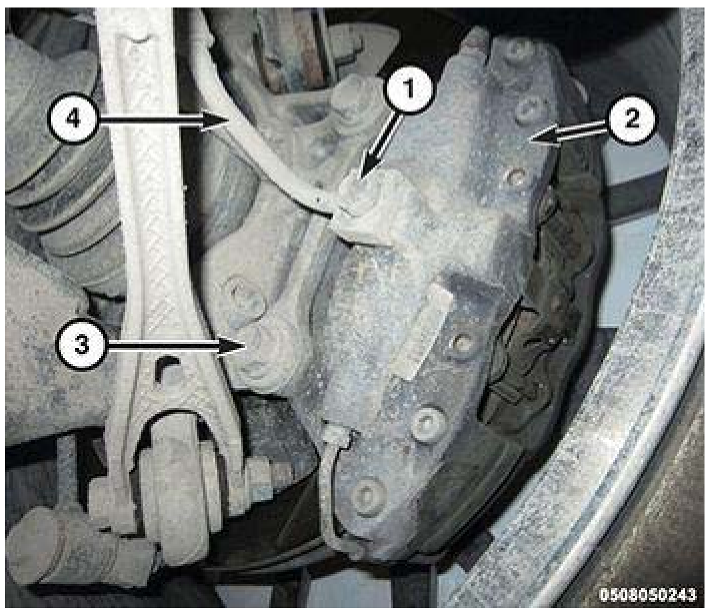

Fig. 58: Brake Caliper Components
Courtesy of CHRYSLER GROUP, LLC

4. Remove the brake hose to brake caliper banjo bolt (1). There are two sealing washers (one each side of hose fitting) that will come off when bolt is removed. Discard these washers; install **NEW** washers on installation.

CAUTION: When pushing pistons back into caliper bores, use only a trim stick as shown or other suitable soft tool. Never use a screwdriver or other metal pry bar due to potential damage to braking surface of rotor, caliper, pistons or dust boots.

5. Using trim stick, slowly apply pressure against brake pad until both pistons (on that side of caliper) are completely bottomed in bores of caliper half.

NOTE: **Repeat above procedure to opposite brake pad and pistons as necessary.**

6. Support spring link using a transmission jack or other appropriate jack. Raise spring link just enough to access the lower brake caliper to knuckle bolt (3).
7. Remove the brake caliper to knuckle bolts (3).
8. Remove brake caliper (2) with pads.
9. Remove the brake pads. Refer to **PADS, BRAKE, REMOVAL**.

NOTE: **These calipers are not serviceable. Do not attempt disassembly.**

INSTALLATION

INSTALLATION

CAUTION: **Always inspect brake pads before installing disc brake caliper and replace as necessary.**

1. Completely retract caliper pistons back into bores of caliper. Use hand pressure or a C-clamp may also be used to retract pistons, first placing a wood block or used brake pad (not to be reused) over piston before installing C-clamp to avoid damaging piston.
2. If brake pads need to be installed in caliper before installation. Refer to **PADS, BRAKE, INSTALLATION**.

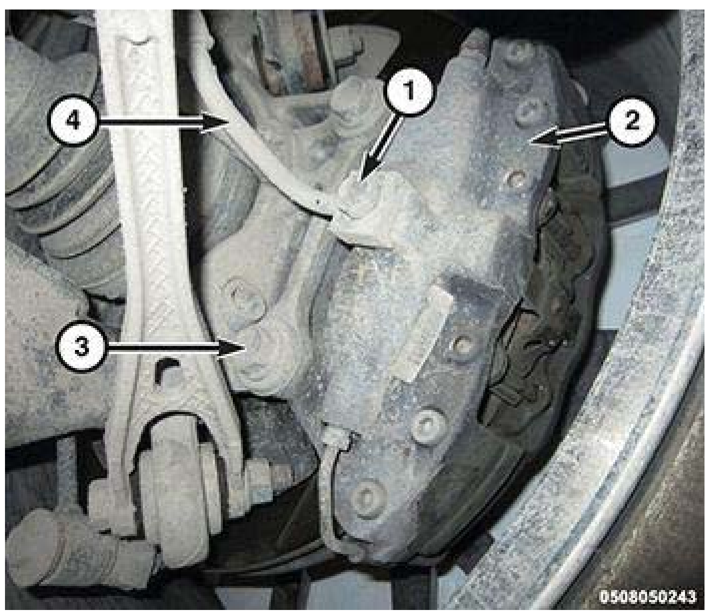

Fig. 59: Brake Caliper Components
Courtesy of CHRYSLER GROUP, LLC

3. Install the brake caliper (2) with pads onto the knuckle.
4. Install the brake caliper to knuckle bolts (1), and tighten to the proper **SPECIFICATIONS** .
5. Remove jack from under spring link.
6. Install brake hose to brake caliper banjo bolt (1), and tighten to the proper **SPECIFICATIONS** .

NOTE: Install NEW washers on each side of hose fitting as banjo bolt is placed through banjo fitting. Thread banjo bolt into caliper and tighten to the proper SPECIFICATIONS.

7. Install the tire and wheel assembly. Refer to **INSTALLATION** .
8. Remove support and lower the vehicle.
9. Remove brake pedal holding tool.
10. Bleed the braking system. Refer to **STANDARD PROCEDURE** .
11. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake pads. If NEW brake pads are installed, they need to be properly burnished. Refer to **PADS, BRAKE, STANDARD PROCEDURE**.

FLUID

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BRAKE FLUID CONTAMINATION

Indications of fluid contamination are swollen or deteriorated rubber parts.

Swollen rubber parts indicate the presence of petroleum in the brake fluid.

To test for contamination, put a small amount of drained brake fluid in clear glass jar. If fluid separates into layers, there is mineral oil or other fluid contamination of the brake fluid.

If brake fluid is contaminated, drain and thoroughly flush system. Replace master cylinder, proportioning valve, caliper seals, wheel cylinder seals, Antilock Brake hydraulic unit and all hydraulic fluid hoses.

SPECIFICATIONS

SPECIFICATIONS

The brake fluid used in this vehicle must conform to DOT 3 specifications and SAE J1703 standards. No other type of brake fluid is recommended or approved for usage in the vehicle brake system. Use only MoparÃ® Brake Fluid DOT 3 Motor Vehicle or equivalent from a tightly sealed container.

CAUTION: Never use reclaimed brake fluid or fluid from an container which has been left open. An open container of brake fluid will absorb moisture from the air and contaminate the fluid.

CAUTION: Never use any type of a petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid, etc.

MASTER CYLINDER, BRAKE

DESCRIPTION

DESCRIPTION

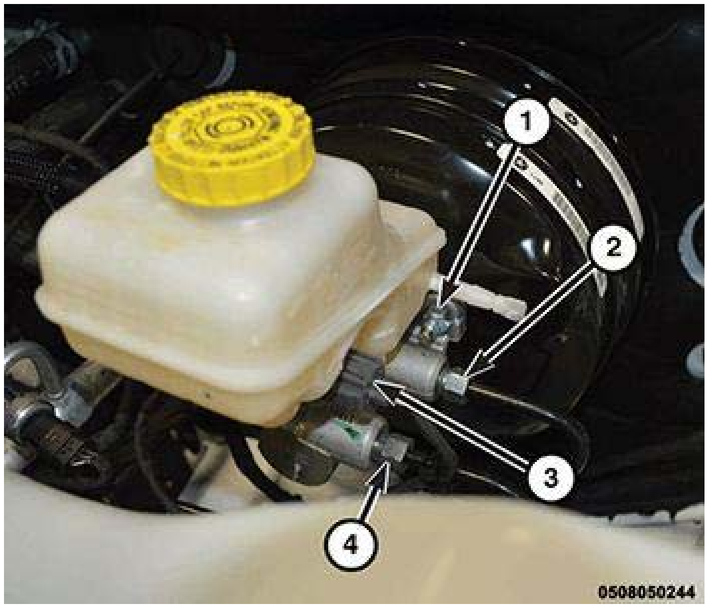

Fig. 60: Master Cylinder To Brake Booster Nut, Primary And Secondary Outlet Ports & Brake Fluid Level Sensor Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

All master cylinders are a two-outlet design and the brake tubes from these primary (2) and secondary (4) outlet ports lead directly to the Integrated Control Unit (ICU) before going to each wheel brake.

The master cylinder has the brake fluid reservoir mounted on top of it which gravity feeds brake fluid to the master cylinder when it is required. On manual transmission model vehicles the brake fluid reservoir also feeds the clutch hydraulic circuit. The reservoir is made of see-through plastic and it houses the brake fluid level switch (3).

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - MASTER CYLINDER/POWER BOOSTER

1. Start the engine and check the booster vacuum hose connections. A hissing noise indicates a vacuum leak. Correct any vacuum leaks before proceeding.
2. Stop the engine and pump the brake pedal until all vacuum reserve in the booster is depleted.
3. Press and hold the brake pedal under light foot pressure. The pedal should hold firm. If the pedal falls away, there may be an external leak or the master cylinder is faulty (internal leakage).
4. Start the engine and note pedal action. It should fall away slightly under light foot pressure, then hold firm. If no pedal action is discernible, the power booster, vacuum supply or vacuum check valve is faulty, proceed to the POWER BOOSTER VACUUM TEST.
5. If the POWER BOOSTER VACUUM TEST passes, rebuild the booster vacuum reserve as follows: Release the brake pedal. Increase engine speed to 1500 RPM, close the throttle and immediately turn off the ignition to stop the engine.
6. Wait a minimum of 90 seconds and try brake action again. The booster should provide two or more vacuum assisted pedal applications. If the vacuum assist is not provided, the booster is faulty.

POWER BOOSTER VACUUM TEST

1. Connect a vacuum gauge to the booster check valve with a short length of hose and T-fitting.

2. Start and run the engine at curb idle for one minute.
3. Observe the vacuum supply. If the vacuum supply is less that 12 inches HG (406 millibars), repair the vacuum supply.
4. Clamp the hose shut between the intake vacuum source and the check valve.
5. Stop the engine and observe the vacuum gauge.
6. If the vacuum drops more than one inch HG (33 millibars) within 15 seconds, the booster diaphragm or check valve is faulty.

POWER BOOSTER CHECK VALVE TEST

1. Remove the power booster check valve from the power booster.
2. Using a hand operated vacuum pump, apply 15-20 inches HG (508-677 millibars) vacuum at the booster side of the check valve.
3. The vacuum should hold steady. If the gauge on the pump indicates vacuum loss, the check valve is faulty and should be replaced.

STANDARD PROCEDURE

STANDARD PROCEDURE - MASTER CYLINDER BLEEDING

CAUTION: When clamping master cylinder in vise, only clamp master cylinder by its mounting flange. Do not clamp master cylinder piston rod, reservoir, seal or body.

1. Clamp master cylinder in a vise.

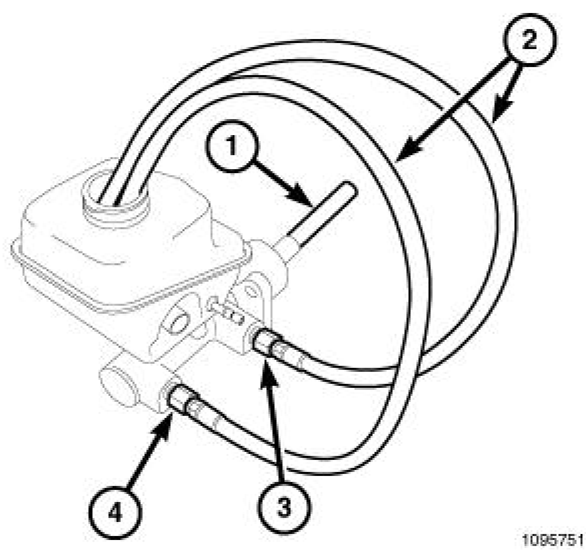

Fig. 61: Bleeding Tools On Master Cylinder
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When installing Adapters in master cylinder, do not overtighten. Damage to master cylinder could occur.

NOTE: Bleeder Adapters (special tool #9748-1, Adapter, Bleeder) and (special tool

#9748-2, Adapter, Bleeder) are not interchangeable. To avoid mix-up, Bleeder Adapter (special tool #9748-1, Adapter, Bleeder) is silver while Bleeder Adapter (special tool #9748-2, Adapter, Bleeder) is black.

2. Attach special tools for bleeding master cylinder in following fashion:
   a. Thread Bleeder Adapter (special tool #9748-2, Adapter, Bleeder) (3), into primary outlet port. Tighten to 14 N.m (124 in. lbs.).
   b. Thread Bleeder Adapter (special tool #9748-1, Adapter, Bleeder) (4), into secondary outlet port. Tighten to 14 N.m (124 in. lbs.).
   c. Thread a Bleeder Tube (special tool #8358-1, Bleed Tube) (2), into each Adapter. Tighten each tube to 14 N.m (124 in. lbs.). Flex each bleeder tube and place open end into mouth of fluid reservoir as far down as possible.

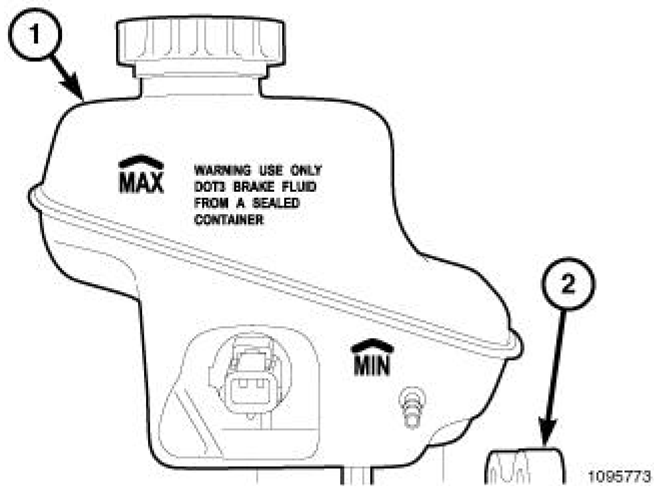

Fig. 62: Reservoir Fluid Level Markings
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Make sure open ends of bleeder tubes stay below surface of brake fluid once reservoir is filled to proper level.**

3. Fill brake fluid reservoir (1) to the MAX level with MoparÂ® brake fluid or equivalent conforming to DOT 3 specifications. Make sure fluid level is above tips of bleeder tubes in reservoir to ensure no air is ingested during bleeding.

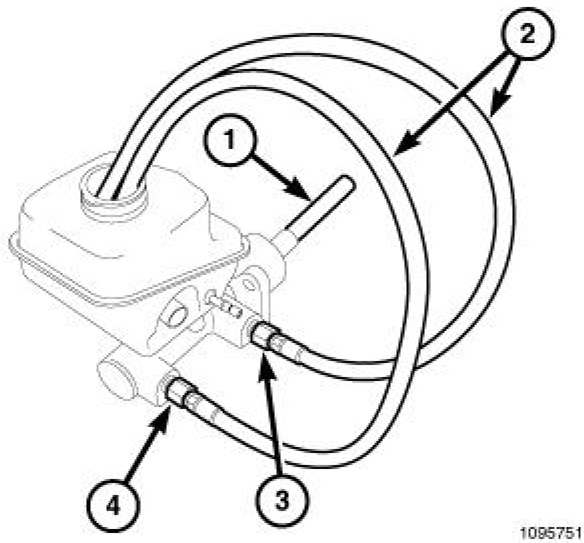

Fig. 63: Bleeding Tools On Master Cylinder
Courtesy of CHRYSLER GROUP, LLC

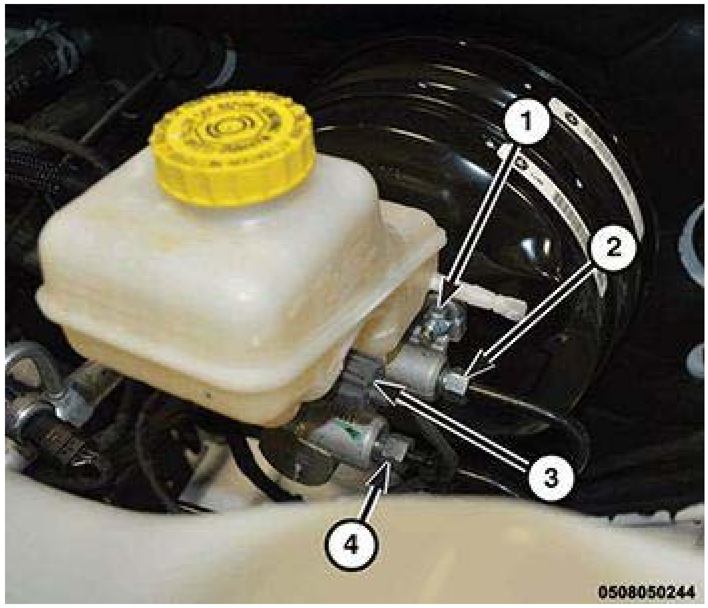
4. Using a wooden dowel as a pushrod (1), slowly depress master cylinder pistons, then release pressure, allowing pistons to return to released position. Repeat several times until all air bubbles are expelled. Make sure fluid level stays above tips of bleeder tubes in reservoir while bleeding.
5. Remove bleeder tubes (2) and adapters (3, 4) from master cylinder outlet ports, then plug outlet ports and install fill cap on reservoir.
6. Remove master cylinder from vise.
7. Install master cylinder on vehicle. Refer to **MASTER CYLINDER, BRAKE, INSTALLATION**.

REMOVAL

REMOVAL

CAUTION: Vacuum in power brake booster must be pumped down (removed) before removing master cylinder from power brake booster. This is necessary to prevent power brake booster from sucking in any contamination as master cylinder is removed. This can be done simply by pumping brake pedal, with vehicle's engine not running, until a firm feeling brake pedal is achieved.

1. With the engine not running, pump the brake pedal until a firm pedal is achieved (4-5 strokes).
2. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
3. Remove the windshield wiper cowl. Refer to **COVER, COWL PANEL, REMOVAL** .
4. Thoroughly clean all surfaces of the brake fluid reservoir and master cylinder. Use only MoparÃ® Brake Parts Cleaner or equivalent.

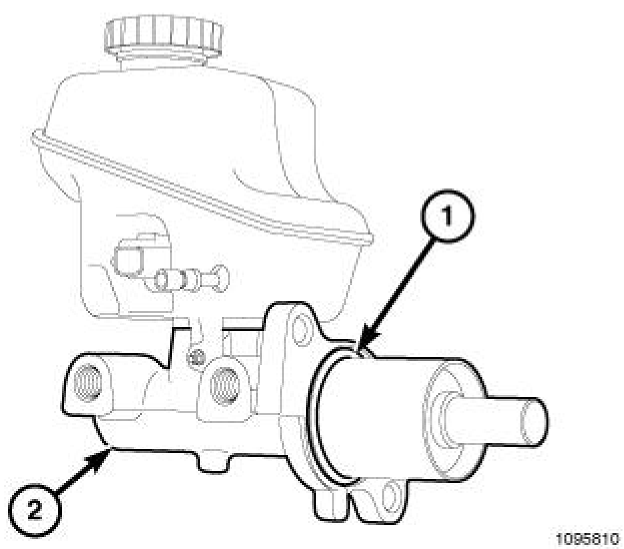


[Fig. 64: Master Cylinder To Brake Booster Nut, Primary And Secondary Outlet Ports & Brake Fluid Level Sensor Wire Harness Connector]
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the brake fluid level sensor wiring harness connector (3).
6. Disconnect the primary (2) and secondary (4) brake tubes from the master cylinder. Install sealing plugs in the open brake tube outlet ports.

CAUTION: Before removing master cylinder from power brake vacuum booster, master cylinder and vacuum booster must be thoroughly cleaned. This must be done to prevent dirt particles from falling into power brake vacuum booster. Use only MoparÃ® Brake Parts Cleaner or equivalent.

7. Remove the two nuts (1) attaching the master cylinder (3) to the power brake booster (1).
8. Slide the master cylinder straight out of the power brake booster.



[Fig. 65: Vacuum Seal On Rear Of Master Cylinder]

Courtesy of CHRYSLER GROUP, LLC

CAUTION: Vacuum seal (1) on rear of master cylinder (2) is used to allow vacuum ability in power brake vacuum booster. Vacuum seal MUST be replaced whenever master cylinder is removed from power brake vacuum booster.

9. Remove the vacuum seal (1) located on the mounting flange of the master cylinder (2). The vacuum seal is removed by **carefully** pulling it off the rear of master cylinder. **Do not attempt to pry the seal off the master cylinder by inserting a sharp tool between seal and the master cylinder casting. Damage can occur.**

INSTALLATION

INSTALLATION

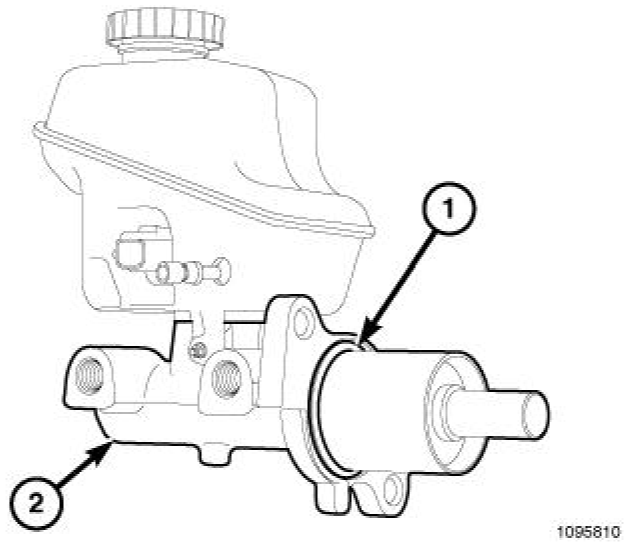


Fig. 66: Vacuum Seal On Rear Of Master Cylinder
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When replacing master cylinder on vehicle, a NEW vacuum seal (1) MUST be installed on master cylinder.

1. Thoroughly bleed master cylinder before installing it on vehicle. Refer to **MASTER CYLINDER, BRAKE, STANDARD PROCEDURE**.
2. Install a **NEW** vacuum seal (1) on rear of master cylinder (2) making sure seal fits squarely in mounting groove.

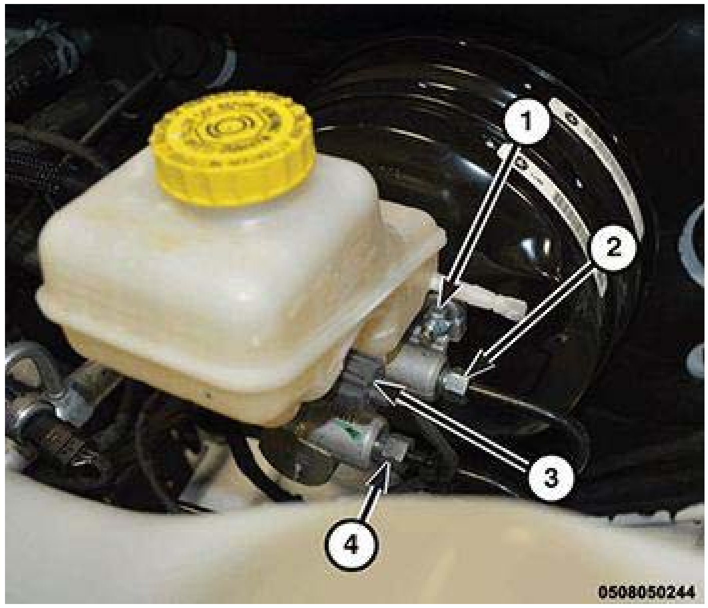

Fig. 67: Master Cylinder To Brake Booster Nut, Primary And Secondary Outlet Ports & Brake Fluid Level Sensor Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

3. Position master cylinder on studs of power brake booster, aligning booster push rod with master cylinder piston.
4. Install two **NEW** Master Cylinder to Brake Booster Nuts (1). Tighten to the proper **SPECIFICATIONS** .
5. Thread primary (2) and secondary (4) brake tubes into master cylinder primary and secondary ports. Tighten Brake Tube Nuts to the proper **SPECIFICATIONS** .
6. Connect the brake fluid level sensor wiring harness connector (4).
7. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.

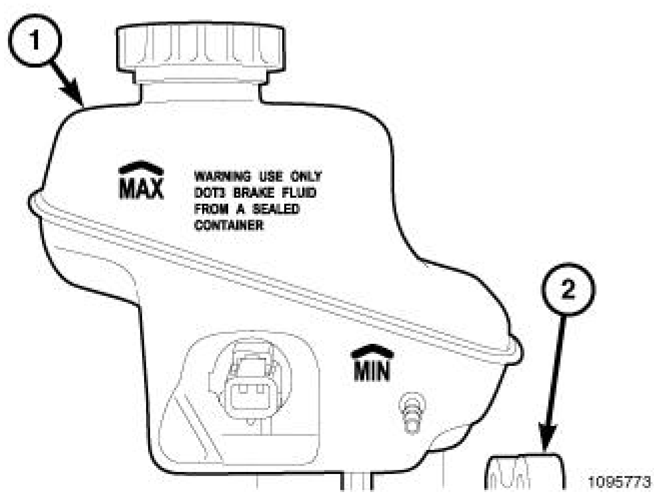

Fig. 68: Reservoir Fluid Level Markings
Courtesy of CHRYSLER GROUP, LLC

.

WARNING: Be certain a firm brake pedal is achieved prior to attempting vehicle operation. If a firm brake pedal cannot be achieved, bleed entire brake hydraulic system and check for leaks.

8. Fill master cylinder fluid reservoir (1) with clean, fresh MoparÃ® Brake Fluid or equivalent.
9. Install access panel in cowl area.
10. Road test vehicle to ensure proper operation of brakes.

PADS, BRAKE

STANDARD PROCEDURE

STANDARD PROCEDURE - BRAKE PAD BURNISHING - SRT8

CAUTION: After installing NEW brake pads, keep in mind that braking effectiveness might be somewhat reduced during the first brake applications.

When NEW brake pads are installed on a vehicle, this procedure must be used to correctly burnish (seat) the brake linings to the brake rotor discs.

1. Accelerate the vehicle to a steady speed of about 40 mph (65 km/h).
2. Using light brake pedal pressure, slow the vehicle from 40 mph to 0 mph in approximately 6 seconds.
3. Accelerate back up to 40 mph for approximately one minute to allow the brakes to cool down.
4. Repeat this procedure 15 to 20 times to correctly seat the brake lining material.

REMOVAL

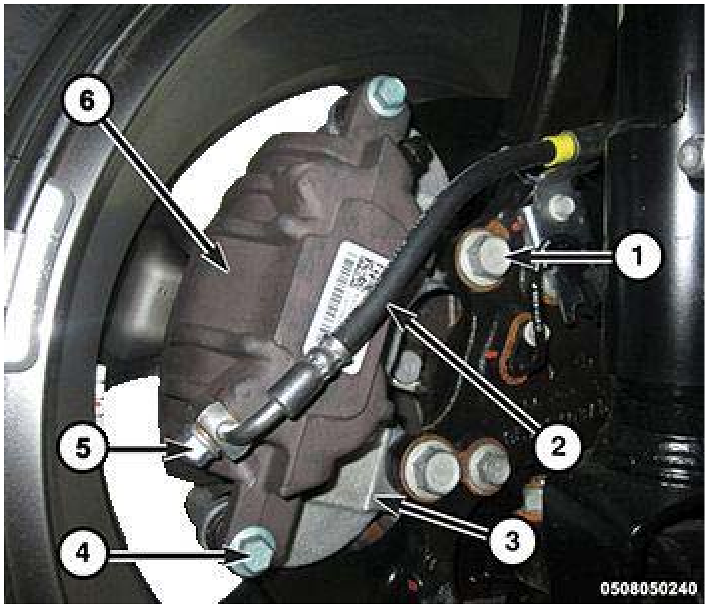
FRONT (EXCEPT SRT8)

NOTE: Before proceeding, refer to CAUTION and WARNING.

NOTE: Removal process is the same for both sides of the vehicle.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the tire and wheel assembly. Refer to **REMOVAL** .

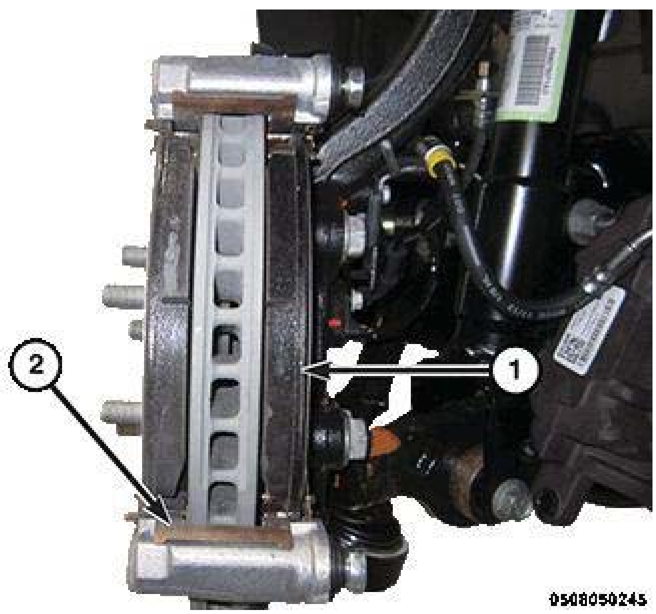
NOTE: In some cases, it may be necessary to retract caliper piston in its bore a small amount in order to provide sufficient clearance between shoes and rotor to easily remove caliper from knuckle. This can usually be accomplished before guide pin bolts are removed by grasping rear of caliper and pulling outward working with guide pins, thus retracting piston. Never push on piston directly as it may get damaged.



[Fig. 69: Brake Caliper Components]
Courtesy of CHRYSLER GROUP, LLC

3. Remove the two brake caliper guide pin bolts (4).
4. Remove the brake caliper (6) from the brake caliper adapter bracket (3) and position it aside.

NOTE: **Use care when installing the caliper onto the adapter bracket to avoid damaging the guide pin boot.**



[Fig. 70: Brake Pad & Anti-Rattle Clip]
Courtesy of CHRYSLER GROUP, LLC

5. Remove the brake pads (1) from caliper adapter.
6. If necessary, remove anti-rattle clips (2) from upper and lower abutments of adapter.

SRT8

NOTE: **Review all Warnings and Cautions. Refer to WARNING.**

NOTE: **Removal process is the same for both sides of the vehicle.**

NOTE: **Six piston caliper shown, four piston caliper similar.**

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the tire and wheel assembly. Refer to **REMOVAL** .

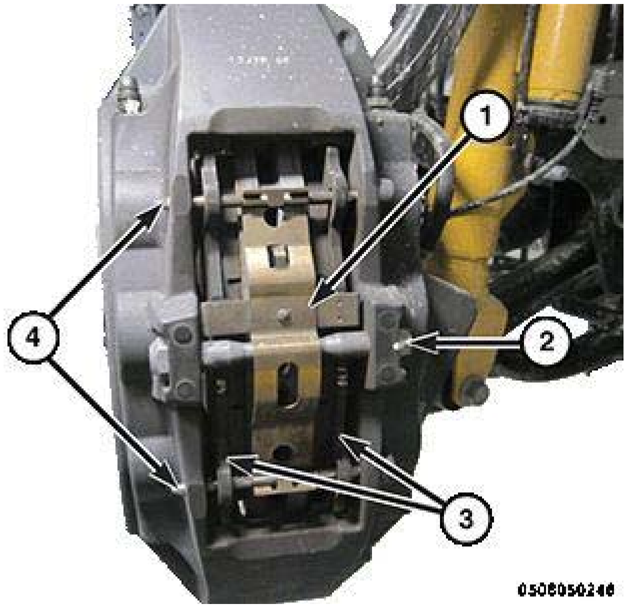


Fig. 71: Brake Caliper Components
Courtesy of CHRYSLER GROUP, LLC

3. Using hammer and pin punch on the outboard end, remove the lower brake pad support pin (4) out of the caliper.
4. Remove brake pad spring clip (1) out from under the upper support pin (4) still in caliper.
5. Using hammer and pin punch on the outboard end, remove the upper brake pad support pin (4) out of the caliper.
6. If equipped, remove the brake caliper center support bolt (2).

CAUTION: **When pushing pistons back into caliper bores, if hand pressure is not sufficient, use only a trim stick as shown or other suitable soft tool to do so. Never use a screwdriver or other metal pry bar due to potential damage to braking surface of rotor or pads.**

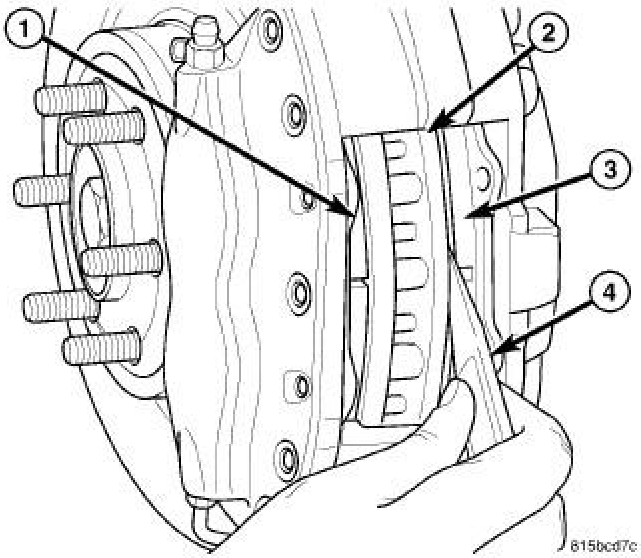

Fig. 72: Pushing Back Pistons Into Bores
Courtesy of CHRYSLER GROUP, LLC

7. Using hand pressure, pull pads back to seat caliper pistons into bores if possible. If not possible, perform the following to do this correctly without damaging the caliper, pistons, dust boots or brake rotor disc.
    a. Place trim stick (3) between inboard brake pad and outer edge of rotor (1).
    b. Using trim stick (3), apply pressure against the inboard brake pad until both pistons are completely bottomed in bores of inboard caliper half. Leave trim stick in place to hold pistons in place.
    c. Place second trim stick between outboard brake pad and rotor, then repeat above step on outboard pad and pistons.

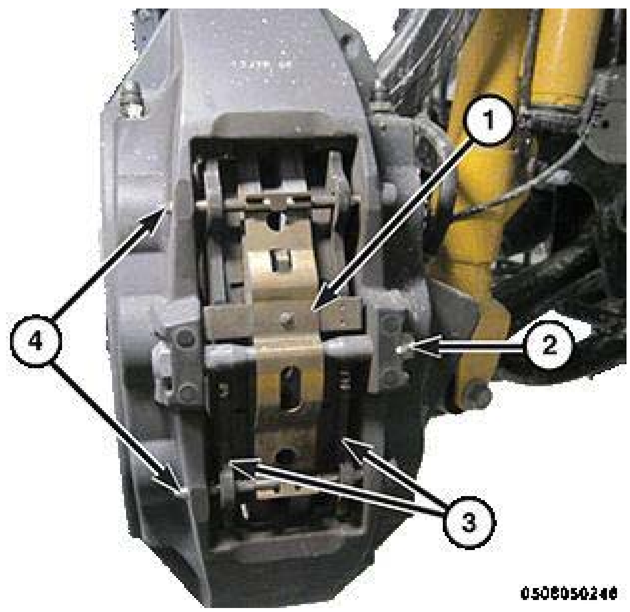

Fig. 73: Brake Caliper Components
Courtesy of CHRYSLER GROUP, LLC

8. Remove the brake pads (3) through opening in caliper.
9. Once brake pads are removed from caliper, inspect all four caliper pistons and dust boots for evidence of

brake fluid leakage. Also inspect dust boots on all caliper pistons for any cuts, tears or heat cracks and brake pad supports (if equipped) for excess wear or damage. If caliper fails inspection, it should be replaced.

REAR (EXCEPT SRT8)

NOTE: **Before proceeding, refer to CAUTION and WARNING.**

NOTE: **Removal process is the same for both sides of the vehicle.**

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the tire and wheel assembly. Refer to **REMOVAL** .

NOTE: **In some cases, it may be necessary to retract caliper piston in its bore a small amount in order to provide sufficient clearance between shoes and rotor to easily remove caliper from knuckle. This can usually be accomplished before guide pin bolts are removed by grasping rear of caliper and pulling outward working with guide pins, thus retracting piston. Never push on piston directly as it may get damaged.**

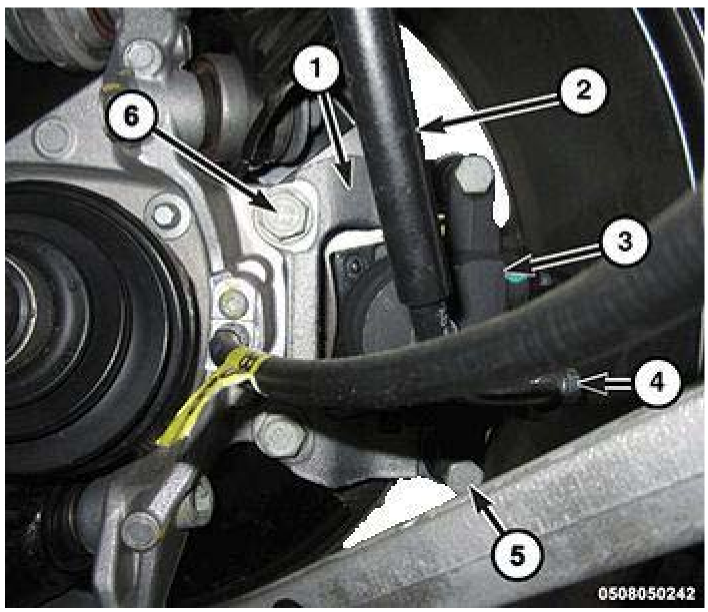

Fig. 74: Brake Caliper Components
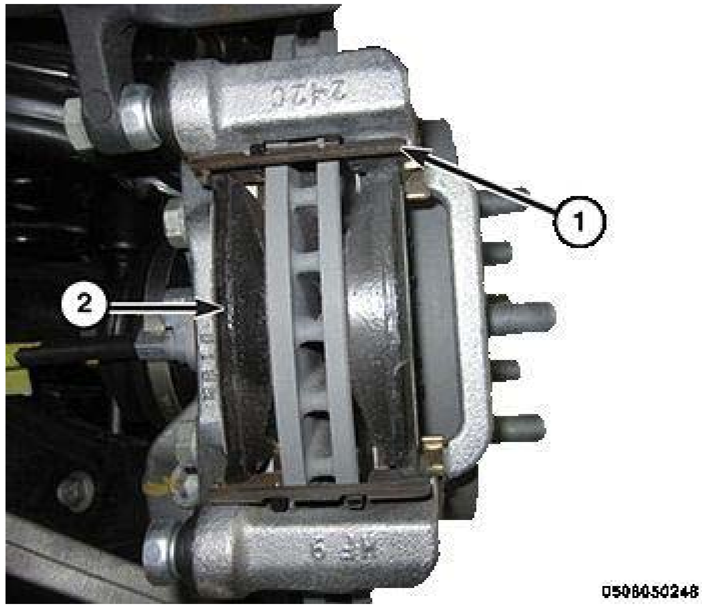
Courtesy of CHRYSLER GROUP, LLC

3. Remove the two brake caliper guide pin bolts (5).
4. Remove the brake caliper (3) from the brake caliper adapter bracket (1) and position it aside.

NOTE: **Use care when installing the caliper onto the adapter bracket to avoid damaging the guide pin boot.**



[Fig. 75: Brake Pad & Anti-Rattle Clip](#)
Courtesy of CHRYSLER GROUP, LLC

5. Remove the brake pads (2) from caliper adapter.
6. If necessary, remove anti-rattle clips (1) from upper and lower abutments of adapter (4).

SRT8

NOTE: **Review all Warnings and Cautions. Refer to WARNING.**

NOTE: **Removal process is the same for both sides of the vehicle.**

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the tire and wheel assembly. Refer to **REMOVAL** .

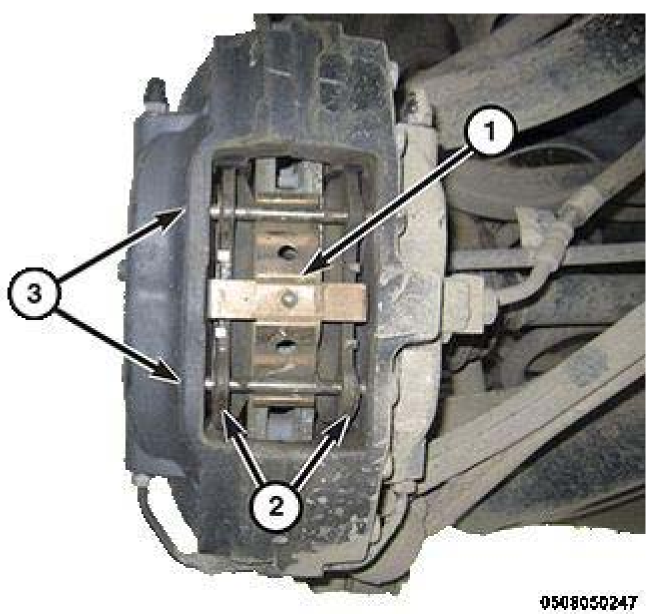


Fig. 76: Brake Caliper Components

Courtesy of CHRYSLER GROUP, LLC

3. Using hammer and pin punch on the outboard end, remove the lower brake pad support pin (3) out of the caliper.
4. Remove brake pad spring clip (1) out from under the upper support pin (3) still in caliper.
5. Using hammer and pin punch on the outboard end, remove the upper brake pad support pin (3) out of the caliper.

CAUTION: When pushing pistons back into caliper bores, if hand pressure is not sufficient, use only a trim stick as shown or other suitable soft tool to do so. Never use a screwdriver or other metal pry bar due to potential damage to braking surface of rotor or pads.

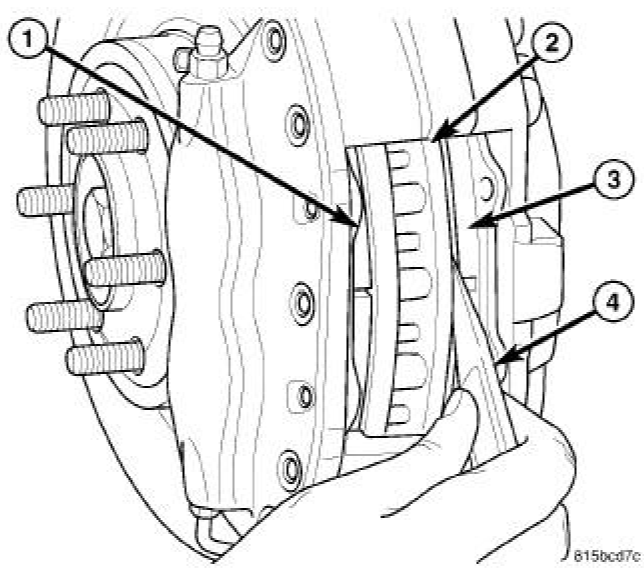

Fig. 77: Pushing Back Pistons Into Bores
Courtesy of CHRYSLER GROUP, LLC

6. Using hand pressure, pull pads back to seat caliper pistons into bores if possible. If not possible, perform the following to do this correctly without damaging the caliper, pistons, dust boots or brake rotor disc.
   a. Place trim stick (3) between inboard brake pad and outer edge of rotor (1).
   b. Using trim stick (3), apply pressure against the inboard brake pad until both pistons are completely bottomed in bores of inboard caliper half. Leave trim stick in place to hold pistons in place.
   c. Place second trim stick between outboard brake pad and rotor, then repeat above step on outboard pad and pistons.

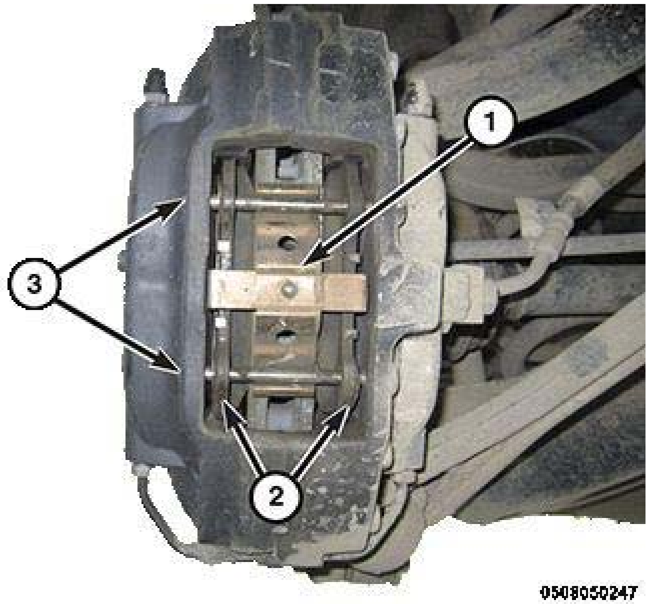

Fig. 78: Brake Caliper Components
Courtesy of CHRYSLER GROUP, LLC

7. Remove the brake pads (2) through opening in caliper.
8. Once brake pads are removed from caliper, inspect all four caliper pistons and dust boots for evidence of brake fluid leakage. Also inspect dust boots on all caliper pistons for any cuts, tears or heat cracks and brake pad supports (if equipped) for excess wear or damage. If caliper fails inspection, it should be replaced.

CLEANING

CLEANING

WARNING: **Chrysler LLC does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.**

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

INSPECTION

INSPECTION

Visually inspect brake pads for uneven lining wear. Also inspect for excessive lining deterioration. Check the clearance between the tips of the wear indicators (if equipped) on the pads and the brake rotors.

If a visual inspection does not adequately determine the condition of the lining, a physical check will be necessary. To check the amount of lining wear, remove the disc brake pads from the vehicle.

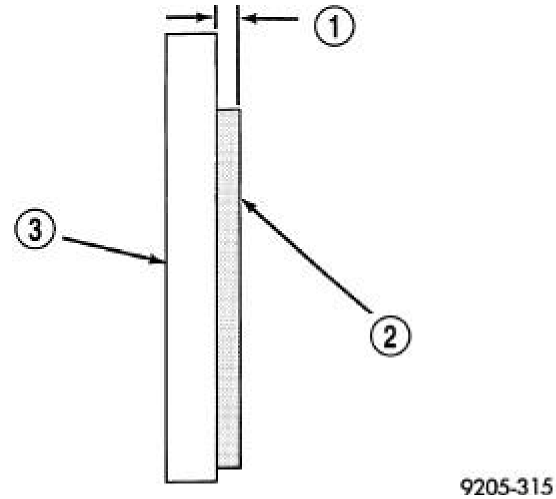

Fig. 79: Brake Pad Friction Material Thickness Measurement
Courtesy of CHRYSLER GROUP, LLC

Measure brake pad minimum thickness (1). Brake pads must be replaced when usable material on a brake pad lining (2) measured at its **thinnest point** measures one millimeter (0.04 inches) or less.

If a brake pad fails inspection, replace **both** disc brake pads (inboard and outboard) at each caliper. It is also necessary to replace the pads on the opposite side of the vehicle as well as the pads failing inspection to maintain proper braking characteristics.

If the brake pad assemblies do not require replacement, be sure to reinstall the brake pads in the original position they were removed from.

NOTE: **It is important to inspect both front and rear brake pads during the same inspection.**

INSTALLATION

FRONT (EXCEPT SRT8)

NOTE: **Installation process is the same for both sides of the vehicle.**

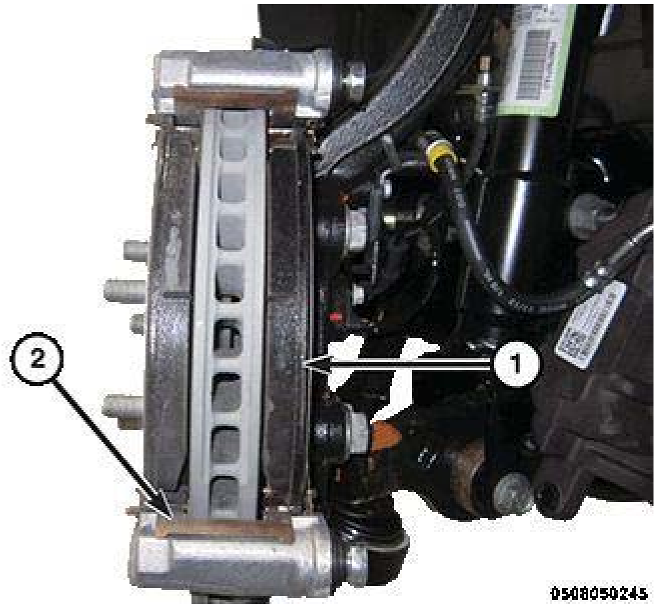

Fig. 80: Brake Pad & Anti-Rattle Clip
Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the abutment shims (2) onto the brake caliper adapter bracket.
2. If equipped, remove the film from the brake pad double sticky isolator.
3. Install the brake pads (1) onto the brake caliper adapter bracket.

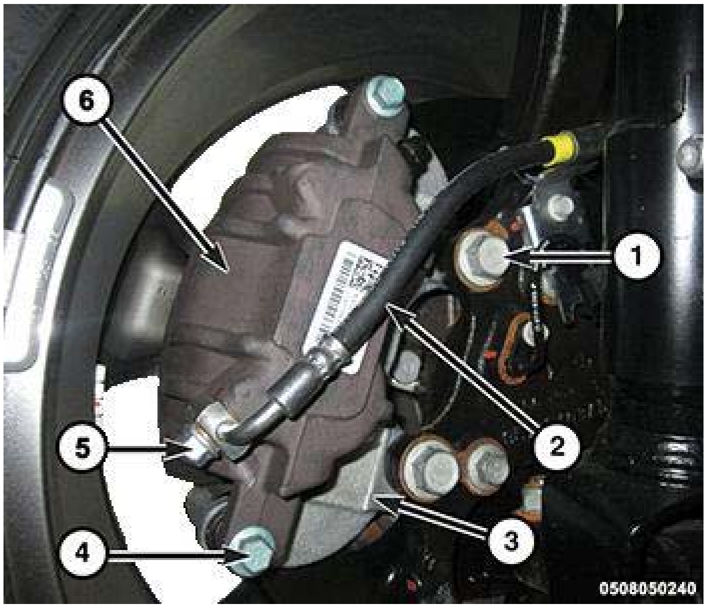

Fig. 81: Brake Caliper Components
Courtesy of CHRYSLER GROUP, LLC

4. Completely retract the caliper piston back into the bore of the caliper. Use a C-clamp to retract the piston. Place a wood block over the piston before installing the C-clamp to avoid damaging the piston.

NOTE:	**Use care when installing the caliper onto the adapter bracket to avoid damaging the guide pin boots.**

5. Install the brake caliper (6) onto the front brake caliper adapter bracket (3).
6. Install the brake caliper guide pin bolts (4) and tighten to the proper **SPECIFICATIONS** .
7. Install the tire and wheel assembly. Refer to **INSTALLATION** .
8. Remove the support and lower the vehicle.
9. Pump brake pedal several times to set pads to caliper and brake rotor.

CAUTION: **When NEW brake pads have been installed, keep in mind that braking effectiveness might be somewhat reduced during the first brake applications following installation.**

10. Check and adjust brake fluid level in reservoir.
11. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake shoes.

SRT8

NOTE: **Installation process is the same for both sides of the vehicle.**

NOTE: **Six piston caliper shown, four piston similar.**

NOTE: **On vehicles with the four piston calipers only, it is required to apply the copper paste on the brake pads between the pad and loose stainless shims as well as the side abutments.**

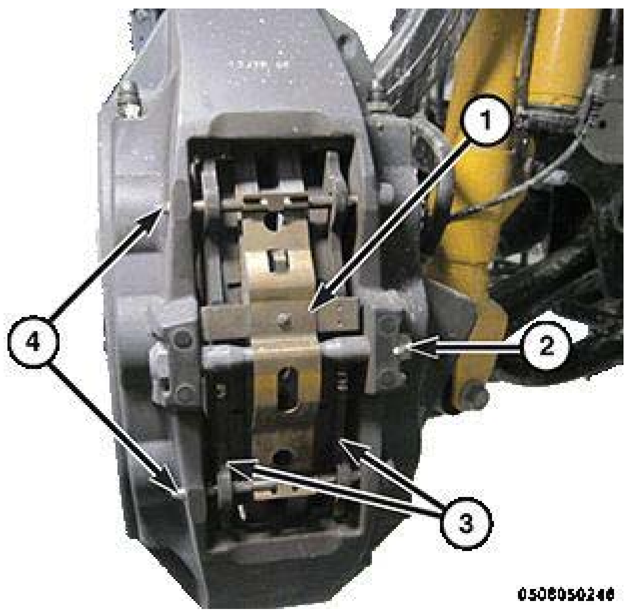

Fig. 82: Brake Caliper Components
Courtesy of CHRYSLER GROUP, LLC

1. Make sure all caliper pistons are fully seated (bottomed) in bores.
2. If equipped, remove the film from the brake pad double sticky isolator.
3. Slide the **NEW** brake pads into opening in disc brake caliper.
4. From inboard side, slide upper brake pad support pin (4) through caliper and upper holes in both brake pads (3). Ensure that the small end of support pin is in the hole in outboard half of caliper.

5. If equipped, install the brake caliper center support bolt (2), and tighten to the proper **SPECIFICATIONS** .
6. Install upper end of brake pad spring clip (1) under upper brake pad support pin (4).
7. Press on lower end of spring clip (1) until it touches brake rotor.
8. From inboard side, slide lower brake pad support pin (4) through caliper and lower holes in both brake pads (3). Ensure that the small end of support pin is in hole in outboard half of caliper.
9. Release the spring clip (1) allowing it to engage lower support pin.
10. From inboard side, seat upper and lower support pins (4) into caliper using pin punch and hammer. Support pins must be driven into caliper until support pin retaining rings are locked into place.
11. Once support pins are fully installed into caliper, inspect assembled caliper to make sure spring clip (1) is centered in opening of caliper, correctly engaging upper and lower support pins, and is resting against both brake pads (3).
12. Install the tire and wheel assembly. Refer to **INSTALLATION** .
13. Remove the support and lower the vehicle.
14. Pump brake pedal several times to set pads to caliper and brake rotor.
15. Check and adjust brake fluid level in reservoir.

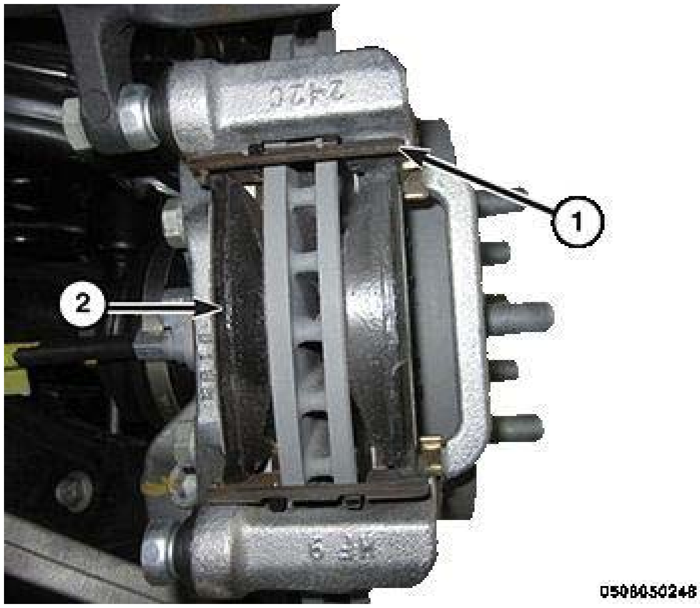
CAUTION: When NEW brake pads have been installed, keep in mind that braking effectiveness might be somewhat reduced during the first brake applications following installation.

NOTE: When NEW brake pads are installed, they must be burnished (seated) to the rotor. This must be done to ensure the proper performance of the replacement brake pads.

16. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake pad linings. NEW brake pads need to be burnished properly. Refer to **PADS, BRAKE, STANDARD PROCEDURE**.

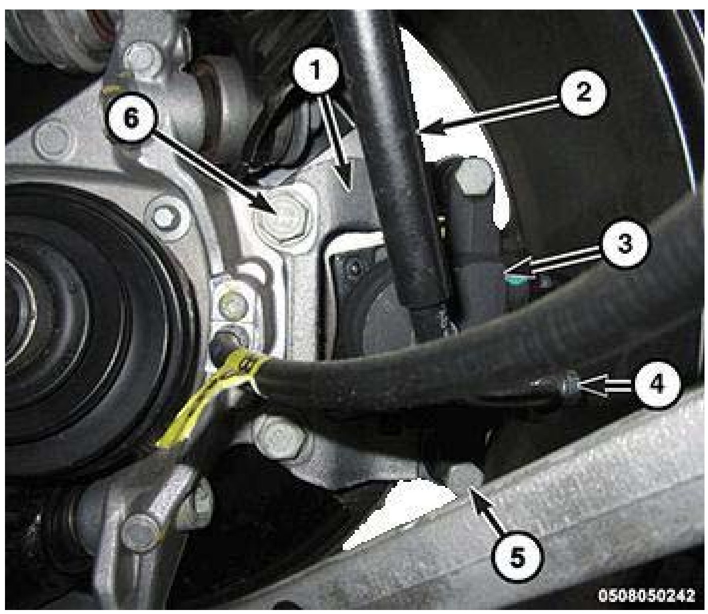
REAR (EXCEPT SRT8)

NOTE: Installation process is the same for both sides of the vehicle.



[Fig. 83: Brake Pad & Anti-Rattle Clip]
Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the abutment shims (1) onto the brake caliper adapter bracket.
2. If equipped, remove the film from the brake pad double sticky isolator.
3. Install the brake pads (2) onto the brake caliper adapter bracket.



[Fig. 84: Brake Caliper Components]
Courtesy of CHRYSLER GROUP, LLC

4. Completely retract the caliper piston back into the bore of the caliper. Use a C-clamp to retract the piston. Place a wood block over the piston before installing the C-clamp to avoid damaging the piston.

NOTE: **Use care when installing the caliper onto the adapter bracket to avoid damaging the guide pin boot.**

5. Install the brake caliper (3) onto the front brake caliper adapter bracket (1).
6. Install the brake caliper guide pin bolts (5) and tighten to the proper **SPECIFICATIONS** .
7. Install the tire and wheel assembly. Refer to **INSTALLATION** .
8. Remove the support and lower the vehicle.
9. Pump brake pedal several times to set pads to caliper and brake rotor.

CAUTION: When NEW brake pads have been installed, keep in mind that braking effectiveness might be somewhat reduced during the first brake applications following installation.

10. Check and adjust brake fluid level in reservoir.
11. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake shoes.

SRT8

NOTE: Installation process is the same for both sides of the vehicle.

NOTE: On vehicles with the four piston calipers only, it is required to apply the copper paste on the brake pads between the pad and loose stainless shims as well as the side abutments.

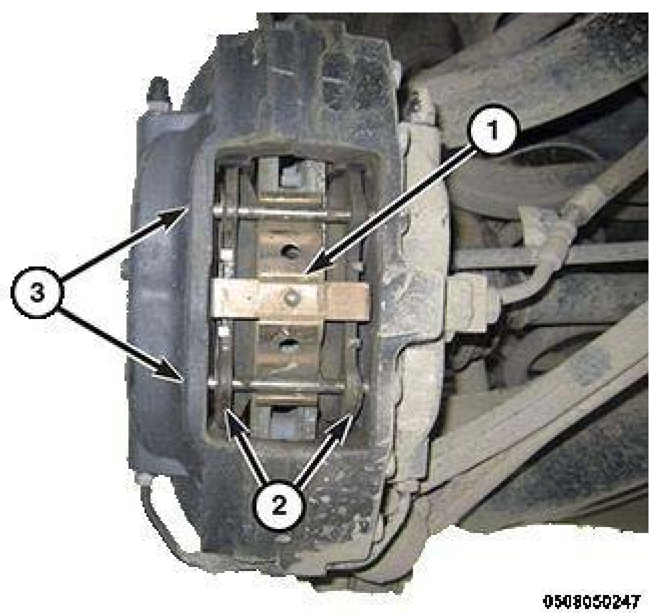


Fig. 85: Brake Caliper Components
Courtesy of CHRYSLER GROUP, LLC

1. Make sure all caliper pistons are fully seated (bottomed) in bores.
2. If equipped, remove the film from the brake pad double sticky isolator.
3. Slide the **NEW** brake pads into opening in disc brake caliper.
4. From inboard side, slide upper brake pad support pin (4) through caliper and upper holes in both brake pads (2). Ensure that the small end of support pin is in the hole in outboard half of caliper.
5. Install upper end of brake pad spring clip (1) under upper brake pad support pin (3).

6. Press on lower end of spring clip (1) until it touches brake rotor.
7. From inboard side, slide lower brake pad support pin (3) through caliper and lower holes in both brake pads (2). Ensure that the small end of support pin is in hole in outboard half of caliper.
8. Release the spring clip (1) allowing it to engage lower support pin.
9. From inboard side, seat upper and lower support pins (3) into caliper using pin punch and hammer. Support pins must be driven into caliper until support pin retaining rings are locked into place.
10. Once support pins are fully installed into caliper, inspect assembled caliper to make sure spring clip (1) is centered in opening of caliper, correctly engaging upper and lower support pins, and is resting against both brake pads (2).
11. Install the tire and wheel assembly. Refer to **INSTALLATION** .
12. Remove the support and lower the vehicle.
13. Pump brake pedal several times to set pads to caliper and brake rotor.
14. Check and adjust brake fluid level in reservoir.

CAUTION: When NEW brake pads have been installed, keep in mind that braking effectiveness might be somewhat reduced during the first brake applications following installation.

NOTE: When NEW brake pads are installed, they must be burnished (seated) to the rotor. This must be done to ensure the proper performance of the replacement brake pads.

15. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake pad linings. NEW brake pads need to be burnished properly. Refer to **PADS, BRAKE, STANDARD PROCEDURE**.

PEDAL(S), BRAKE AND/OR ACCELERATOR

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Remove driver side silencer under instrument panel.
3. Remove steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .

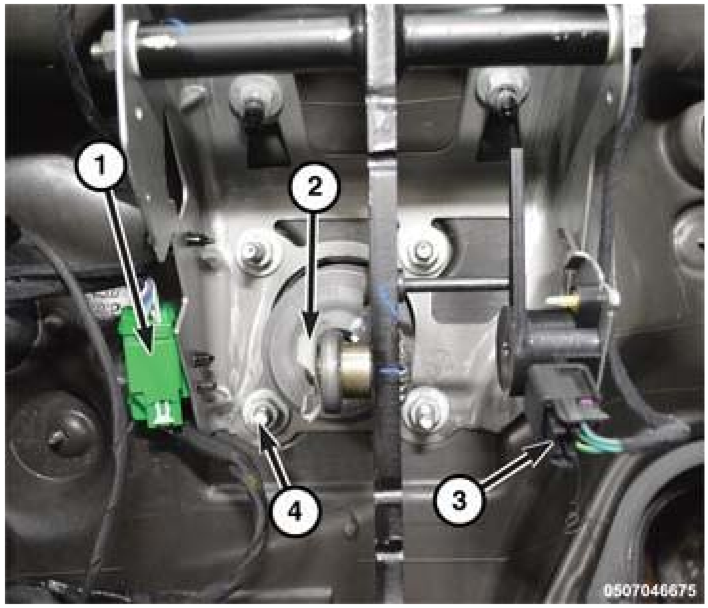

Fig. 86: Removing/Installing Pedal
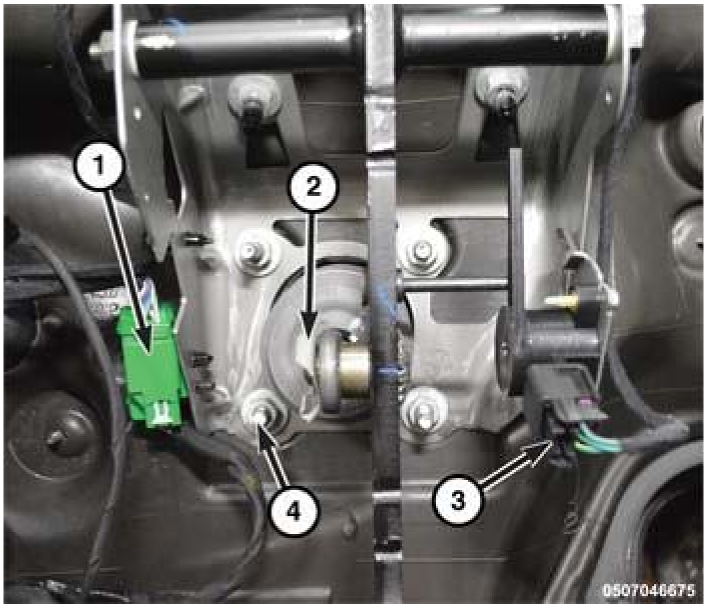
Courtesy of CHRYSLER GROUP, LLC

4. Remove stop lamp switch wiring harness connector (3).
5. Remove booster push rod from pin on brake pedal. To do so:
    a. Position small screwdriver between center tang on power brake booster brake pedal pin retaining clip.
    b. Rotate screwdriver enough to allow retaining clip center tang to pass over end of brake pedal pin, then slide retaining clip off brake pedal pin.
    c. **Discard retaining clip (2). It is not to be reused. Install NEW retaining clip when assembling.**
6. Slide booster push rod off brake pedal pin.
7. Remove four power brake booster mounting nuts (4).
8. Remove two nuts fastening pedal bracket to upper dash panel.
9. Push power brake booster forward into engine compartment as far as possible by hand. Do not force it.
10. Remove brake pedal assembly.

INSTALLATION

INSTALLATION



[Fig. 87: Removing/Installing Pedal]
Courtesy of CHRYSLER GROUP, LLC

1. Install the brake pedal assembly under instrument panel and slide over booster push rod.
2. From engine compartment side, push power brake booster mounting studs back through dash panel and brake pedal bracket.
3. Install two upper mounting nuts fastening pedal bracket to upper dash panel. **Do not tighten at this time.**
4. Install the four Brake Pedal/Booster Nuts (4), and tighten to the proper **SPECIFICATIONS** .
5. Tighten two upper Brake Pedal/Booster Nuts (1) to the proper **SPECIFICATIONS** .
6. Slide booster push rod onto brake pedal pin. Install **NEW** retaining clip (3) securing push rod to brake pedal.
7. Connect the stop lamp switch wiring harness connector (3).
8. Install steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .
9. Install driver side silencer under instrument panel.
10. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.
11. Road test vehicle testing operation of brakes.

RESERVOIR, BRAKE MASTER CYLINDER

REMOVAL

REMOVAL

1. Remove the brake master cylinder and brake master cylinder reservoir assembly. Refer to **MASTER CYLINDER, BRAKE, REMOVAL**.
2. Thoroughly clean all surfaces of brake fluid reservoir and master cylinder. Use only MoparÂ® Brake Parts Cleaner or equivalent.

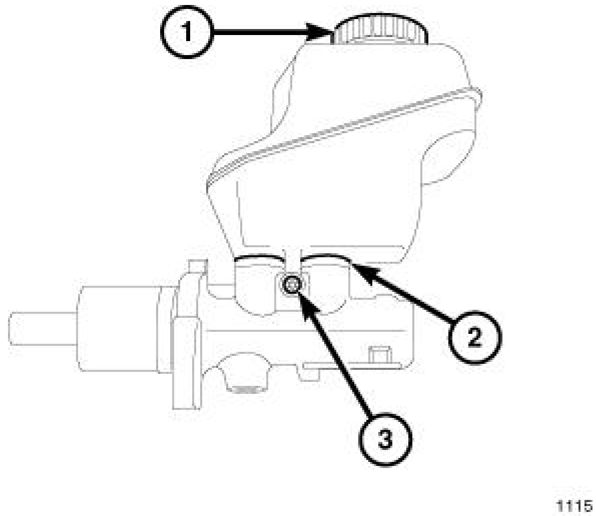


Fig. 88: Fluid Reservoir Mounting
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When removing fluid reservoir from the master cylinder, do not pry off using any type of tool. This can damage the fluid reservoir or master cylinder housing.

3. Remove screw (3) fastening fluid reservoir to master cylinder housing.
4. Rock the brake fluid reservoir side-to-side while pulling up to remove it from seal grommets in master cylinder housing.

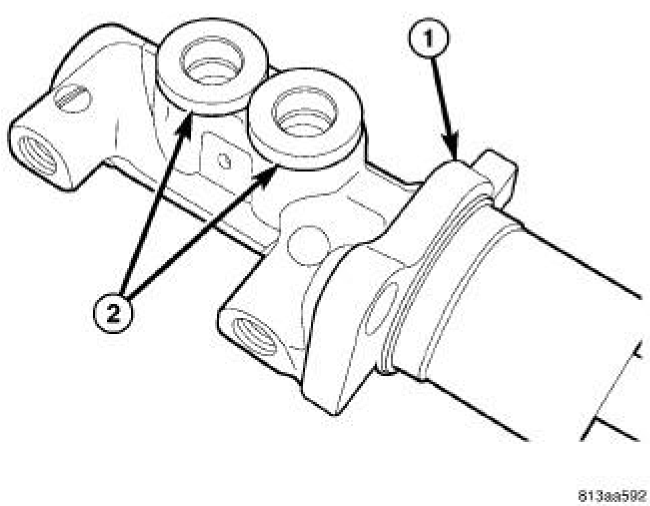

Fig. 89: Reservoir Seal Grommets
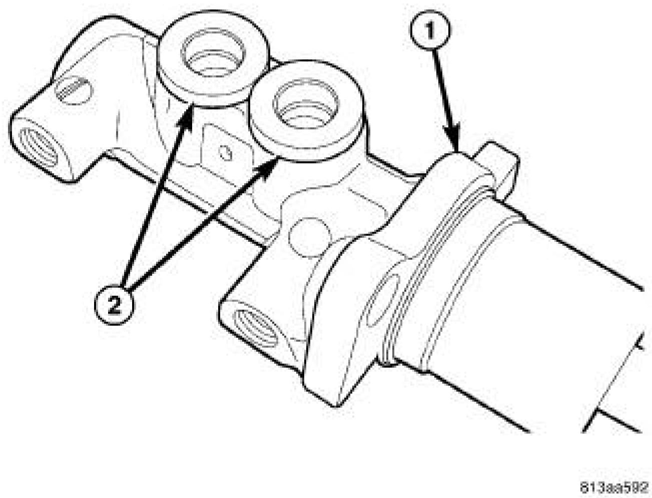
Courtesy of CHRYSLER GROUP, LLC

5. Remove two brake fluid reservoir seal grommets (2) from master cylinder housing (1).

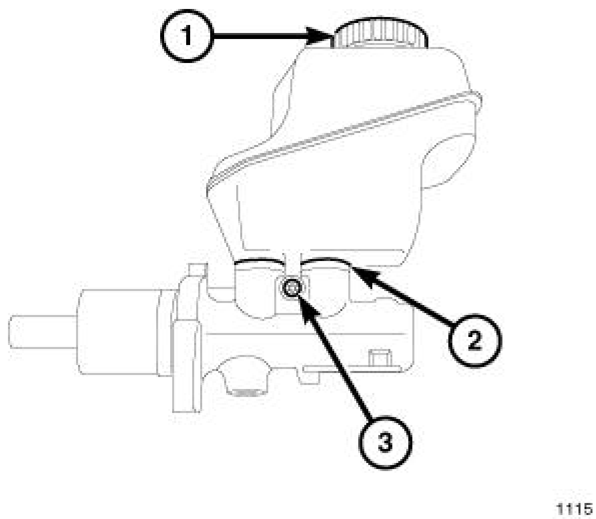
INSTALLATION

INSTALLATION



[Fig. 90: Reservoir Seal Grommets](#)
Courtesy of CHRYSLER GROUP, LLC

1. Install **NEW** brake fluid reservoir sealing grommets (2) in master cylinder housing (1).



[Fig. 91: Fluid Reservoir Mounting](#)
Courtesy of CHRYSLER GROUP, LLC

2. Lubricate reservoir mounting area with fresh clean brake fluid. Place reservoir in position over sealing grommets. Seat reservoir into sealing grommets using a rocking motion while firmly pressing down on fluid reservoir. Once installed, make sure fluid reservoir is touching the top of both sealing grommets (2) or reservoir is not properly installed.
3. Install and tighten the brake fluid reservoir to master cylinder bolt (3).
4. Install the brake master cylinder and brake master cylinder reservoir assembly. Refer to **MASTER CYLINDER, BRAKE, INSTALLATION**.

ROTOR, BRAKE

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BRAKE ROTOR

Any servicing of the rotor requires extreme care to maintain the rotor within service tolerances to ensure proper brake action.

Excessive runout or wobble in a rotor can increase pedal travel due to piston knock-back. This increases guide pin sleeve wear due to the tendency of the caliper to follow the rotor wobble.

When diagnosing a brake noise or pulsation, the machined disc braking surface should be inspected.

BRAKING SURFACE INSPECTION

Light braking surface scoring and wear is acceptable. If heavy scoring or warping is evident, the rotor must be refaced or replaced. Refer to **ROTOR, BRAKE, STANDARD PROCEDURE**.

Excessive wear and scoring of the rotor can cause improper lining contact on the rotor's braking surface. If the ridges on the rotor are not removed before new brake shoes are installed, improper wear of the shoes will result.

If a vehicle has not been driven for a period of time, the rotor's braking surface will rust in the areas not covered by the brake shoes at that time. Once the vehicle is driven, noise and chatter from the disc brakes can result when the brakes are applied.

Some discoloration or wear of the rotor surface is normal and does not require resurfacing when linings are replaced. If cracks or burned spots are evident, the rotor must be replaced.

ROTOR MINIMUM THICKNESS

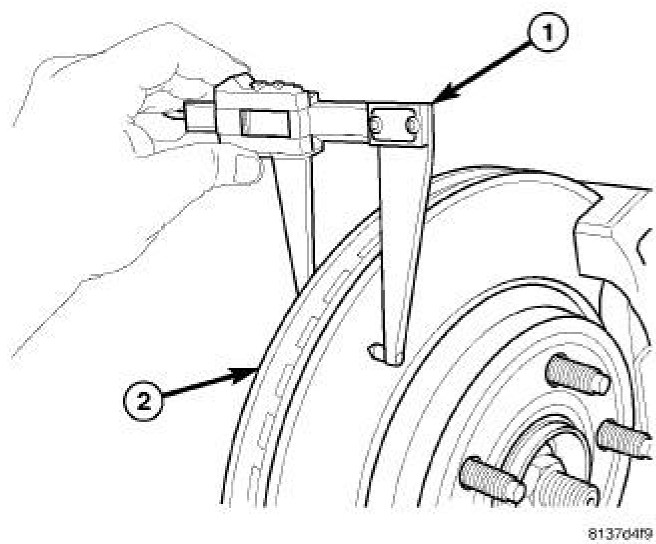


Fig. 92: Measuring Rotor Thickness
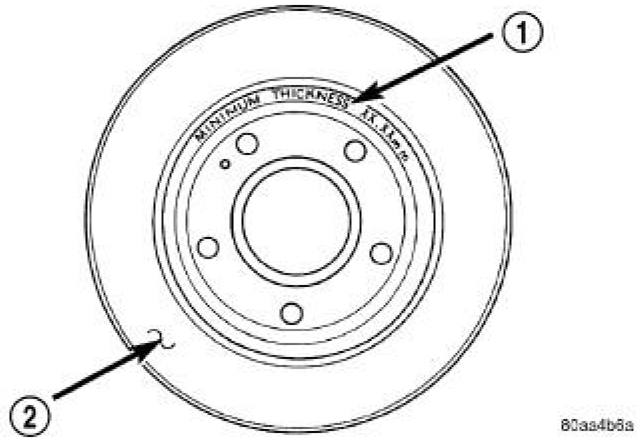
Courtesy of CHRYSLER GROUP, LLC

Measure rotor thickness (1) at the center of the brake shoe contact surface. Replace the rotor if it is worn below minimum thickness or if machining the rotor will cause its thickness to fall below specifications.

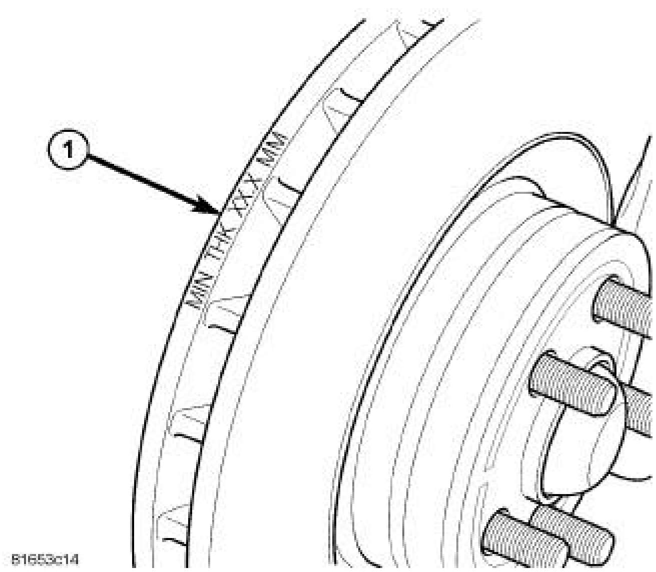
CAUTION: **Do not machine the rotor if it will cause the rotor to fall below minimum thickness.**



[Fig. 93: Minimum Brake Rotor Thickness Markings (Typical)](#)
Courtesy of CHRYSLER GROUP, LLC

1 - ROTOR MINIMUM THICKNESS MARKING
2 - ROTOR

Most minimum thickness specifications (1) are cast into the rotor's unmachined surface (2). Some brake rotors have the minimum thickness specification located elsewhere. Refer to the following paragraph. Limits can also be found in this component's specification table. Refer to **ROTOR, BRAKE, SPECIFICATIONS**.



[Fig. 94: Minimum Thickness Markings On Rotor Edge](#)
Courtesy of CHRYSLER GROUP, LLC

The minimum thickness specification is stamped into the outer diameter edge (1) (along vented end) of the disc.

ROTOR THICKNESS VARIATION

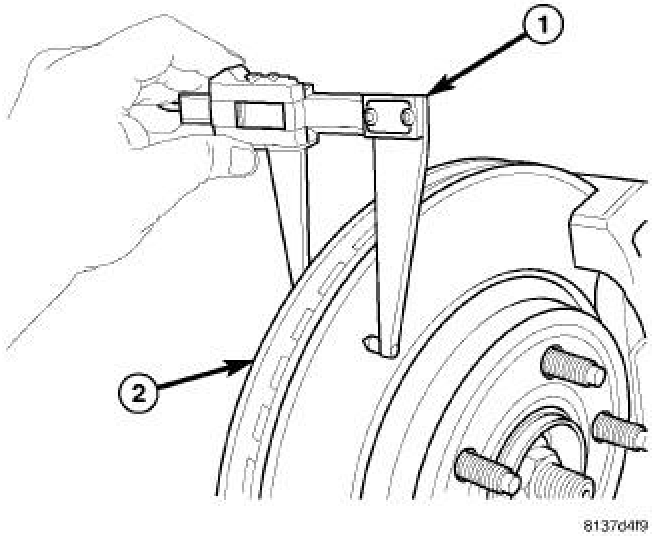


Fig. 95: Measuring Rotor Thickness
Courtesy of CHRYSLER GROUP, LLC

Thickness variation in a rotor's braking surface can result in pedal pulsation, chatter and surge. This can also be caused by excessive runout in the rotor or the hub.

Rotor thickness variation measurements should be made in conjunction with measuring runout. Measure thickness of the brake rotor (2) at 12 equal points around the rotor braking surface with a micrometer (1) at a radius approximately 25 mm (1 inch) from edge of rotor. If thickness measurements vary beyond the specification listed in the specification table, the rotor should be refaced or replaced. Refer to **ROTOR, BRAKE, SPECIFICATIONS** or **ROTOR, BRAKE, STANDARD PROCEDURE**.

ROTOR RUNOUT

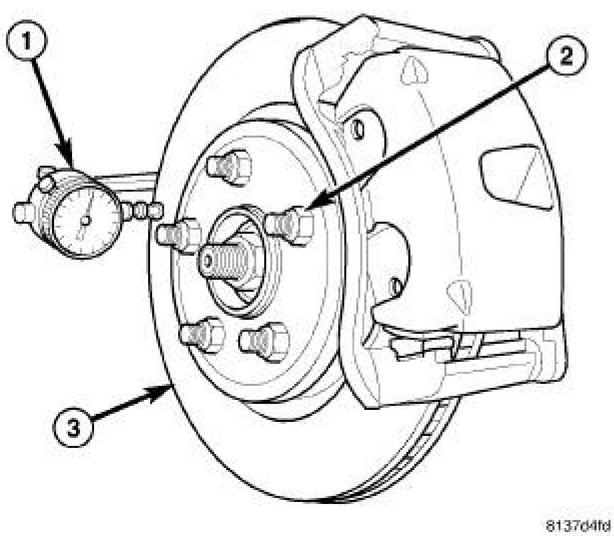

Fig. 96: Measuring Rotor Runout
Courtesy of CHRYSLER GROUP, LLC

On-vehicle rotor runout is the combination of the individual runout of the hub face and the runout of the brake rotor (hub runout can be measured separately). To measure rotor runout on the vehicle:

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove tire and wheel assembly. Refer to **REMOVAL** .
3. Install standard wheel mounting nuts, flat side to rotor, on all studs (2). Progressively tighten nuts to 150 N.m (110 ft. lbs.).
4. Mount Dial Indicator (special tool #C-3339A, Set, Dial Indicator) (1), with Whee, (special tool #25-W, Roller Contact Point), or equivalent, to knuckle. Position Dial Indicator Wheel to contact rotor braking surface approximately ten millimeters from outer edge of rotor (3).
5. Slowly rotate brake rotor checking lateral runout, marking the low and high spots. Record these measurements.
6. Check and record runout of opposite side of rotor in same fashion, marking the low and high spots.
7. Compare runout measurement to specifications. Refer to **ROTOR, BRAKE, SPECIFICATIONS**.

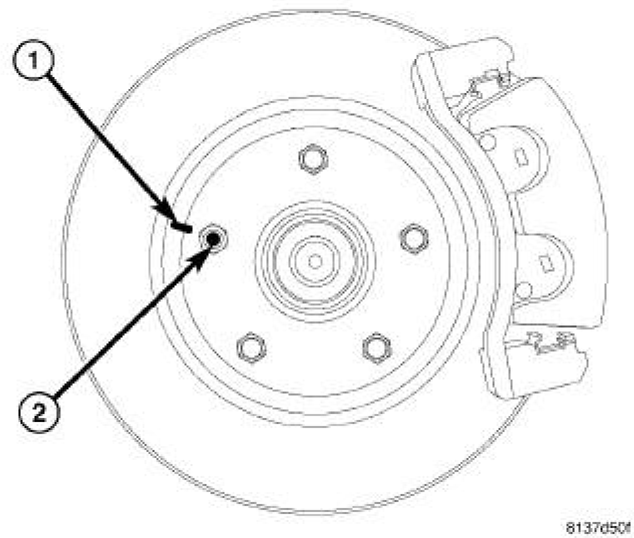

Fig. 97: Wheel Stud & Rotor Index Marked
Courtesy of CHRYSLER GROUP, LLC

If runout is in excess of specifications, check the lateral runout of the hub face. Before removing the rotor from the hub, place a chalk mark across both the rotor (1) and the one wheel stud (2) closest to where the high runout measurement was taken. This way, the original mounting spot of the rotor on the hub is indexed.

8. Remove the rotor from the hub. Refer to **ROTOR, BRAKE, REMOVAL**.

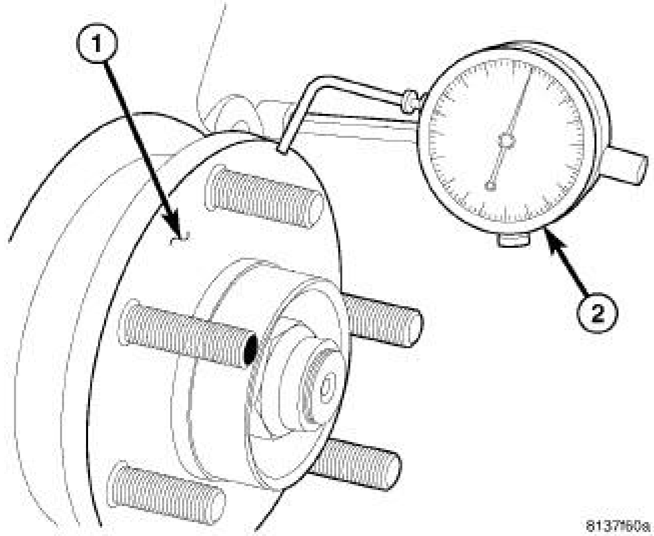

Fig. 98: Measuring Hub Runout
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Before measuring hub runout, clean the hub face surface with an appropriate cleaner. This provides a clean surface to get an accurate indicator reading.**

9. Mount Dial Indicator (special tool #C-3339A, Set, Dial Indicator) (2), to the knuckle. Position Dial Indicator stem so it contacts hub face (1) near outer diameter. Care must be taken to position stem outside of stud circle, but inside of chamfer on the hub rim.
10. Slowly rotate hub measuring runout. Hub runout should not exceed 0.01 mm (0.0004 inch). If runout exceeds this specification, the hub must be replaced. Refer to **HUB AND BEARING, REMOVAL** .

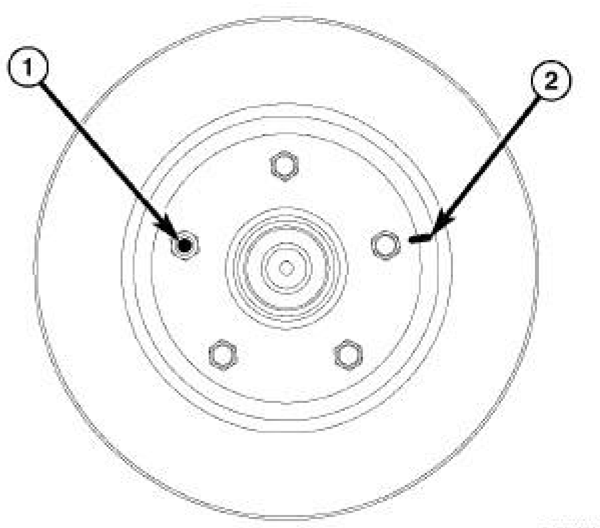

Fig. 99: Rotor Reindexed On Wheel Studs
Courtesy of CHRYSLER GROUP, LLC

11. If hub runout does not exceed this specification, install original rotor back on hub, aligning chalk mark on rotor (2) with a wheel mounting stud, two studs apart from original stud (1).

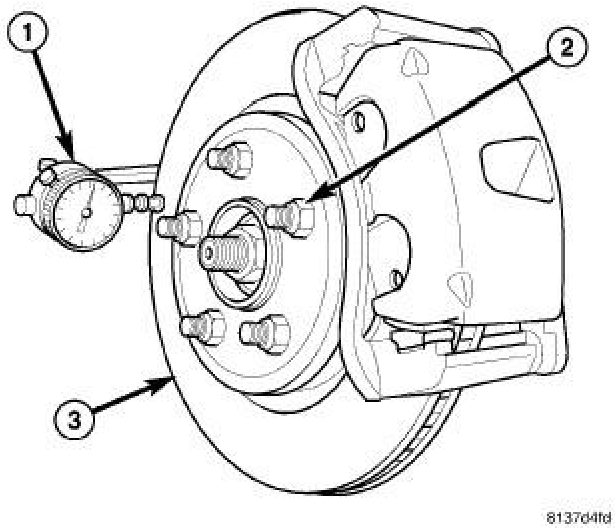

Fig. 100: Measuring Rotor Runout
Courtesy of CHRYSLER GROUP, LLC

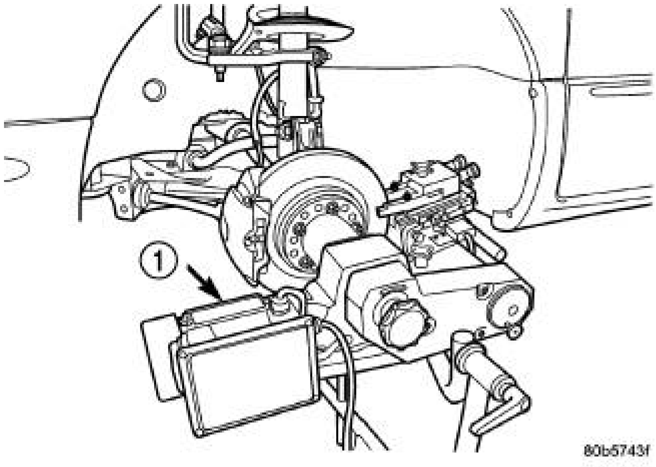
12. Tighten the lug nuts to the proper **WHEELS, SPECIFICATIONS** .
13. Mount Dial Indicator (1) and remeasure runout on both sides of the brake rotor as explained in earlier steps to see if runout is now within specifications. Refer to **ROTOR, BRAKE, SPECIFICATIONS**.
14. If runout is still not within specifications, reface or replace brake rotor. Refer to **ROTOR, BRAKE, STANDARD PROCEDURE**.

STANDARD PROCEDURE

STANDARD PROCEDURE - BRAKE ROTOR MACHINING

NOTE: **Refacing the rotor is not required each time the brake pads are replaced, only when the need is foreseen.**

Any servicing of the rotor requires extreme care to maintain the rotor within service tolerances to ensure proper brake action.



[Fig. 101: On-Car Brake Lathe]

Courtesy of CHRYSLER GROUP, LLC

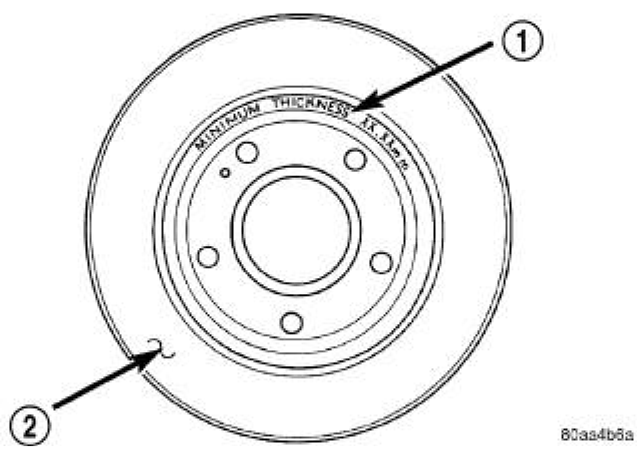
1 - ON-CAR BRAKE LATHE

If the rotor surface is deeply scored or warped, or there is a complaint of brake roughness or brake pedal pulsation, the rotor should be refaced using a hub-mounted on-car brake lathe (1), or replaced.

The use of a hub-mounted on-car brake lathe (1) is highly recommended to eliminate the possibility of excessive runout. It trues the brake rotor to the vehicle's hub and bearing.

Minimum allowable thickness is the minimum thickness to which the brake rotor machined surface may be cut.

CAUTION: **Do not machine the rotor if it will cause the rotor to fall below minimum thickness.**



[Fig. 102: Minimum Brake Rotor Thickness Markings (Typical)]

Courtesy of CHRYSLER GROUP, LLC

NOTE: **Most brake rotors (2) have markings for minimum allowable thickness specification cast into an unmachined surface of the rotor or stamped into the hat section (1). Some brake rotors have the minimum thickness specification located elsewhere. Refer to the following paragraph. Minimum thickness specifications can also be found in this component's specification table. Refer**

to ROTOR, BRAKE, SPECIFICATIONS.

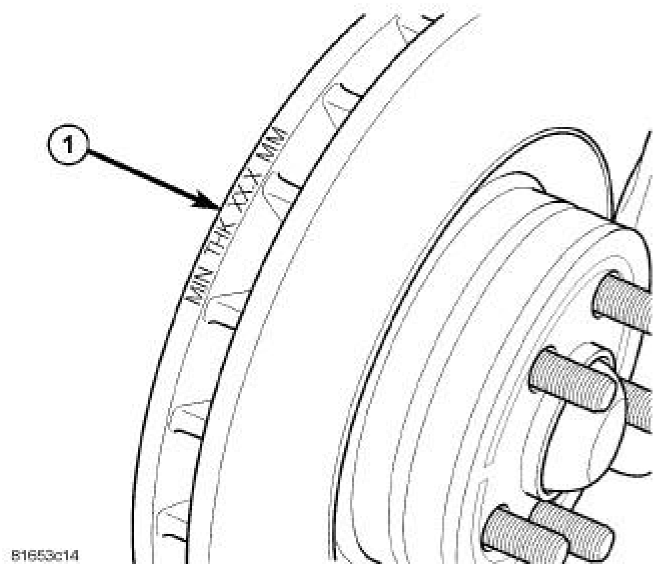


Fig. 103: Minimum Thickness Markings On Rotor Edge
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The minimum thickness specification is stamped into the outer diameter edge (1) (along vented end) of the disc.**

Before lathe installation, verify the brake rotor face and the hub adapters are free of any chips, rust, or contamination.

When mounting and using the brake lathe, strict attention to the brake lathe manufacturer's operating instructions is required.

Machine both sides of the brake rotor at the same time. Cutting both sides at the same time minimizes the possibility of a tapered or uneven cut.

When refacing a rotor, the required TIR (Total Indicator Reading) and thickness variation limits MUST BE MAINTAINED. Extreme care in the operation of rotor turning equipment is required. Specifications for brake rotor machining can be found in ROTOR, BRAKE, SPECIFICATIONS.

SPECIFICATIONS

SPECIFICATIONS

NOTE: **When refacing a rotor, the required TIR (Total Indicator Reading) and thickness variation limits MUST BE MAINTAINED. Extreme care in the operation of rotor turning (machining) equipment is required.**

LIMITS/SPECIFICATIONS - 17 INCH BRAKES (BASE)

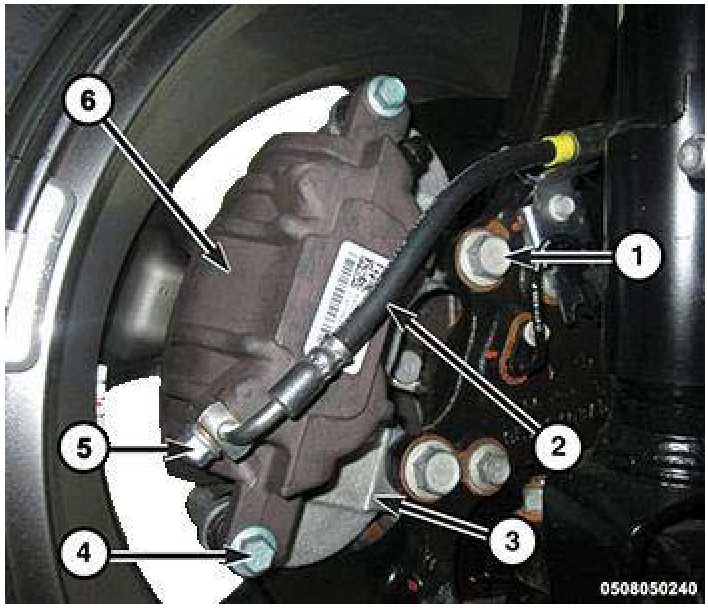
REMOVAL

FRONT-NON SRT

NOTE: **Before proceeding, refer to WARNING and CAUTION.**

NOTE: **Removal process is the same for both sides of the vehicle.**

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the tire and wheel assembly. Refer to **REMOVAL** .

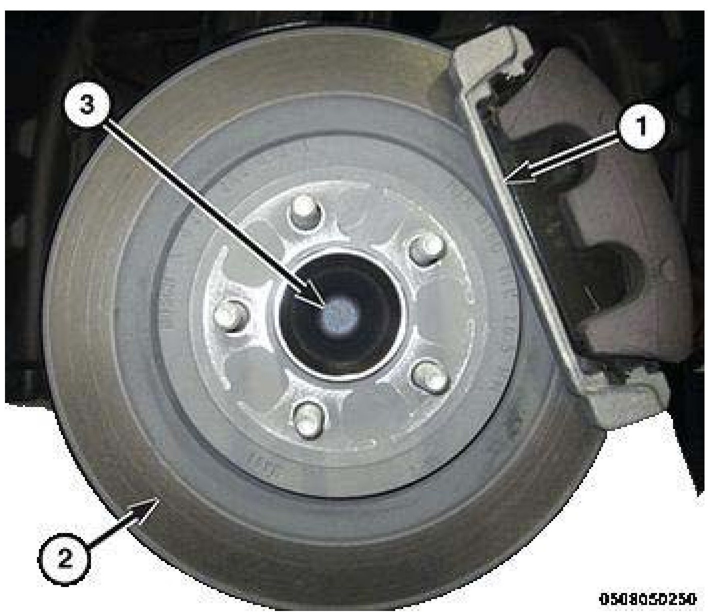


[Fig. 104: Brake Caliper Components](#)
Courtesy of CHRYSLER GROUP, LLC

3. Remove the two brake caliper adapter to knuckle bolts (1).

NOTE: **The bolts (1) are one time use and need to be discarded.**

4. Remove the brake caliper (6) and adapter (3) as an assembly and position aside.



[Fig. 105: Brake Caliper, Rotor & Hub](#)
Courtesy of CHRYSLER GROUP, LLC

5. Remove any clips retaining brake rotor (2) to wheel studs.
6. Slide brake rotor (2) off the hub (3).

FRONT-SRT8

NOTE: **Before proceeding, refer to CAUTION and WARNING.**

NOTE: **Removal process is the same for both sides of the vehicle.**

NOTE: **Six piston braking system shown, four piston braking system similar.**

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the tire and wheel assembly. Refer to **REMOVAL** .

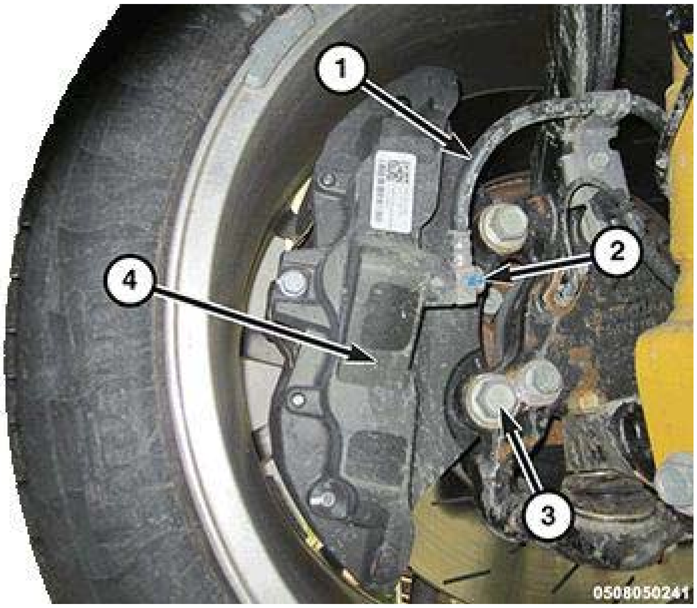


Fig. 106: Brake Caliper Components

6. Remove any clips retaining brake rotor (1) to hub.
7. Slide brake rotor (1) off the hub (3).

INSTALLATION

FRONT-NON SRT

NOTE: **Installation process is the same for both sides of the vehicle.**

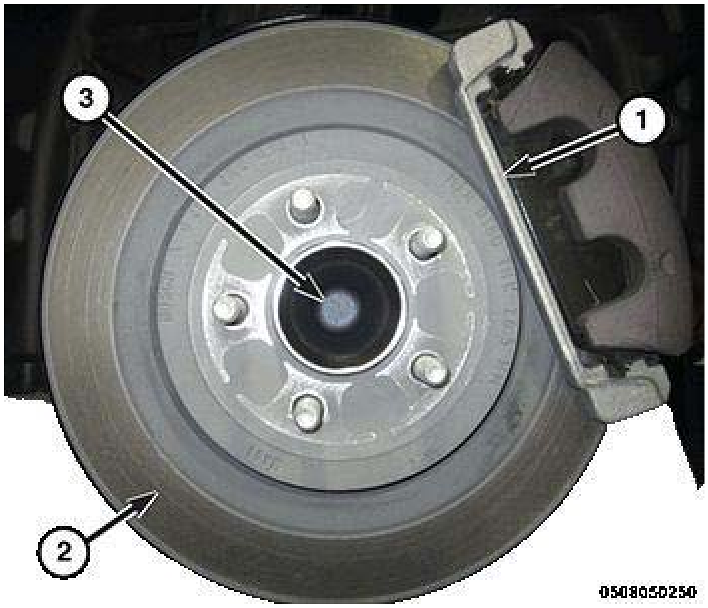

Fig. 113: Brake Caliper, Rotor & Hub
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Inspect brake pads before installation. Refer to PADS, BRAKE, INSPECTION.**

1. Clean hub face to remove any dirt or corrosion where rotor mounts.
2. Install brake rotor (2) onto the hub

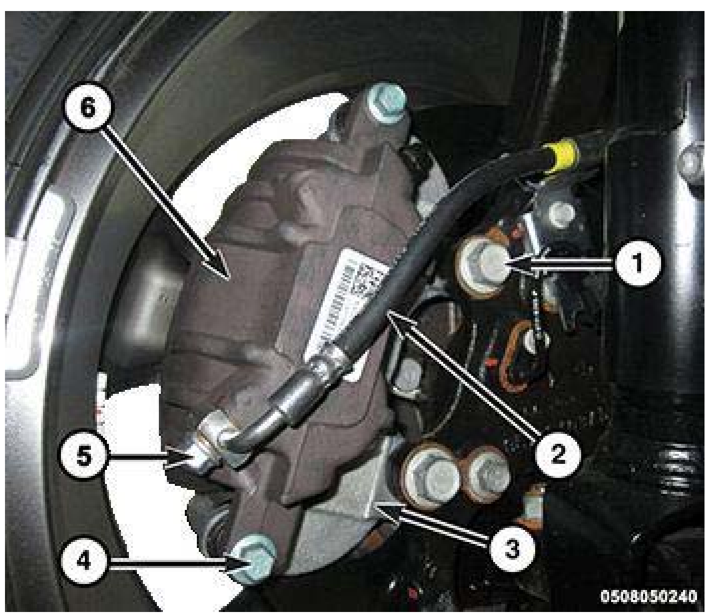

Fig. 114: Brake Caliper Components
Courtesy of CHRYSLER GROUP, LLC

3. Install the brake caliper (6) and adapter (3) over the brake rotor as an assembly.
4. Install **NEW** brake caliper adaptor to knuckle bolts (1), and tighten to the **SPECIFICATIONS** .
5. Install the tire and wheel assembly. Refer to **INSTALLATION** .
6. Remove support and lower the vehicle.
7. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.
8. Check and adjust brake fluid level in reservoir as necessary.

CAUTION: If NEW brake rotors or pads have been installed, keep in mind that braking effectiveness might be somewhat reduced during the first brake applications following installation.

CAUTION: A burnish procedure must be performed anytime NEW brake pads or rotors are installed on a vehicle equipped with the Police Package. This procedure is particularly important in situations where high speed pursuit is a possibility. It is recommended that the procedure be performed by the Police agency operating the vehicle so it can be performed in a safe controlled environment. This information is covered in the Police Package Owners Manual Supplement which was supplied when the vehicle was originally delivered.

9. Road test the vehicle and make several stops to seat the brake pads to the rotor.

FRONT-SRT8

NOTE: Installation process is the same for both sides of the vehicle.

NOTE: Six piston braking system shown, four piston braking system similar.

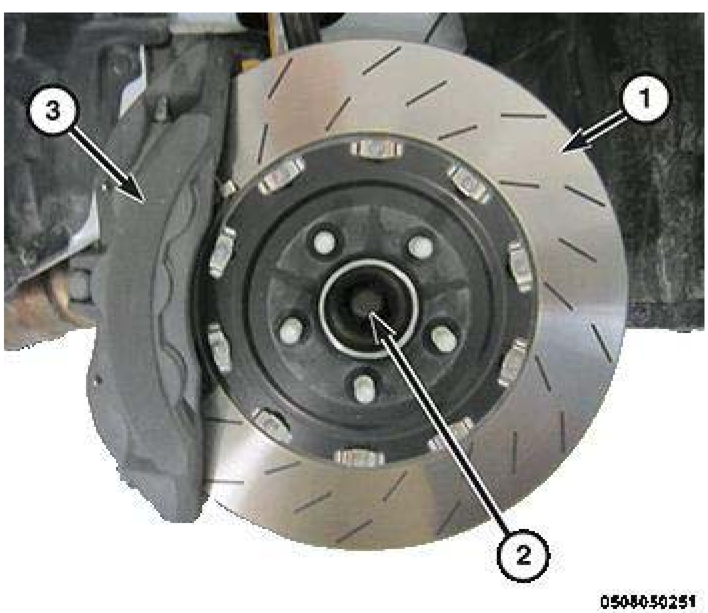

Fig. 115: Brake Rotor, Hub & Caliper
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Inspect brake pads before installation. Refer to PADS, BRAKE, INSPECTION.**

1. Clean hub face to remove any dirt or corrosion where rotor mounts.
2. Install brake rotor (1) onto the hub (2).

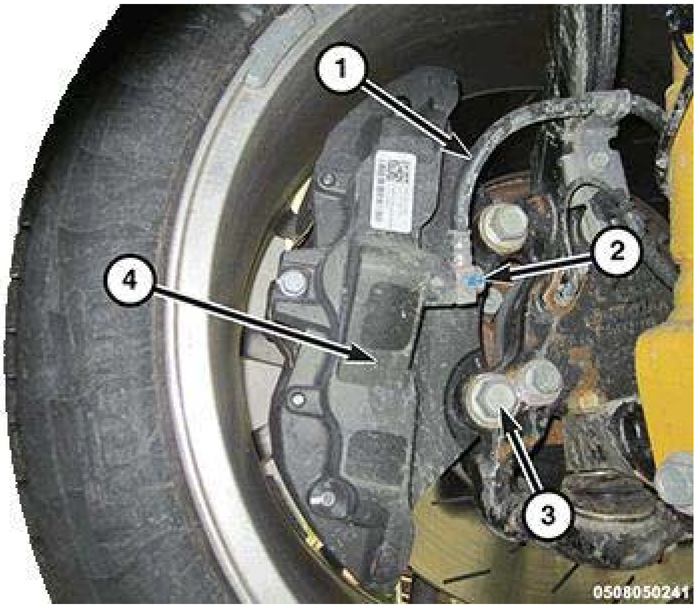

Fig. 116: Brake Caliper Components
Courtesy of CHRYSLER GROUP, LLC

3. Install the brake caliper assembly (4) to the knuckle.
4. Install the brake caliper to knuckle bolts (3), and tighten to the proper **SPECIFICATIONS** .
5. Install the tire and wheel assembly. Refer to **INSTALLATION** .
6. Remove support and lower the vehicle.
7. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.
8. Check and adjust brake fluid level in reservoir as necessary.

CAUTION: **If NEW brake rotors or pads have been installed, keep in mind that braking effectiveness might be somewhat reduced during the first brake applications following installation.**

9. Road test the vehicle and make several stops to seat the brake pads to the rotor. Refer to **PADS, BRAKE, STANDARD PROCEDURE**.

NOTE: **Inspect disc brake pads and parking brake shoes before installation. Refer to PADS, BRAKE, INSPECTION.**

1. Clean hub face to remove any dirt or corrosion where brake rotor mounts.
2. Install brake rotor (1) onto the hub (2).

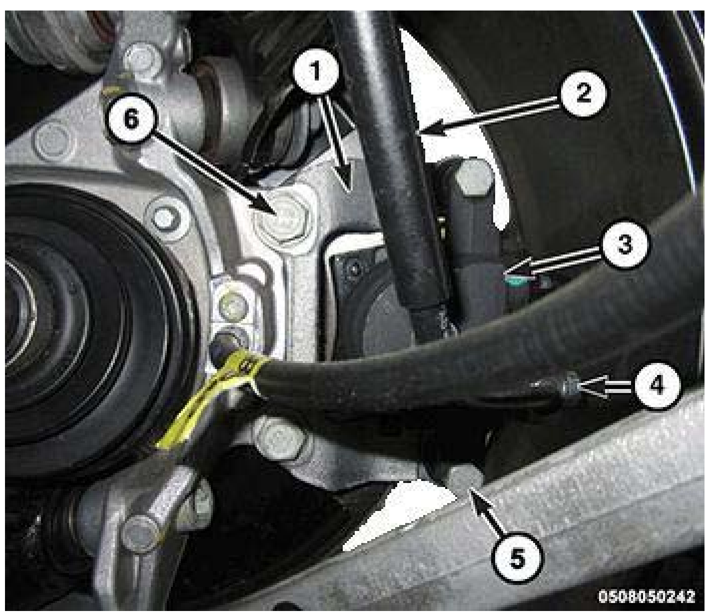

Fig. 118: Brake Caliper Components
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Install the brake caliper (3) and adapter (1) over the brake rotor as an assembly.**

3. Install **NEW** brake caliper adaptor to knuckle bolts (6), and tighten to the proper SPECIFICATIONS .

4. Install the tire and wheel assembly. Refer to **INSTALLATION** .
5. Remove the support and lower the vehicle.
6. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.
7. Check and adjust brake fluid level in reservoir as necessary.

CAUTION: If NEW brake rotors or pads have been installed, keep in mind that braking effectiveness might be somewhat reduced during the first brake applications following installation.

CAUTION: A burnish procedure must be performed anytime NEW brake pads or rotors are installed on a vehicle equipped with the Police Package. This procedure is particularly important in situations where high speed pursuit is a possibility. It is recommended that the procedure be performed by the Police agency operating the vehicle so it can be performed in a safe controlled environment. This information is covered in the Police Package Owners Manual Supplement which was supplied when the vehicle was originally delivered.

8. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake shoes.

REAR-SRT8

NOTE: Installation process is the same for both sides of the vehicle.

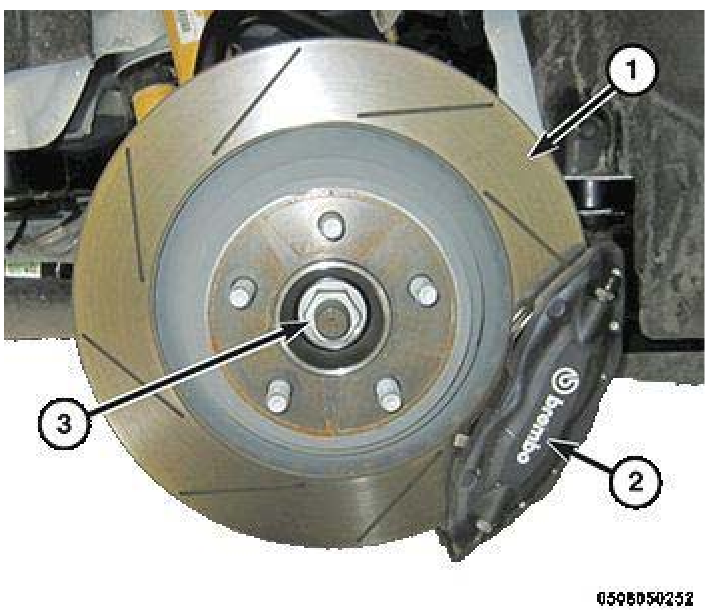

Fig. 119: Brake Rotor, Caliper & Hub Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: Inspect brake pads and parking brake shoes before installation. Refer to PADS, BRAKE, INSPECTION.

1. Clean hub face to remove any dirt or corrosion where rotor mounts.
2. Install brake rotor (1) onto the hub (3).

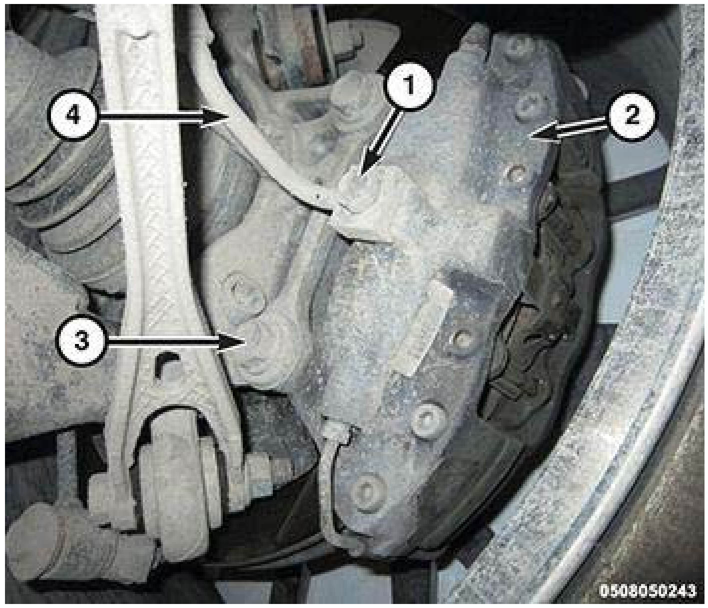

Fig. 120: Brake Caliper Components
Courtesy of CHRYSLER GROUP, LLC

3. Install the brake caliper assembly (2) to the knuckle.
4. Install the brake caliper adaptor to knuckle bolts (3). Tighten to the proper **SPECIFICATIONS** .
5. Remove jack from under spring link.
6. Install the tire and wheel assembly. Refer to **INSTALLATION** .
7. Remove support and lower the vehicle.
8. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.
9. Check and adjust brake fluid level in reservoir as necessary.

CAUTION: If NEW brake rotors or pads have been installed, keep in mind that braking effectiveness might be somewhat reduced during the first brake applications following installation.

10. Road test the vehicle and make several stops to seat the brake pads to the rotor. Refer to **PADS, BRAKE, STANDARD PROCEDURE**.

PARKING BRAKE

DESCRIPTION

DESCRIPTION

This vehicle uses drum-in-hat style parking brakes at each rear wheel. The system is actuated using a foot-operated mechanism and three parking brake cables.

CABLE, PARKING BRAKE, FRONT

REMOVAL

REMOVAL

NOTE: **Before proceeding, refer to CAUTION and WARNING.**

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

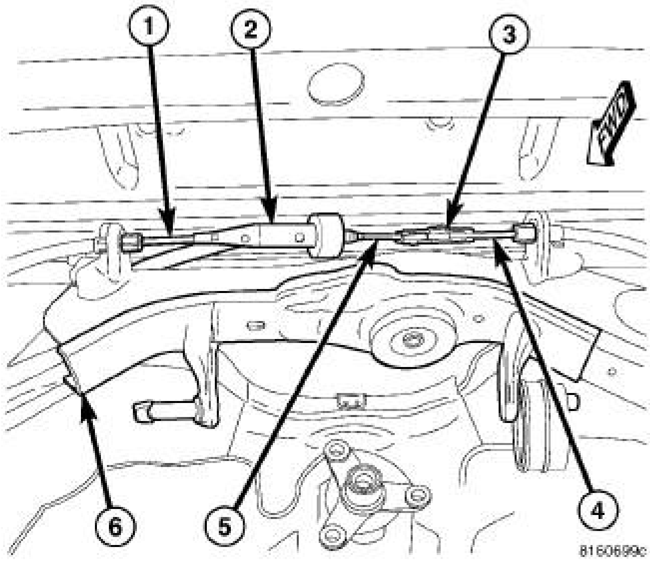

Fig. 121: Cables At Equalizer
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.**

2. Disconnect front parking brake cable (5) at connector (3) to right rear parking brake cable (4) above axle differential (not shown).

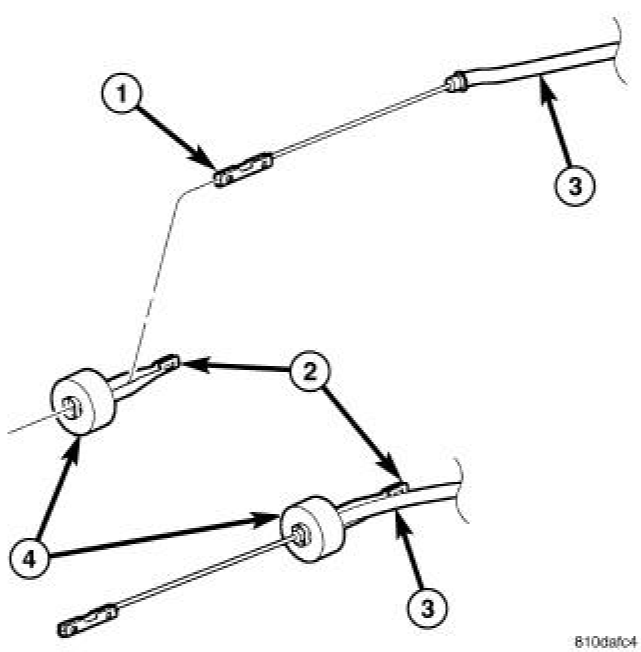

Fig. 122: Front Cable Installation Into Equalizer

Courtesy of CHRYSLER GROUP, LLC

3. Remove front cable (3) from equalizer (2).

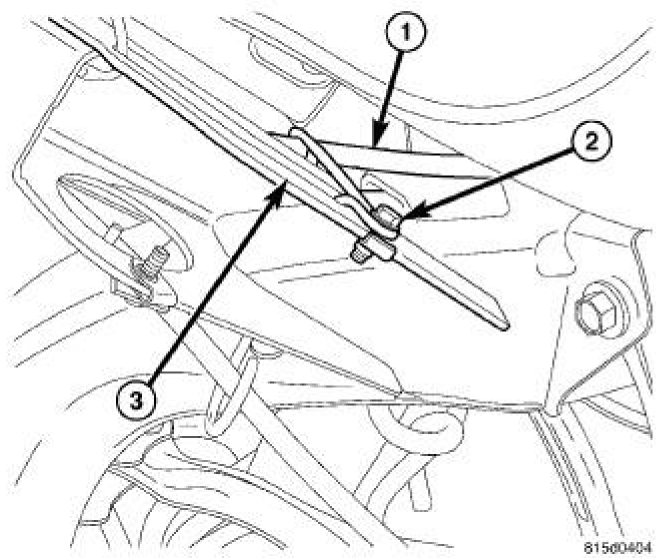

Fig. 123: Front Cable At Left Front Of Crossmember
Courtesy of CHRYSLER GROUP, LLC

4. Remove screw (2) fastening cable (1) routing bracket to rear crossmember front flange (3).

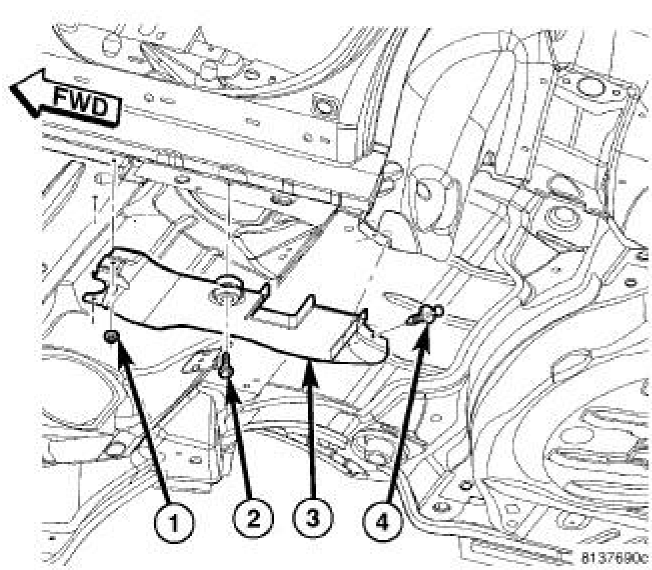

Fig. 124: Lower Rear Wheelhouse Shield
Courtesy of CHRYSLER GROUP, LLC

5. Remove nuts (1), bolt (2) and push-pins (4), securing lower rear wheelhouse shield (3) to body of vehicle. Remove lower rear wheelhouse shield.

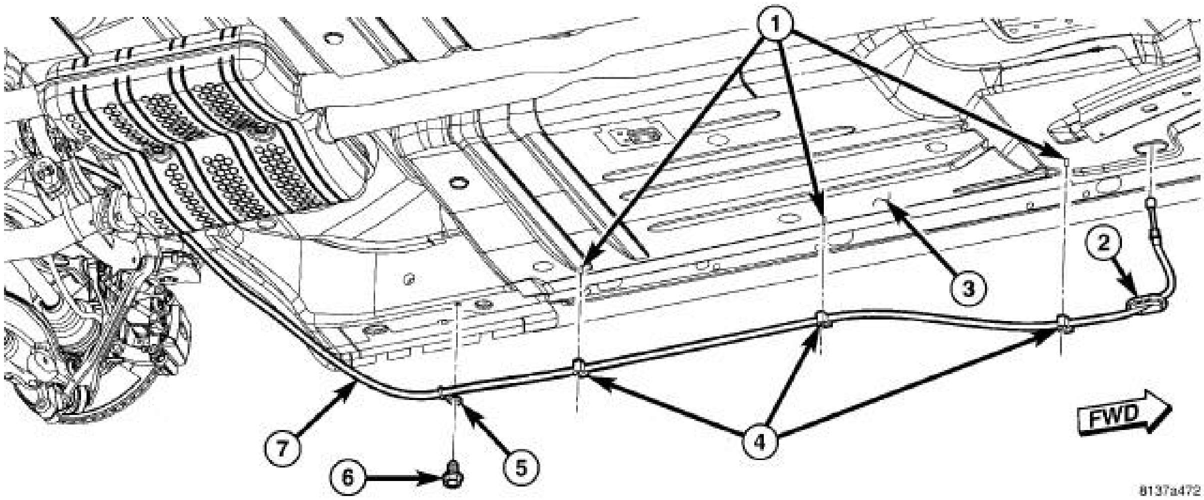

Fig. 125: Front Parking Brake Cable
Courtesy of CHRYSLER GROUP, LLC

6. Remove screw (6) and routing clip (4) nuts fastening cable (7) to underside of body (3).
7. Remove support and lower the vehicle.
8. Remove driver door opening sill scuff plate and cowl side trim.
9. Remove clip and roll back carpet away from front cable.

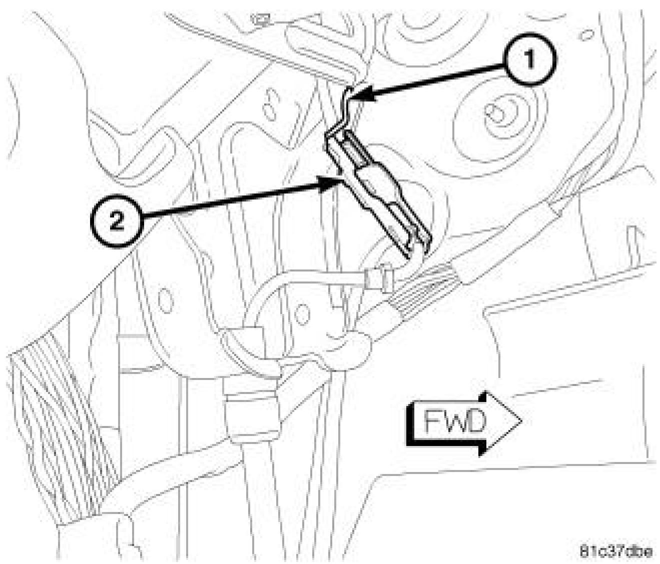

Fig. 126: Cable Connector Secured In Fork
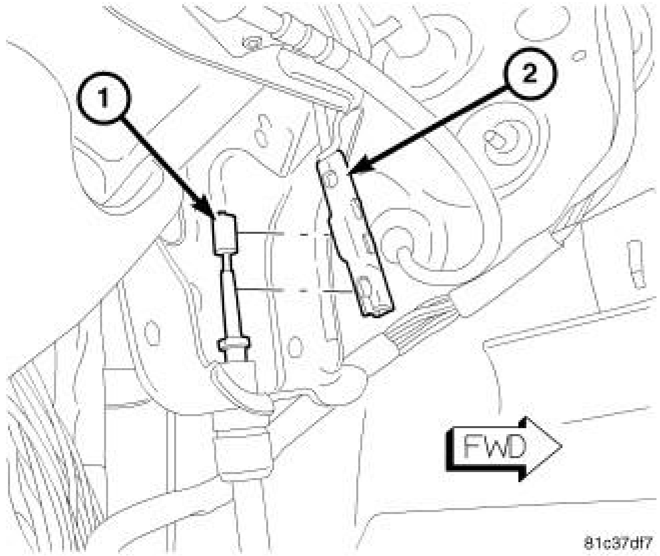
Courtesy of CHRYSLER GROUP, LLC

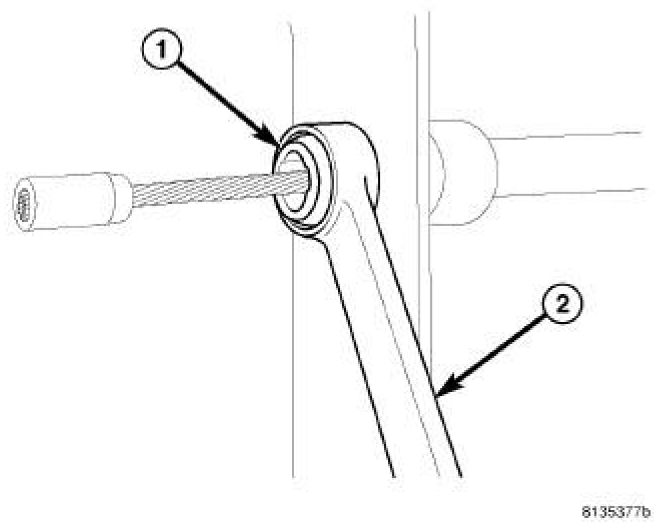
CAUTION: Do not remove front parking brake cable from cable connector at lever without securing connector first. If not secured, cable connector will wind up inside lever assembly making it most difficult to retrieve and reconnect to front cable upon installation.

10. Using pliers, reach up inside parking brake lever assembly and pull downward on parking brake cable connector. Secure cable connector (2) in retaining fork (1) formed into parking brake lever bracket as shown.



[Fig. 127: Front Cable At Lever Connector]
Courtesy of CHRYSLER GROUP, LLC

11. Disengage and remove front parking brake cable strand (1) from cable connector (2), leaving cable connector secured in retaining fork.



[Fig. 128: Removing Cable Using Wrench]
Courtesy of CHRYSLER GROUP, LLC

12. Place 13 mm 12-point box wrench (2) over cable retainer (1) at lever bracket as shown to collapse retainer fingers. Pull cable from bracket.

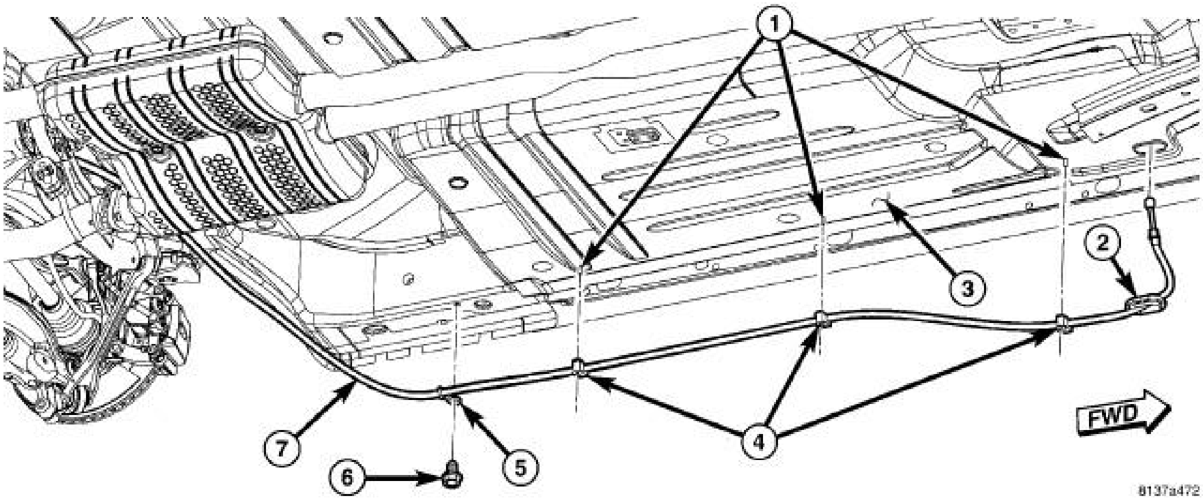


Fig. 129: Front Parking Brake Cable
Courtesy of CHRYSLER GROUP, LLC

13. Remove parking brake cable grommet (2) from floor pan (3).
14. Remove parking brake cable (7) through hole in floor pan.

INSTALLATION

INSTALLATION

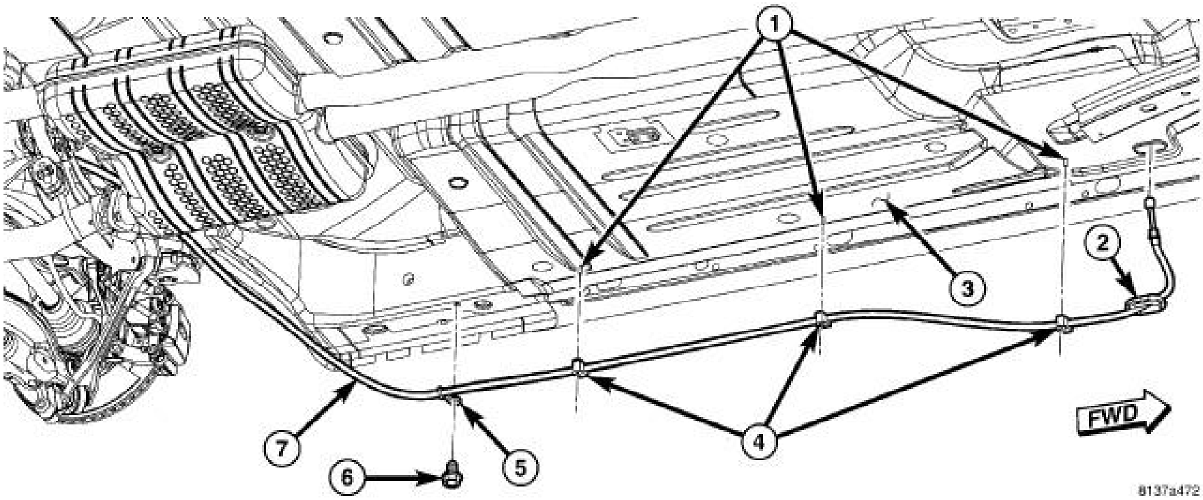

Fig. 130: Front Parking Brake Cable
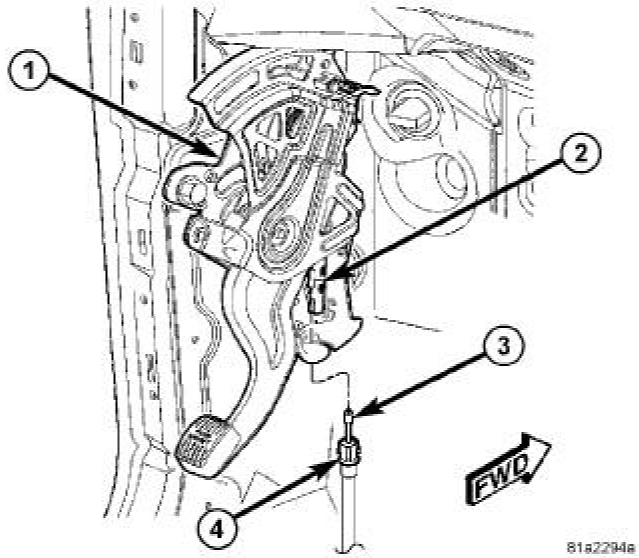
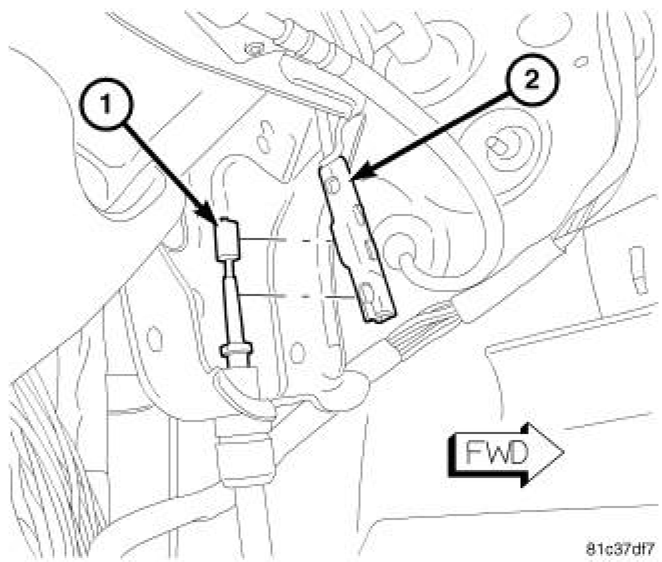
Courtesy of CHRYSLER GROUP, LLC

1. Guide parking brake cable (7) down through hole in floor pan.
2. Install parking brake cable grommet (2) in hole of floor pan (3).



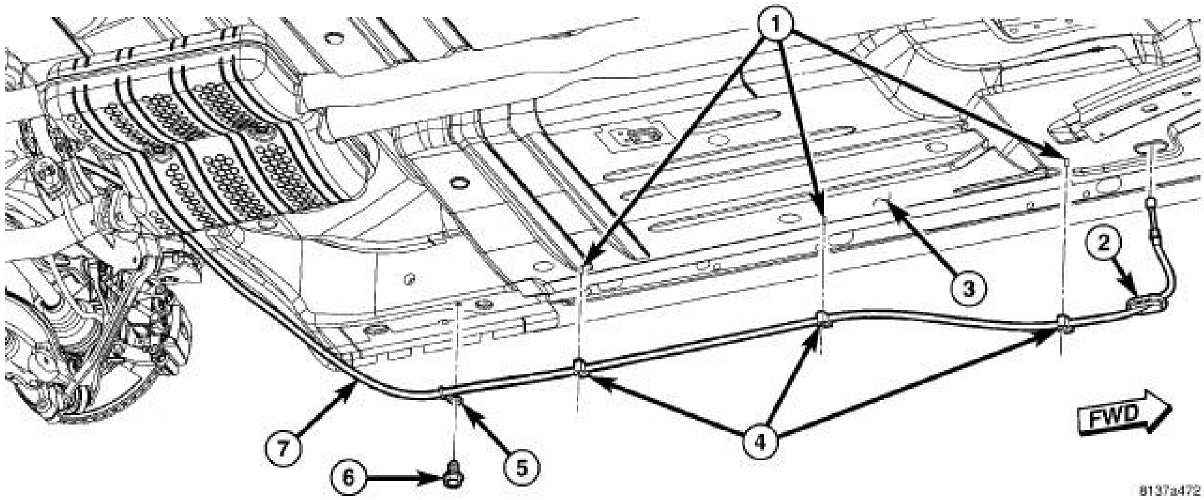
[Fig. 131: Front Cable At Lever](#)
Courtesy of CHRYSLER GROUP, LLC

3. Guide cable strand (3) up through lever bracket and press cable housing retainer (4) into bracket allowing retainer fingers to lock cable in place.



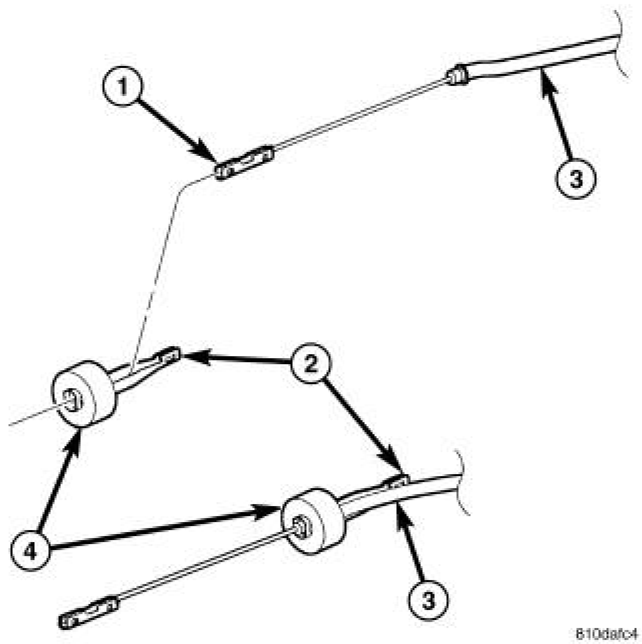
[Fig. 132: Front Cable At Lever Connector](#)
Courtesy of CHRYSLER GROUP, LLC

4. Connect front parking brake cable strand (1) to cable connector (2) secured in retaining fork.
5. Once front parking brake cable strand is completely seated in cable connector (2), lift cable connector out of retaining fork using pliers and slowly allow lever mechanism to take up slack in cable.
6. Lay carpet back into place and install retaining clip.
7. Install driver door opening sill scuff plate and cowl side trim.
8. Raise and support vehicle.



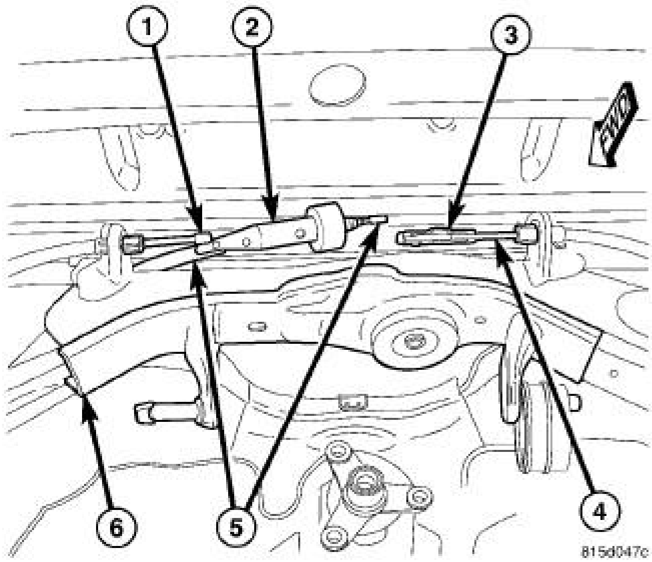
[Fig. 133: Front Parking Brake Cable](#)
Courtesy of CHRYSLER GROUP, LLC

9. Install screw (6) and routing clip (4) nuts fastening cable (7) to underside of body (3).



[Fig. 134: Front Cable Installation Into Equalizer](#)
Courtesy of CHRYSLER GROUP, LLC

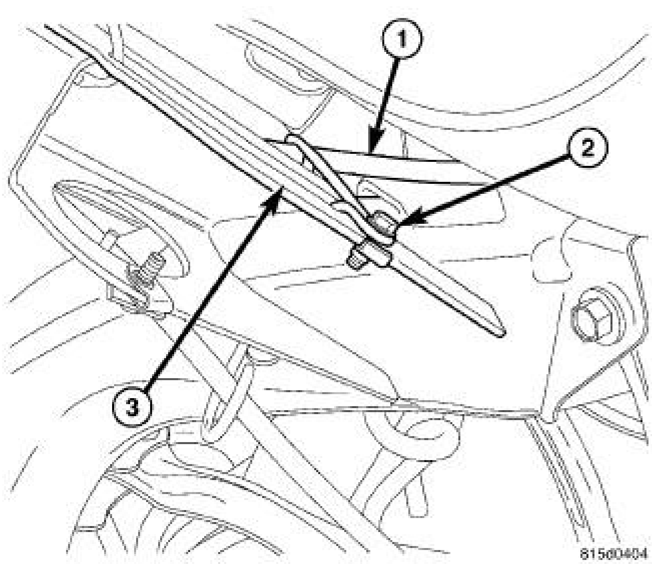
10. Route cable above rear crossmember, then slide cable end (1) (shown with connector) and housing (3) through equalizer (2) above rear axle differential.



[Fig. 135: Parking Brake Cables At Rear Crossmember](#)
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.**

11. Connect front parking brake cable (5) at connector (3) to right rear parking brake cable (4) (axle differential not shown).



[Fig. 136: Front Cable At Left Front Of Crossmember](#)
Courtesy of CHRYSLER GROUP, LLC

12. Install screw (2) fastening cable (1) routing bracket to rear crossmember front flange (3).

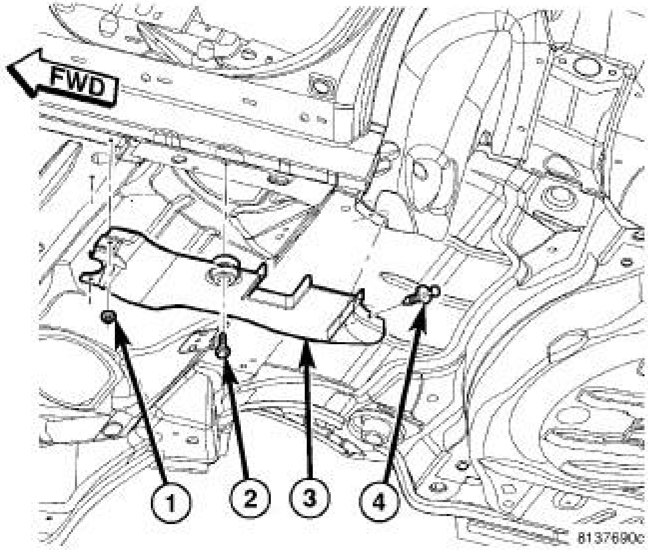


Fig. 137: Lower Rear Wheelhouse Shield
Courtesy of CHRYSLER GROUP, LLC

13. Position lower rear wheelhouse shield (3) onto body of vehicle. Install nuts (1), bolt (2) and push-pins (4) securing lower rear wheelhouse shield to body. Tighten nuts and bolt securely.
14. Lower vehicle until rear wheels are just above floor level.
15. Apply parking brake lever. Release lever, then reapply.
16. Check to make sure rear wheels will not rotate with lever applied.
17. Release parking brake lever, then check to make sure rear wheels rotate without excessive drag.
18. Apply parking brake lever.
19. Remove support and lower the vehicle.

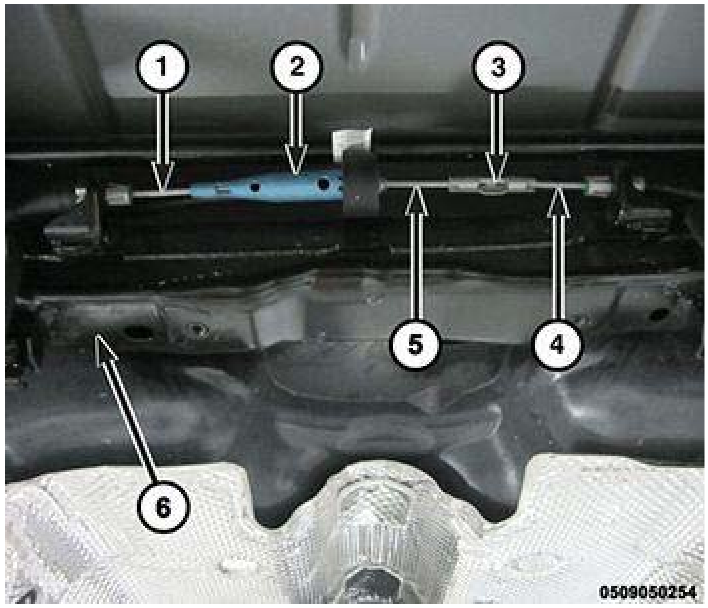
CABLE, PARKING BRAKE, REAR

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to CAUTION and WARNING.

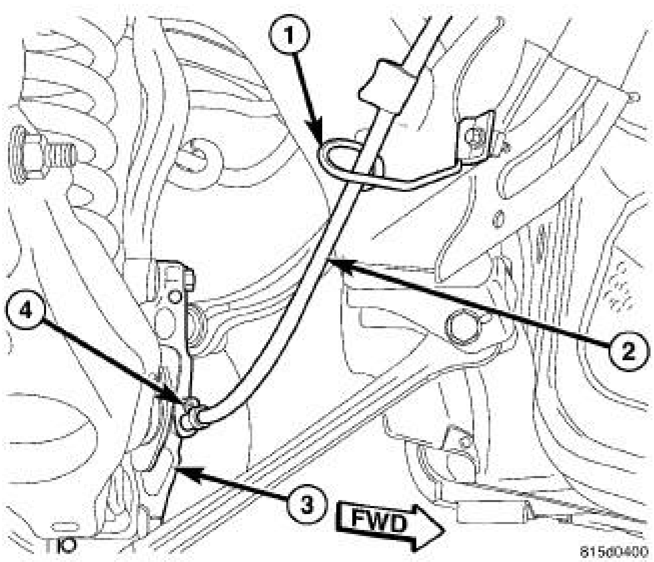
1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .



[Fig. 138: Cables At Equalizer](#)
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.**

2. Disconnect rear parking brake cable near front cable as follows:
    - If removing left rear cable, disconnect cable (1) at equalizer (2) above rear axle differential (not shown) and rear crossmember (6).
    - If removing right rear cable, disconnect cable (4) at connector (3) above rear axle differential (not shown) and rear crossmember (6).
3. Remove parking brake shoes on side of cable service. Refer to **SHOES, PARKING BRAKE, REMOVAL**.



[Fig. 139: Rear Cable Routing To Knuckle](#)
Courtesy of CHRYSLER GROUP, LLC

4. Remove screw (4) fastening cable (2) to knuckle (3). Remove cable from knuckle.
5. Remove cable (2) from routing guide (1).

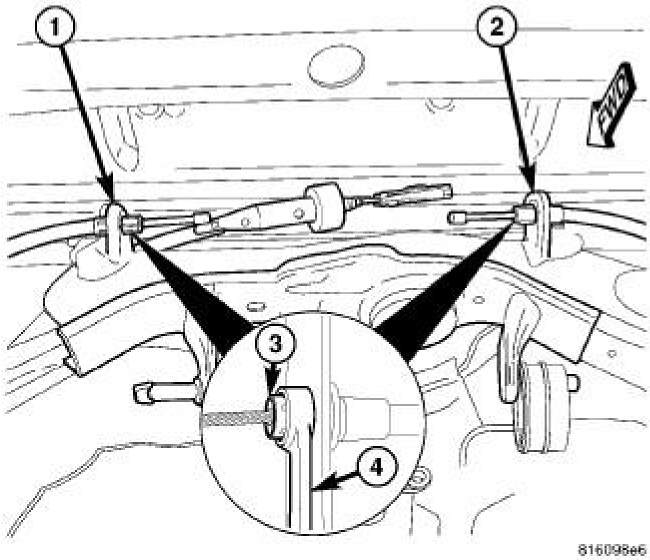


Fig. 140: Cables At Crossmember Bracket
Courtesy of CHRYSLER GROUP, LLC

6. Place 13 mm 12-point box wrench (4) over cable strand and completely onto cable retainer (3) as shown at crossmember bracket (1 - left) (2 - right). It may be necessary to wiggle wrench around somewhat to collapse retainer fingers. With wrench in place, pull cable from bracket.
7. Remove parking brake cable from vehicle.

INSTALLATION

INSTALLATION

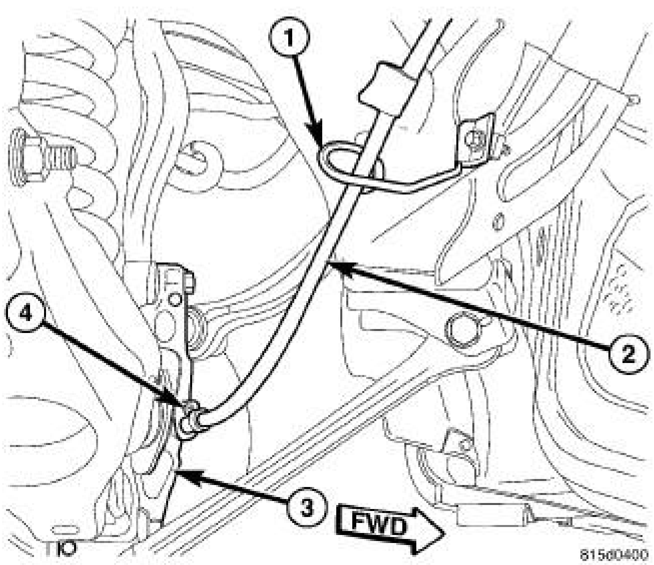

Fig. 141: Rear Cable Routing To Knuckle
Courtesy of CHRYSLER GROUP, LLC

1. Route leading end of rear parking brake cable (2) up through cable guide (1) on crossmember.

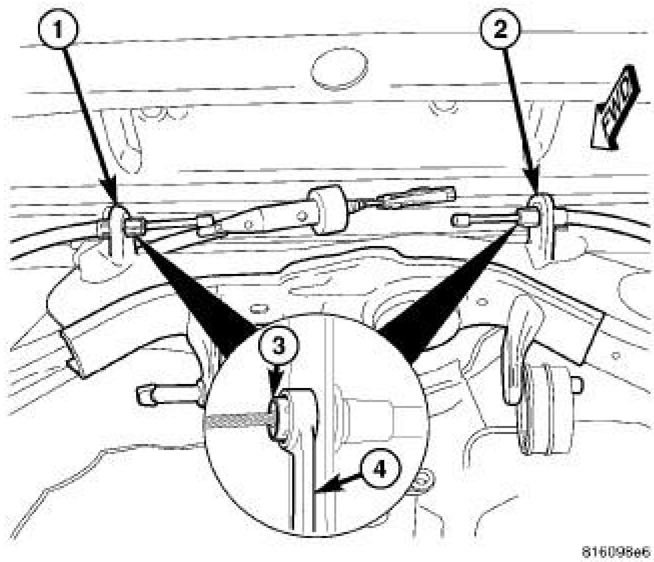

Fig. 142: Cables At Crossmember Bracket
Courtesy of CHRYSLER GROUP, LLC

2. Guide cable leading end through crossmember bracket (1 - left) (2 - right) near equalizer and press cable housing retainer into bracket allowing retainer fingers to lock cable in place.

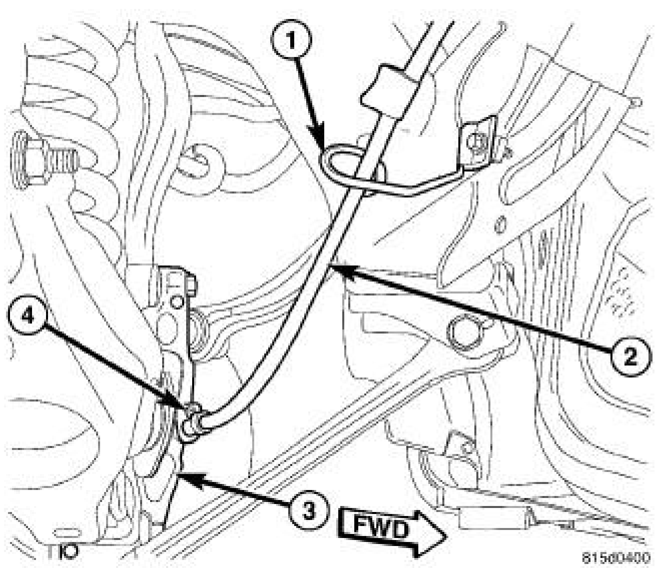

Fig. 143: Rear Cable Routing To Knuckle
Courtesy of CHRYSLER GROUP, LLC

3. Insert opposite end of cable (2) through rear knuckle (3) and install the Parking Brake Cable to Knuckle Bolt (4). Tighten to the proper **SPECIFICATIONS** .
4. Install parking brake shoes as well as all components necessary to access them. Refer to **SHOES, PARKING BRAKE, INSTALLATION**.

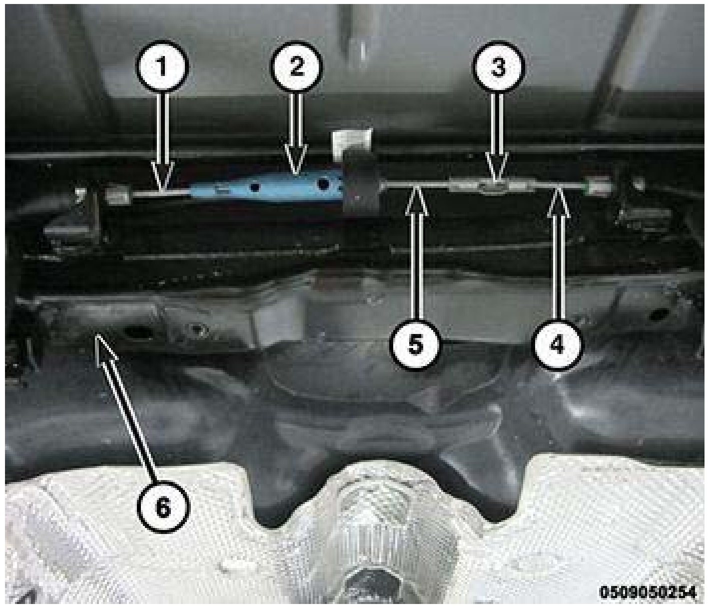

Fig. 144: Cables At Equalizer
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Due to short travel and low spring tension, it is not necessary to lock out parking brake lever to service parking brake components.**

5. Connect rear parking brake cable at equalizer/front cable as follows:
    - If installing left rear cable, connect cable (1) at equalizer (2) above rear axle differential (not shown) and rear crossmember (6).
    - If installing right rear cable, connect cable (4) at connector (3) above rear axle differential (not shown) and rear crossmember (6).
6. Remove the support and lower the vehicle until rear wheels are just above floor level.
7. Apply parking brake lever. Release lever, then reapply.
8. Check to make sure rear wheels will not rotate with lever applied.
9. Release parking brake lever, then check to make sure rear wheels rotate without excessive drag.
10. Adjust parking brake shoes as necessary. Refer to **SHOES, PARKING BRAKE, ADJUSTMENTS**.
11. Remove support and lower the vehicle.

LEVER, PARKING BRAKE

REMOVAL

REMOVAL

NOTE: **Before proceeding, refer to CAUTION and WARNING.**

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

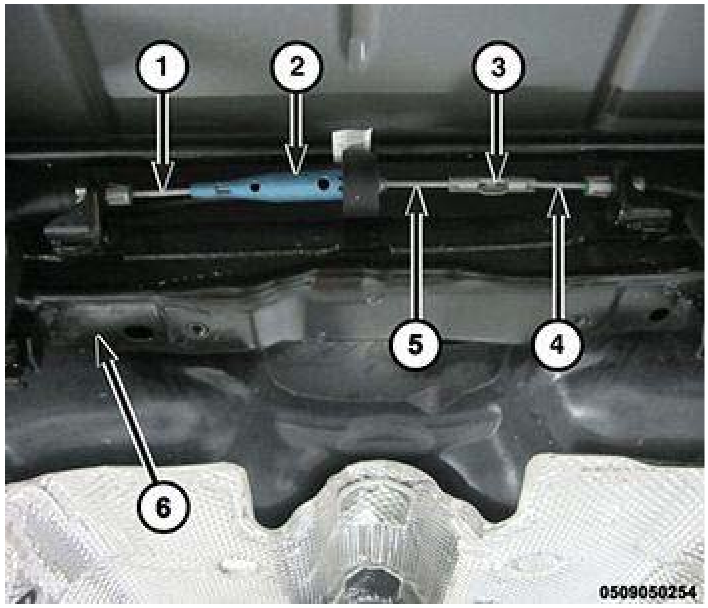

Fig. 145: Cables At Equalizer
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.**

2. Disconnect front parking brake cable (5) at connector (3) to right rear parking brake cable.
3. Remove support and lower the vehicle.
4. Remove steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, REMOVAL** .

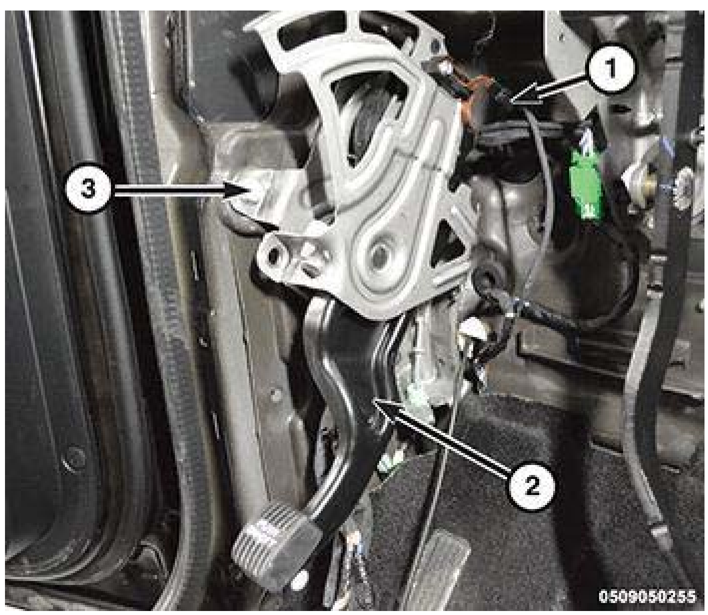

Fig. 146: Locating Parking Brake Switch Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect parking brake switch wire harness connector (1).

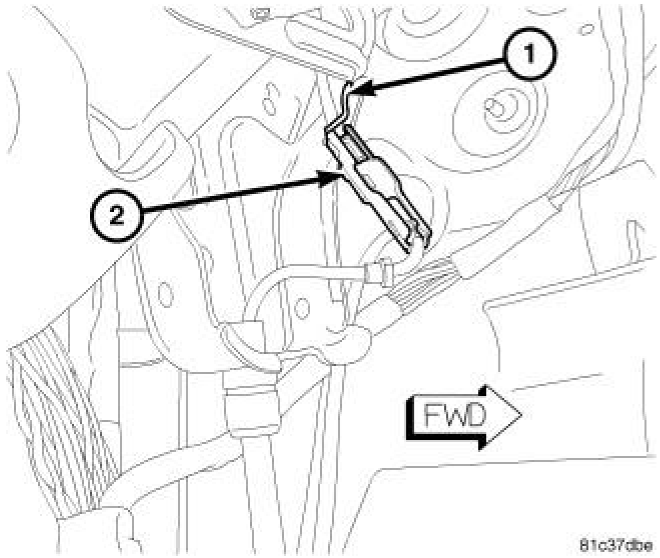

Fig. 147: Cable Connector Secured In Fork
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not remove front parking brake cable from cable connector at lever without securing connector first. If not secured, cable connector will wind up inside lever assembly making it most difficult to retrieve and reconnect to front cable upon installation.

6. Using pliers, reach up inside parking brake lever assembly and pull downward on parking brake cable connector. Secure cable connector (2) in retaining fork (1) formed into parking brake lever bracket as shown.

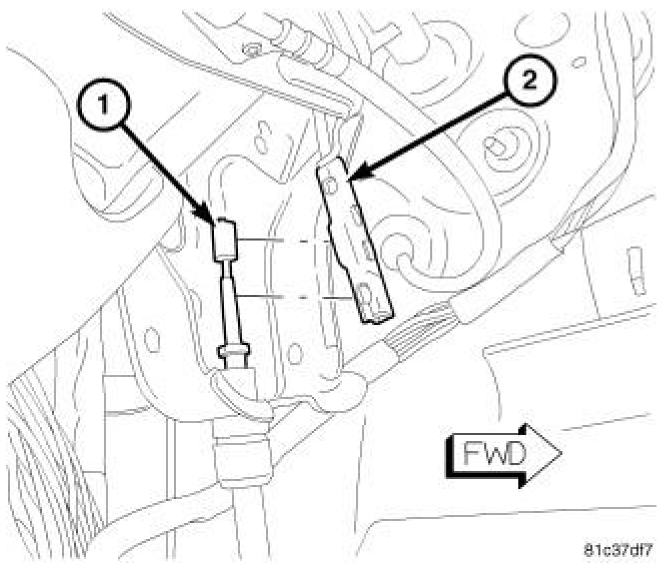

Fig. 148: Front Cable At Lever Connector
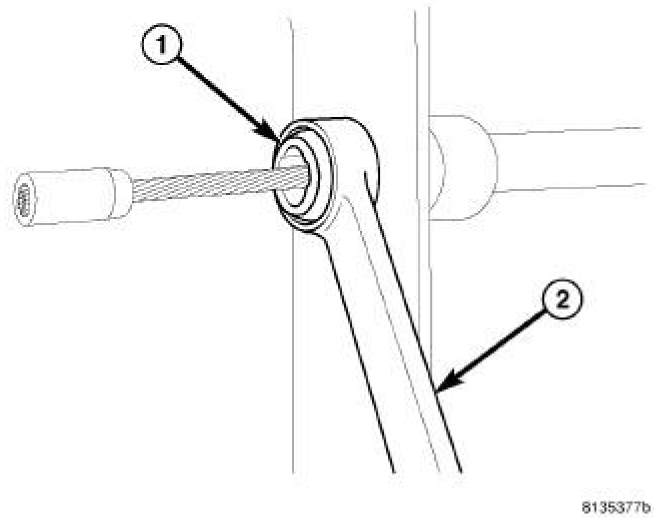
Courtesy of CHRYSLER GROUP, LLC

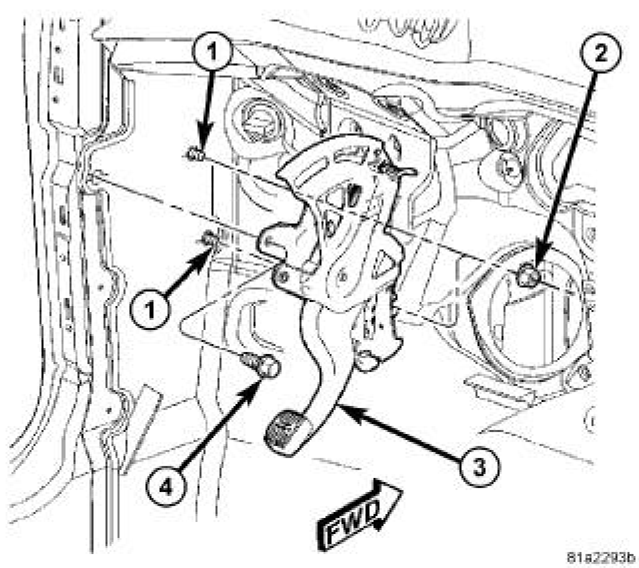
7. Disengage and remove front parking brake cable strand (1) from cable connector (2), leaving cable connector secured in retaining fork.



[Fig. 149: Removing Cable Using Wrench](#)
Courtesy of CHRYSLER GROUP, LLC

1 - CABLE RETAINER
2 - 12-POINT BOX WRENCH

8. Place 13 mm 12-point box wrench (2) over cable retainer (1) at lever bracket as shown to collapse retainer fingers. Pull cable from bracket.



[Fig. 150: Lever Mounting](#)
Courtesy of CHRYSLER GROUP, LLC

9. Remove bolt (4) and two nuts (2) mounting parking brake lever (3) to body.
10. Remove parking brake lever (3).

INSTALLATION

.

INSTALLATION

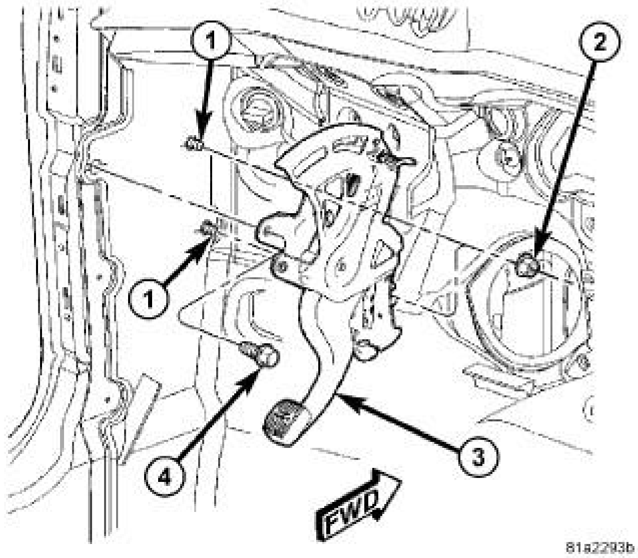


Fig. 151: Lever Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Install parking brake lever (3) over mounting studs (1).
2. Install the Parking Brake Lever to Body Bolt (4) and Nuts (2). Tighten to the proper **SPECIFICATIONS** .

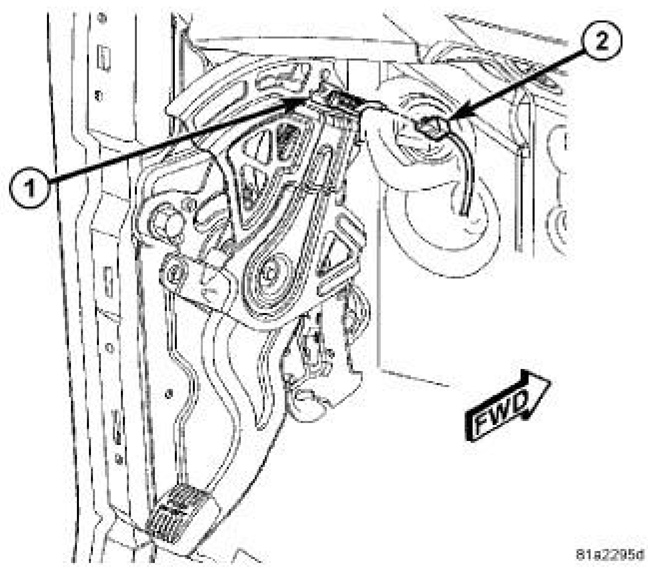

Fig. 152: Parking Brake Switch Connector
Courtesy of CHRYSLER GROUP, LLC

3. Connect wire harness connector (2) at parking brake switch (1).

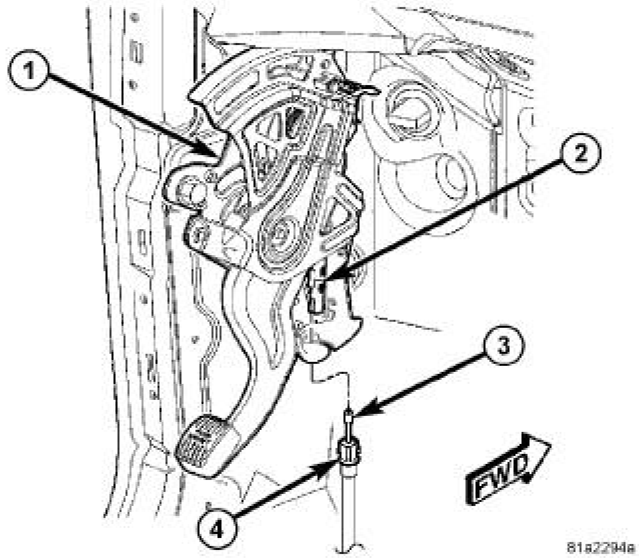

Fig. 153: Front Cable At Lever
Courtesy of CHRYSLER GROUP, LLC

4. Guide cable strand (3) up through lever bracket and press cable housing retainer (4) into bracket allowing retainer fingers to lock cable in place.

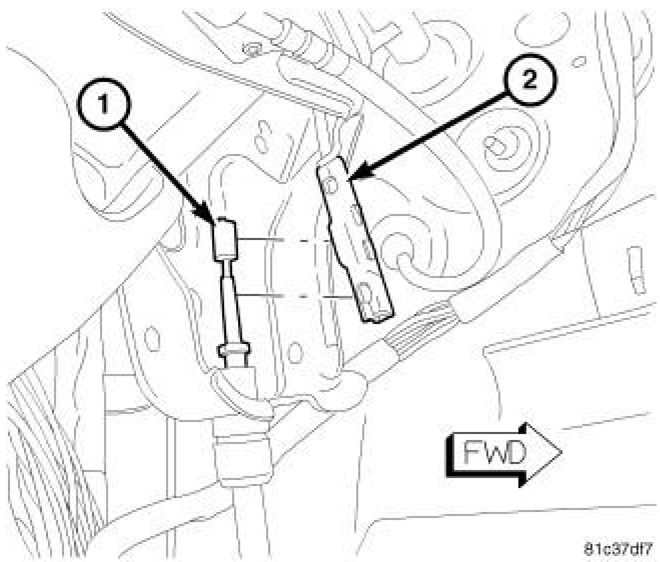

Fig. 154: Front Cable At Lever Connector
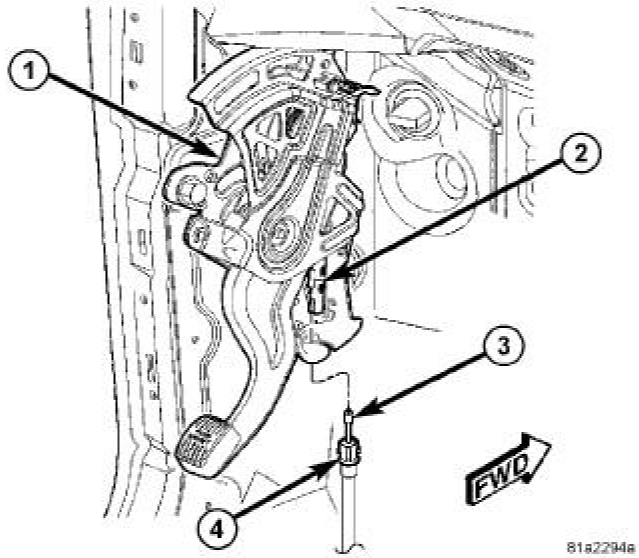
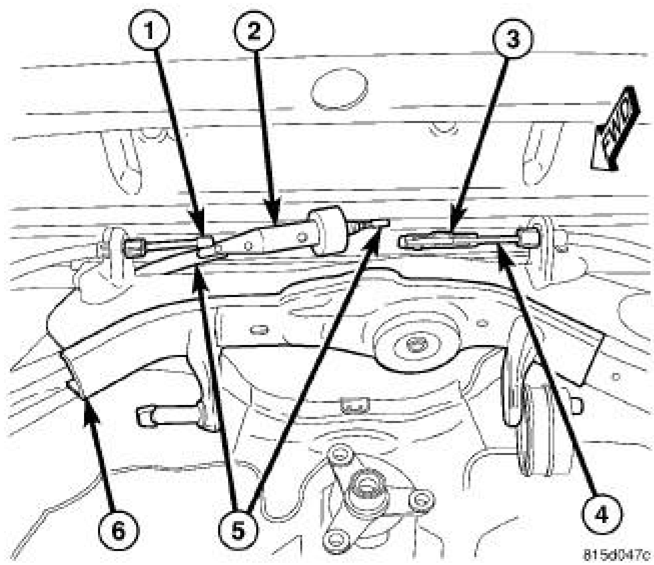
Courtesy of CHRYSLER GROUP, LLC

5. If original parking brake lever is being installed:
    a. Connect front parking brake cable strand (1) to cable connector (2) secured in retaining fork.
    b. Once front parking brake cable strand is completely seated in cable connector (2), lift cable connector out of retaining fork using pliers and slowly allow lever mechanism to take up slack in cable.



[Fig. 155: Front Cable At Lever]
Courtesy of CHRYSLER GROUP, LLC

6. If NEW parking brake lever is being installed:
   a. Connect front parking brake cable strand (3) at lever connector (2).
   b. Once front parking brake cable strand is completely seated in cable connector (2), remove pin locking out automatic tensioning spring.
7. Install steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .
8. Raise and support the vehicle.



[Fig. 156: Parking Brake Cables At Rear Crossmember]
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Due to short travel and low spring tension, it is not necessary to lock-out**

parking brake lever to service parking brake components.

9. Connect front parking brake cable (5) at connector (3) to right rear parking brake cable (4).
10. Remove support and lower the vehicle until rear wheels are just above floor level.
11. Apply parking brake lever. Release lever to test release cable and handle. Reapply lever. While doing this, check to make sure the red indicator lamp in the cluster turns on and off properly.
12. Check to make sure rear wheels will not rotate with lever applied.
13. Release parking brake lever, then check to make sure rear wheels rotate without excessive drag.
14. Apply parking brake lever.
15. Remove support and lower the vehicle.

SHOES, PARKING BRAKE

ADJUSTMENTS

ADJUSTMENTS

While most vehicles require only a fine adjustment of the parking brake shoes, some vehicles may require a preliminary adjustment before a fine adjustment can be made. If a preliminary adjustment must be made, refer to PRELIMINARY ADJUSTMENT following the fine adjustment procedure listed below.

1. Place parking brake lever in "full released" position.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

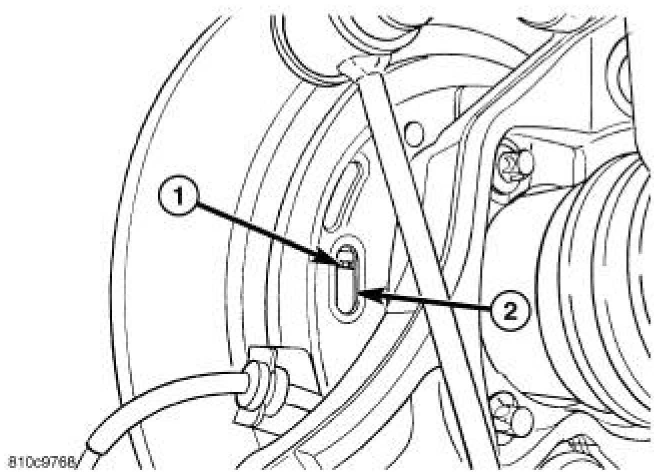


Fig. 157: Access To Shoe Adjuster Star-Wheel
Courtesy of CHRYSLER GROUP, LLC

3. Remove plug in parking brake shoe support to access adjuster star-wheel (1).

NOTE: **Through the access hole (2), rotate the adjuster star wheel (1) in the following direction to expand the shoes outward against the drum.**

- **Left brake - Rotate star-wheel toward rear of vehicle.**
- **Right brake - Rotate star-wheel toward front of vehicle.**

4. Using an appropriate tool, turn adjuster star wheel (1) until wheel will not rotate (dead lock).
5. Back off adjuster six detents (teeth).
6. Rotate wheel, checking for light drag. If drag is too heavy, continue to back off adjuster one detent at a time until light drag is present. **Do not back off star-wheel more than 17 detents from wheel lock.**
7. Install access plug.
8. Adjust opposite wheel parking brake shoes using same method.
9. Remove the support and lower the vehicle.
10. Apply and release parking brake lever once to ensure proper operation of parking brakes.

REMOVAL

REMOVAL

NOTE: **Removal process is the same for both sides of the vehicle.**

NOTE: **Right side shown, left side similar.**

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove rear hub and bearing. Refer to **HUB AND BEARING, REMOVAL** .

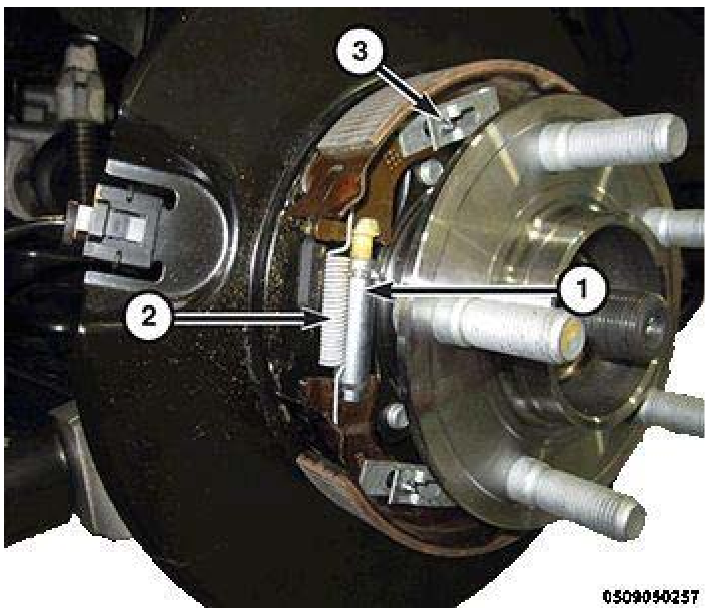

Fig. 158: Parking Brake Shoe Adjustment, Adjuster Spring & Adjuster
Courtesy of CHRYSLER GROUP, LLC

3. Completely back off parking brake shoe adjustment (1).
4. Remove parking brake shoe adjuster spring (2).
5. Remove shoe adjuster (1).
6. Remove upper brake shoe hold-down clip and pin (3).

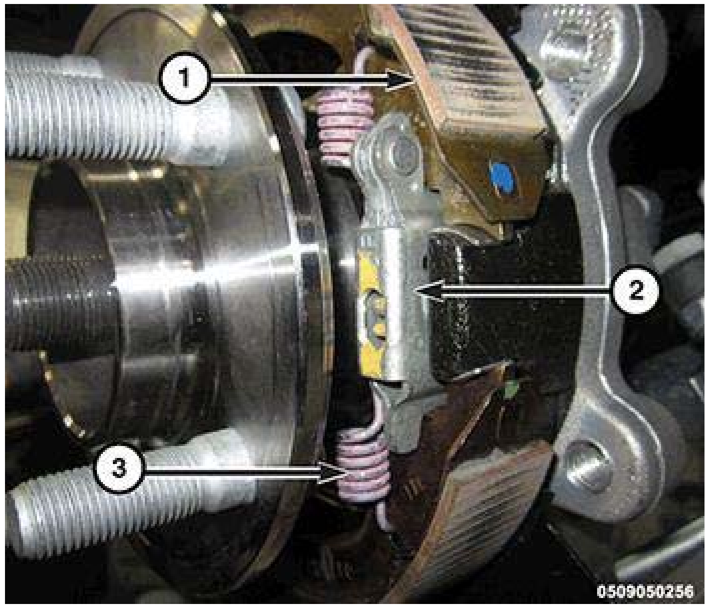

Fig. 159: Upper Shoe, Actuator Lever & Return Spring
Courtesy of CHRYSLER GROUP, LLC

7. Remove upper shoe (1) from return spring (3).
8. Remove return spring (3) from lower shoe.
9. Remove shoe actuator lever (2).
10. Remove lower brake shoe hold-down clip and pin.
11. Remove lower shoe.
12. Inspect springs, adjuster, lever and aluminum shoe anchor pin for wear or damage. Replace as necessary.

INSTALLATION

INSTALLATION

NOTE:	**Installation process is the same for both sides of the vehicle.**
NOTE:	**Right side shown, left side similar.**
NOTE:	**Inspect springs, adjuster, lever and aluminum shoe anchor pin for wear or damage prior to installation. Replace as necessary.**

.

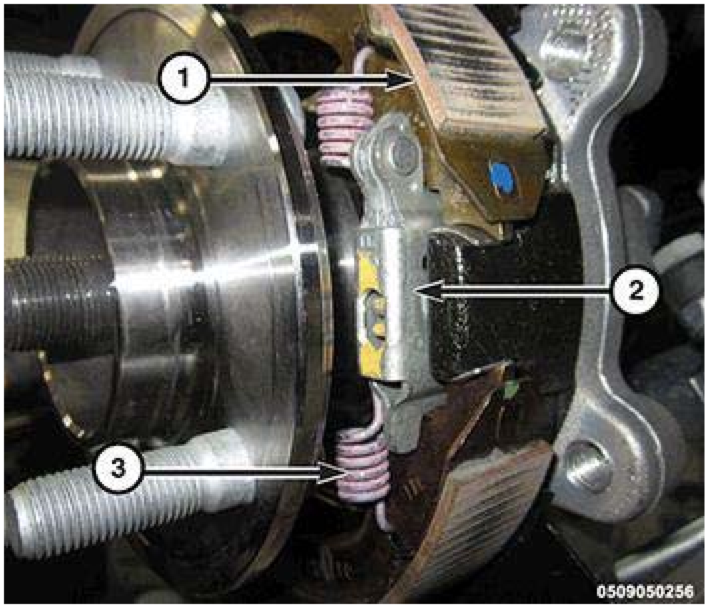

Fig. 160: Upper Shoe, Actuator Lever & Return Spring
Courtesy of CHRYSLER GROUP, LLC

1. Install lower brake shoe hold-down pin through rear of support.
2. Install lower shoe against support plate.
3. Install lower brake shoe hold-down clip.
4. Install shoe actuator lever (2) on end of parking brake cable. Make sure actuator lever is positioned with word "UP" facing outward.
5. Install return spring (3) to lower shoe.
6. Install upper shoe (1) against support plate and onto shoe actuator lever (2).

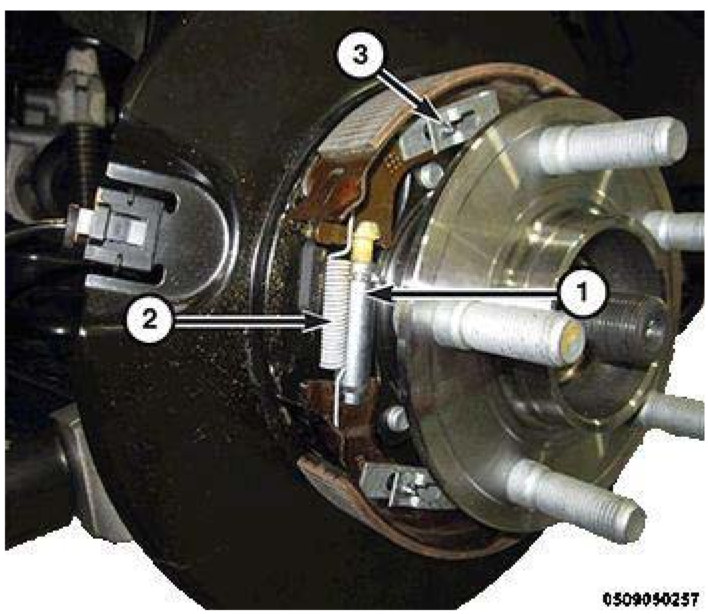

Fig. 161: Parking Brake Shoe Adjustment, Adjuster Spring & Adjuster
Courtesy of CHRYSLER GROUP, LLC

7. Install upper brake shoe hold-down pin (3) through rear of support and upper shoe.

8. Install upper brake shoe hold-down clip.
9. Attach return spring to upper shoe.
10. Install shoe adjuster (1). Place end of adjuster with star wheel upward.
11. Install parking brake shoe adjuster spring (2).

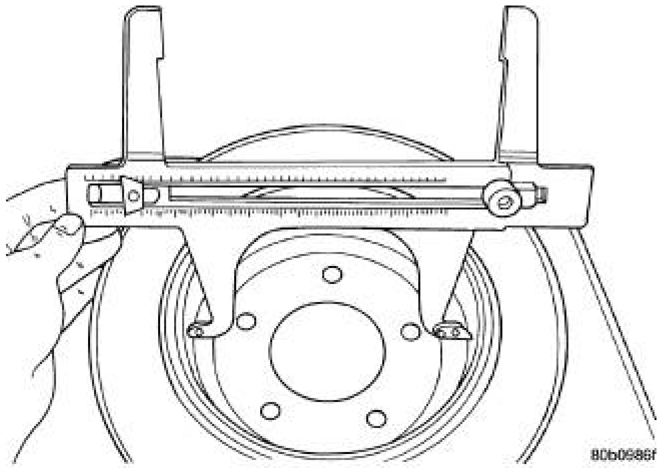

Fig. 162: Measuring Parking Brake Drum Diameter
Courtesy of CHRYSLER GROUP, LLC

12. Using Brake Shoe Gauge, (special tool #C-3919, Gauge, Brake Shoes), or equivalent, measure inside diameter of parking brake drum portion of rotor. Set gauge.

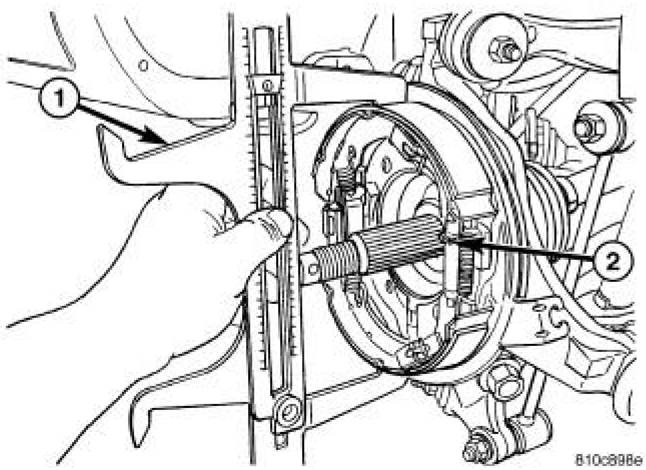

Fig. 163: Measuring Parking Brake Shoes
Courtesy of CHRYSLER GROUP, LLC

13. Place Gauge (1) over parking brake shoes at widest point.
14. Using adjuster star wheel (2), adjust parking brake shoes until linings on both park brake shoes just touch jaws on gauge. This will give a good preliminary adjustment of parking brake shoes, before a final adjustment is made at end of this procedure.
15. Install hub and bearing with wheel speed sensor as well as all components necessary to access it. Refer to **HUB AND BEARING, INSTALLATION** .

16. Remove support and lower the vehicle.
17. Perform final adjustment of parking brake shoes. Refer to **SHOES, PARKING BRAKE, ADJUSTMENTS**.

Article GUID: A00735931

2015-16 ELECTRICAL

Battery System - Service Information - Challenger

DESCRIPTION

DESCRIPTION

This vehicle is equipped with a single 12-volt battery. All of the components of the battery system are located within the trunk compartment of the vehicle. The battery system for this vehicle contains the following components:

- **Battery** - The storage battery provides a reliable means of storing a renewable source of electrical energy within the vehicle.
- **Battery Cables** - The battery cables connect the positive and negative charged battery terminal posts to the vehicle electrical system.
- **Battery Hold-down** - The battery hold-down hardware secures the battery in the battery tray.
- **Battery Tray** - The battery tray provides a secure mounting location in the vehicle for the battery and an anchor point for the battery hold-down hardware.
- **Intelligent Battery Sensor** - The Intelligent Battery Sensor (IBS) serves to record and process measured battery variable values (current, voltage, temperature) for the vehicle powernet management system.

For battery system maintenance schedules, refer to MAINTENANCE SCHEDULES, DESCRIPTION .

OPERATION

OPERATION

The battery system is designed to provide a safe, efficient, reliable and mobile means of delivering and storing electrical energy. This electrical energy is required to operate the engine starting system, as well as to operate many of the other vehicle accessory systems for limited durations while the engine and/or the charging system are not operating. The battery system is also designed to provide a reserve of electrical energy to supplement the charging system for short durations while the engine is running and the electrical current demands of the vehicle exceed the output of the charging system. In addition to delivering, and storing electrical energy for the vehicle, the battery system serves as a capacitor and voltage stabilizer for the vehicle electrical system. It absorbs most abnormal or transient voltages caused by the switching of any of the electrical components or circuits in the vehicle.

DIAGNOSIS AND TESTING

GR8 ELECTRICAL SYSTEM TESTER

The Midtronics GR8 battery system tester is designed to help diagnose the cause of a defective battery. Refer to BATTERY, STANDARD PROCEDURE for directions on using the Midtronics GR8 battery tester.

DIAGNOSIS AND TESTING - BATTERY SYSTEM

The battery, starting, and charging systems in the vehicle operate with one another and must be tested as a

complete system. In order for the engine to start and the battery to maintain its charge properly, all of the components that are used in these systems must perform within specifications. It is important that the battery, starting, and charging systems be thoroughly tested and inspected any time a battery needs to be charged or replaced. The cause of abnormal battery discharge, overcharging or early battery failure must be diagnosed and corrected before a battery is replaced and before a vehicle is returned to service. The service information for these systems has been separated within this service information to make it easier to locate the specific information you are seeking. However, when attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used for the battery, starting, and charging systems range from the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliampere ammeter, a volt/ohmmeter, a battery charger, a carbon pile rheostat (load tester) and a 12-volt test lamp may be required. All OBD-sensed systems are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for any failure it detects. Refer to **DIAGNOSIS AND TESTING** for the proper charging system on-board diagnostic test procedures.

BATTERY SYSTEM DIAGNOSIS		
CONDITION	**POSSIBLE CAUSES**	**CORRECTION**
THE BATTERY SEEMS WEAK OR DEAD WHEN ATTEMPTING TO START THE ENGINE.	1. The electrical system ignition-off draw is excessive.	1. Refer to **BATTERY, STANDARD PROCEDURE** for the proper test procedures. Repair the excessive ignition-off draw, as required.
	2. The charging system is inoperative.	2. Determine if the charging system is performing to specifications. Refer to **DIAGNOSIS AND TESTING** . Repair the inoperative charging system, as required.
	3. The battery is discharged.	3. Determine the battery state-of-charge using the Midtronics GR8 battery tester. Refer to **BATTERY, STANDARD PROCEDURE**. Charge the battery as required.
	4. The battery terminal connections are loose or corroded.	4. Refer to **CABLES, BATTERY, DIAGNOSIS AND TESTING**. Clean and tighten the battery terminal connections, as required.
	5. The battery has an incorrect size or rating for this vehicle.	5. Refer to **SPECIFICATIONS** for the proper size and rating. Replace an incorrect battery, as required.
	6. The battery is inoperative.	6. Determine the battery cranking capacity using the Midtronics GR8 battery tester. Refer to **BATTERY, STANDARD PROCEDURE**. Replace the inoperative battery, as required.
	7. The starting system is inoperative.	7. Determine if the starting system is performing to specifications. Refer to **DIAGNOSIS AND TESTING** . Repair the inoperative starting system, as required.

BATTERY SYSTEM DIAGNOSIS		
CONDITION	**POSSIBLE CAUSES**	**CORRECTION**
	8. The battery is physically damaged.	8. Inspect the battery for loose terminal posts or a cracked and leaking case. Replace the damaged battery, as required.
THE BATTERY STATE OF CHARGE CANNOT BE MAINTAINED.	1. The battery has an incorrect size or rating for this vehicle.	1. Refer to **SPECIFICATIONS** for the proper size and rating. Replace an incorrect battery, as required.
	2. The battery terminal connections are loose or corroded.	2. Refer to **CABLES, BATTERY, DIAGNOSIS AND TESTING**. Clean and tighten the battery terminal connections, as required.
	3. The electrical system ignition-off draw is excessive.	3. Refer to **BATTERY, STANDARD PROCEDURE** for the proper test procedures. Repair the inoperative electrical system, as required.
	4. The battery is inoperative.	4. Test the battery using the Midtronics GR8 battery tester. Refer to **BATTERY, STANDARD PROCEDURE**. Replace the inoperative battery, as required.
	5. The starting system is inoperative.	5. Determine if the starting system is performing to specifications. Refer to **DIAGNOSIS AND TESTING** . Repair the inoperative starting system, as required.
	6. The charging system is inoperative.	6. Determine if the charging system is performing to specifications. Refer to **DIAGNOSIS AND TESTING** . Repair the inoperative charging system, as required.
	7. Electrical loads exceed the output of the charging system.	7. Inspect the vehicle for aftermarket electrical equipment which might cause excessive electrical loads.
	8. Slow driving or prolonged idling with high-amperage draw systems in use.	8. Advise the vehicle operator, as required.
THE BATTERY WILL NOT ACCEPT A CHARGE.	1. The battery is inoperative.	1. Test the battery using the Midtronics GR8 battery tester. Refer to **BATTERY, STANDARD PROCEDURE**. Replace the inoperative battery, as required.

SPECIFICATIONS

SPECIFICATIONS

The battery Group Size number, the Cold Cranking Amperage (CCA) rating, and the Reserve Capacity (RC) rating, or Ampere-Hours (AH) rating, can be found on the original equipment battery label. Be certain that a

replacement battery has the correct Group Size number, as well as CCA, and RC or AH ratings that equal or exceed the original equipment specification for the vehicle being serviced. Battery sizes and ratings are discussed in more detail below.

- **Group Size** - The outside dimensions and terminal placement of the battery conform to standards established by the Battery Council International (BCI). Each battery is assigned a BCI Group Size number to help identify a correct -sized replacement.
- **Cold Cranking Amperage** - The Cold Cranking Amperage (CCA) rating specifies how much current (in amperes) the battery can deliver for 30 seconds at -18Â° C (0Â° F). Terminal voltage must not fall below 7.2 volts during or after the 30 second discharge period. The CCA required is generally higher as engine displacement increases, depending upon the starter current draw requirements.
- **Reserve Capacity** - The Reserve Capacity (RC) rating specifies the time (in minutes) it takes for battery terminal voltage to fall below 10.5 volts, at a discharge rate of 25 amperes. RC is determined with the battery fully-charged at 26.7Â° C (80Â° F). This rating estimates how long the battery might last after a charging system failure, under minimum electrical load.
- **Ampere-Hours** - The Ampere-Hours (AH) rating specifies the current (in amperes) that a battery can deliver steadily for 20 hours, with the voltage in the battery not falling below 10.5 volts. This rating is sometimes identified as the 20-hour discharge rating.

BATTERY CLASSIFICATIONS AND RATINGS				
BCI Group Size Classification	**Cold Cranking Amperage**	**Reserve Capacity**	**Ampere - Hours**	**Load Test Amperage**

CLEANING

CLEANING

The following information details the recommended cleaning procedures for the battery and related components. In addition to the maintenance schedules found in this service information , it is recommended that these procedures be performed any time the battery or related components must be removed for vehicle service. Refer to **MAINTENANCE SCHEDULES, DESCRIPTION** .

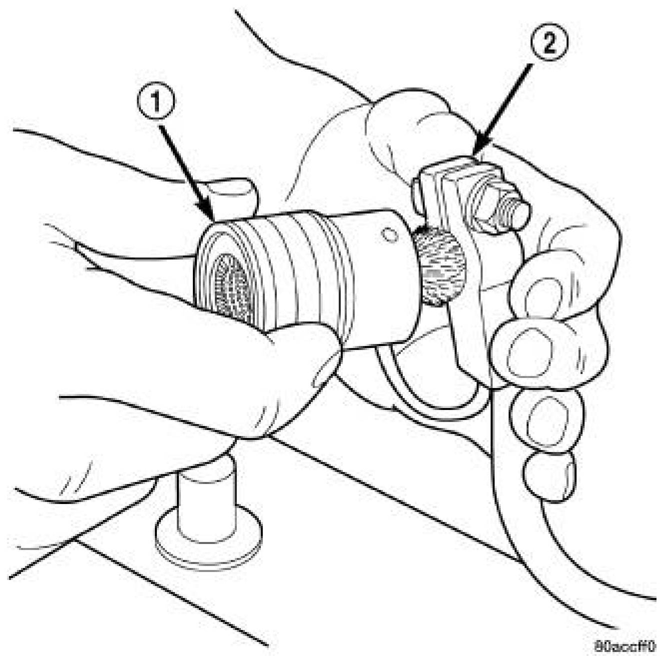

Fig. 1: Cleaning Battery Cable Terminal Clamps
Courtesy of CHRYSLER GROUP, LLC

1. Clean the battery cable terminal clamps (2) of all corrosion. Remove any corrosion using a wire brush or cleaning tool (1), and a sodium bicarbonate (baking soda) and warm water cleaning solution.
2. Clean the battery tray and battery hold-down hardware using a stiff bristle parts cleaning brush and a sodium bicarbonate (baking soda) and warm water cleaning solution.

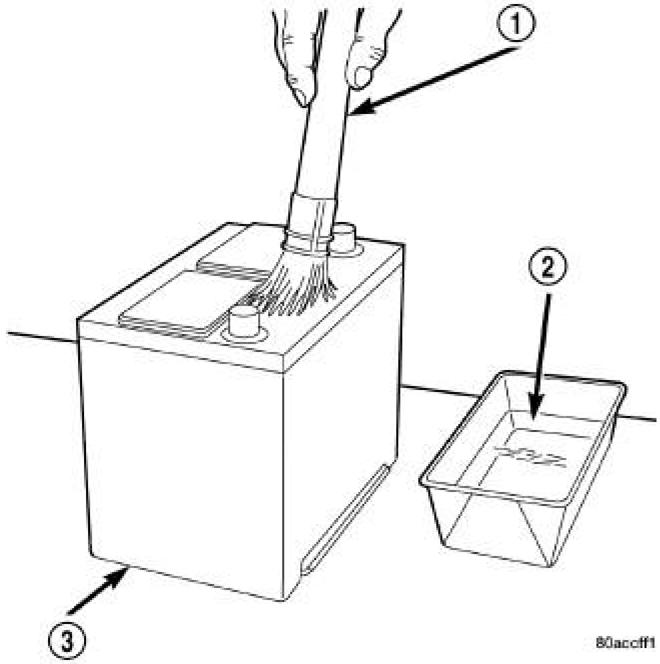

Fig. 2: Cleaning Outside Of Battery Case
Courtesy of CHRYSLER GROUP, LLC

3. If the removed battery is to be reinstalled, clean the outside of the battery case and the top cover (3) with a sodium bicarbonate (baking soda) and warm water cleaning solution (2) using a stiff bristle parts cleaning brush (1) to remove any acid film. Rinse the battery with clean water. Ensure that the cleaning solution does not enter the battery cells through the vent holes. If the battery is being replaced, refer to **SPECIFICATIONS** for the factory-installed battery specifications. Confirm that the replacement battery is the correct size and has the correct ratings for the vehicle.

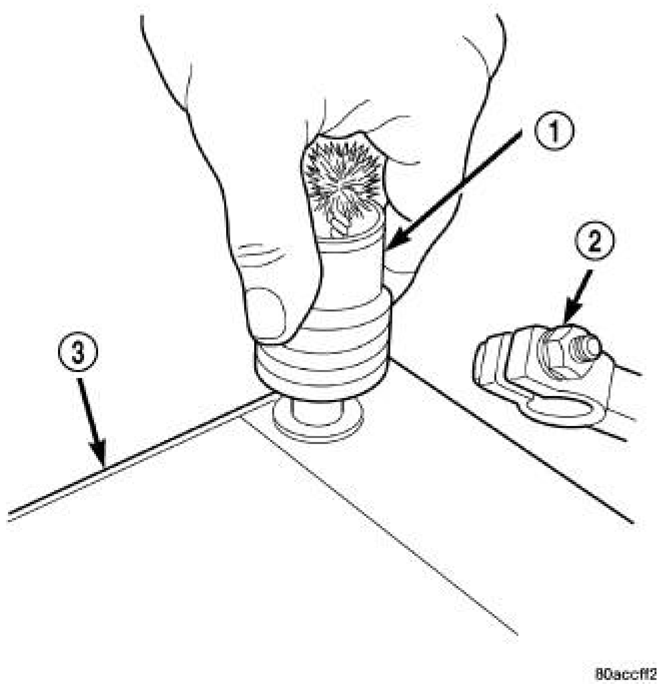

Fig. 3: Cleaning Battery Terminal Post Using Terminal Cleaner
Courtesy of CHRYSLER GROUP, LLC

4. Clean any corrosion from the battery terminals with a wire brush or terminal cleaner (1), and a sodium bicarbonate (baking soda) and warm water cleaning solution.

INSPECTION

INSPECTION

The following information details the recommended inspection procedures for the battery and related components. In addition to the maintenance schedules, it is recommended that these procedures be performed any time the battery or related components are removed for vehicle service. Refer to **MAINTENANCE SCHEDULES, DESCRIPTION** .

1. Inspect the battery cable terminal clamps for damage. Replace any battery cable that has a damaged or deformed terminal clamp.
2. Inspect the battery tray and battery hold down hardware for damage. Replace any damaged parts.
3. Slide the thermal guard off of the battery case, if equipped. Inspect the battery case for cracks or other damage that could result in electrolyte leaks. Also, check the battery terminal posts for looseness. Batteries with damaged cases or loose terminal posts must be replaced.
4. Inspect the battery thermal guard for tears, cracks, deformation or other damage. Replace any battery thermal guard that has been damaged.
5. Inspect the battery built-in test indicator sight glass (if equipped) for an indication of the battery condition. If the battery is discharged, charge as required. Refer to **BATTERY, STANDARD PROCEDURE**.

BATTERY

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BATTERY

WARNING: IF THE BATTERY SHOWS SIGNS OF FREEZING, LEAKING OR LOOSE POSTS, DO NOT TEST, ASSIST-BOOST, OR CHARGE. THE BATTERY MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: EXPLOSIVE HYDROGEN GAS FORMS IN AND AROUND THE BATTERY. DO NOT SMOKE, USE FLAME, OR CREATE SPARKS NEAR THE BATTERY. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.

WARNING: THE BATTERY CONTAINS SULFURIC ACID, WHICH IS POISONOUS AND CAUSTIC. AVOID CONTACT WITH THE SKIN, EYES, OR CLOTHING. IN THE EVENT OF CONTACT, FLUSH WITH WATER AND CALL A PHYSICIAN IMMEDIATELY. KEEP OUT OF THE REACH OF CHILDREN.

A battery that will not accept a charge is inoperative, and must be replaced. Further testing is not required. A fully-charged battery must be load tested to determine its cranking capacity. A battery that is fully-charged, but does not pass the load test, is inoperative and must be replaced.

NOTE: **Completely discharged batteries may take several hours to accept a charge. Refer to BATTERY, STANDARD PROCEDURE for the proper battery charging procedures.**

MIDTRONICS GR8 BATTERY TESTER

The Midtronics GR8 battery tester is designed to help diagnose the cause of an inoperative battery. Refer to **BATTERY, STANDARD PROCEDURE** for instructions on the use of the Midtronics GR8 battery tester.

STANDARD PROCEDURE

BATTERY CHARGING

Battery charging is the means by which the battery can be restored to its full voltage potential. A battery is fully-charged when:

- Midtronics (special tool #GR8-1220KIT-CHRY, AGM Battery Tester/Charger Station) tester indicates battery is OK.
- All of the battery cells are gassing freely during battery charging.
- Open-circuit voltage of the battery is 12.65 volts or above.

WARNING: **Never exceed twenty amperes when charging a cold (-1Â° C [30Â° F] or lower) battery. The battery may arc internally and explode. Personal injury and/or vehicle damage may result.**

WARNING: **If the battery shows signs of freezing, leaking, loose posts, do not test, assist-boost, or charge. The battery may arc internally and explode. Personal injury and/or vehicle damage may result.**

WARNING: **EXPLOSIVE HYDROGEN GAS FORMS IN AND AROUND THE BATTERY. DO NOT SMOKE, USE FLAME, OR CREATE SPARKS NEAR THE BATTERY. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.**

WARNING: **THE BATTERY CONTAINS SULFURIC ACID, WHICH IS POISONOUS AND CAUSTIC. AVOID CONTACT WITH THE SKIN, EYES, OR CLOTHING. IN THE EVENT OF CONTACT, FLUSH WITH WATER AND CALL A PHYSICIAN IMMEDIATELY. KEEP OUT OF THE REACH OF CHILDREN.**

CAUTION: **Always disconnect and isolate the battery negative cable before charging a battery. Do not exceed sixteen volts while charging a battery. Damage to the vehicle electrical system components may result.**

CAUTION: **Battery electrolyte will bubble inside the battery case during normal battery charging. Electrolyte boiling or being discharged from the battery vents indicates a battery overcharging condition. Immediately reduce the charging rate or turn off the charger to evaluate the battery condition. Damage to the battery may result from overcharging.**

After the battery has been charged to 12.65 volts or greater, perform a load test to determine the battery

cranking capacity. Refer to **BATTERY, STANDARD PROCEDURE** for the proper battery load test procedures. If the battery will endure a load test, return the battery to service. If the battery will not endure a load test, it is inoperative and must be replaced.

Clean and inspect the battery hold-down, tray, terminals, posts, and top before completing battery service. Refer to **CLEANING** and **INSPECTION** for the proper battery system cleaning and inspection procedures.

CHARGING A COMPLETELY DISCHARGED BATTERY

The following procedure should be used to recharge a completely discharged battery. Unless this procedure is properly followed, a good battery may be needlessly replaced.

1. Measure the voltage at the battery posts with a voltmeter, accurate to 1/10 (0.10) volt. If the reading is below ten volts, the battery charging current will be low. It could take some time before the battery accepts a current greater than a few milliamperes. Such low current may not be detectable on the ammeters built into many battery chargers.
2. Disconnect and isolate the battery negative cable. Connect the Midtronics (special tool #GR8-1220KIT-CHRY, AGM Battery Tester/Charger Station).

NOTE: **Some battery chargers are equipped with polarity-sensing circuitry. This circuitry protects the battery charger and the battery from being damaged if they are improperly connected. If the battery state-of-charge is too low for the polarity-sensing circuitry to detect, the battery charger will not operate. This makes it appear that the battery will not accept charging current. See the instructions provided by the manufacturer of the battery charger for details on how to bypass the polarity-sensing circuitry.**

3. Battery chargers vary in the amount of voltage and current they provide. The amount of time required for a battery to accept measurable charging current at various voltages is shown in **CHARGE RATE TABLE** . If the charging current is still not measurable at the end of the charging time, the battery is inoperative and must be replaced. If the charging current is measurable during the charging time, the battery may be good and the charging should be completed in the normal manner.

CHARGE RATE TABLE

CHARGE RATE TABLE	
Voltage	**Hours**
16.0 volts maximum	up to 4 hours
14.0 to 15.9 volts	up to 8 hours
13.9 volts or less	up to 16 hours

CHARGING TIME REQUIRED

The time required to charge a battery will vary, depending upon the following factors:

- **Battery Capacity** - A completely discharged heavy-duty battery requires twice the charging time of a small capacity battery.
- **Temperature** - A longer time will be needed to charge a battery at -18Â° C (0Â° F) than at 27Â° C (80Â° F). When a fast battery charger is connected to a cold battery, the current accepted by the battery will be very low at first. As the battery warms, it will accept a higher charging current rate (amperage).

- **Charger Capacity** - A battery charger that supplies only five amperes will require a longer charging time. A battery charger that supplies twenty amperes or more will require a shorter charging time.
- **State-Of-Charge** - A completely discharged battery requires more charging time than a partially discharged battery. The specific gravity is very low in a completely discharged battery. At first, the charging current (amperage) will be low. As the battery charges, the specific gravity of the electrolyte will gradually rise.

The Battery Charging Time Table gives an indication of the time required to charge a typical battery at room temperature based upon the battery state-of-charge and the charger capacity.

BATTERY CHARGING TIME TABLE

BATTERY CHARGING TIME TABLE			
Charging Amperage	**5 Amps**	**10 Amps**	**20 Amps**
Open Circuit Voltage	**Hours Charging @ 21Ā° C (70Ā° F)**		
12.25 to 12.49	6 hours	3 hours	1.5 hours
12.00 to 12.24	10 hours	5 hours	2.5 hours
10.00 to 11.99	14 hours	7 hours	3.5 hours
Below 10.00	18 hours	9 hours	4.5 hours

GR8 BATTERY TESTER / CHARGER

Always use the Midtronics GR8 Instruction Manual that was supplied with the tester as a reference. If the Instruction Manual is not available the following procedure can be used:

WARNING: Always wear appropriate eye protection and use extreme caution when working with batteries.

BATTERY TESTING

1. If testing the battery OUT-OF-VEHICLE, clean the battery terminals with a wire brush before testing. Refer to **CLEANING**. If the battery is equipped with side post terminals, install and tighten the supplied lead terminal stud adapters. Do not use steel bolts. Failure to properly install the stud adapters, or using stud adapters that are dirty or worn-out may result in false test readings.
2. If testing the battery IN-THE-VEHICLE, make certain all of the vehicle accessory loads are OFF, including the ignition. Connect the Midtronics GR8 directly to the battery posts.

NOTE: Multiple batteries connected in parallel must have the ground cable disconnected to perform a battery test. Failure to disconnect may result in false battery test readings.

3. Using the ARROW key select **in** or **out** of vehicle testing and press ENTER to make a selection.
4. If not selected, choose the Cold Cranking Amp (CCA) battery rating. Or select the appropriate battery rating for your area (see menu). The tester will then run its self programmed test of the battery and display the results. Refer to the test result table noted below.
5. While viewing the battery test result, press the CODE button and the tester will prompt you for the last 4 digits of the VIN. Use the UP/DOWN arrow buttons to scroll to the correct character; then press ENTER to select and move to the next digit. Then press the ENTER button to view the SERVICE CODE.

Pressing the CODE button a second time will return you to the test results.

NOTE: **The SERVICE CODE is required on every warranty claim submitted for battery replacement.**

QUICK REFERENCE GUIDE

Inspect the battery for damages and check the electrolyte level. Always use the necessary safety precautions when working with batteries to prevent severe injury or death. Follow all manufacturers' instructions and BCI (Battery Council International) safety recommendations, which include the following precautions:

MAIN MENU

The Main Menu is the starting point for all tools and utilities, which are depicted as icons. Some icons lead directly to the function they represent, while others are menu icons that lead to two or more options.

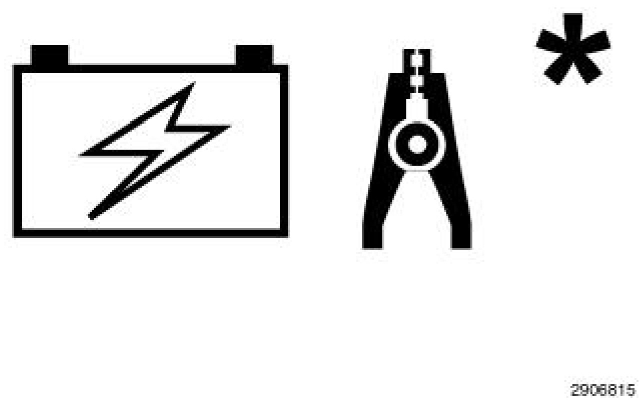

Fig. 4: Battery Tester Main Menu Icon 1

Provides a list of topics and definitions. Also includes Midtronics Customer Service phone numbers.

CHARGE/TEST MENU

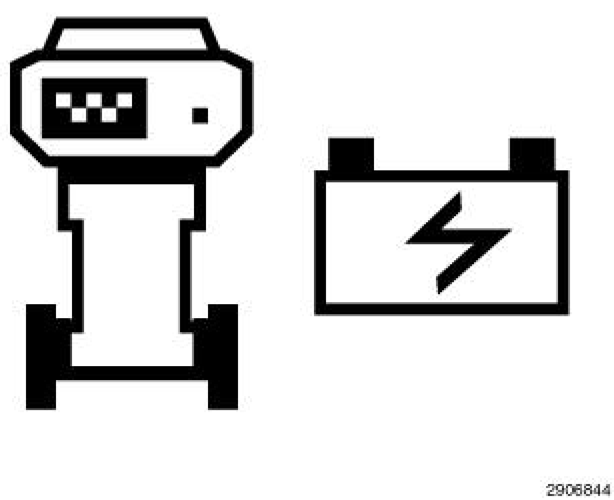

Fig. 10: Charge/Test Menu Icon 1
Courtesy of CHRYSLER GROUP, LLC

Automatically tests and charges battery, starting, and charging system. Generates a warranty code for Replace and Bad Cell decisions.

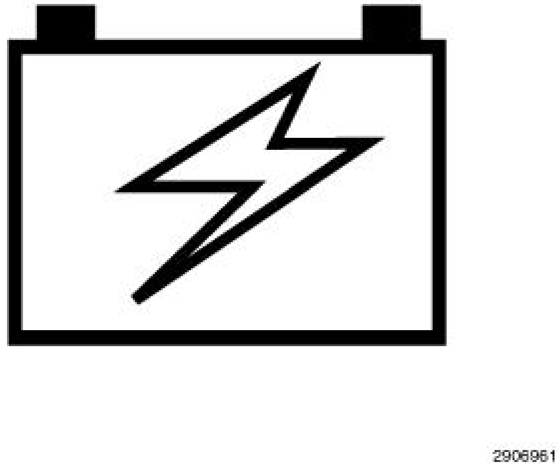

Fig. 11: Charge/Test Menu Icon 2
Courtesy of CHRYSLER GROUP, LLC

Pre Delivery Inspection (PDI): For testing delivered vehicles and lot maintenance. Uses the same inputs as a diagnostic charge.

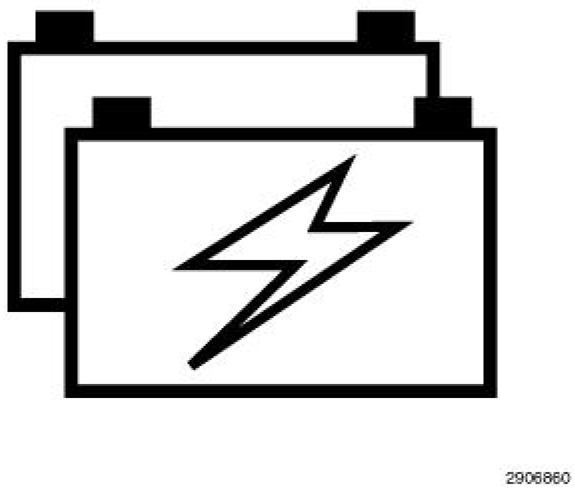

Fig. 12: Charge/Test Menu Icon 3
Courtesy of CHRYSLER GROUP, LLC

Dual Battery Charge mode allows the charger to be used with dual battery systems.

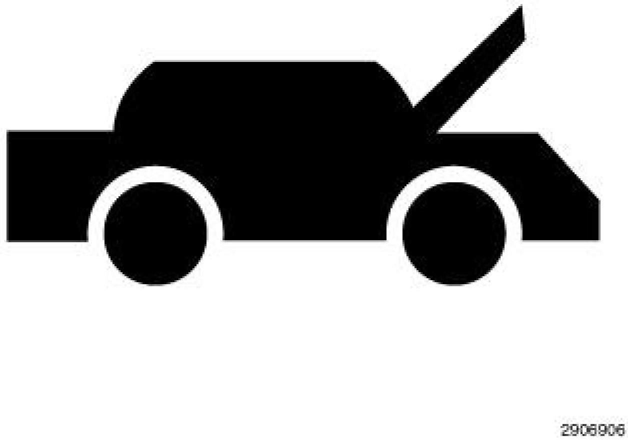

Fig. 13: Charge/Test Menu Icon 4
Courtesy of CHRYSLER GROUP, LLC

Makes high output current available to boost charge an in-vehicle battery and assist in starting the engine.

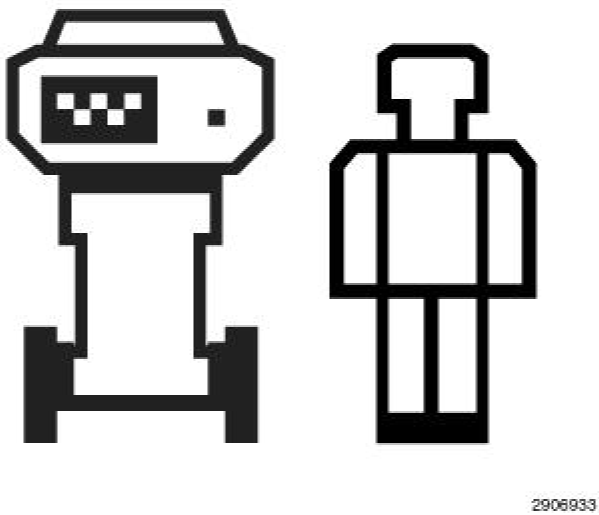

Fig. 14: Charge/Test Menu Icon 5
Courtesy of CHRYSLER GROUP, LLC

Provides a timed charge that ranges from 5 to 120 minutes or a continuous charge that ends when you press the STOP key.

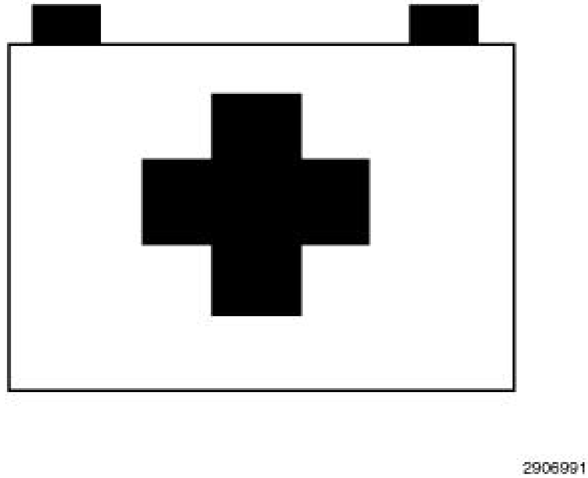

Fig. 15: Charge/Test Menu Icon 6
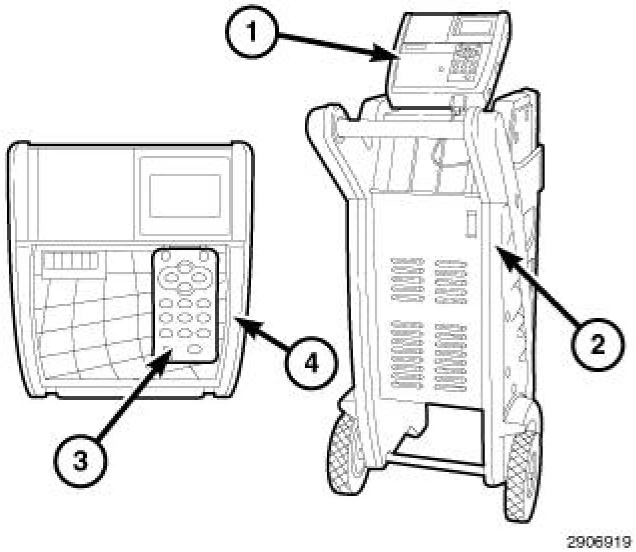
Courtesy of CHRYSLER GROUP, LLC

In this mode the charger can provide a trickle charge for long term, low amp battery charging.

Fig. 16: Charge/Test Menu Icon 7
Courtesy of CHRYSLER GROUP, LLC

Generates 15-digit warranty codes for physically defective batteries or customer good will.



[Fig. 17: GR8 Battery Tester]

1. Average cranking voltage
2. Average cranking current if amp clamp is used
3. Cranking time in seconds
4. Y axis = System performance: cranking voltage

IGNITION-OFF DRAW TEST

The term Ignition-Off Draw (IOD) identifies a normal condition where power is being drained from the battery with the ignition in the Off position. A normal vehicle electrical system will draw from five to thirty-five milliamperes (0.005 to 0.035 ampere) with the ignition switch in the Off position, and all non-ignition controlled circuits in proper working order. Up to thirty-five milliamperes are needed to enable the memory functions for the Powertrain Control Module (PCM), digital clock, electronically tuned radio, and other modules which may vary with the vehicle equipment.

A vehicle that has not been operated for approximately twenty days, may discharge the battery to an inadequate level. When a vehicle will not be used for twenty days or more (stored), use the scan tool to put the vehicle in shipping mode. This will reduce battery discharging.

Excessive IOD can be caused by:

- Electrical items left on.
- Inoperative or improperly adjusted switches.
- Inoperative or shorted electronic modules and components.
- An internally shorted generator.
- Intermittent shorts in the wiring.

If the IOD is over thirty-five milliamperes, the problem must be found and corrected before replacing a battery. In most cases, the battery can be charged and returned to service after the excessive IOD condition has been corrected.

1. Verify that all electrical accessories are off. Turn off all lamps, turn the ignition off, and close all doors. If the vehicle is equipped with an illuminated entry system or an electronically tuned radio, allow the electronic timer function of these systems to automatically shut off (time out). This may take up to ten minutes. See ELECTRONIC MODULE IGNITION-OFF DRAW TABLE for more information.

ELECTRONIC MODULE IGNITION-OFF DRAW TABLE

ELECTRONIC MODULE IGNITION-OFF DRAW (IOD) TABLE			
Module	**Time Out? (If Yes, Interval And Wake-Up Input)**	**IOD**	**IOD After Time Out**
Radio	No	1 to 3 milliamperes	N/A
Audio Power Amplifier	No	up to 1 milliampere	N/A
Powertrain Control Module (PCM)	No	0.95 milliampere	N/A

2. Determine that the underhood lamp is operating properly, then disconnect the lamp wire harness connector or remove the lamp bulb.

3. Turn off all electrical accessories.
4. If connected, disconnect the scan tool. The scan tool can wake the modules on the vehicles or not allow them to sleep.
5. Connect a 10 gauge jumper wire between the negative battery cable and the negative battery post.
6. Disconnect the negative battery cable.

NOTE: Do not break the connection between the 10 amp jumper wire and the battery. If the connection between the battery negative terminal post and the negative cable terminal clamp is lost during any part of the IOD test, the electronic timer function will be activated and all of the tests will have to be repeated.

CAUTION: Do not open any doors, or turn on any electrical accessories with the lowest milliampere scale selected, or the multi-meter may be damaged.

7. Turn the ignition ON and then OFF and wait 10 minutes for all systems to enter sleep mode.
8. Set an electronic digital multi-meter to its highest amperage scale. Connect the multi-meter to the battery negative cable terminal clamp and the battery negative terminal post, but not on the jumper connection.
9. Remove the 10 gauge jumper wire without breaking the digital multi-meter connection.
10. The multi-meter leads must be securely clamped to the battery negative cable terminal clamp and the battery negative terminal post, but not the 10 gauge jumper wire.
11. The high-amperage IOD reading on the multi-meter should be very low or nonexistent, depending upon the electrical equipment in the vehicle. If the amperage reading remains high, remove and replace each fuse or circuit breaker in the PDC, one at a time until the amperage reading becomes very low, or nonexistent. Refer to the appropriate wiring information for complete PDC, circuit breaker, and circuit identification. This will isolate each circuit and identify the circuit that is the source of the high-amperage IOD. If the amperage reading remains high after removing and replacing each fuse, disconnect the wire harness from the generator. If the amperage reading now becomes very low or nonexistent, diagnose and repair the Charging System as necessary. After the high-amperage IOD has been corrected, switch the multi-meter to progressively lower amperage scales and, if necessary, repeat the fuse and circuit breaker remove-and-replace process to identify and correct all sources of excessive IOD. It is now safe to select the lowest milliampere scale of the multi-meter to check the low-amperage IOD.
12. Observe the multi-meter reading. The low-amperage IOD should not exceed thirty-five milliamperes (0.035 ampere). If the current draw exceeds thirty-five milliamperes, isolate each circuit using the fuse and circuit breaker remove and replace process in Step 10. The multi-meter reading will drop to within the acceptable limit when the source of the excessive current draw is disconnected. Repair this circuit as required; whether a wiring short, incorrect switch adjustment, or an inoperative component is the cause.

OPEN-CIRCUIT VOLTAGE TEST

A battery open-circuit voltage (no load) test will show the approximate state-of-charge of a battery.

Before proceeding with this test, completely charge the battery, refer to the appropriate battery charging procedure.

1. Before measuring the open-circuit voltage, the surface charge must be removed from the battery. Turn on the headlamps for fifteen seconds, then allow up to five minutes for the battery voltage to stabilize.

2. Disconnect and isolate both battery cables, negative cable first.
3. Using a voltmeter connected to the battery posts (see the instructions provided by the manufacturer of the voltmeter), measure the open-circuit voltage.

See **OPEN-CIRCUIT VOLTAGE TABLE** . This voltage reading will indicate the battery state-of-charge, but will not reveal its cranking capacity. If a battery has an open-circuit voltage reading of 12.4 volts or greater, it may be load tested to reveal its cranking capacity.

OPEN-CIRCUIT VOLTAGE TABLE

OPEN CIRCUIT VOLTAGE TABLE	
Open Circuit Voltage	**Charge Percentage**
11.7 volts or less	0%
12.0 volts	25%
12.2 volts	50%
12.4 volts	75%
12.6 volts or more	100%

REMOVAL

REMOVAL

WARNING: A SUITABLE PAIR OF HEAVY DUTY RUBBER GLOVES AND SAFETY GLASSES SHOULD BE WORN WHEN REMOVING OR SERVICING A BATTERY.

WARNING: Remove metallic jewelry to avoid injury by accidental arcing of battery current.

1. Make sure ignition switch is in OFF position and all accessories are turned OFF.
2. Remove the rear compartment floor, trim panel to gain access to the battery.
3. Disconnect and isolate negative battery cable with Intelligent Battery Sensor (IBS). Refer to **SENSOR, INTELLIGENT BATTERY (IBS), REMOVAL**.
4. Disconnect the battery positive cable from the battery terminal.
5. Unlatch the battery retention strap.

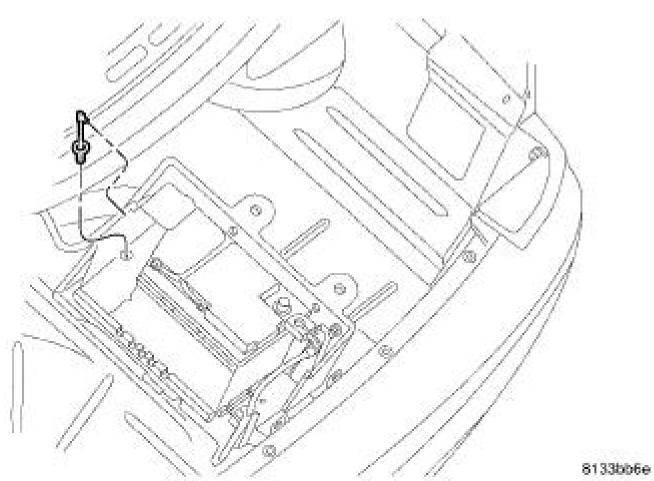

Fig. 22: Battery Vent Tube

Courtesy of CHRYSLER GROUP, LLC

CAUTION: Use care when disconnecting the battery vent tube from the battery. The vent tube nipple is made of plastic and is easily damaged if not disconnected properly.

6. Gently disconnect the battery vent tube from the battery nipple.

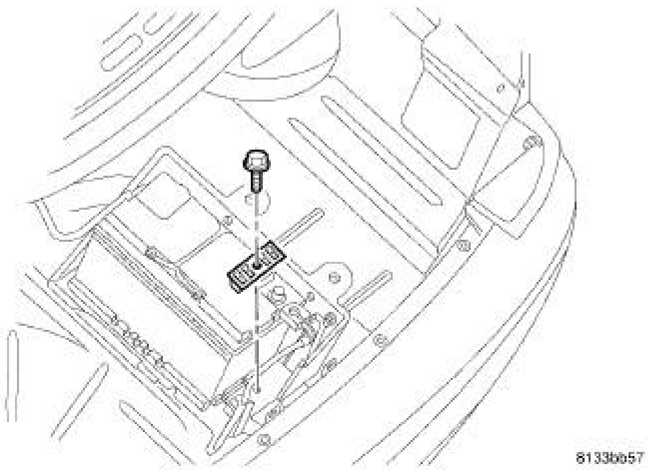

Fig. 23: Battery Hold Down Clamp

Courtesy of CHRYSLER GROUP, LLC

7. Remove the battery hold down clamp and remove the battery from the vehicle.

INSTALLATION

INSTALLATION

WARNING: A SUITABLE PAIR OF HEAVY DUTY RUBBER GLOVES AND SAFETY GLASSES SHOULD BE WORN WHEN REMOVING OR SERVICING A BATTERY.

WARNING: Remove metallic jewelry to avoid injury by accidental arcing of battery current.

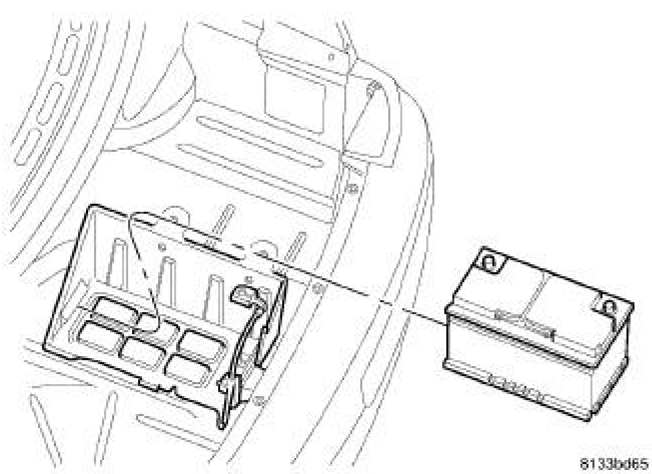

Fig. 24: Battery Tray

2. Install the battery hold down clamp and bolt. Torque the bolt to the proper torque **SPECIFICATIONS**.

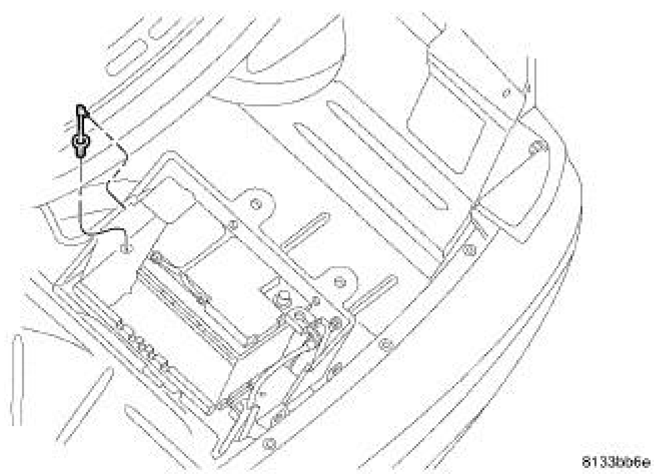

Fig. 26: Battery Vent Tube
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Use care when connecting the battery vent tube to the battery. The vent tube nipple is made of plastic and is easily damaged if not connected properly.

3. Gently connect the battery vent tube to the battery nipple.
4. Latch the battery retention strap.
5. Connect the battery positive cable.
6. Connect the negative battery cable with Intelligent Battery Sensor (IBS). Refer to **SENSOR,**

INTELLIGENT BATTERY (IBS), INSTALLATION.

7. Install the rear compartment floor trim panel.

CABLES, BATTERY

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BATTERY CABLES

A voltage drop test will determine if there is excessive resistance in the battery cable terminal connections or the battery cable. If excessive resistance is found in the battery cable connections, the connection point should be disassembled, cleaned of all corrosion or foreign material, then reassembled. Following reassembly, check the voltage drop for the battery cable connection and the battery cable again to confirm repair.

When performing the voltage drop test, it is important to remember that the voltage drop is giving an indication of the resistance between the two points at which the voltmeter probes are attached. **EXAMPLE:** When touching the leads of the voltmeter on the battery cable end and the B+ terminal of the starter, the voltage reading should read 0 volts. A reading above 0.2 volts indicates high resistance in the cable.

VOLTAGE DROP TEST

The following operation will require a voltmeter accurate to (0.10) volt. Before performing this test, be certain that the following procedures are accomplished:

- The battery is fully-charged. Refer to **BATTERY, STANDARD PROCEDURE** for the proper battery charging procedure.
- The battery has successfully passed a load test. Refer to **BATTERY, STANDARD PROCEDURE** for the proper load test procedure.
- Fully engage the parking brake.
- If the vehicle is equipped with an automatic transmission, place the gearshift selector lever in the Park position. If the vehicle is equipped with a manual transmission, place the gearshift selector lever in the Neutral position and block the clutch pedal in the fully depressed position.
- Verify that all lamps and accessories are turned off.

1. Remove the spare tire cover to gain access to the battery. Connect the positive lead of the voltmeter to the battery negative terminal post. Connect the negative lead of the voltmeter to the battery negative cable terminal clamp. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor connection between the battery negative cable terminal clamp and the battery negative terminal post.
2. Connect the positive lead of the voltmeter to the battery positive terminal post. Connect the negative lead of the voltmeter to the battery positive cable terminal clamp. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor connection between the battery positive cable terminal clamp and the battery positive terminal post.
3. Using a suitable jumper wire, connect the voltmeter to measure between the battery negative cable terminal clamp and a good clean ground on the engine block. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery negative cable eyelet terminal connection at the transmission housing. Repeat the test. If the reading is still above 0.2 volt, perform steps 4 and 5.

4. Connect the voltmeter to measure between the battery negative cable terminal clamp and the battery negative cable eyelet terminal connection at the vehicle body. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery negative cable eyelet terminal connection at the vehicle body. Repeat the test. If the reading is still above 0.2 volt, replace the battery rear negative cable. Refer to **CABLES, BATTERY, REMOVAL**.
5. Connect the voltmeter to measure between the battery negative cable eyelet terminal connection at the right front strut tower and the battery negative cable eyelet terminal connection at the transmission housing. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery negative cable eyelet terminal connection at the right front strut tower. Repeat the test. If the reading is still above 0.2 volt, replace the battery front negative cable. Refer to **CABLES, BATTERY, REMOVAL**.
6. Using a suitable jumper wire, connect the voltmeter to measure between the battery positive cable terminal clamp and the starter solenoid B(+) terminal stud. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery positive cable eyelet terminal connection at the starter solenoid B(+) terminal stud. Repeat the test. If the reading is still above 0.2 volt, perform steps 7 and 8.
7. Remove the right front wheelhouse splash shield to gain access to the battery positive cable bulkhead outside terminal. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** . Connect the voltmeter to measure between the battery positive cable bulkhead outside terminal and the starter solenoid B(+) terminal stud. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery positive cable bulkhead outside terminal connection. Repeat the test. If the reading is still above 0.2 volt, replace the battery front positive cable. Refer to **CABLES, BATTERY, REMOVAL**.

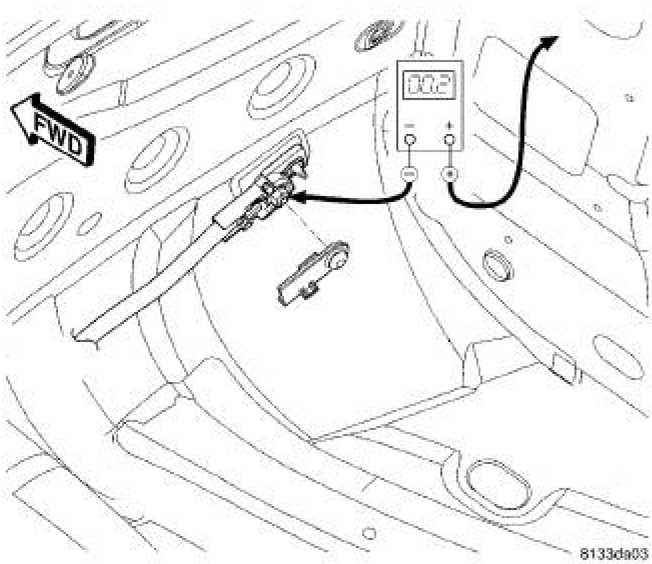

Fig. 27: Testing Battery System
Courtesy of CHRYSLER GROUP, LLC

8. Remove the right front carpet to gain access to the battery positive cable bulkhead inside terminal. Connect the voltmeter to measure between the battery positive cable terminal clamp and the battery positive cable bulkhead inside terminal connection. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery positive

cable bulkhead inside terminal connection. Repeat the test. If the reading is still above 0.2 volt, replace the battery rear positive cable. Refer to **CABLES, BATTERY, REMOVAL**.

REMOVAL

REMOVAL

NEGATIVE - ENGINE COMPARTMENT

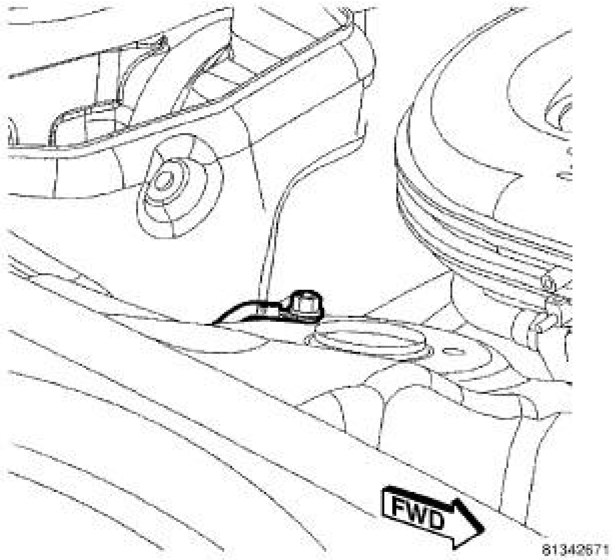

Fig. 28: Fastener Securing Negative Battery Cable To Right Front Strut Tower

2. Position the Power Distribution Center (PDC) onto the battery tray mounting tabs. Gently apply downward pressure on the PDC until it snaps into place.
3. Install the battery. Refer to **BATTERY, INSTALLATION**.

SENSOR, INTELLIGENT BATTERY (IBS)

DESCRIPTION

DESCRIPTION

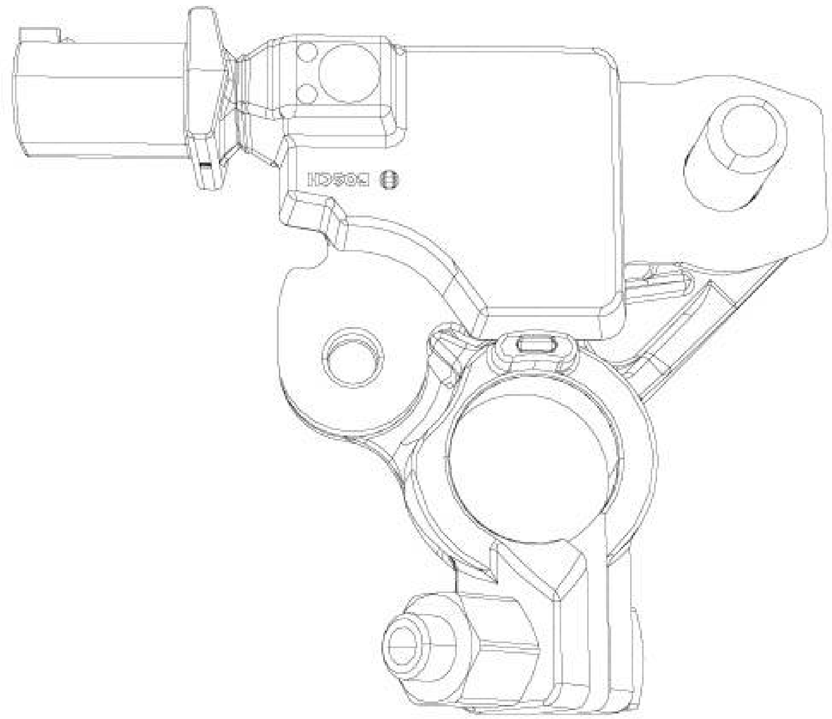

Fig. 61: Intelligent Battery Sensor (IBS) Component Location
Courtesy of CHRYSLER GROUP, LLC

The Intelligent Battery Sensor (IBS) serves to record and process measured battery variable values (current, voltage, temperature) for the vehicle powernet management system. The Intelligent Battery Sensor (IBS) will calculate the Battery 'state of charge', 'state of health', and 'state of function'.

The mechanical part of the IBS is comprised of the battery clamp for the negative terminal and a captured bolt to attach the ground cable to. The functional tasks include establishing the electrical contact between the body and the negative battery post, housing the electronic module (actual sensor element) and the provision of an adequate thermal contact between the sensor system temperature sensor and the negative battery post. The mechanical part of the IBS also protects the sensitive electronic components from external influences.

The IBS is mounted directly on the 12 VDC battery's negative post. The battery post clamp nut is a captive nut and the stud will break if the nut is removed.

OPERATION

OPERATION

The Intelligent Battery Sensor (IBS) contains a low value resistor, or shunt. The shunt creates voltage drop, which is read by an internal microcontroller to determine the current flow in and out of the battery. In addition to the shunt, the IBS contains a sensor to monitor the battery's temperature. Data gathered by the IBS, including temperature, voltage, and current measurements, are transmitted over a LIN communication bus to either the Body Control Module (BCM) or the Powertrain Control Module (PCM), depending on the application. The IBS serves two primary purposes. The first is to provide the Powertrain Control Module (or PCM) with both immediate and historical battery information, so the PCM can precisely control the charging system. The second purpose is to provide data to the BCM for operation of the load-shedding feature. A fused power circuit and the LIN bus are connected to the IBS though a two-terminal connector.

In addition to real-time measurements, the IBS transmits some calculated battery data over the LIN bus, including state of charge, state of health, and state of function. These values are calculated by storing measurements over time.

The battery sensor is readable/diagnosable via a "scan tool" that can display all of the available parameters needed for vehicle servicing or trouble shooting.

Information the Intelligent Battery Sensor (IBS) transmits out on the CAN Bus is

- SOC = Battery state of charge (or SOC) is expressed as a percentage. The IBS calculates the SOC based on measured voltage, and charge and discharge rates. Therefore, SOC is not a direct percentage of battery voltage.
- SOF = Battery State of Function: Battery state of function (or SOF) is a calculated prediction of the lowest voltage the battery will drop to during engine cranking.

The PCM and BCM use this calculated information to optimize vehicle power management for increased fuel efficiency. The data transmitted from IBS is interpreted and sent over the CAN network by the module connected the IBS's LIN bus.

When the IBS is powered up for the first time or is powered after a power disconnection, it enters a "recalibration" phase, where the IBS must recognize the type of battery and its characteristics and state. In this phase the tolerances on the state functions (SOC, SOF) are greater than in normal working condition. When IBS is disconnected from the battery, the device loses its stored memory. When power is restored, the IBS starts a relearn process. Until the relearn process is complete, accurate battery state information is unavailable to other vehicle systems. The IBS relearn process requires five normal, operator initiated starts with at least four hours normal or more during cold ambient conditions of engine off time between each start. Usually, the process takes a few days of vehicle operation to complete. Remember, the relearn process is restarted every time power is reconnected to the IBS.

If the IBS is faulty it cannot be serviced, it must be replaced.

REMOVAL

REMOVAL

WARNING: Do not remove the captive nut, doing so will cause the stud to break.

1. **Loosen** the captive nut.
2. Disconnect the Intelligent Battery Sensor (IBS) electrical connector.
3. Disconnect and isolate the negative battery cable at the IBS M8 stud.
4. Loosen the M6 pole clamp.
5. Remove the IBS from the negative battery post.

INSTALLATION

INSTALLATION

NOTE: Connecting the negative battery cable to the Intelligent Battery Sensor (IBS) must be done before installing on the battery post.

NOTE: DO NOT use a hammer to tap down the sensor. Use a post spreader to open the post if reusing the existing sensor.

NOTE: Avoid IBS rotation during tightening of M8 nut as to avoid contact of 2 way connector breakage when rotating in to the battery.

1. Place the IBS onto the negative battery post and push the IBS down until properly seated on the cone of the post.
2. Connect the negative battery cable to the IBS M8 stud and tighten to the proper **SPECIFICATIONS**.

   NOTE: M8 has much higher torque than the M6 clamp and can break IBS free if the M6 is tightened prior.

3. Secure the M6 pole clamp and tighten to the proper **SPECIFICATIONS**.
4. Install 2 pin connector (Power & LIN) making sure there is no stress on the wires.
5. Install the components removed to access the battery. Refer to **BATTERY, INSTALLATION**.

2015-16 ELECTRICAL

Charging - Service Information - Challenger

DESCRIPTION

DESCRIPTION

The charging system consists of:

- Generator
- Generator decoupler pulley (if equipped)
- Electronic Voltage Regulator (EVR) circuitry within the Powertrain Control Module (PCM)
- Ignition switch
- Battery (refer to **BATTERY SYSTEM - SERVICE INFORMATION**)
- Generator lamp (if equipped)
- Check gauges lamp (if equipped)
- Voltmeter (refer to **INSTRUMENT CLUSTER - SERVICE INFORMATION**)
- Wiring harness and connections (refer to appropriate SYSTEM WIRING DIAGRAMS article)

OPERATION

OPERATION

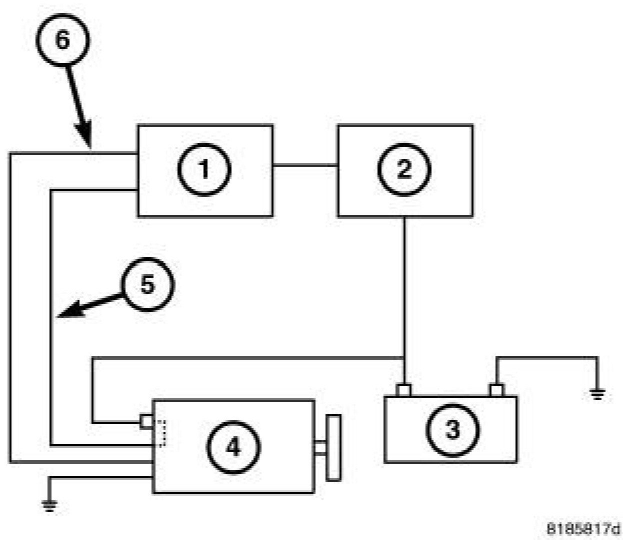

Fig. 1: Charging System Block Diagram
Courtesy of CHRYSLER GROUP, LLC

1 - PCM	
2 - PDC	
3 - Battery	
4 - Generator	

5 - Feed Back Circuit B+
6 - Control Circuit
7 - Battery Sense

The charging system is turned on and off with the Powertrain Control Module (PCM) and ignition switch with engine running. The field circuit will not be energized until engine is running and ignition switch on. This voltage is connected through the PCM and supplied to one of the generator field terminals (Gen. Source B+) at the back of the generator. The generator is internally grounded. The generator regulates the field using pin-1 of the field connector (high side driver).

The generator is driven by the engine through a serpentine belt and pulley, or a decoupler pulley arrangement.

The PCM receives a voltage input from the generator (5) and also a battery voltage input (7) from the Power Distribution Center (PDC), it then compares the voltages to the desired voltage programed in the Electronic Voltage Regulator (EVR) software, and, if there is a difference it sends a signal to the generator EVR circuit to increase or decrease output. It uses a Pulse Width Modulation (PWM) to send signals to the generator circuitry to control the amount of output from the generator. The amount of DC current produced by the generator is controlled by the EVR circuitry contained within the PCM (1).

All vehicles are equipped with On-Board Diagnostics (OBD). All OBD-sensed systems, including EVR circuitry, are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for certain failures it detects.

The Check Gauges Lamp (if equipped) monitors: **charging system voltage,** engine coolant temperature and engine oil pressure. If an extreme condition is indicated, the lamp will be illuminated. This is done as reminder to check the three gauges. The lamp is located on the instrument panel.

Voltage is monitored at the B+ terminal stud to insure it is connected. If the B+ cable is loose, the PCM will shut down generator field. Because of this new feature, pin-2 of the field connector is internally connected to the B+ terminal.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ON-BOARD DIAGNOSTIC SYSTEM

The Powertrain Control Module (PCM) monitors critical input and output circuits of the charging system, making sure they are operational. A Diagnostic Trouble Code (DTC) is assigned to each input and output circuit monitored by the OBD system. Some circuits are checked continuously and some are checked only under certain conditions.

If the OBD system senses that a monitored circuit is bad, it will put a DTC into electronic memory. The DTC will stay in electronic memory as long as the circuit continues to be bad. The PCM is programmed to clear the memory after 40 good trip if the problem does not occur again.

DIAGNOSTIC TROUBLE CODES

A DTC description can be read using the scan tool. Refer to the appropriate Powertrain Diagnosis and Testing information.

A DTC does not identify which component in a circuit is bad. Thus, a DTC should be treated as a symptom, not

as the cause for the problem. In some cases, because of the design of the diagnostic test procedure, a DTC can be the reason for another DTC to be set. Therefore, it is important that the test procedures be followed in sequence, to understand what caused a DTC to be set.

ERASING DIAGNOSTIC TROUBLE CODES

The Scan Tool must be used to erase a DTC.

The following procedures may be used to diagnose the charging system if:

- the check gauges lamp or battery lamp is illuminated with the engine running
- the voltmeter (if equipped) does not register properly
- an undercharged or overcharged battery condition occurs.

Remember that an undercharged battery is often caused by:

- accessories being left on with the engine not running
- a faulty or improperly adjusted switch that allows a lamp to stay on. Refer to Ignition-Off Draw Test. Refer to **IGNITION-OFF DRAW TEST** .
- loose generator belt.

INSPECTION

The Powertrain Control Module (PCM) monitors critical input and output circuits of the charging system, making sure they are operational. A Diagnostic Trouble Code (DTC) is assigned to each input and output circuit monitored by the On-Board Diagnostic (OBD) system. Some charging system circuits are checked continuously, and some are checked only under certain conditions.

For more DTC information, refer to the **DTC INDEX** article. This will include a complete list of DTC's including DTC's for the charging system.

To perform a complete test of the charging system, refer to the appropriate Powertrain Diagnosis and Testing information and the scan tool. Perform the following inspections before attaching the scan tool.

1. Inspect the battery condition. Refer to **DIAGNOSIS AND TESTING** .
2. Inspect condition of battery cable terminals, battery posts, connections at engine block, starter solenoid and relay. They should be clean and tight. Repair as required.
3. Inspect all fuses in both the fuseblock and Power Distribution Center (PDC) or IPM (if equipped) for tightness in receptacles. They should be properly installed and tight. Repair or replace as required.
4. Inspect generator mounting bolts for tightness. Replace or tighten bolts if required. For torque specifications, refer to **TORQUE SPECIFICATIONS**.
5. Inspect generator drive belt condition and tension.
6. Inspect decoupler pulley (if equipped). Ensure decoupler pulley is driving the alternator rotor.
7. Inspect automatic belt tensioner (if equipped). Refer to **ACCESSORY DRIVE** for more information.
8. Inspect generator electrical connections at generator field, battery output, and ground terminal (if equipped). Also check generator ground wire connection at engine (if equipped). They should all be clean and tight. Repair as required.

GENERATOR

REMOVAL

3.6L

WARNING: Disconnect the negative battery cable before removing the battery output wire (B+ wire) from the generator. Failure to do so can result in injury or damage the electrical system.

1. Disconnect and isolate the negative battery cable (1).

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.

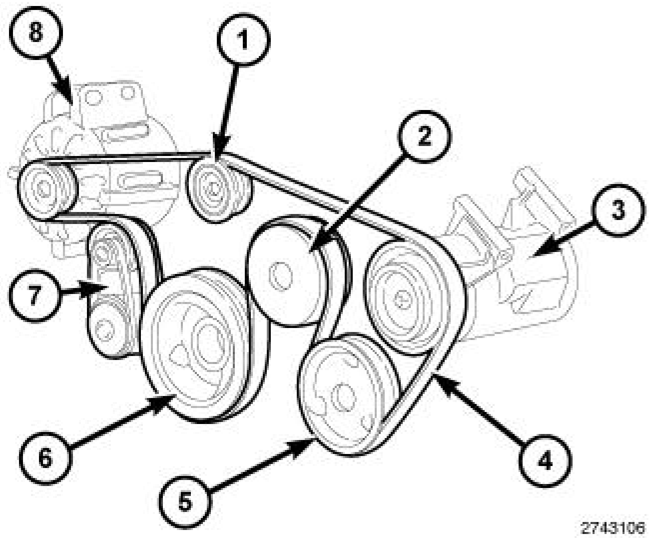

Fig. 2: Identifying Drive Belt Tensioners & Accessory Drive Belt
Courtesy of CHRYSLER GROUP, LLC

2. Rotate the accessory drive belt tensioner (7) counterclockwise until it contacts it's stop and remove the accessory drive belt (4), then slowly rotate the tensioner into the freearm position.

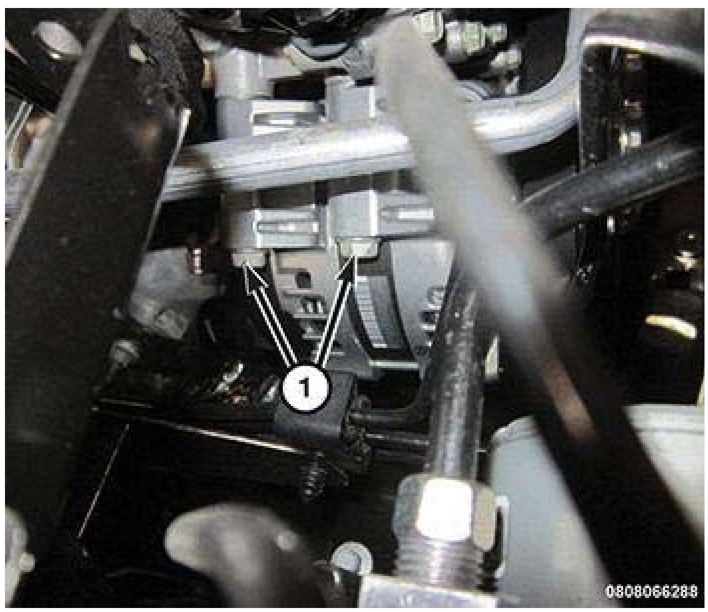

Fig. 3: Upper Generator Retaining Bolts
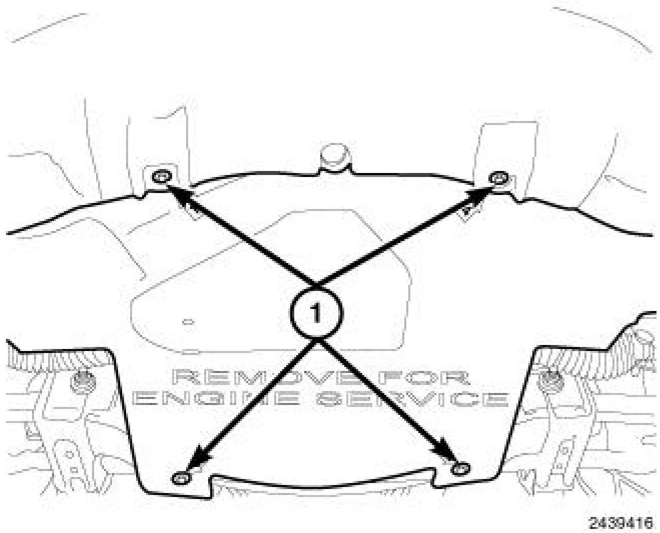
Courtesy of CHRYSLER GROUP, LLC

3. Remove the upper generator retaining bolts (1).
4. Remove the insulator cover from the B+ output terminal at the rear of the generator.
5. Remove the B+ terminal retaining nut at the rear of the generator and remove the B+ terminal.
6. Depress the field wire connector tab at the rear of the generator and disconnect the field wire connector (2).



[Fig. 4: Lower Splash Shield & Fasteners](#)

9. Remove the lower generator retaining bolt (1).
10. Remove the generator from below the engine compartment.

5.7L AND 6.4L

WARNING: **Disconnect the negative battery cable before removing the battery output wire (B+ wire) from the generator. Failure to do so can result in injury or damage the electrical system.**

1. Disconnect and isolate the negative battery cable.

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.

2. Rotate the accessory drive belt tensioner clockwise until it contacts the stop and remove the accessory drive belt, then slowly rotate the tensioner into the freearm position.

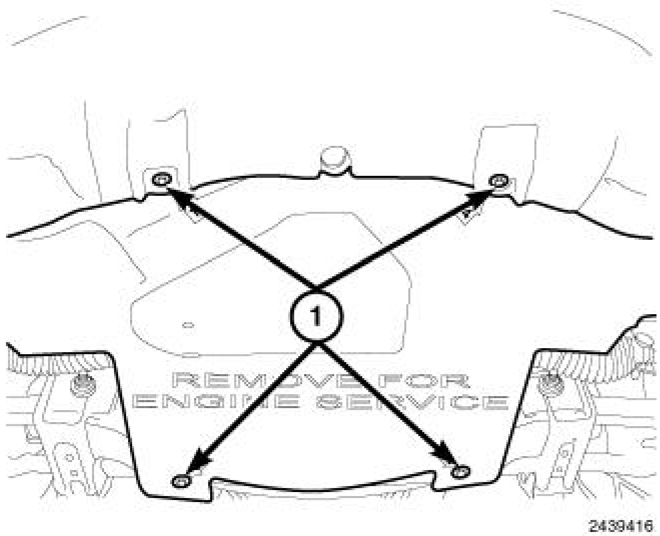

Fig. 6: Lower Splash Shield & Fasteners

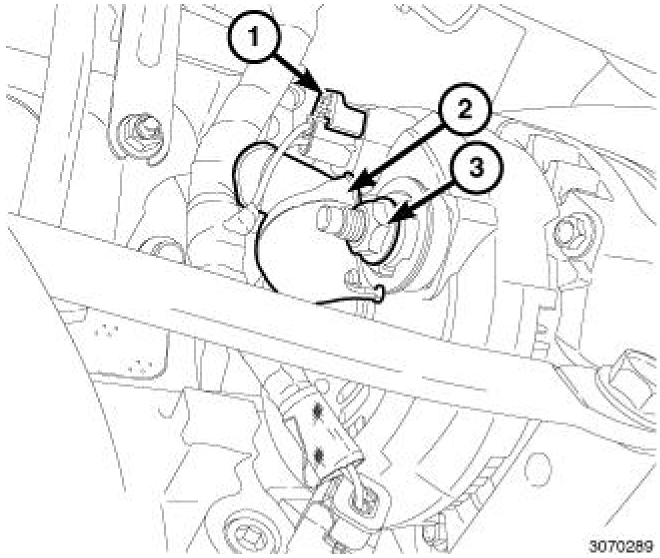
10. Remove the remaining lower generator retaining bolt (1).
11. Lower the vehicle.
12. Remove the upper generator retaining bolt (1) and remove the generator (2) from the vehicle.

6.2L

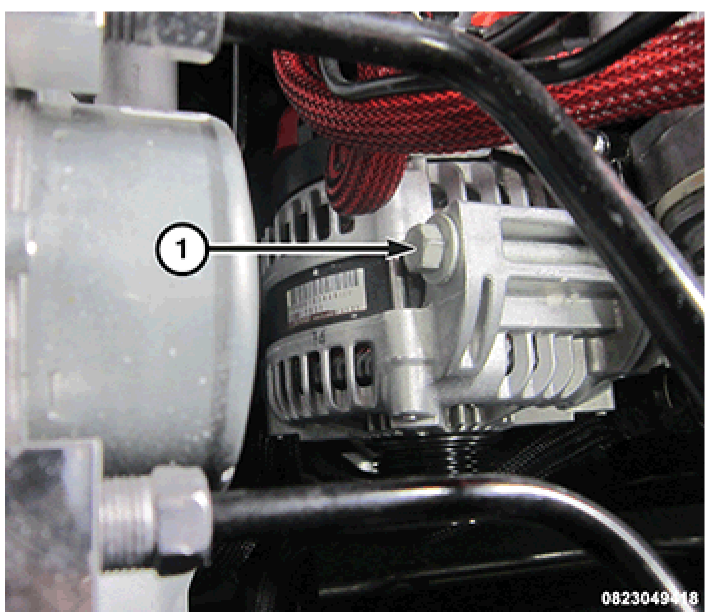
WARNING: Disconnect the negative battery cable before removing the battery output wire (B+ wire) from the generator. Failure to do so can result in injury or damage the electrical system.

1. Disconnect and isolate the negative battery cable (1).
2. Remove the serpentine belt. Refer to **BELT, SERPENTINE, REMOVAL** .
3. Raise and support the vehicle.
4. Remove the belly pan retainers (1) and remove the belly pan.



[Fig. 9: Connector Tab, Insulator Cover And Retaining Nut]
Courtesy of CHRYSLER GROUP, LLC

5. Depress the field wire connector tab (1) at the rear of the generator and disconnect the field wire connector.
6. Remove the insulator cover (2) from B+ output terminal at the rear of the generator.
7. Remove the B+ terminal retaining nut (3) at the rear of the generator and remove the B+ terminal.
8. Unsnap the plastic insulator cap from B+ output terminal at the rear of the generator.
9. Remove the B+ terminal retaining nut at the rear of the generator and remove the B+ terminal.
10. Depress the field wire connector tab at the rear of the generator and disconnect the field wire connector.



[Fig. 10: Lower Generator Retaining Bolt]

13. Remove the upper generator retaining bolts (1) and remove the generator from the vehicle.

INSTALLATION

3.6L

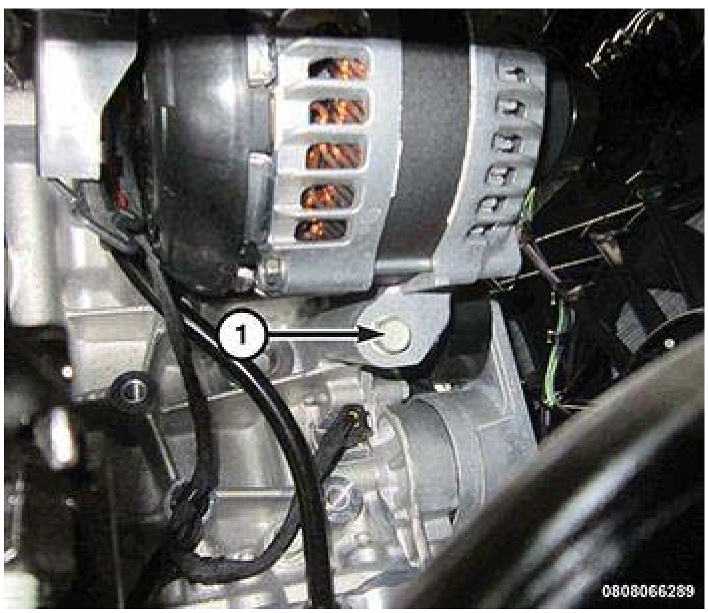

Fig. 12: Lower Generator Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Position the generator, install all bolts to engine finger tight, then tighten fasteners to specification.**

1. Position the generator to the engine and install the lower retaining bolt (1) finger tight.
2. Lower the vehicle.

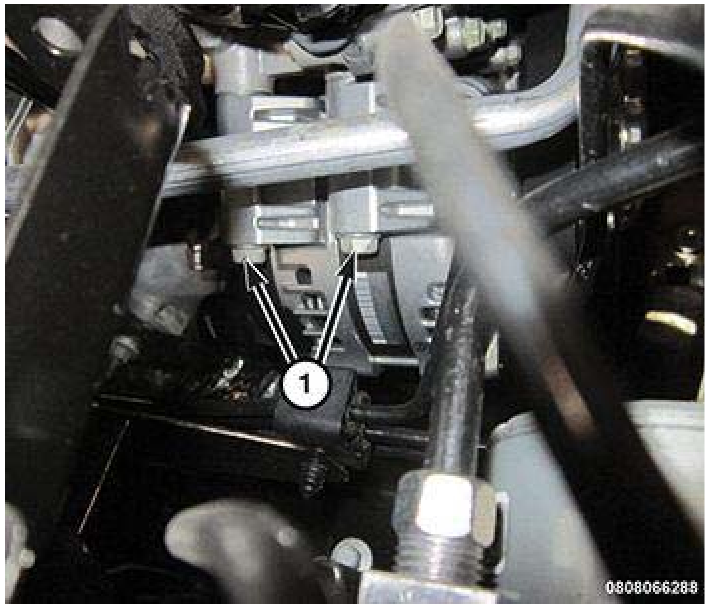

Fig. 13: Upper Generator Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Install the upper generator retaining bolts (1) and tighten to the proper torque specification. Refer to **SPECIFICATIONS**.
4. Snap the field wire connector into the rear of the generator.
5. Position the generator B+ terminal eyelet to the generator output stud, install the retaining nut and tighten to the proper torque specification. Refer to **SPECIFICATIONS**.
6. Install the insulator cover onto the B+ output terminal.
7. Raise and support the vehicle.

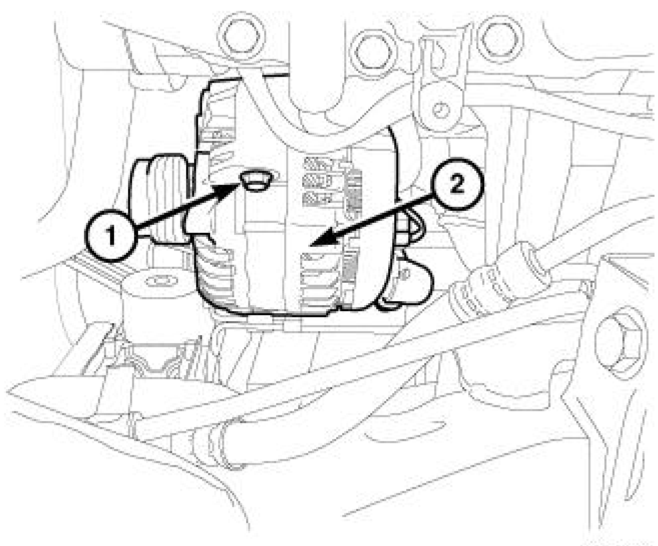

Fig. 14: Generator Retaining Bolt And Generator
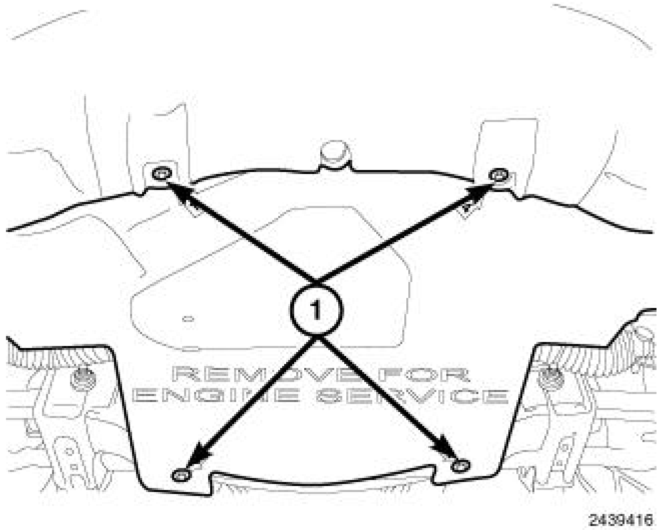
Courtesy of CHRYSLER GROUP, LLC

8. Tighten the lower generator retaining bolt to the proper torque specification. Refer to **SPECIFICATIONS**.

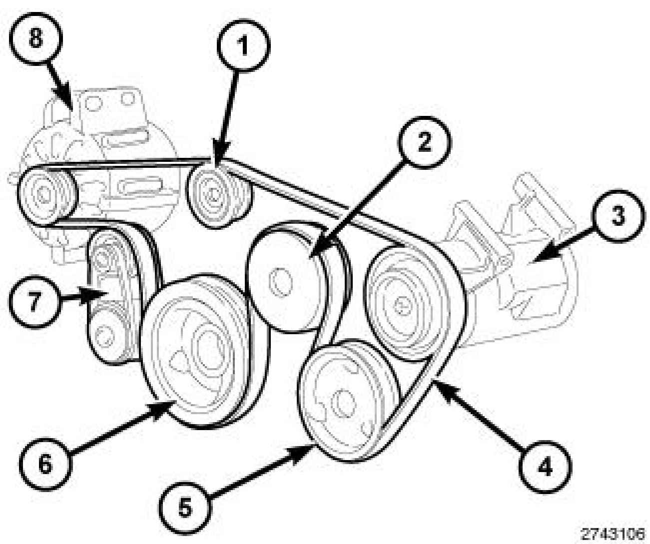


[Fig. 15: Lower Splash Shield & Fasteners](#)
Courtesy of CHRYSLER GROUP, LLC

9. Position the belly pan and install the belly pan retainers (1).
10. Lower the vehicle.

CAUTION: When installing a serpentine accessory drive belt, the belt MUST be routed correctly. The water pump will be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat.

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.



[Fig. 16: Drive Belt Tensioners & Accessory Drive Belt Routing](#)
Courtesy of CHRYSLER GROUP, LLC

11. Rotate the accessory drive belt tensioner (7) counterclockwise until it contacts the stop and install the accessory drive belt (4) onto the pulleys and slowly release the tensioner.

12. Connect the negative battery cable and tighten nut to the proper torque specification. Refer to **SPECIFICATIONS**.

5.7L AND 6.4L

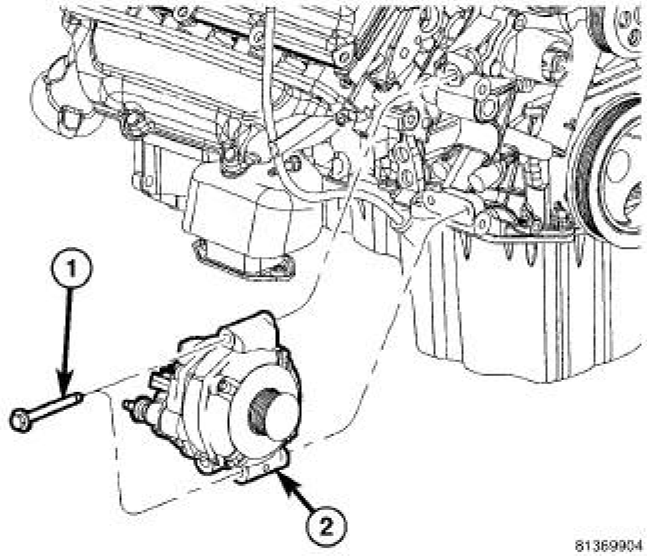


Fig. 17: Generator & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the generator (2) and install the upper generator retaining bolt (1) finger tight.
2. Raise and support the vehicle.

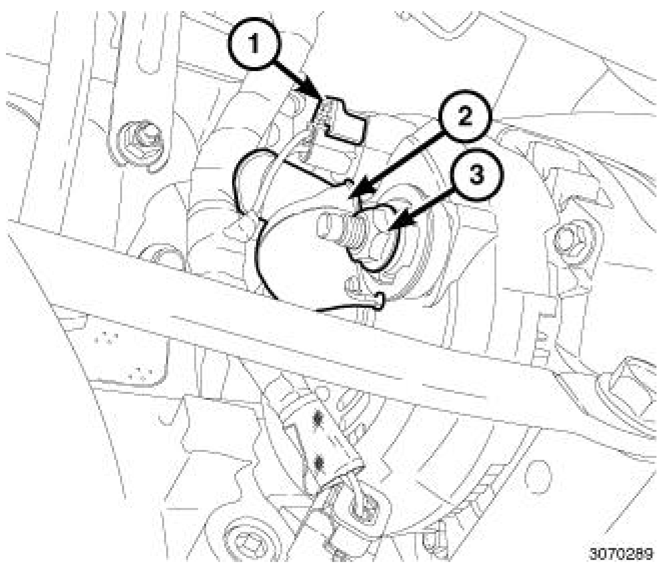

Fig. 18: Connector Tab, Insulator Cover And Retaining Nut
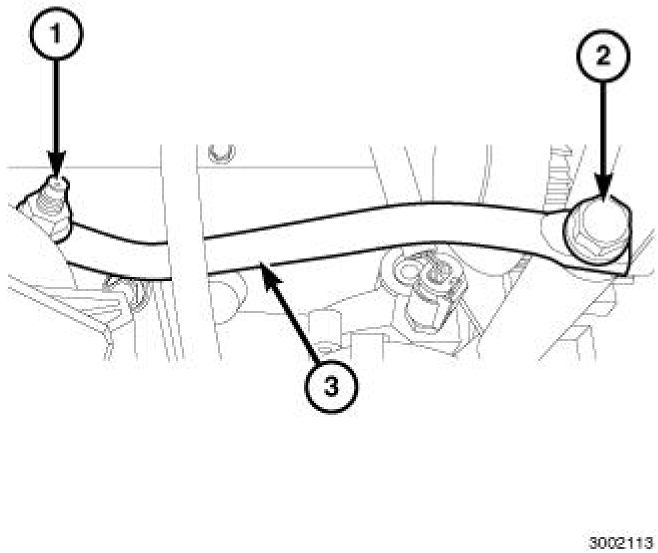
Courtesy of CHRYSLER GROUP, LLC

3. Position the generator B+ terminal eyelet to the generator output stud, install the retaining nut (3) and tighten to the proper torque specification. Refer to **SPECIFICATIONS**.
4. Install the insulator cover (2) onto the B+ output terminal.
5. Snap the field wire connector (1) into the rear of the generator.



[**Fig. 19: Support Bracket, Bolt & Nut**]
Courtesy of CHRYSLER GROUP, LLC

6. Position the generator support bracket (3) to the engine mount, install the retaining nut (1) finger tight.
7. Position the generator support bracket (3) to the generator and install the retaining bolt (2) finger tight.
8. Install the remaining generator retaining bolt and tighten both lower retaining bolts to the proper torque specification. Refer to **SPECIFICATIONS**.
9. Tighten the generator support bracket (3) to engine mount retaining nut (1) to the proper torque specification. Refer to **SPECIFICATIONS**.

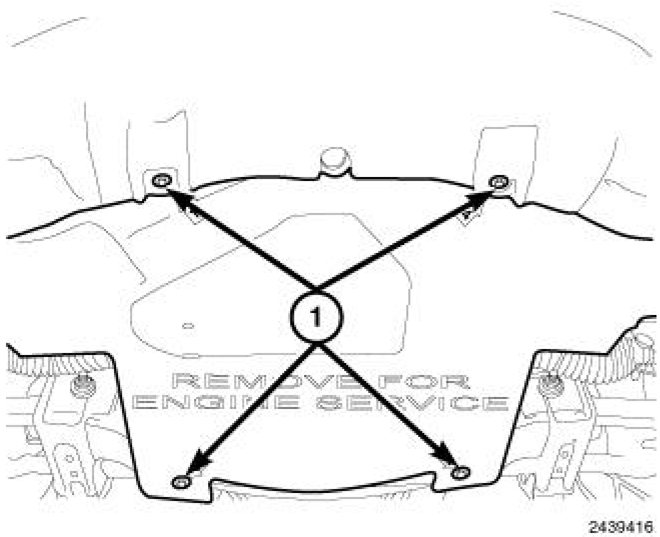


Fig. 20: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

10. Position the belly pan and install the belly pan retainers (1).
11. Lower the vehicle.
12. Tighten the generator upper retaining bolt to the proper torque specification. Refer to **SPECIFICATIONS**.

CAUTION: **When installing a serpentine accessory drive belt, the belt MUST be routed correctly. The water pump may be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat.**

CAUTION: **Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.**

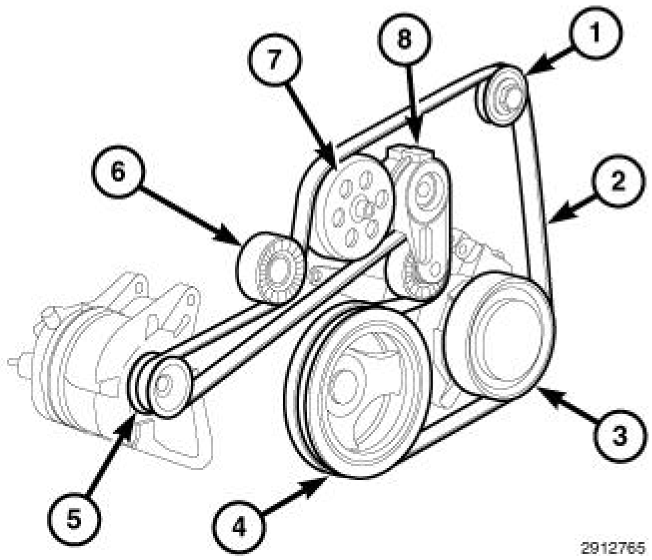

Fig. 21: Identifying Drive Belt Tensioner And Drive Belt
Courtesy of CHRYSLER GROUP, LLC

13. Rotate the accessory drive belt tensioner (8) clockwise until it contacts the stop, install the accessory drive belt (2) onto the pulleys and slowly release the tensioner.
14. Connect the negative battery cable and tighten the nut to the proper torque specification. Refer to **SPECIFICATIONS**.

6.2L

1. Position the generator and install the two upper generator retaining bolts finger tight.
2. Raise and support the vehicle.

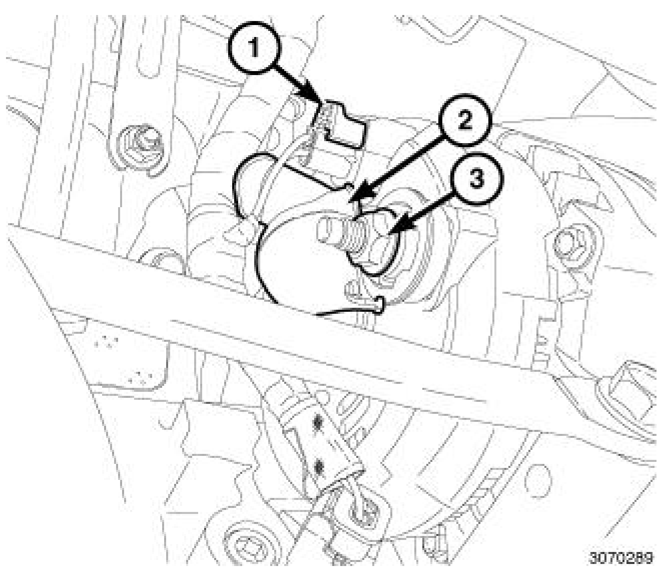

Fig. 22: Connector Tab, Insulator Cover And Retaining Nut
Courtesy of CHRYSLER GROUP, LLC

3. Position the generator B+ terminal eyelet to the generator output stud, install the retaining nut (3) and tighten to the proper torque specification. Refer to **SPECIFICATIONS**.
4. Install the insulator cover (2) onto the B+ output terminal.
5. Snap the field wire connector (1) into the rear of the generator.

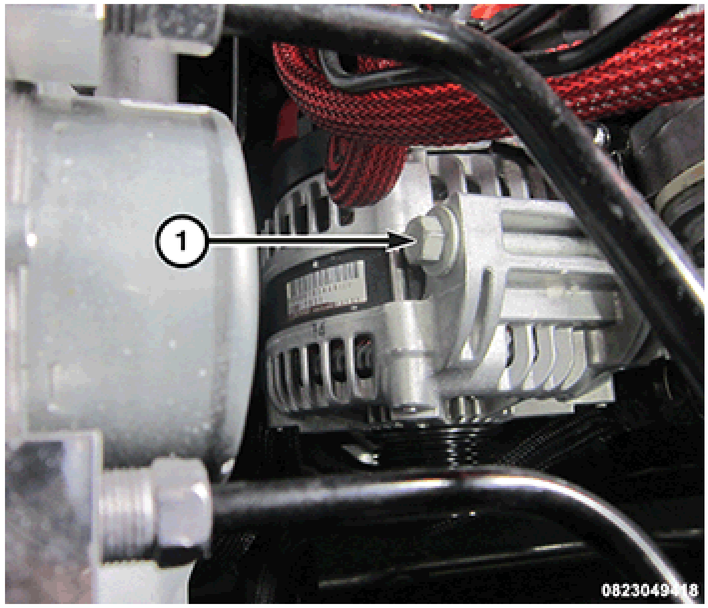

Fig. 23: Lower Generator Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

6. Tighten the lower retaining bolt to the proper torque specification. Refer to **SPECIFICATIONS**.

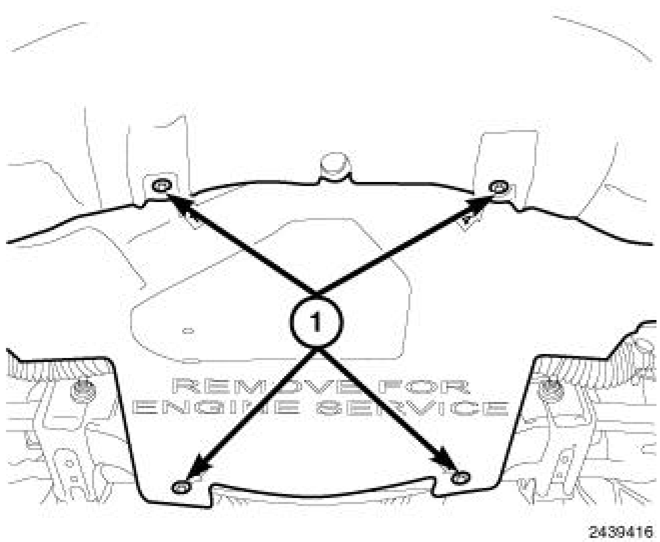

Fig. 24: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

7. Position the belly pan and install the belly pan retainers (1).

8. Lower the vehicle.

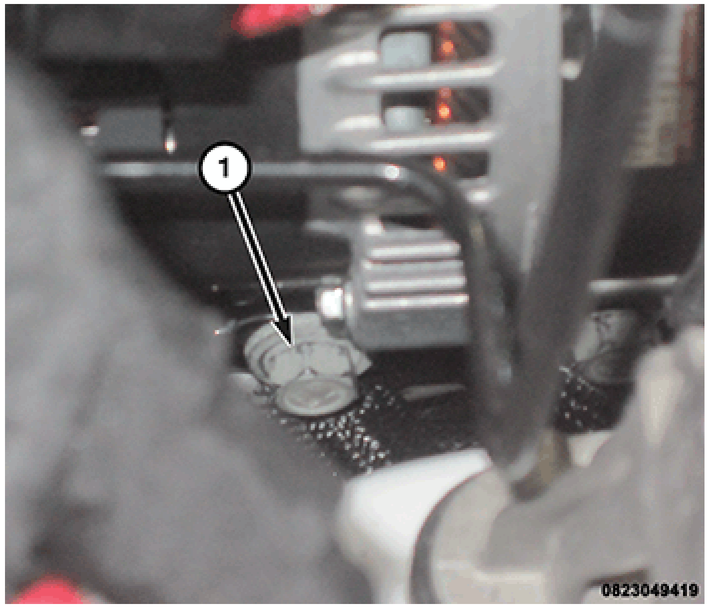

Fig. 25: Upper Generator Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

9. Install and tighten the generator upper retaining bolts to the proper torque specification. Refer to **SPECIFICATIONS**.

CAUTION: When installing a serpentine accessory drive belt, the belt MUST be routed correctly. The water pump may be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat.

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.

10. Install the serpentine belt. Refer to **BELT, SERPENTINE, INSTALLATION** .
11. Connect the negative battery cable and tighten the nut to the proper torque specification. Refer to **SPECIFICATIONS**.

2015-16 GENERAL INFORMATION

Circuit Testing Procedures - Challenger

WARNING

GENERAL WARNINGS

WARNINGS provide information to prevent personal injury and vehicle damage. Below is a list of general warnings that should be followed any time a vehicle is being serviced.

WARNING: Always wear safety glasses for eye protection.

WARNING: Use safety stands anytime a procedure requires being under a vehicle.

WARNING: Be sure that the ignition switch is always in the off position, unless the procedure requires it to be on.

WARNING: Set the parking brake when working on any vehicle. An automatic transmission should be in park. A manual transmission should be in neutral.

WARNING: Operate the engine only in a well-ventilated area.

WARNING: Keep away from moving parts when the engine is running, especially the fan and belts.

WARNING: To prevent serious burns, avoid contact with hot parts such as the radiator, exhaust manifold(s), tail pipe, catalytic converter and muffler.

WARNING: Do not allow flame or sparks near the battery. Gases are always present in and around the battery.

WARNING: Always remove rings, watches, loose hanging jewelry and avoid loose clothing.

DESCRIPTION

CIRCUIT FUNCTIONS

All circuits in the wiring diagrams use an alpha/numeric code to identify the wire and its function. To identify which circuit code applies to a system, refer to the CIRCUIT IDENTIFICATION CODE CHART.

NOTE: This chart shows the main circuits only and does not show the secondary codes that may apply to some models.

CIRCUIT IDENTIFICATION CODE CHART

CIRCUIT CODE	FUNCTION
A	BATTERY FEED

CIRCUIT CODE	FUNCTION
B	BRAKE CONTROLS
C	CLIMATE CONTROLS
D	DIAGNOSTIC CIRCUITS
E	DIMMING ILLUMINATION CIRCUITS
F	FUSED CIRCUITS
G	MONITORING CIRCUITS (GAUGES)
H	MULTIPLE
I	NOT USED
J	OPEN
K	POWERTRAIN CONTROL MODULE
L	EXTERIOR LIGHTING
M	INTERIOR LIGHTING
N	MULTIPLE
O	NOT USED
P	POWER OPTION (BATTERY FEED)
Q	POWER OPTIONS (IGNITION FEED)
R	PASSIVE RESTRAINT
S	SUSPENSION/STEERING
T	TRANSMISSION/TRANSAXLE/ TRANSFER CASE
U	OPEN
V	SPEED CONTROL, WIPER/WASHER
W	WIPERS
X	AUDIO SYSTEMS
Y	TEMPORARY
Z	GROUNDS

CIRCUIT INFORMATION

Each wire shown in the wiring diagrams contains a code which identifies the main circuit, a specific portion of the main circuit, gauge of wire, and color.

As an example, circuit **A 2 18 LB/YL** is decoded in the following manner:

Circuit Type:	**A** (Battery Feed Circuit)
Circuit Level:	**2** (Level Two)
Wire Size:	**18** (Eighteen Gauge Wire)
Wire Color:	**LB/YL** (Light Blue with Yellow Tracer)

WIRE COLOR CODE CHART

COLOR CODE	COLOR
BL	BLUE
BK	BLACK
BR	BROWN

COLOR CODE	COLOR
DB	DARK BLUE
DG	DARK GREEN
GY	GRAY
LB	LIGHT BLUE
LG	LIGHT GREEN
OR	ORANGE
PK	PINK
RD	RED
TN	TAN
VT	VIOLET
WT	WHITE
YL	YELLOW

DIAGNOSTIC CODE INDEX

DIAGNOSTIC CODE INDEX

DTC	Description
WIRING	WIRING HARNESS TESTING

DIAGNOSIS AND TESTING

WIRING HARNESS TESTING

TROUBLESHOOTING TOOLS

When diagnosing a problem in an electrical circuit there are several common tools necessary. These tools are listed and explained below:

Voltmeter

The voltmeter is used to measure the electrical pressure or the voltage difference between two points. A voltmeter reads available voltages such as battery voltage, generator output voltage, and voltage drop across a component or conductor. A high voltage drop may indicate a high resistance in the circuit. The voltmeter can be used to locate an open circuit and circuits with an unintentional ground. Observing polarity, always connect a voltmeter in parallel to the existing circuit. If the leads are reversed on a digital multimeter, a minus sign appears in the display.

CAUTION: Most of the electrical components used in today's vehicles are Solid State. When checking voltages in these circuits, use a meter with a 10 - megohm or greater impedance rating.

Ohmmeter

The ohmmeter is used to measure the resistance of a component or the resistance between two points in a circuit in ohms, and to check a portion of the circuit for continuity. Some meters have a built-in tone to indicate that the

circuit has continuity. No resistance indicates a short circuit or unintentional ground whereas resistance that is higher than specification indicates a high resistance in the circuit such as a loose, dirty or corroded connection, or a defective component. An "OL" reading means that the circuit or component had infinite resistance; an open circuit or defective component is indicated. Ohmmeters have an internal battery and must never be connected to a power circuit. Connecting an ohmmeter to a powered circuit causes the meter fuse to blow and can damage its dry cell battery. Ohmmeters can be connected into a circuit without regard to polarity, unless the circuit contains a diode. When using an ohmmeter, the component or portion of the circuit must be isolated from other components or branches to avoid false readings.

CAUTION: Most of the electrical components used in today's vehicles are Solid State. When checking resistance in these circuits use a meter with a 10 - megohm or greater impedance rating. In addition, make sure the power is disconnected from the circuit. Circuits that are powered up by the vehicle's electrical system can cause damage to the equipment and provide false readings.

Ammeter

Amperage or current is the measure of the rate of electron "flow" in a circuit. It is measured in the unit of the Ampere, simply called an Amp (A). In order to measure current in a circuit, the circuit must be broken or opened, and an ammeter must be inserted in series (in-line) with the circuit so that all the current that flows through the circuit will have to go through the meter. When measuring current in this manner, it requires the meter be made part of the circuit, this type of measurement is more difficult than measuring either voltage or resistance.

When an ammeter is placed in series with a circuit, it ideally drops no voltage as current goes through it. In other words, it acts very much like a piece of wire, with very little resistance from one test probe to the other. Consequently, an ammeter will act as a short circuit if placed in parallel (across the terminals of) a substantial source of voltage. If this is done, a surge in current will result, potentially damaging the meter. Ammeters are generally protected from excessive current by means of a small fuse located inside the meter housing. If the ammeter is accidently connected across a substantial voltage source, the resultant surge in current will "blow" the fuse and render the meter incapable of measuring current until the fuse is replaced.

Consult the owner's manual of the particular model of meter you own for details on measuring current.

CAUTION: Do not crank the engine or turn on any accessories that may draw more than 10 Amps. You may open the protective fuse in the multimeter.

12-Volt Test Light

The 12-Volt test light when properly used, is one of the best and quickest pieces of test equipment available for troubleshooting 12-volt power systems. It's especially good for times when there are only two voltages, battery voltage and no voltage. For example, if you're checking to see if you have 12-volts on the Battery(+), the test light will immediately tell you if voltage is present or not.

With any test equipment, you should confirm that it's in good working order before you begin testing. For a test light, you have to have a voltage source. Connect the test light's ground clip to a good ground and touch it to a point where you believe that there is 12-volt supply. If the light doesn't light up, check the light by connecting it directly across the battery. Initially, make sure that you have the ground clip on the negative battery terminal. If you touch the probe to the positive terminal, the test light should light up. If it doesn't and the battery is not

completely dead, the test light isn't working properly. The test light must be in proper working order before any circuit testing can occur.

Jumper Wire

The sole purpose of the jumper wire is to complete a circuit. It is nothing more than a suitable length of insulated wire with terminals or connectors on each end. Jumper wires may be bought or made with various sizes of wire and styles of terminals including alligator clips, spade lugs and pin plugs, and should include a fuse device of some type for circuit and component protection. A jumper wire is used to verify a faulty conductor by substituting a known good one. It is jumped across a suspicious conductor in the circuit. If the circuit works with the jumper, but not without, there is an open somewhere in the area being jumped. A jumper wire is ONLY used to bypass a faulty conductor (including switches and connectors). NEVER bypass a load device with a jumper wire. The circuit needs the resistance from the load device and shorting across it causes high current flow, which could damage other components.

WARNING: Never use a jumper wire across a load, such as a motor, connected between a battery feed and ground.

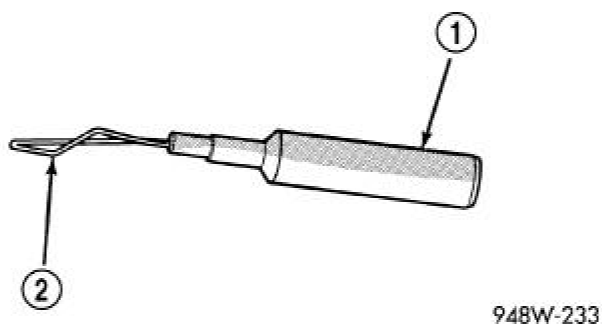

Fig. 1: Probing Tool
Courtesy of CHRYSLER GROUP, LLC

1 - SPECIAL TOOL 6801	
2 - PROBING END	

Probing Tools

These tools are used for probing terminals in connectors. Select the proper size tool from Special Tool Package (special tool #6807, Terminal Tools), and insert the probing end (2) into the terminal being tested. Use the other end of the tool (1) to insert the meter probe.

INTERMITTENT AND POOR CONNECTIONS

Most intermittent electrical problems are caused by faulty electrical connections or wiring. It is also possible for a sticking component or relay to cause a problem.

Before condemning a component or wiring assembly, check the following items:

- Connectors are fully seated
- Spread terminals, or terminal push out

- Terminals in the wiring assembly are fully seated into the connector/component and locked into position
- Dirt or corrosion on the terminals. Any amount of corrosion or dirt could cause an intermittent problem
- Damaged connector/component casing exposing the item to dirt or moisture
- Wire insulation that has rubbed through causing a short to ground
- Some or all of the wiring strands broken inside of the insulation
- Wiring broken inside of the insulation

TROUBLESHOOTING WIRING PROBLEMS

When troubleshooting wiring problems there are six steps which can aid in the procedure. The steps are listed and explained below. Always check for non-factory items added to the vehicle before doing any diagnosis. If the vehicle is equipped with these items, disconnect them to verify these add-on items are not the cause of the problem.

Perform the following Six Step Diagnosis Process:

1. Verify the problem.
2. Verify any related symptoms. Do this by performing operational checks on components that are in the same circuit (refer to appropriate SYSTEM WIRING DIAGRAMS article).
3. Analyze the symptoms. Use the wiring diagrams to determine what the circuit is doing, where the problem most likely is occurring and where the diagnosis will continue.
4. Isolate the problem area.
5. Repair the problem area.
6. Verify the proper operation. For this step, check for proper operation of all items on the repaired circuit (refer to appropriate SYSTEM WIRING DIAGRAMS article).

NOTE:	**The Six Step Diagnosis Process used by Chrysler is a time proven process. The basic concepts of this process have been used by others for problem solving for many years. The successful application of this process requires a solid understanding of the conditions that affect each step, and when its time to advance to the next step. These conditions based on experience formulate what is known as "Best Practices".**

STANDARD PROCEDURE

CHECK A 12-VOLT FUSED BATTERY B(+) CIRCUIT FOR VOLTAGE

THEORY OF OPERATION

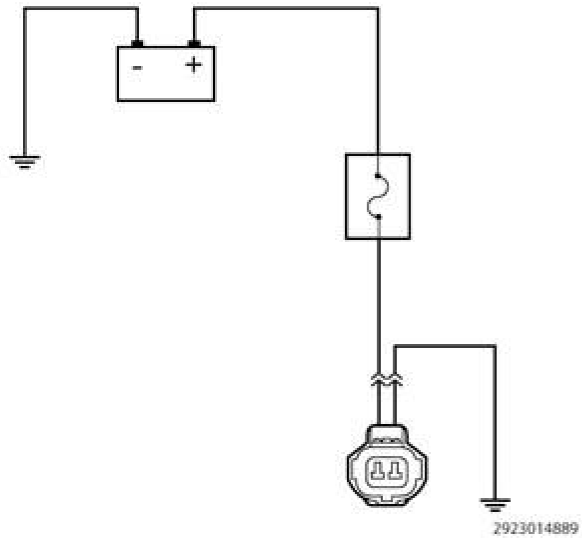

Fig. 2: 12-Volt Fused Battery B(+) Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure(s) is to demonstrate how to check the voltage of a 12-volt fused battery B(+) circuit with a test light or voltmeter.

NOTE: **The circuit shown in illustration is an example, and is intended for demonstrational purpose only.**

The following are circuit tests covered in this procedure:

- Testing 12-Volt Fused Battery B(+) Circuit Voltage With A Test Light
- Testing 12-Volt Fused Battery B(+) Circuit Voltage With A Voltmeter

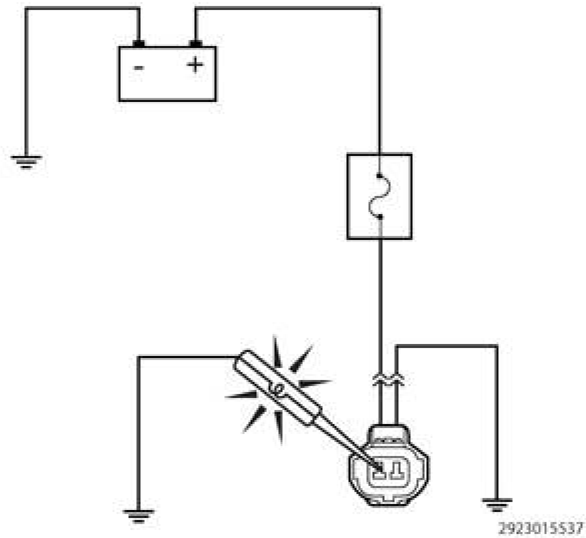
NOTE: **Perform the following test using a known good test light or functioning multimeter.**

Below is a list of possible causes that could be related to a No Voltage condition.

Possible Causes
OPEN CIRCUIT (CHAFED, PIERCED, PINCHED OR BROKEN WIRES)
OPEN FUSE
OPEN IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

1. **TESTING 12-VOLT FUSED BATTERY B(+) CIRCUIT VOLTAGE WITH A TEST LIGHT**



[Fig. 3: Testing 12-Volt Fused Battery B(+) Circuit Voltage With Test Light]
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Before testing any circuits, first verify the 12-volt test light is operating properly. Connect the 12-volt test light to battery ground or to any other known good ground. Touch the lead of the test light to Battery(+). If the test light is operational, it should illuminate brightly.**

1. Turn the ignition off.
2. Disconnect the wire harness connector from the component that is being tested.

   NOTE: **Check connectors - Clean/repair as necessary.**

3. At this time, leave all in-line connectors connected.
4. Connect the 12-volt test light to a known good ground.
5. Use the test light lead to carefully probe the Battery or Ignition voltage circuit in the harness connector.
6. First check with the ignition off, next check with the ignition on, and lastly check while cranking the engine.

   Does the test light illuminate brightly?

   Yes

   - The circuit is not open at this time or the condition that originally caused the open may not be present at this time. Continue to monitor the test light and wiggle the wire harness and connectors to check for an intermittent open or excessive resistance condition.
   - Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the open could occur intermittently.
   - Look for any chafed, pierced, pinched, or partially broken wires.
   - Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.

- Perform any Technical Service Bulletins (TSBs) that may apply.

No

- Repair the open in the circuit. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors where the open could occur.
- One method to help isolate the open is to disconnect any in-line connectors and measure the resistance from one side of the in-line connector to the matching component harness connector. If the open goes away, the open is on the other side of the in-line connector.
- If this is a fused circuit, make sure to inspect the fuse. If the fuse is open, check the circuit for a short to ground before installing a new fuse. The circuit may have a short to ground causing the fuse to open. This short to ground could be in the wire harness or in one of the components the circuit is supplying voltage to.

2. **TESTING 12-VOLT FUSED BATTERY B(+) CIRCUIT VOLTAGE WITH A VOLTMETER**

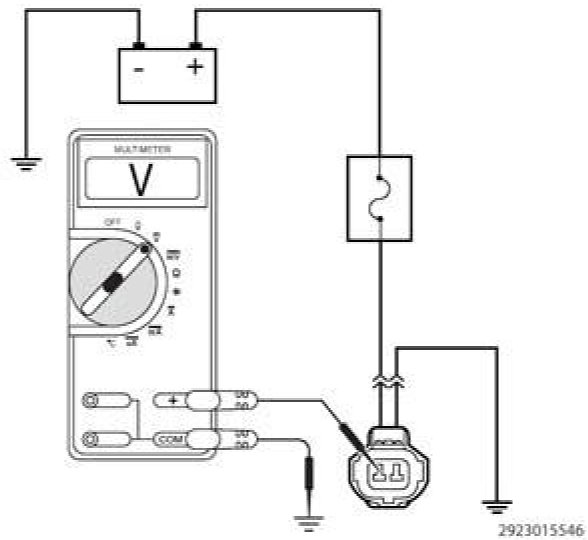


Fig. 4: Testing 12-Volt Fused Battery B(+) Circuit Voltage With Voltmeter
Courtesy of CHRYSLER GROUP, LLC

NOTE: The connector displayed in the graphics are only an example.

1. Turn the ignition off.
2. Disconnect the wire harness connector from the component that is being tested.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. Use a multimeter set to measure DC voltage.
5. Connect the ground lead of the meter to a known good ground.
6. Use the positive lead of the multimeter and probe the circuit that is being checked for voltage.
7. Ignition on, engine not running.

Is the voltage within specifications for this circuit?

Yes

- The circuit is functioning properly or the condition that originally caused the open or short may not be present at this time. Continue to measure the voltage and wiggle the wire harness and connectors while checking for an intermittent open or short.
- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

No

- Repair the open or short to ground in the circuit. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur.
- One method to help isolate the open or short is to disconnect any in-line connectors that the circuit being checked runs through and check for the voltage again. If the voltage is present, the open or short is on the other side of the in-line connector.

CHECK A 12-VOLT SWITCHED BATTERY B(+) CIRCUIT FOR VOLTAGE

THEORY OF OPERATION

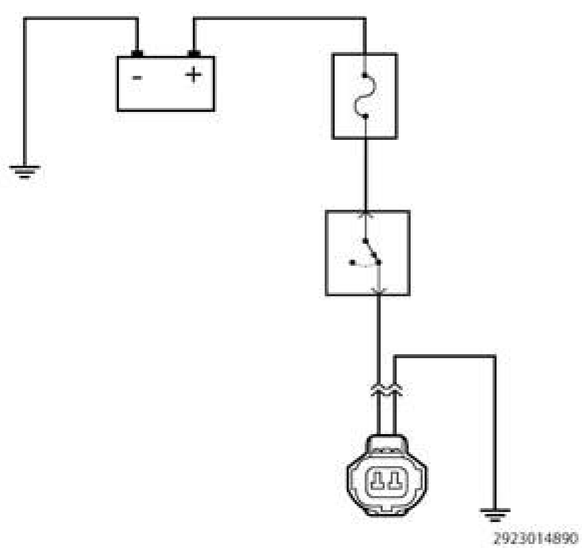

Fig. 5: 12-Volt Switched Battery B(+) Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure is to demonstrate how to check the voltage of a 12-Volt switched battery B(+) circuit with a test light or voltmeter.

NOTE:	**The circuit shown in illustration is an example, and is intended for demonstrational purpose only.**

The following are circuit tests covered in this procedure:

- Testing 12-Volt Switched Battery B(+) Circuit Voltage With A Test Light
- Testing 12-Volt Switched Battery B(+) Circuit Voltage With A Voltmeter

NOTE: Perform the following test using a known good test light or functioning multimeter.

Below is a list of possible causes that could be related to a No Voltage condition.

Possible Causes
OPEN CIRCUIT (CHAFED, PIERCED, PINCHED OR BROKEN WIRES)
OPEN FUSE
OPEN IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

1. **TESTING 12-VOLT SWITCHED BATTERY B(+) CIRCUIT VOLTAGE WITH A TEST LIGHT**

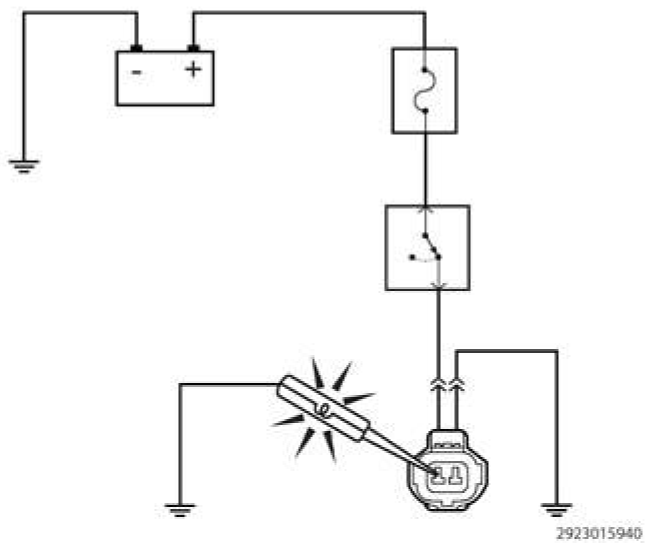

Fig. 6: Testing 12-Volt Switched Battery B(+) Circuit Voltage With Test Light
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before testing any circuits, first verify the 12-volt test light is operating properly. Connect the 12-volt test light to battery ground or to any other known good ground. Touch the lead of the test light to Battery(+). If the test light is operational, it should illuminate brightly.

1. Turn the ignition off.
2. Disconnect the wire harness connector from the component that is being tested.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time, leave all in-line connectors connected.
4. Connect the 12-volt test light to a known good ground.
5. Use the test light lead to carefully probe the Battery or Ignition voltage circuit in the harness

connector.

6. First check with the ignition off, next check with the ignition on, and lastly check while cranking the engine.

   Does the test light illuminate brightly?

   Yes

   - The circuit is not open at this time or the condition that originally caused the open may not be present at this time. Continue to monitor the test light and wiggle the wire harness and connectors to check for an intermittent open or excessive resistance condition.
   - Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the open could occur intermittently.
   - Look for any chafed, pierced, pinched, or partially broken wires.
   - Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
   - Perform any Technical Service Bulletins (TSBs) that may apply.

   No

   - Repair the open in the circuit. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors where the open could occur.
   - One method to help isolate the open is to disconnect any in-line connectors and measure the resistance from one side of the in-line connector to the matching component harness connector. If the open goes away, the open is on the other side of the in-line connector.
   - If this is a fused circuit, make sure to inspect the fuse. If the fuse is open, check the circuit for a short to ground before installing a new fuse. The circuit may have a short to ground causing the fuse to open. This short to ground could be in the wire harness or in one of the components the circuit is supplying voltage to.

2. **TESTING 12-VOLT SWITCHED BATTERY B(+) CIRCUIT VOLTAGE WITH A VOLTMETER**

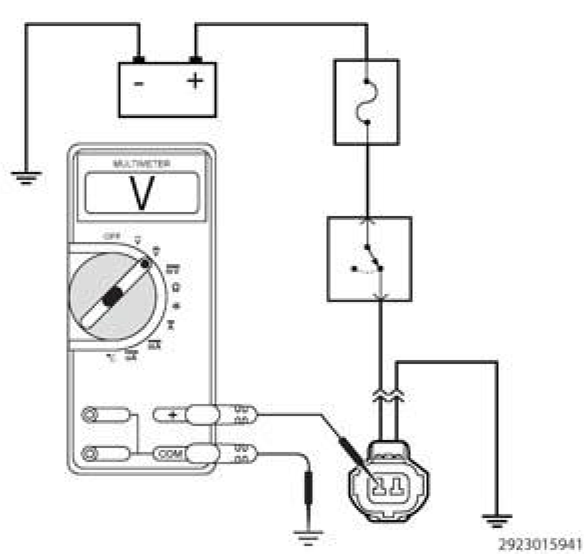

Fig. 7: Testing 12-Volt Switched Battery B(+) Circuit Voltage With Voltmeter

Courtesy of CHRYSLER GROUP, LLC

NOTE: The connector displayed in the graphics are only an example.

1. Turn the ignition off.
2. Disconnect the wire harness connector from the component that is being tested.

   NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. Use a multimeter set to measure DC voltage.
5. Connect the ground lead of the meter to a known good ground.
6. Use the positive lead of the multimeter and probe the circuit that is being checked for voltage.
7. Ignition on, engine not running.

   Is the voltage within specifications for this circuit?

   Yes

   - The circuit is functioning properly or the condition that originally caused the open or short may not be present at this time. Continue to measure the voltage and wiggle the wire harness and connectors while checking for an intermittent open or short.
   - Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
   - Look for any chafed, pierced, pinched, or partially broken wires.
   - Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
   - Perform any Technical Service Bulletins (TSBs) that may apply.

   No

   - Repair the open or short to ground in the circuit. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur.
   - One method to help isolate the open or short is to disconnect any in-line connectors that the circuit being checked runs through and check for the voltage again. If the voltage is present, the open or short is on the other side of the in-line connector.

CHECK A 5-VOLT SUPPLY CIRCUIT FOR VOLTAGE

THEORY OF OPERATION

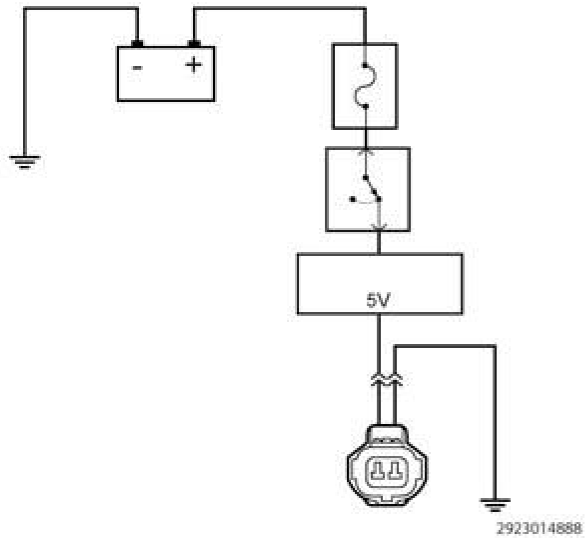

Fig. 8: 5-Volt Supply Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure is to demonstrate how to check the voltage of a 5-Volt supply circuit with a voltmeter.

NOTE: **The circuit shown in illustration is an example, and is intended for demonstrational purpose only.**

The following are circuit tests covered in this procedure:

- Testing A 5-Volt Supply Circuit For Voltage
- Testing A 5-Volt Supply Circuit And Sensor Ground Circuit

NOTE: **Perform the following test using a known good multimeter.**

Below is a list of possible causes that could be related to a No Voltage condition.

Possible Causes
OPEN CIRCUIT (CHAFED, PIERCED, PINCHED OR BROKEN WIRES)
OPEN IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)
ELECTRONIC CONTROL MODULE (5-VOLT SUPPLY OUTPUT)

DIAGNOSTIC TEST

1. **TESTING A 5-VOLT SUPPLY CIRCUIT FOR VOLTAGE**

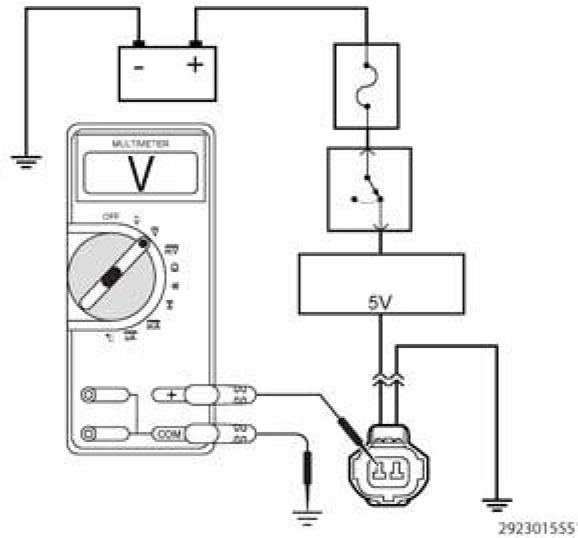

Fig. 9: Testing 5-Volt Supply Circuit For Voltage With Voltmeter
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the sensor harness connector.

NOTE: **Check connectors - Clean/repair as necessary.**

3. Turn the ignition on.
4. Set the multimeter to measure DC voltage.
5. Connect the negative lead of the multimeter to a known good ground.
6. With the positive lead of the multimeter, carefully probe the 5-volt supply circuit.

   Is the voltage between 4.7 and 5.2 volts?

   Yes

   - Go To 2

   No

   - Check the 5-volt supply circuit for an open or short to ground. For further assistance, perform the appropriate Sensor Reference Voltage DTC diagnostic procedure.

2. **TESTING A 5-VOLT SUPPLY CIRCUIT AND SENSOR GROUND CIRCUIT**

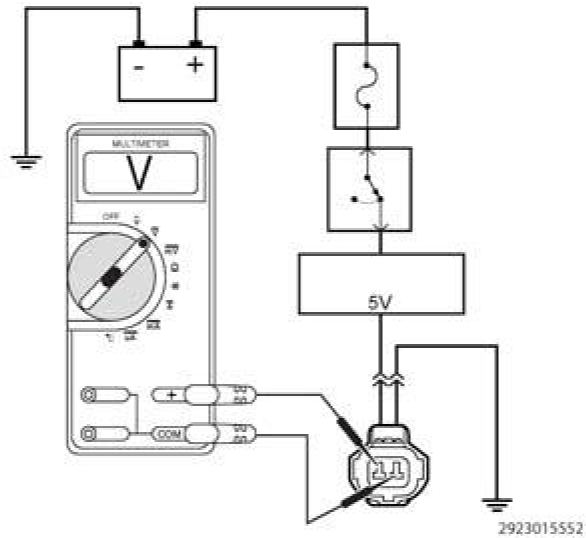

Fig. 10: Testing 5-Volt Supply Circuit And Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. With the multimeter set to measure DC voltage.
2. Move the negative lead of the multimeter to carefully probe the sensor ground or sensor return circuit in the harness connector.
3. With the positive lead of the multimeter, carefully probe the 5-volt supply circuit.

   Is the voltage between 4.7 and 5.2 volts?

   Yes

   - At this time the 5-Volt Supply and sensor ground circuit are working properly. Continue to measure the voltage between the wires, wiggle the wire harness and connectors while checking for an intermittent condition.
   - Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the open could occur intermittently.
   - Look for any chafed, pierced, pinched, or partially broken wires.
   - Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
   - Perform any Technical Service Bulletins (TSBs) that may apply.

   No

   - Repair the open or excessive resistance in the Sensor Ground (Sensor Return) circuit.

CHECK A CIRCUIT FOR A SHORT TO GROUND

THEORY OF OPERATION

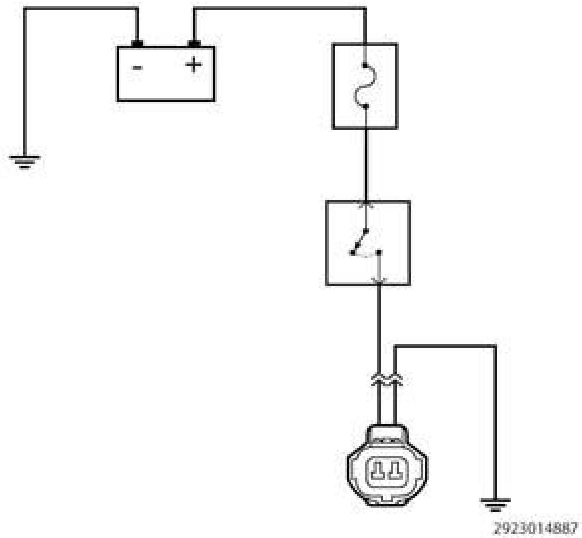

Fig. 11: 12-Volt Switched Battery Circuit (Switch In Off Position)
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure is to demonstrate how to check a circuit for a Short to Ground.

NOTE: **The circuit shown in illustration is an example, and is intended for demonstrational purpose only.**

The following are circuit tests covered in this procedure:

- Testing For A Short To Ground Using An Ohmmeter

NOTE: **Perform the following test using a known good multimeter.**

Below is a list of possible causes that could be related to a Short to Ground condition.

Possible Causes
SHORTED CIRCUIT (CHAFED, PIERCED OR PINCHED WIRES)
SHORTED IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

TESTING FOR A SHORT TO GROUND USING AN OHMMETER

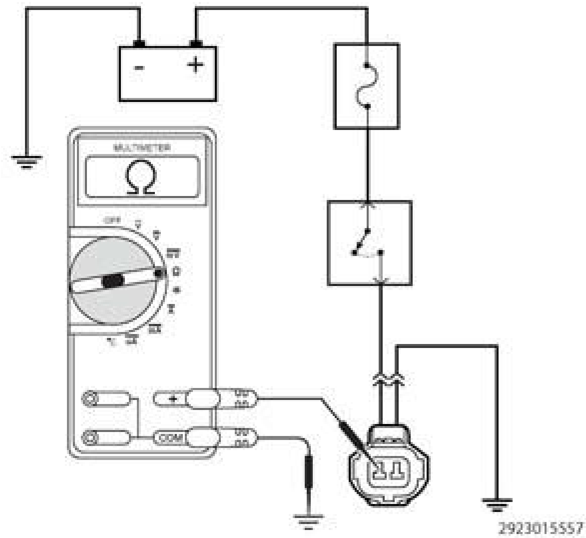

Fig. 12: Testing For A Short To Ground Using An Ohmmeter
Courtesy of CHRYSLER GROUP, LLC

NOTE:	**Before measuring the resistance of any circuit, first measure the resistance between the two leads of the multimeter. Take this value and subtract it from the value recorded when measuring the resistance of the circuit being checked (The meter leads can add 0.5 ohm or more of total resistance).**

1. Turn the ignition off.
2. Disconnect the wire harness connectors from the module and component for the suspected circuit being shorted to ground.

NOTE:	**Check connectors - Clean/repair as necessary.**

3. With the component wire harness connectors disconnected, use a meter set to measure Ohms (Ω), and measure the resistance between the circuit and a known good ground.
4. Use the negative lead of the meter and touch a known good ground.
5. Use the positive lead of the meter and carefully probe the circuit suspected of having the short.

Is the resistance to ground below 10k ohms ?

Yes

- Repair the short to ground. Use the wiring diagram as a guide to follow the path of the circuit.
- One method to help isolate the short is to disconnect any in-line connectors that the circuit being tested runs through and measure for the short again. If the short goes away, the short is on the other side of the in-line connector.

No

- The circuit is not shorted to ground or the condition that originally caused the short may not be present at this time. Continue to measure the resistance, wiggle the wire harness and connectors while checking for an intermittent short.

- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

CHECK A CIRCUIT FOR A SHORT TO VOLTAGE

THEORY OF OPERATION

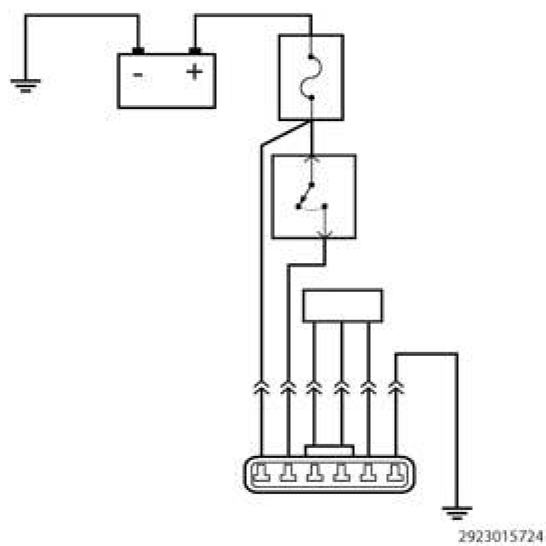

Fig. 13: 12-Volt Switched Ignition Circuit
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure is to demonstrate different methods of checking for a short to voltage in a circuit. When diagnosing a DTC it might be necessary to verify that proper voltage is on a circuit or that a circuit is not shorted high.

NOTE: **The circuit shown in illustration is an example, and is intended for demonstrational purpose only.**

The following are circuit tests covered in this procedure:

- Testing For A Short To Battery Voltage Using A Voltmeter
- Testing For A Short To Switched Battery Voltage Using A Voltmeter
- Testing For A Short To Battery Voltage Using A 12-Volt Test Light
- Testing For A Short To Switched Battery Voltage Using A 12-Volt Test Light

NOTE: **Perform the following test using a known good test light or functioning multimeter.**

Below is a list of possible causes that could be related to a Short To Voltage condition.

Possible Causes
SHORTED CIRCUIT (CHAFED, PIERCED OR PINCHED WIRES)
SHORTED IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

1. **TESTING FOR A SHORT TO BATTERY VOLTAGE USING A TEST LIGHT**

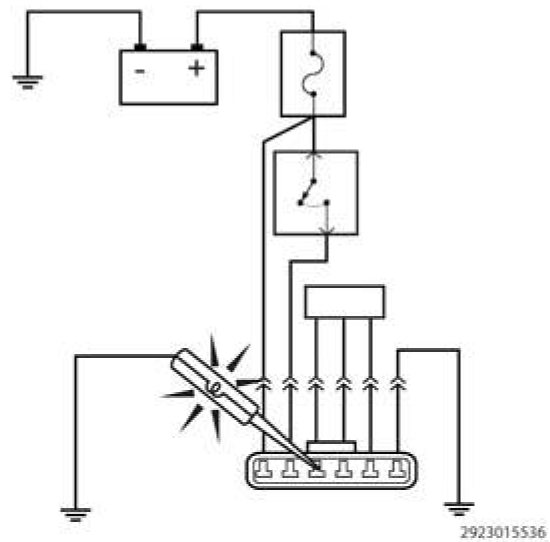

Fig. 14: Testing For A Short To Battery Voltage Using A Test Light
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Before testing any circuits, first verify the 12-volt test light is operating properly. Connect the 12-volt test light to battery ground or to any other known good ground. Touch the lead of the test light to Battery(+). If the test light is operational, it should illuminate brightly.**

1. Turn the ignition off.
2. Disconnect the wire harness connectors of all components that contain the circuits that are suspected of having the short.

   NOTE: **Check connectors - Clean/repair as necessary.**

3. At this time leave all in-line connectors connected.
4. Connect the 12-volt test light to a known good ground.
5. Use the lead of the test light and carefully probe the circuit suspected of having the short.

   WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

6. First, check with the ignition off, next with the ignition on, and lastly while cranking the engine.

Does the test light illuminate brightly?

Yes

- Repair the short to voltage. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur.
- One method to help isolate the short is to disconnect any in-line connectors that the circuit being checked runs through and check for the short again. If the short goes away, the short is on the other side of the in-line connector.

No

- The circuit is not shorted to voltage or the condition that originally caused the short may not be present at this time. Continue to measure the resistance and wiggle the wire harness to check for an intermittent short.

  NOTE: **By disconnecting the wire harness connectors you may have eliminated the source of the voltage causing the short. Use the wiring diagram as a guide, check to see if there are any battery circuits in the same wire harness as the circuit you are testing. It is necessary to check for a short to those circuits using an ohmmeter. Perform the Check for a Short Between Multiple Circuits diagnostic procedure. Refer to CHECK FOR A SHORT BETWEEN MULTIPLE CIRCUITS .**

- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related component and wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

2. **TESTING FOR A SHORT TO SWITCHED IGNITION VOLTAGE USING A TEST LIGHT**

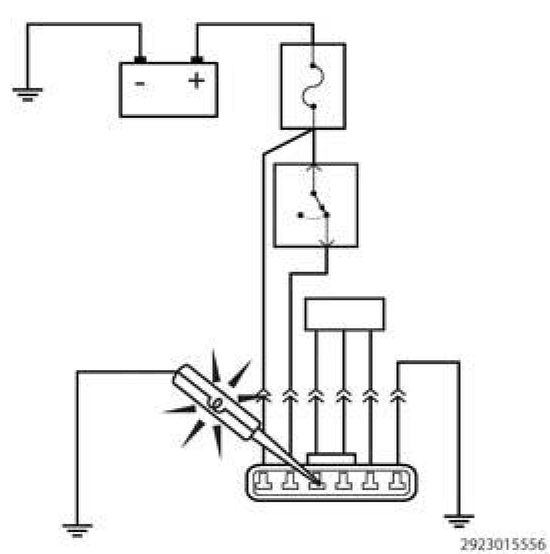

Fig. 15: Testing For A Short To Switched Ignition Voltage Using A Test Light
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Before testing any circuits, first verify the 12-volt test light is operating properly. Connect the 12-volt test light to battery ground or to any other known good ground. Touch the lead of the test light to Battery(+). If the test light is operational, it should illuminate brightly.**

1. Turn the ignition off.
2. Disconnect the wire harness connectors of all components that contain the circuits that are suspected of having the short.

   NOTE: **Check connectors - Clean/repair as necessary.**

3. At this time leave all in-line connectors connected.
4. Connect the 12-volt test light to a known good ground.
5. Use the lead of the test light and carefully probe the circuit suspected of having the short.

   WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

6. First, check with the ignition off, next with the ignition on, and lastly while cranking the engine.

   Does the test light illuminate brightly?

   Yes

   - Repair the short to voltage. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur.
   - One method to help isolate the short is to disconnect any in-line connectors that the circuit being checked runs through and check for the short again. If the short goes away, the short is on the other side of the in-line connector.

   No

   - The circuit is not shorted to voltage or the condition that originally caused the short may not be present at this time. Continue to measure the resistance and wiggle the wire harness to check for an intermittent short.

     NOTE: **By disconnecting the wire harness connectors you may have eliminated the source of the voltage causing the short. Use the wiring diagram as a guide, check to see if there are any battery circuits in the same wire harness as the circuit you are testing. It is necessary to check for a short to those circuits using an ohmmeter. Perform the Check for a Short Between Multiple Circuits diagnostic procedure. Refer to CHECK FOR A SHORT**

BETWEEN MULTIPLE CIRCUITS .

- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related component and wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

3. **TESTING FOR A SHORT TO BATTERY VOLTAGE USING A VOLTMETER**

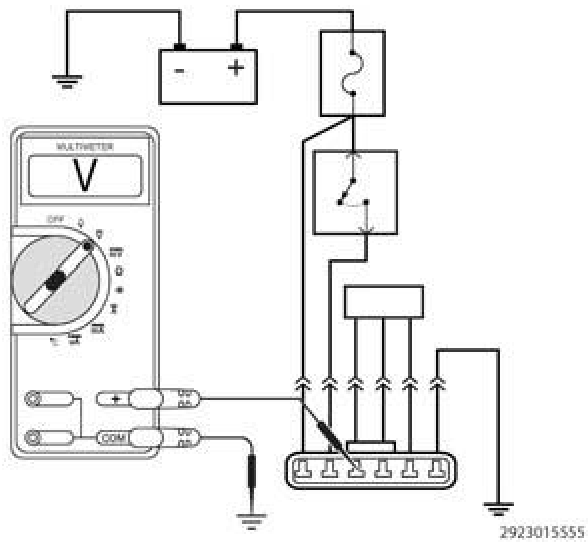

Fig. 16: Testing For A Short To Battery Voltage Using A Voltmeter
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the wire harness connectors of the components that contain the circuit that is suspected as having a short.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. With all the component wire harness connectors disconnected, use a multimeter set to measure DC voltage.
5. Connect the ground lead of the meter to a known good ground.
6. Use the positive lead of the multimeter and probe the circuit that is being checked for a short.

   Is there any voltage present?

   Yes

   - Repair the short to battery voltage. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur.
   - One method to help isolate the short is to disconnect any in-line connectors that the circuit

being checked runs through and measure for the short again. If the short goes away, the short is on the other side of the in-line connector.

No

- The circuit is not shorted to voltage or the condition that originally caused the short may not be present at this time. Continue to measure the voltage and wiggle the wire harness to check for an intermittent short.

NOTE: **By disconnecting the wire harness connectors you may have eliminated the source of the voltage causing the short. Use the wiring diagram as a guide, check to see if there are any battery circuits in the same wire harness as the circuit you are testing. It is necessary to check for a short to those circuits using an ohmmeter. Perform the Check for a Short Between Multiple Circuits diagnostic procedure. Refer to CHECK FOR A SHORT BETWEEN MULTIPLE CIRCUITS .**

- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

4. **TESTING FOR A SHORT TO SWITCHED IGNITION VOLTAGE USING A VOLTMETER**

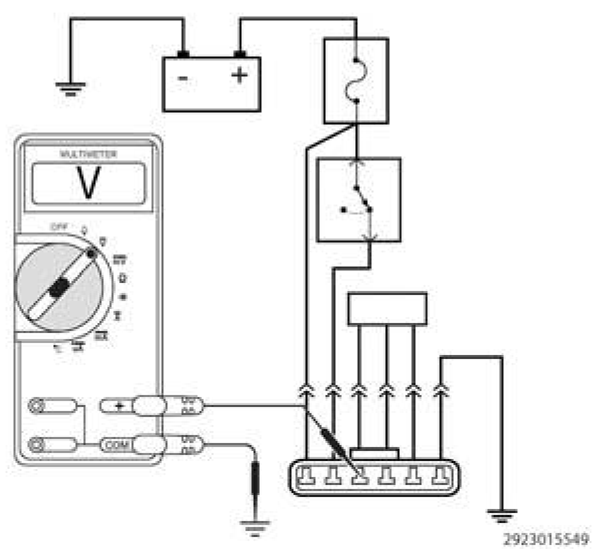

Fig. 17: Testing For A Short To Switched Ignition Voltage Using A Voltmeter
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the wire harness connectors of all components that contain the circuits that are suspected as being shorted.

NOTE: **Check connectors - Clean/repair as necessary.**

3. At this time leave all in-line connectors connected.
4. With all the component wire harness connectors disconnected, use a multimeter set to measure DC voltage.
5. Connect the ground lead of the meter to a known good ground.
6. Use the positive lead of the multimeter and probe the circuit suspected of having the short.
7. Ignition on, engine not running.

Is any voltage present?

Yes

- Repair the short to ignition voltage. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur.
- One method to help isolate the short is to disconnect any in-line connectors that the circuit being checked runs through and check for the short again. If the short goes away, the short is on the other side of the in-line connector.

No

- The circuit is not shorted to voltage or the condition that originally caused the short may not be present at this time. Continue to measure the voltage and wiggle the wire harness to check for an intermittent short.

  NOTE: **By disconnecting the wire harness connectors you may have eliminated the source of the voltage causing the short. Use the wiring diagram as a guide, check to see if there are any battery circuits in the same wire harness as the circuit you are testing. It is necessary to check for a short to those circuits using an ohmmeter. perform the Check for a Short Between Multiple Circuits diagnostic procedure. Refer to CHECK FOR A SHORT BETWEEN MULTIPLE CIRCUITS .**

- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

CHECK FOR AN OPEN GROUND CIRCUIT

THEORY OF OPERATION

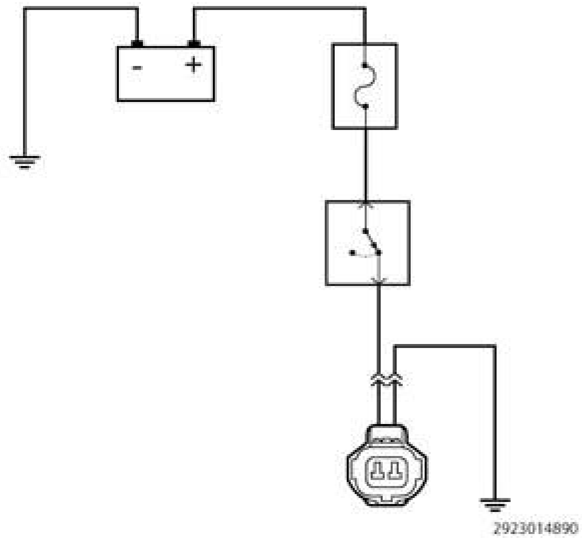

Fig. 18: 12-Volt Switched Battery B(+) Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure is to demonstrate how to check the operation of a generic ground circuit with a test light.

NOTE: **The circuit shown in illustration is an example, and is intended for demonstrational purpose only.**

The following are circuit tests covered in this procedure:

- Testing Ground Circuit With Test Light

NOTE: **Perform the following test using a known good test light.**

Possible Causes
OPEN GROUND CIRCUIT (CHAFED, PIERCED, PINCHED OR BROKEN WIRE)
OPEN IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

TESTING GROUND CIRCUIT WITH TEST LIGHT

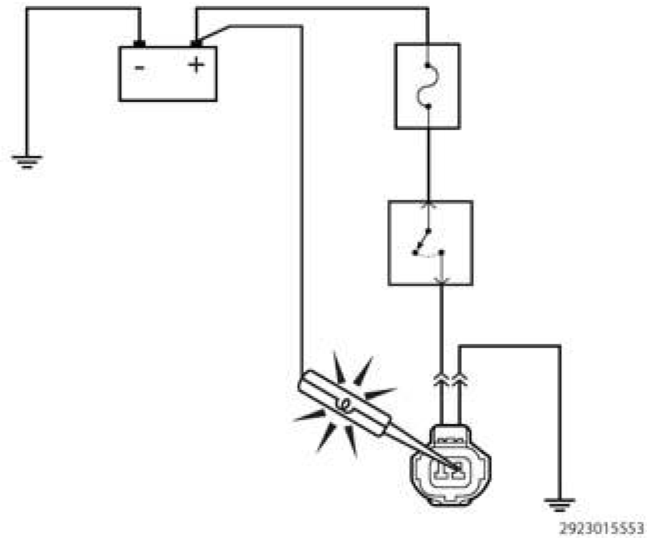

Fig. 19: Testing Ground Circuit With Test Light
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Before testing any circuits, first verify the 12-volt test light is operating properly. Connect the 12-volt test light to battery ground or to any other known good ground. Touch the lead of the test light to Battery(+). If the test light is operational, it should illuminate brightly.**

1. Turn the ignition off.
2. Disconnect the wire harness connectors of the components that contain the ground circuit suspected of containing excessive resistance.

   NOTE: **Check connectors - Clean/repair as necessary.**

3. At this time leave all in-line connectors connected.
4. With all the component wire harness connectors disconnected, connect the 12-volt test light to Battery(+).
5. Use the test light lead to lightly probe the ground circuit in the harness connector.

   Does the test light illuminate brightly?

   Yes

   - The suspected ground circuit is not open or the condition that originally caused the open or excessive resistance is not present at this time. Another way to check for an open would be to use an ohmmeter and measure the resistance of the ground circuit. While continuing to measure the resistance of the circuit, wiggle the wire harness and connectors to check for an intermittent open or poor connection.
   - Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the open could occur intermittently.
   - Look for any chafed, pierced, pinched, or partially broken wires.
   - Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.

- Perform any Technical Service Bulletins (TSBs) that may apply.

No

- Repair the open in the ground circuit. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors where the open could occur.
- One method to help isolate the open is to disconnect any in-line connectors and measure the resistance from one side of the in-line connector to the matching component harness connector. If the open goes away, the open is on the other side of the in-line connector.

CHECK FOR A SHORT BETWEEN MULTIPLE CIRCUITS

THEORY OF OPERATION

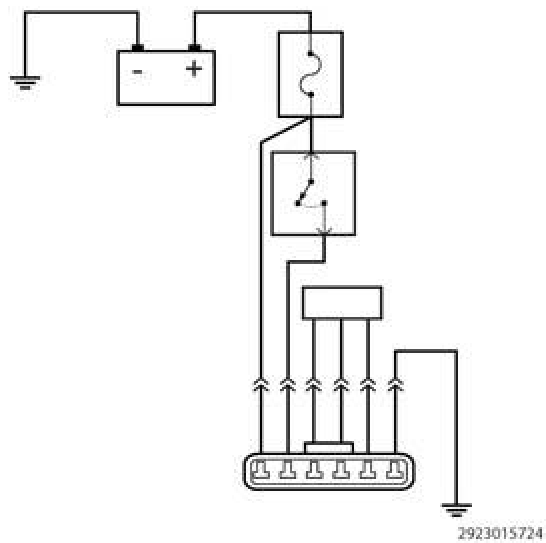

Fig. 20: 12-Volt Switched Ignition Circuit
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure is to demonstrate how to check for a short circuit between multiple circuits.

NOTE: **The circuit shown in illustration is an example, and is intended for demonstrational purpose only.**

The following are circuit tests covered in this procedure:

- Testing For A Short Between Multiple Circuits

NOTE: **Perform the following test using a known good multimeter.**

Below is a list of possible causes that could be related to a Multiple Short condition.

Possible Causes
SHORTED CIRCUIT (CHAFED, PIERCED OR PINCHED WIRES)
SHORTED IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

TESTING FOR A SHORT BETWEEN MULTIPLE CIRCUITS

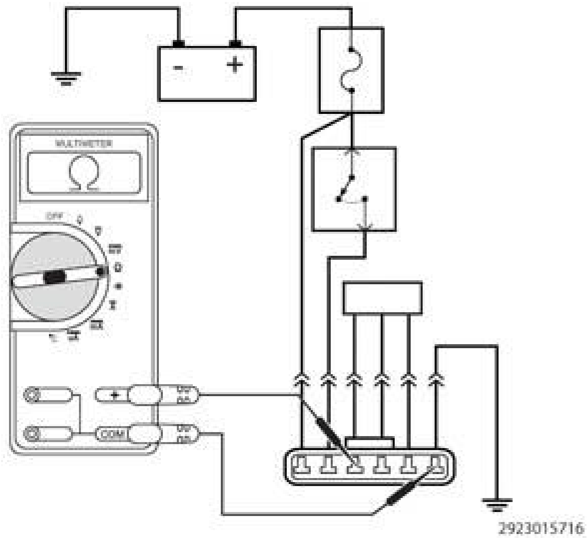

Fig. 21: Testing For A Short Between Multiple Circuits
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before measuring the resistance of any circuit, first measure the resistance between the two leads of the multimeter. Take this value and subtract it from the value recorded when measuring the resistance of the circuit being checked (The meter leads can add 0.5 ohm or more of total resistance).

1. Turn the ignition off.
2. Disconnect the wire harness connectors of the components that contain the circuits that are suspected of being shorted together.

   NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. With all the component wire harness connectors disconnected, use a multimeter set to Ohms (Ω), and measure the resistance between the applicable circuits in one of the harness connectors.
5. Use one lead of the multimeter and carefully probe the circuit suspected of being shorted.
6. Use the other lead of the meter and one at a time, carefully probe the other circuits in the harness connector.

   Is the resistance below 10k ohms when probing any two circuits?

   Yes

   - Repair the short between the circuits. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur.
   - One method to help isolate the short is to disconnect any in-line connectors that the circuit being tested runs through and measure for the short again. If the short goes away, the short is on the other

side of the in-line connector.

No

- The circuit is not shorted or the condition that originally caused the short may not be present at this time. Continue to measure the resistance and wiggle the wire harness and connectors while checking for an intermittent short.

NOTE: **By disconnecting the wire harness connectors you may have eliminated the source that was causing the short.**

- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

CHECK THE RESISTANCE OF A CIRCUIT USING AN OHMMETER

THEORY OF OPERATION

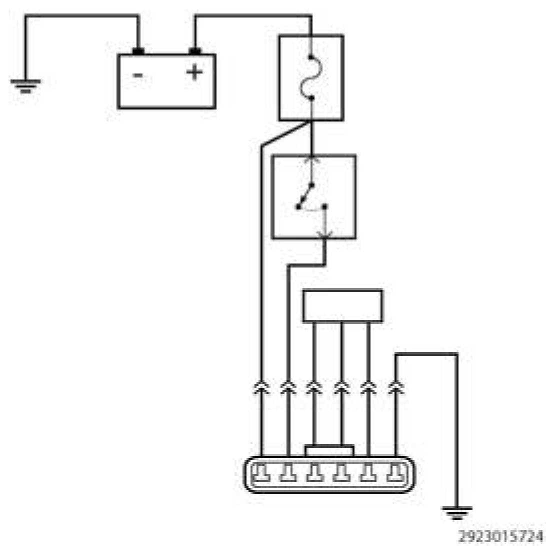

Fig. 22: 12-Volt Switched Ignition Circuit
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure is to demonstrate how to check the resistance of a circuit with an ohmmeter.

NOTE: **The circuit shown in illustration is an example, and is intended for demonstrational purpose only.**

The following are circuit tests covered in this procedure:

- Testing For An Open Circuit Using An Ohmmeter

NOTE: **Perform the following test using a known good multimeter.**

Below is a list of possible causes that could be related to an Open Circuit condition.

Possible Causes
OPEN CIRCUIT (CHAFED, PIERCED, PINCHED OR BROKEN WIRES)
OPEN IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

TESTING FOR AN OPEN CIRCUIT USING AN OHMMETER

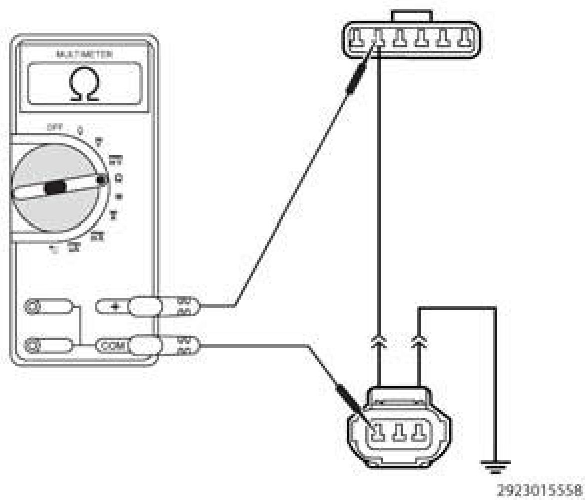

Fig. 23: Testing For An Open Circuit Using An Ohmmeter
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Before measuring the resistance of any circuit, first measure the resistance between the two leads of the multimeter. Take this value and subtract it from the value recorded when measuring the resistance of the circuit being checked (The meter leads can add 0.5 ohm or more of total resistance).**

1. Turn the ignition off.
2. Disconnect the wire harness connectors of the components that contain the circuit suspected of being open.

   NOTE: **Check connectors - Clean/repair as necessary.**

3. At this time leave all in-line connectors connected.
4. With the component wire harness connectors disconnected, use a multimeter set to Ohms (Ω), and measure the resistance of the circuit.
5. Use one lead of the meter and probe the circuit in one harness connector.
6. Use the other lead of the meter and probe the same circuit in the other harness connector.

   Is the resistance in the circuit below 10k ohms?

Yes

- The circuit does not contain any excessive resistance or the condition that originally caused the excessive resistance may not be present at this time. Continue to measure the resistance of the circuit, wiggle the wire harness and connectors to check for an intermittent open or poor connection.
- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the open could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

No

- Repair the excessive resistance in the circuit between the two wire harness connectors. Using the wiring diagram as a guide, trace the circuit and check for any in-line connectors where the open or excessive resistance could occur.
- One method to help isolate the open is to disconnect any in-line connectors and measure the resistance from one side of the in-line connector to the matching component harness connector. If the open or excessive resistance is not present, the open or excessive resistance is on the other side of the in-line connector.

CHECK FOR EXCESSIVE CURRENT DRAW

THEORY OF OPERATION

What is current draw?

Current draw, or parasitic draw is an electrical load that draws current from the battery when the ignition is turned off. Some are considered normal, some above normal. Normal draw comes from various electronic devices connected to battery positive at all times. Many vehicle modules draw a few mA (milliamps) as a means to "Keep Alive Memory". Whether it's the clock in the radio or the last known position of the memory mirrors, these tiny amounts of current typically will only add up to 20 or 30 mA. The vehicle can sit parked for days, even a few weeks without any problems of excessive battery drain that might prevent starting. As long as the vehicle is driven periodically in order for the alternator to recharge the battery there is no problem. A problem may occur, in situations such as new vehicles in dealer stock or long term airport parking situations.

Below are some examples of modules and components that require keep alive memory:

- Powertrain Control Module (PCM)
- Body Control Module (BCM)
- Memory Seat Module (MSM)
- Radio

What is excessive current draw?

Excessive current draw can be determined by an ammeter reading in excess of 50 mA. The typical "normal"

current draw will not exceed 20 or 30 mA.

How to locate the problem?

Locating the problem involves a process of elimination. If the problem is not obvious, like the trunk light staying on, you will have to start troubleshooting:

- Start by removing one fuse at a time until you see the reading on the meter drop off (be careful to reinstall the fuses in their proper location).
- Once you've determined the high-draw circuit, there still may be a half-dozen loads, each individually drawing current from the battery.
- To zero in on that circuit or circuits, use the schematic diagram and disconnect each device on the circuit one-at-a-time and check the meter.
- When the milliamp reading drops off significantly, you've found the problem.

Perform the following test to determine where the cause of the draw is located.

Possible Causes
INSTALLED AFTERMARKET ACCESSORIES (AUDIO SYSTEMS, VEHICLE ALARMS, ETC.)
COURTESY LIGHTS REMAINING ON (INTERIOR, TRUNK, HOOD, ETC.)
BATTERY CHARGERS PLUGGED INTO THE CIGARETTE LIGHTER/POWER OUTLETS

DIAGNOSTIC TEST

TESTING FOR PARASITIC DRAW

NOTE: **For a more accurate current draw reading, wait 20 minutes to make sure all modules have powered down before continuing. Some modules may stay powered up longer than others.**

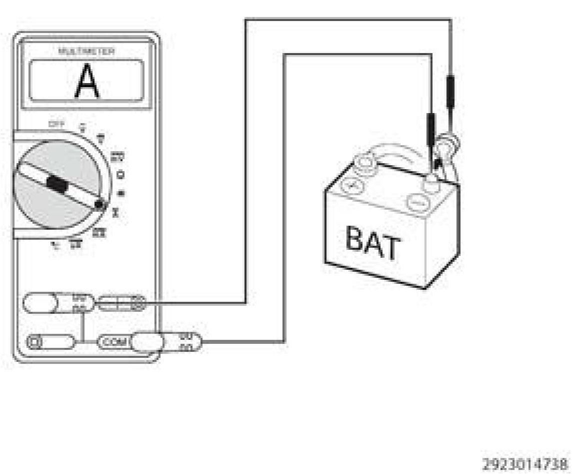

Fig. 24: Testing For Parasitic Draw Using Multimeter
Courtesy of CHRYSLER GROUP, LLC

Turn the ignition off.

1. Disconnect the Negative battery cable (ground).
2. Using a multimeter, set the multimeter leads up to properly measure Amperage.
3. Connect the ground lead that is plugged into the COM port of the multimeter to the Negative battery post/terminal.
4. Connect the other lead of the multimeter that is plugged into the Amp port of the multimeter to the Negative battery cable.

CAUTION: **Do not crank the engine or turn on any accessories that may draw more than 10 Amps. You may open the protective fuse in the multimeter.**

5. While monitoring the amperage reading on the multimeter, begin to remove fuses (one at a time) from each fuse location on the vehicle and see if the amperage drops.

NOTE:

- **Only remove one fuse at a time until the cause of the voltage draw is determined.**
- **Many vehicles have multiple fuse locations on the vehicle.**

6. If the amperage does not drop, install the fuse you just removed and remove the next fuse.

Does the amperage drop to between 0.02 to 0.04 of an Amp when removing any fuses?

Yes

- Use the wiring diagram as a guide to help indicate what components or modules are powered by the fuse.
- At this point you can install the fuse and begin disconnecting the components powered by the fuse.
  - When the amperage drops after disconnecting a component this will indicate which component is at fault.
  - It is important to know how long some modules are designed to remain awake.
  - You don't want to replace a component that is operating normally.
  - The condition that originally caused the draw may not be present at this time.

No

- The condition that originally caused the draw may not be present at this time.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded ground terminals.
- Perform any Technical Service Bulletins (TSBs) that may apply.

CIRCUIT LOAD TESTING PROCEDURE

THEORY OF OPERATION

A circuit load test can be performed to test the ability of a circuit to carry the current required to operate a

connected device. A circuit load test should be performed after a circuit has passed a resistance test using a DVOM and the circuit is still suspected of a failure.

- A single copper wire strand will carry enough current to light a test light bulb, while showing very low resistance using a DVOM.
- Some test lights are insufficient for load testing because of the very low resistance bulb being used.
- The Load Test tool listed below will require higher current flow to power the bulb; and this will test the ability of the circuit to carry a load.
- This test will indicate if the circuit being tested can carry the current required to operate a connected device.

WARNING: To avoid possible serious or fatal injury, DO NOT load test any air bag/restraint system components or circuits using the procedures listed here. Refer to the Service Information for proper air bag/restraint system testing procedures.

CAUTION: Do not load test any circuits with components still connected to the circuit.

NOTE: Depending upon the location of the circuit in question, this test may require jumper wires.

NOTE: Use the wiring diagrams as a guide to trace the circuits and look for any in-line connectors where the circuit failure could occur intermittently. Look for any chafed, pierced, pinched, or partially broken wires. Look for broken, bent, pushed out or corroded terminals - clean/repair as necessary. Verify that there is good pin to terminal contact in the related wire harness connectors.

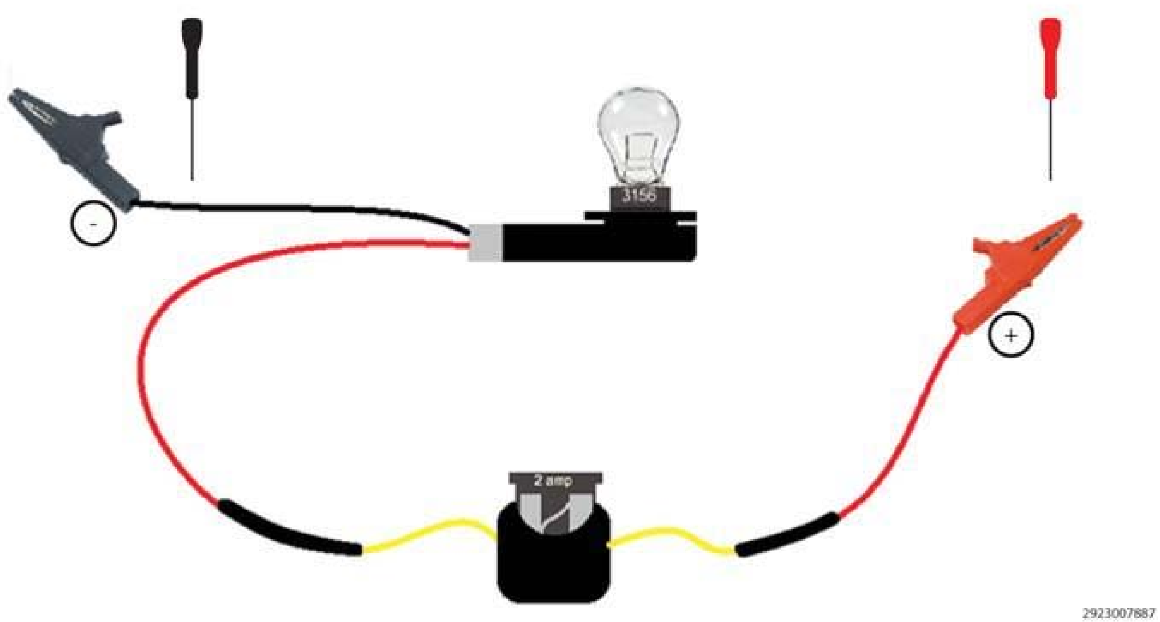

Fig. 25: Load Test Tool
Courtesy of CHRYSLER GROUP, LLC

Here is an example of a simple tool you can build to test a circuit`s ability to carry a load.

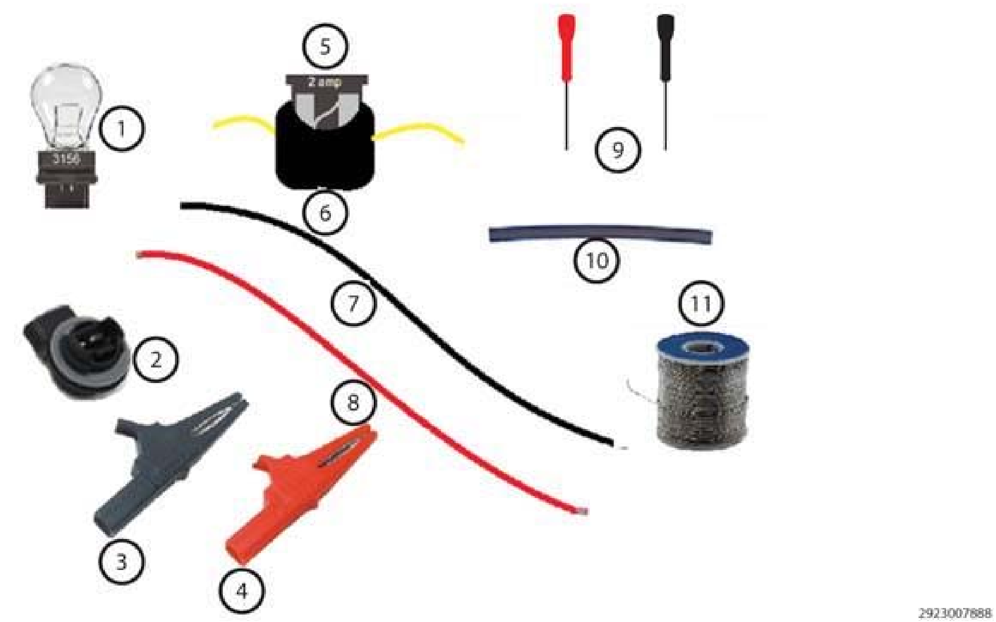

Fig. 26: Load Test Tool Components
Courtesy of CHRYSLER GROUP, LLC

The following is a list of components required to build a load test tool:

1. 3156 Bulb
2. 3156 Bulb socket
3. Negative alligator clip with covers
4. Positive alligator clip with covers
5. 2 Amp mini fuse
6. Mini fuse holder
7. 2' to 4' of Black 16ga wire
8. 2' to 4' of Red 16ga wire
9. Approved back probe tool
10. Shrink tubing
11. Solder

LOAD TESTING A GROUND CIRCUIT

DIAGNOSTIC LOAD TEST (GROUND CIRCUIT)

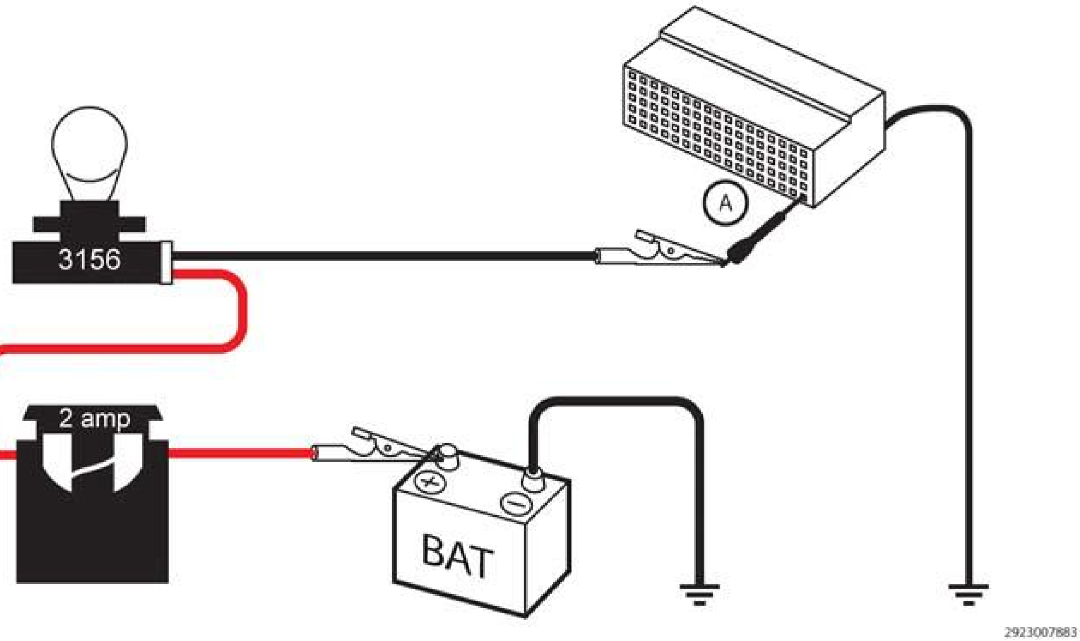

Fig. 27: Performing Diagnostic Load Test (Ground Circuit)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the connector from the device(s) to gain access and isolate the terminal for the circuit being tested.
2. Connect the positive lead of the load test tool to the positive side of the battery.
3. Using an approved connector back probe tool, connect the negative lead of the load test tool to the circuit being tested at point (A).

CAUTION: Use only approved connector back probe tools when back probing a connector so as not to cause damage to the terminals or insulation of the connector. Damage to the terminals can cause poor terminal contact or retention. Damage to the insulation can introduce corrosion due to water infiltration.

Does the bulb light bright, when compared to a direct battery connection?

Yes

- The circuit being tested can carry a load, check other circuits, connectors and terminals for concerns.

No

- Repair the circuit, connector or terminal that has an open or excessive resistance.
- Perform any related Recalls or Technical Service Bulletins (TSBs) that may apply.

LOAD TESTING A BATTERY OR IGNITION FEED CIRCUIT

DIAGNOSTIC LOAD TEST (BATTERY/IGNITION FEED CIRCUIT)

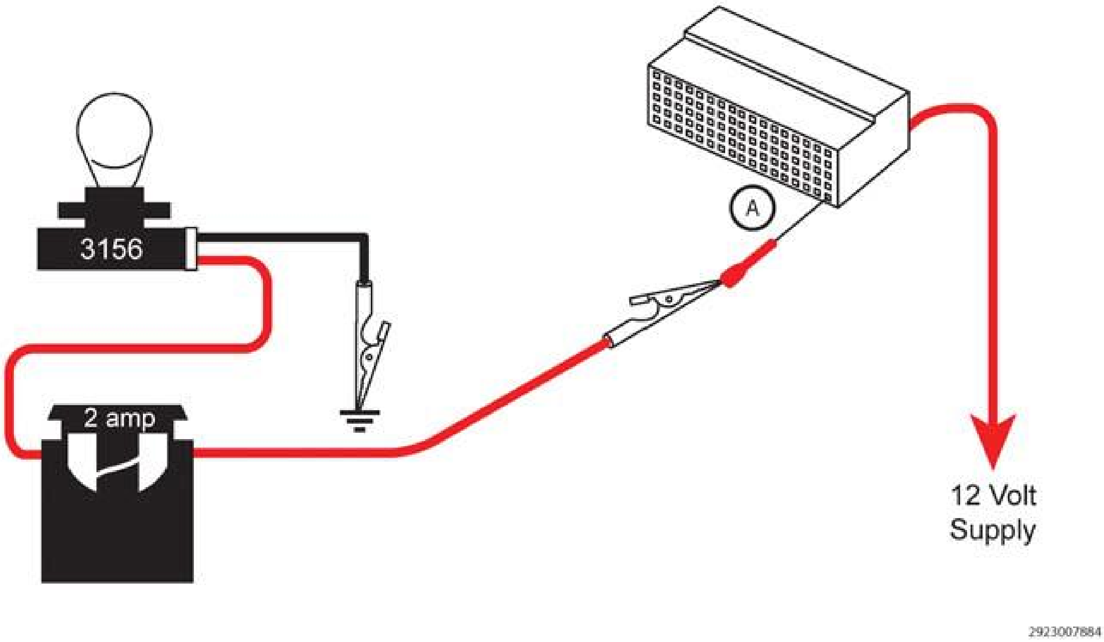

Fig. 28: Performing Diagnostic Load Test (Battery/Ignition Feed Circuit)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the connector from the device(s) to gain access and isolate the terminal for the circuit being tested.
2. Using an approved connector back probe tool, connect the positive lead of the load test tool to the circuit being tested at point (A).
3. Connect the negative lead of the load test tool to the negative side of the battery or ground.

CAUTION: Use only approved connector back probe tools when back probing a connector so as not to cause damage to the terminals or insulation of the connector. Damage to the terminals can cause poor terminal contact or retention. Damage to the insulation can introduce corrosion due to water infiltration.

Does the bulb light bright, when compared to a direct battery connection?

Yes

- The circuit being tested can carry a load, check other circuits, connectors and terminals for concerns.

No

- Repair the circuit, connector or terminal that has an open or excessive resistance.
- Perform any related Recalls or Technical Service Bulletins (TSBs) that may apply.

LOAD TESTING A BATTERY OR IGNITION FEED CIRCUIT AND GROUND CIRCUIT

DIAGNOSTIC LOAD TEST (BATTERY FEED & GROUND CIRCUIT)

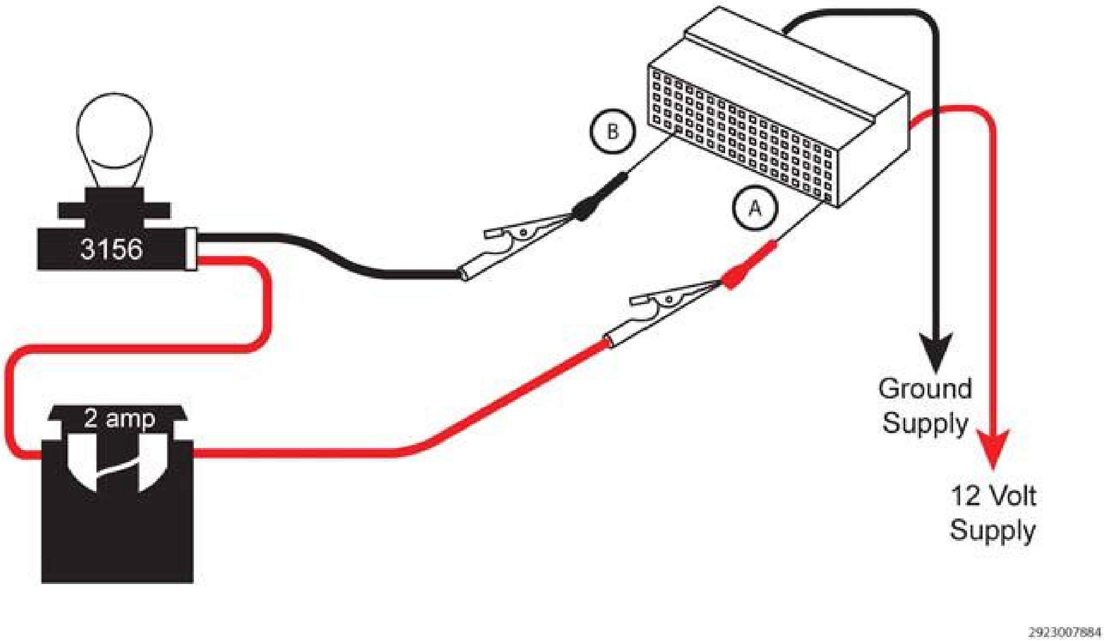

Fig. 29: Performing Diagnostic Load Test (Battery Feed & Ground Circuit)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the connector from the device(s) to gain access and isolate the terminal for the circuit being tested.
2. Using an approved connector back probe tool, connect the positive lead of the load test tool to the circuit being tested at point (A).
3. Using an approved connector back probe tool, connect the negative lead of the load test tool to the circuit being tested at point (B).

CAUTION: Use only approved connector back probe tools when back probing a connector so as not to cause damage to the terminals or insulation of the connector. Damage to the terminals can cause poor terminal contact or retention. Damage to the insulation can introduce corrosion due to water infiltration.

Does the bulb light bright, when compared to a direct battery connection?

Yes

- The circuit being tested can carry a load, check other circuits, connectors and terminals for concerns.

No

- Test the circuits individually to determine which circuit is the cause of the test failure.
- Repair the circuit, connector or terminal that has an open or excessive resistance.
- Perform any related Recalls or Technical Service Bulletins (TSBs) that may apply.

LOAD TESTING A CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

DIAGNOSTIC LOAD TEST (OPEN/HIGH RESISTANCE CIRCUIT)

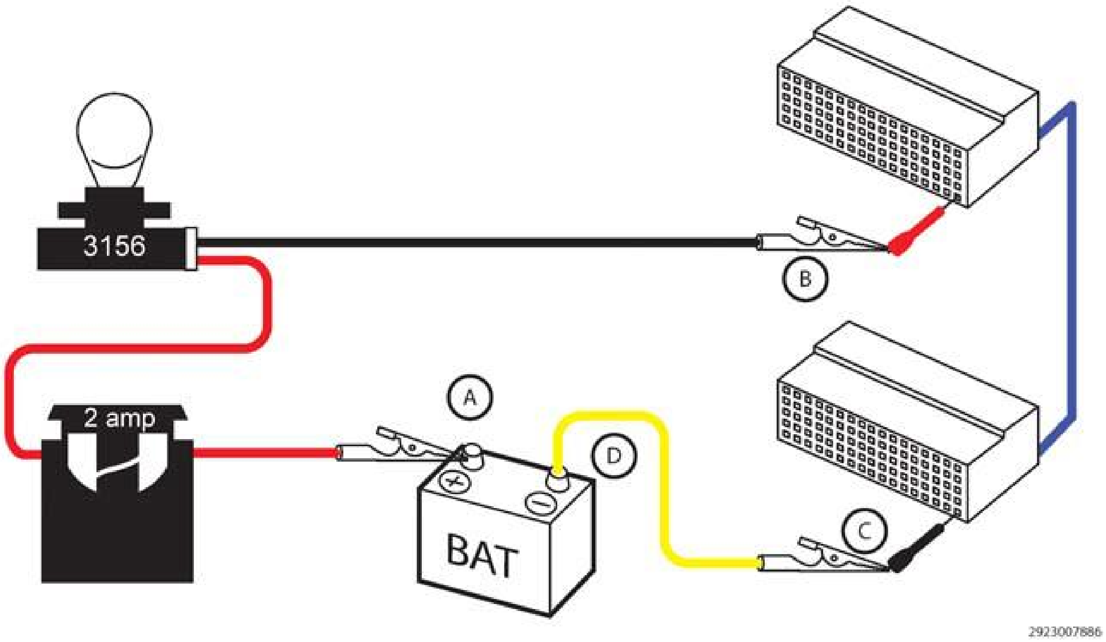

Fig. 30: Performing Diagnostic Load Test (Open/High Resistance Circuit)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect all components from the circuit being tested.
2. Connect the positive lead of the load test tool to the positive side of the battery (A).
3. Using an approved connector back probe tool, connect the negative lead of the load test tool to the circuit being tested at point (B).
4. Using an approved connector back probe tool, connect a jumper wire to the circuit being tested at point (C).
5. Then connect the other end of the jumper wire to the negative side of the battery or ground (D).

CAUTION: Use only approved connector back probe tools when back probing a connector so as not to cause damage to the terminals or insulation of the connector. Damage to the terminals can cause poor terminal contact or retention. Damage to the insulation can introduce corrosion due to water infiltration.

Does the bulb light bright, when compared to a direct battery connection?

Yes

- The circuit being tested can carry a load, check other circuits, connectors and terminals for concerns.

No

- Repair the circuit, connector or terminal that has an open or excessive resistance.
- Perform any related Recalls or Technical Service Bulletins (TSBs) that may apply.

VOLTAGE DROP TEST PROCEDURE

THEORY OF OPERATION

Voltage drop is the reduction in voltage in an electrical circuit between the voltage source and load components. The wires and connectors of a circuit should contain almost no resistance and **all** the voltage should be consumed through the load. The "load" is the component using the power, such as a light, starter, or blower motor. If a circuit has excessive resistance, it prevents the wire from carrying sufficient current under high load conditions. A voltage drop test is an effective way to locate excessive resistance in connections and circuits.

To perform a voltage drop test, a Digital Volt Ohm Meter (DVOM) is used to measure the voltage drop across a live circuit or connection while it is under the load. If the circuit or connection being tested has excessive resistance, the DVOM will measure the voltage that the resistance is using. **Little or no voltage drop should be read, ideally less than 0.2 of a volt** , anything greater indicates excessive resistance and the circuit or connection should be inspected for cleaning or repair.

Possible Causes
EXCESSIVE CIRCUIT RESISTANCE (CHAFED, PIERCED OR CORRODED WIRES)
HIGH RESISTANCE WITH IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

TESTING FOR VOLTAGE DROP

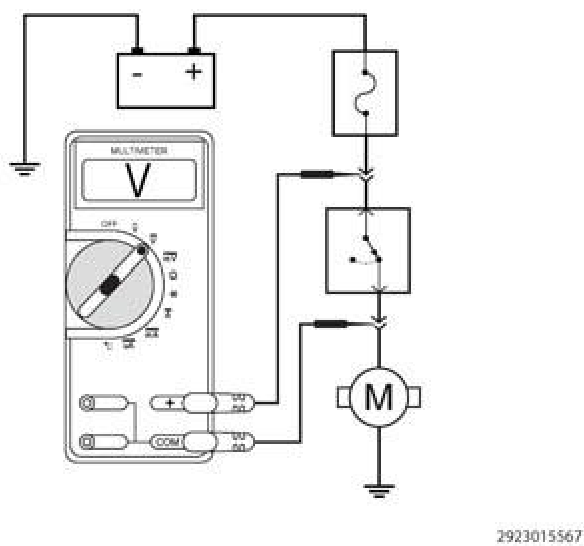

Fig. 31: Testing for Voltage Drop
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Use the wiring diagram as a guide, trace the circuit being tested and locate the components related to the circuit.
3. Set the multimeter to measure DC voltage.
4. Carefully back probe the two component harness connectors of the circuit being tested.

WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

NOTE: **If you are testing the starting circuit, disable the engine so the engine does not start.**

5. Crank the engine for five seconds if you are testing the starting circuit and monitor the multimeter voltage reading.
6. For circuits that don't require the engine running, turn the ignition on.
7. For circuits that require the engine running, start the engine.

NOTE: **If the circuit you are checking needs to be operating, such as the Blower Motor or a Lamp, do so now.**

8. Monitor the voltage reading.
9. The voltmeter will show the difference in voltage between the two points.

Is the voltage less than 0.2 of a Volt?

Yes

- At this time the circuit is functioning properly. Continue to measure the voltage between the components and wiggle the wire harness and connectors while checking for an intermittent condition.
- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the excessive resistance could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

No

- Repair the excessive resistance in the circuit.
- Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors where the excessive resistance may occur.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES

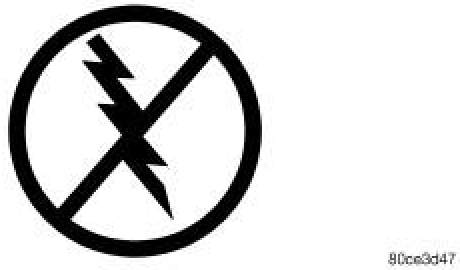

Fig. 32: Electrostatic Discharge Symbol
Courtesy of CHRYSLER GROUP, LLC

All ESD sensitive components are solid state and a symbol is used to indicate this. When handling any component with this symbol, comply with the following procedures to reduce the possibility of electrostatic charge build up on the body and inadvertent discharge into the component. If it is not known whether the component is ESD sensitive, assume that it is.

Perform the following procedure when handling ESD sensitive components:

1. Always touch a known good ground before handling the component. This should be repeated while handling the component and more frequently after sliding across a seat, sitting down from a standing position, or walking a distance.
2. Avoid touching electrical terminals of the component, unless instructed to do so by a written procedure.
3. When using a voltmeter, be sure to connect the ground lead first.
4. Do not remove the component from its protective packing until it is time to install the component.
5. Before removing the component from its package, ground the package to a known good ground on the vehicle.

WIRE SPLICING

CAUTION: If additional wire is needed when making a splice repair to any wire, it is important that the same or next larger size wire gauge be used. Refer to the appropriate wiring diagram for the original wire gauge size.

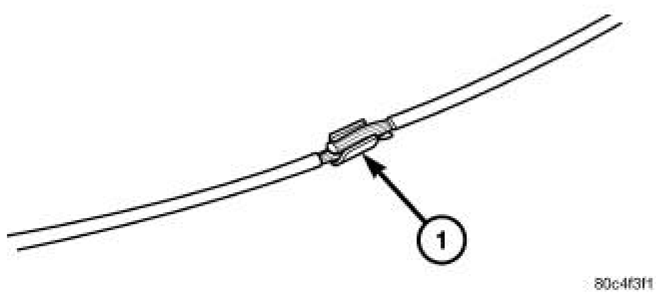

Fig. 33: Splice Band
Courtesy of CHRYSLER GROUP, LLC

1. Remove 13 millimeters (0.50 inch) of insulation from each wire that needs to be spliced.
2. Place a piece of adhesive sealant-lined heat shrink tubing (Part Number 04778570 or equivalent) over the wire on one side of the splice. Be certain the length of tubing will be sufficient to cover and seal the entire

repair area.

3. Place the strands of the wires being spliced so that they are overlapping each other within the splice band (1).

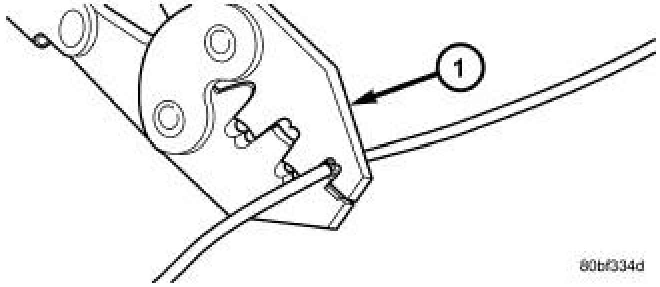

Fig. 34: Crimping Tool
Courtesy of CHRYSLER GROUP, LLC

4. Using a crimping tool (1) (MOPAR Part Number 05019912AA, Miller Special Tool Number (special tool #10042, Crimper, Wire/Terminal) or equivalent) crimp the splice band and wires together securely.

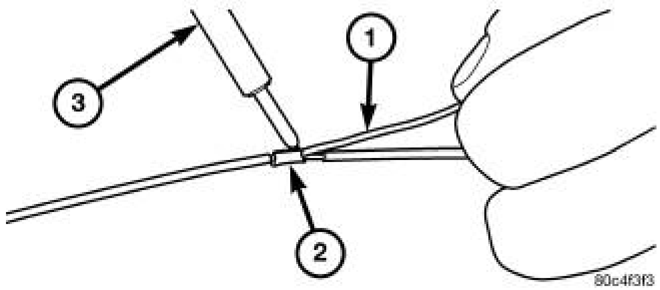

Fig. 35: Solder Splice
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Never use acid core solder for electrical wiring repairs.

5. Using Rosin Core type solder (1) only and a suitable soldering iron (3), solder the wire and splice band connection (2) together.

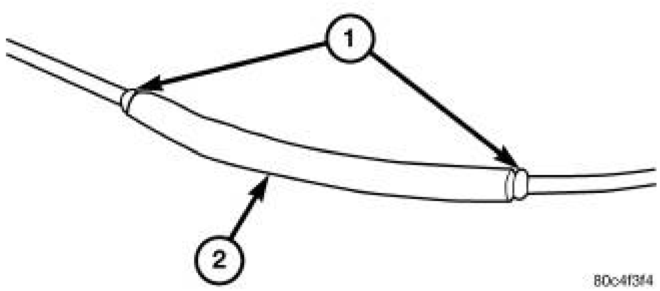

Fig. 36: Heat Shrink Tube
Courtesy of CHRYSLER GROUP, LLC

6. Center the heat shrink tubing (2) over the splice joint repair and heat using a suitable heat gun. Heat the joint until the tubing is tightly sealed and sealant (1) begins to ooze out of both ends of the tubing.

REMOVAL

CONNECTOR TERMINAL REMOVAL

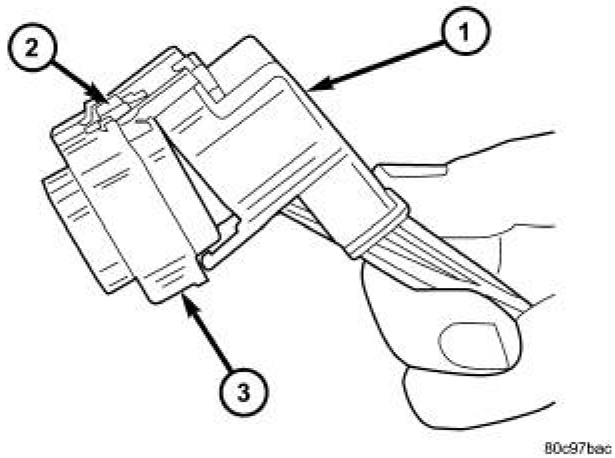

Fig. 37: Removal Of Dress Cover
Courtesy of CHRYSLER GROUP, LLC

1 - DRESS COVER	
2 - CONNECTOR LOCK	
3 - CONNECTOR	

1. Disconnect battery.
2. Release Connector Lock (2).
3. Disconnect the connector (3) being repaired from its mating half/component.
4. Remove the dress cover (if applicable) (1).

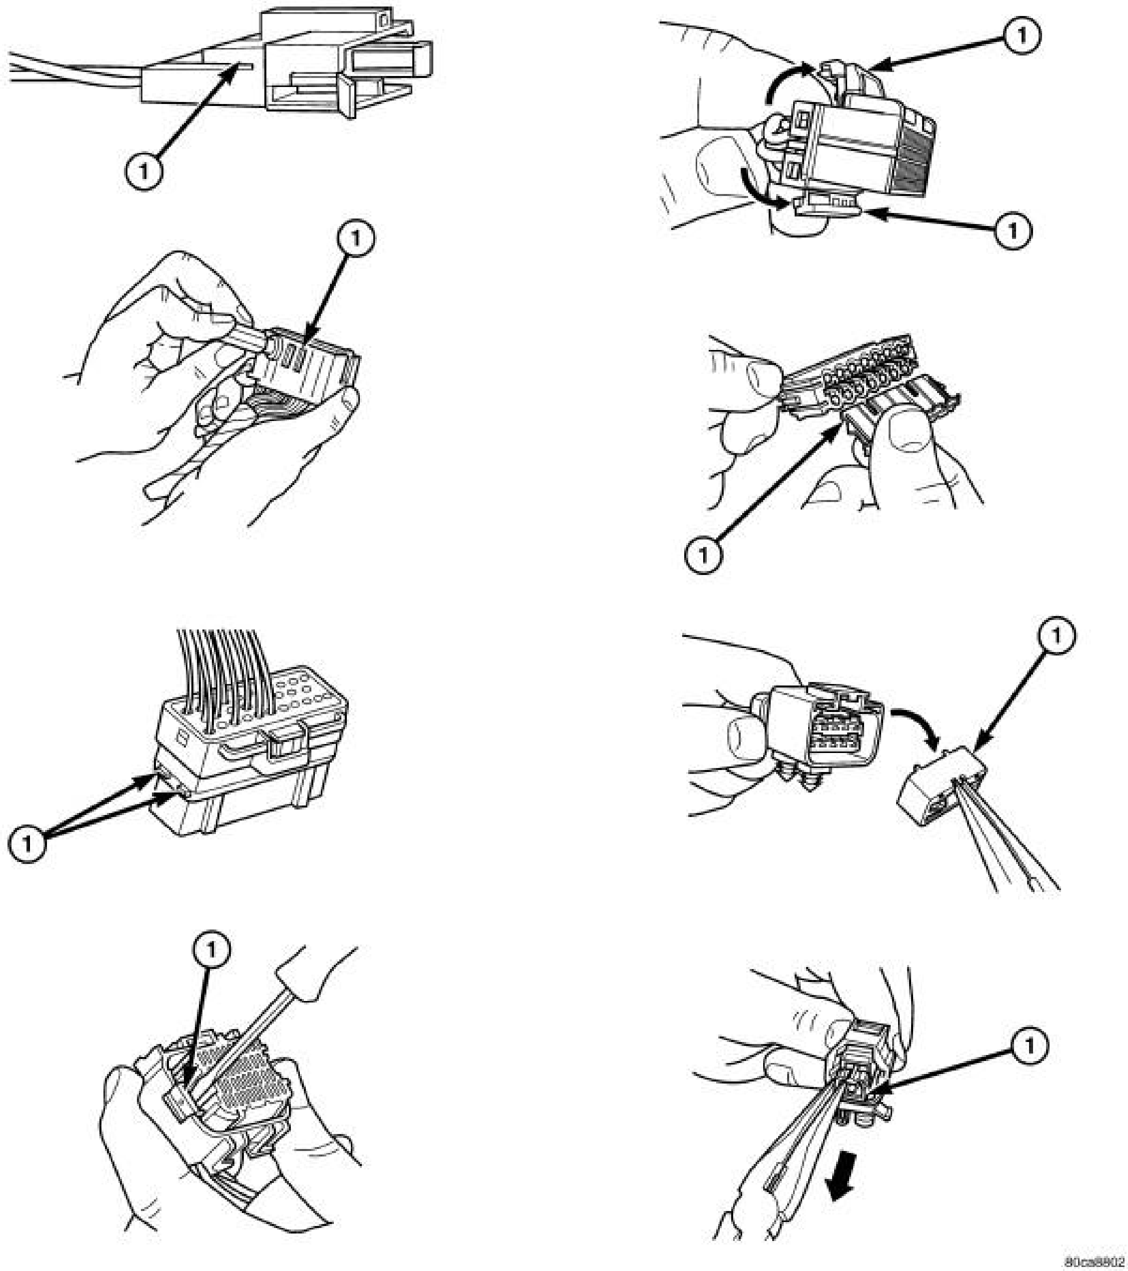

Fig. 38: Connector Secondary Terminal Lock
Courtesy of CHRYSLER GROUP, LLC

1 - Secondary Terminal Lock

5. Release the Secondary Terminal Lock, if required (1).

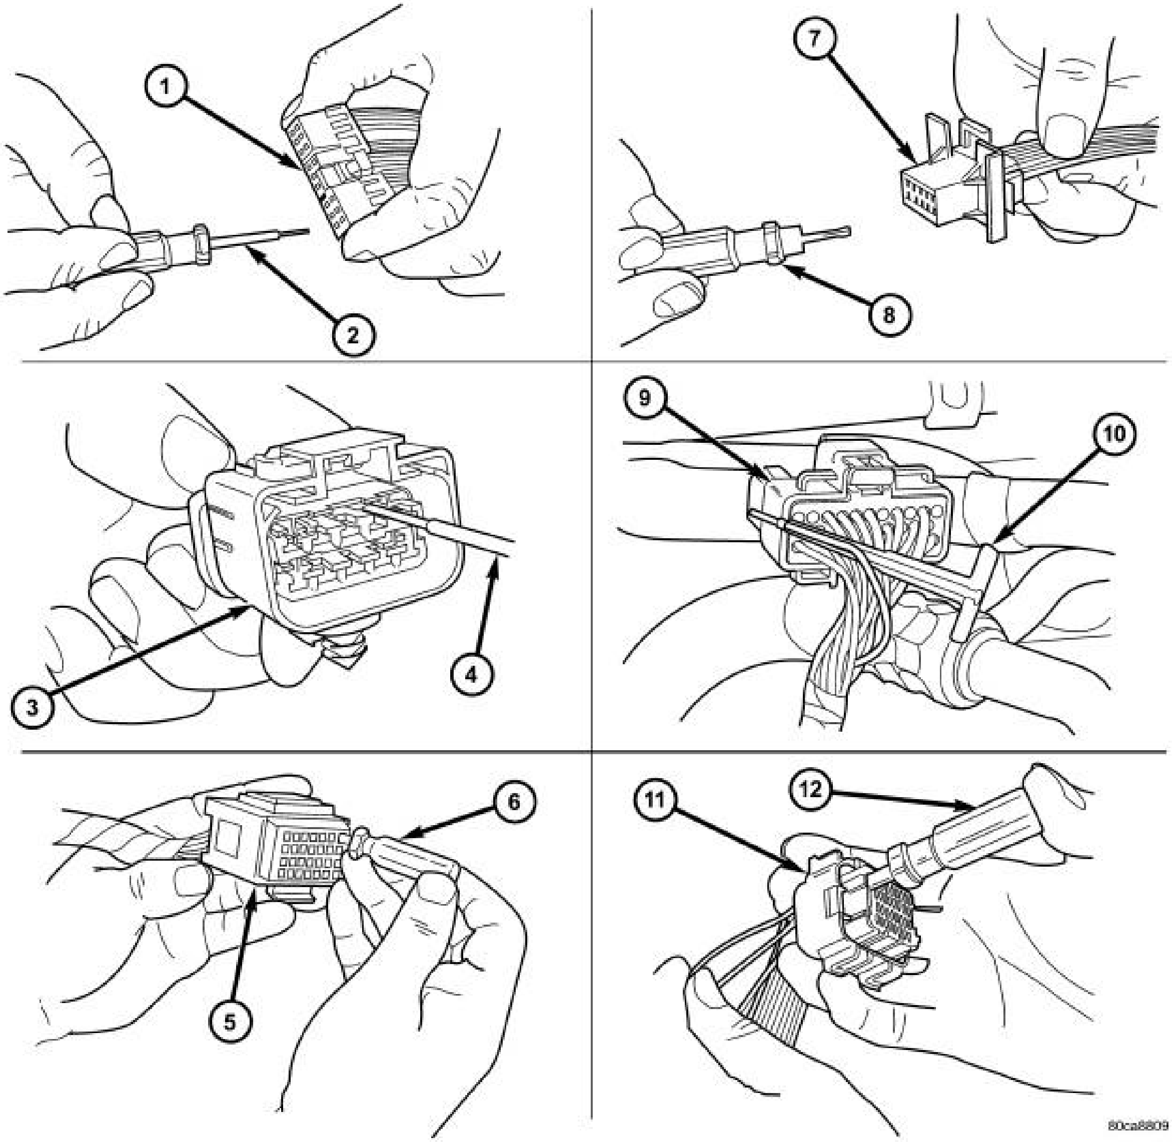

Fig. 39: Terminal Removal
Courtesy of CHRYSLER GROUP, LLC

1 - TYPICAL CONNECTOR

3 - APEX CONNECTOR
4 - PICK FROM TERMINAL REMOVER KIT 10300
5 - AUGAT CONNECTOR
6 - ELECTRICAL TERMINAL REMOVAL TOOL
7 - MOLEX CONNECTOR
8 - PICK FROM TERMINAL REMOVER KIT 10300
9 - THOMAS AND BETTS CONNECTOR
10 - TERMINAL REMOVER
11 - CONNECTOR
12 - ELECTRICAL TERMINAL REMOVER

6. Position the connector locking finger away from the terminal using the proper special tool. Pull on the

wire to remove the terminal from the connector.

INSTALLATION

CONNECTOR TERMINAL INSTALLATION

1. Select a wire from the terminal repair kit that best matches the color and gauge of the wire being repaired.
2. Cut the repair wire to the proper length and remove one-half (1/2) inch of insulation.
3. Splice the repair wire to the wire harness. Refer to **WIRE SPLICING** .
4. Insert the repaired wire into the connector.
5. Install the connector locking wedge, if required, and reconnect the connector to its mating half/component.
6. Re-tape the wire harness starting at 1-1/2 inches behind the connector and 2 inches past the repair.
7. Connect battery and test all affected systems.

.

2015-16 CLUTCH

Clutch System - Challenger

WARNING

WARNING

WARNING: EXERCISE CARE WHEN SERVICING CLUTCH COMPONENTS. FACTORY INSTALLED CLUTCH DISCS DO NOT CONTAIN ASBESTOS FIBERS. DUST AND DIRT ON CLUTCH PARTS MAY CONTAIN ASBESTOS FIBERS FROM AFTERMARKET COMPONENTS. BREATHING EXCESSIVE CONCENTRATIONS OF THESE FIBERS CAN CAUSE SERIOUS BODILY HARM. WEAR A RESPIRATOR DURING SERVICE AND NEVER CLEAN CLUTCH COMPONENTS WITH COMPRESSED AIR OR WITH A DRY BRUSH. EITHER CLEAN THE COMPONENTS WITH A WATER DAMPENED RAGS OR USE A VACUUM CLEANER SPECIFICALLY DESIGNED FOR REMOVING ASBESTOS FIBERS AND DUST. DO NOT CREATE DUST BY SANDING A CLUTCH DISC. REPLACE THE DISC IF THE FRICTION MATERIAL IS DAMAGED OR CONTAMINATED. DISPOSE OF ALL DUST AND DIRT CONTAINING ASBESTOS FIBERS IN SEALED BAGS OR CONTAINERS. THIS WILL HELP MINIMIZE EXPOSURE TO YOURSELF AND TO OTHERS. FOLLOW ALL RECOMMENDED SAFETY PRACTICES PRESCRIBED BY THE OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION (OSHA) AND THE ENVIRONMENTAL SAFETY AGENCY (EPA), FOR THE HANDLING AND DISPOSAL OF PRODUCTS CONTAINING ASBESTOS.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - CLUTCH

ROAD TEST

Road test the vehicle and inspect components to determine the clutch problem.

During a road test, drive the vehicle at normal speeds. Shift the transmission through all gear ranges and observe clutch action. If the clutch chatters, grabs, slips or does not release properly, remove and inspect the clutch components. If the problem is noise or hard shifting further diagnosis may be needed as the transmission or another driveline component may be at fault.

CLUTCH CONTAMINATION

Clutch contamination can be caused by oil, water or clutch fluid on the clutch discs and pressure plate surfaces. This will cause chatter, slip and grab. Inspect the clutch components and verify the contaminate.

Oil contamination indicates a leak at either the rear main seal or transmission input shaft causing an oil residue on the housing interior and clutch cover and flywheel. Heat buildup caused by slippage between the pressure plate, discs and flywheel can bake the oil residue onto the components. A glaze-like residue ranges in color from amber to black will be noticed.

Road splash contamination, dirt/water can enter the clutch housing due to loose bolts, housing cracks or through hydraulic line openings. Driving through deep water puddles can force water/road splash into the housing through such openings.

IMPROPER CLUTCH RELEASE OR ENGAGEMENT

Clutch release or engagement problems are caused by wear or damage to one or more clutch components.

Release problems can result in hard shifting and noise. Inspect the clutch cylinders/interconnecting line, slave cylinder, release bearing, clutch discs and pressure plate. Inspect these components for loose, worn and damaged mounting bolts or components.

Normal condensation in vehicles that are stored or out of service for long periods of time can generate enough corrosion to make the discs stick to the flywheel, or pressure plate. If this condition is experienced loosen the disc manually through the inspection plate opening if equipped.

Engagement problems can result in slip, chatter/shudder and noisy operation. Inspect the clutch discs and pressure plate for contamination, wear, misalignment and distortion.

CLUTCH MISALIGNMENT

Clutch components must be in proper alignment with the crankshaft and transmission input shaft. Misalignment caused by excessive runout or warpage of any clutch component will cause grab, chatter and improper clutch release.

PRESSURE PLATE

Check pressure plate for flatness with a straightedge. Pressure plate friction area must be flat within 0.50 mm (0.020 in.). Attaching bolt holes should be in contact with surface plate within 0.38 mm (0.015 in.). Inspect friction faces of the flywheel and pressure plate for:

- Flywheel Dowel Pin Fit
- Excessive Discoloration
- Burned Areas
- Small Cracks
- Deep Grooves
- Ridges

CLUTCH DISC

Replace clutch discs and pressure plate if discs are worn within 0.38 mm (0.015 in.) of the rivet heads. Inspect clutch discs for:

- Discoloration
- Burned Areas
- Cracks
- Worn Disc Hub Splines
- Broken Springs

- Loose Rivets
- Oil Soaked

DIAGNOSIS CHART

The diagnosis charts describe common clutch problems, possible causes and correction. Refer to **DIAGNOSIS CHART**.

DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
Discs facing worn out.	1. Normal wear.	1. Replace pressure plate and discs.
	2. Driver frequently rides (slips) the clutch. Results in rapid overheating and wear.	2. Replace pressure plate and discs.
	3. Insufficient pressure plate diaphragm spring tension.	3. Replace pressure plate and discs.
Clutch disc facing contaminated with oil, grease, or clutch fluid.	1. Leak at rear main engine seal or transmission input shaft seal.	1. Replace appropriate seal.
	2. Excessive amount of grease applied to the input shaft splines.	2. Remove grease and apply the correct amount of grease.
	3. Road splash, water entering housing.	3. Replace clutch disc. Clean pressure plate and reuse if in good condition.
	4. Slave cylinder leaking.	4. Replace hydraulic clutch linkage.
Clutch is running partially disengaged.	1. Release bearing sticking or binding and does not return to the normal running position.	1. Verify failure. Replace the release bearing and transmission front bearing retainer as necessary.
Flywheel below minimum thickness specification.	1. Improper flywheel machining. Flywheel has excessive taper or excessive material removal.	1. Replace flywheel.
Pressure plate or diaphragm spring warped or distorted.	1. Rough handling. Impact bent cover, spring, or disc.	1. Replace discs and pressure plate as necessary.
	2. Improper bolt tightening procedure.	2. Tighten clutch cover using proper procedure.
Facing on flywheel side of disc torn, gouged, or worn.	1. Flywheel surface scored or nicked.	1. Correct surface condition if possible. Replace flywheel, discs and pressure plate as necessary.
	2. Clutch disc sticking or binding on transmission input shaft.	2. Inspect components and correct/replace as necessary.
Clutch discs facing burnt. Flywheel and pressure plate surfaces glazed.	1. Frequent operation under high loads or hard acceleration conditions.	1. Correct condition of flywheel and pressure plate surface. Replace discs and pressure plate.
	2. Driver frequently rides (slips) clutch. Results in rapid wear and overheating of disc and cover.	2. Correct condition of flywheel surface. Replace clutch discs and pressure plate.

CONDITION	POSSIBLE CAUSES	CORRECTION
Clutch discs binding on input shaft splines.	1. Clutch discs hub splines damaged during installation.	1. Clean, smooth, and lubricate hub splines if possible. Replace discs and pressure plate if necessary.
	2. Input shaft splines rough, damaged, or corroded.	2. Clean, smooth, and lubricate shaft splines if possible. Replace input shaft if necessary.
Clutch discs rusted to flywheel and/or pressure plate.	1. Clutch not used for and extended period of time (e.g. long term vehicle storage).	1. Sand rusted surfaces with 180 grit sanding paper. Replace discs, pressure plate and flywheel if necessary.
Pilot bearing seized, loose, or rollers are worn.	1. Bearing cocked during installation.	1. Install and lubricate a new bearing.
	2. Bearing defective.	2. Install and lubricate a new bearing.
	3. Bearing not lubricated.	3. Install and lubricate a new bearing.
	4. Clutch misalignment.	4. Inspect clutch and correct as necessary. Install and lubricate a new bearing.
Clutch will not disengage properly.	1. Low clutch fluid level.	1. Replace hydraulic linkage assembly.
	2. Clutch cover loose.	2. Follow proper bolt tightening procedure.
	3. Clutch disc bent or distorted.	3. Replace discs and pressure plate.
	4. Pressure plate diaphragm spring bent or warped.	4. Replace discs and pressure plate.
	5. Clutch disc installed backwards.	5. Remove and install clutch disc correctly.
	6. Clutch master or slave cylinder failure.	6. Replace hydraulic linkage assembly.
Clutch pedal squeak.	1. Pivot pin loose.	1. Tighten pivot pin if possible. Replace clutch pedal if necessary.
	2. Master cylinder bushing not lubricated.	2. Lubricate master cylinder bushing.
	3. Pedal bushings worn out or cracked.	3. Replace and lubricate bushings.
Clutch master or slave cylinder plunger dragging and/or binding.	1. Master or slave cylinder components worn or corroded.	1. Replace clutch hydraulic linkage assembly.
Release bearing is noisy.	1. Release bearing defective or damaged.	1. Replace release bearing.
Contact surface of release bearing damaged.	1. Pressure plate release fingers bent or distorted.	1. Replace pressure plate and release bearing.
	2. Release bearing defective or damaged.	2. Replace the release bearing.

CONDITION	POSSIBLE CAUSES	CORRECTION
	3. Release bearing misaligned.	3. Check and correct runout of clutch components. Check front bearing sleeve for damage/alignment. Repair as necessary.
Partial engagement of clutch discs. One side of disc is worn and the other side is glazed and lightly worn.	1. Clutch pressure plate position incorrect.	1. Replace clutch discs and pressure plate.
	2. Pressure plate release fingers bent or distorted.	2. Replace clutch discs and pressure plate.
	3. Clutch disc damaged or distorted.	3. Replace clutch discs and pressure plate
	4. Clutch misalignment.	4. Check alignment and runout of flywheel, disc, pressure plate, and/or clutch housing. Correct as necessary.

STANDARD PROCEDURE

STANDARD PROCEDURE - CLUTCH SYSTEM BLEED

NOTE: **Be certain the clutch pedal returns to the upper most position while bleeding the clutch system.**

NOTE: **It may take as many as two hundred strokes of the clutch pedal to properly bleed the clutch system.**

1. Check the fluid level in the brake master cylinder reservoir. If the brake fluid level is not up to the step in the reservoir, add DOT 4 brake fluid. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
2. Slowly depress the clutch pedal.
   a. If the pedal feels hard in a short distance, air is present in the clutch slave cylinder.
   b. If the pedal feels spongy, air is present in the clutch master cylinder.
3. Continue checking the fluid level while depressing and releasing the clutch pedal. Depress and release the clutch pedal until an appropriate clutch pedal response and feel is achieved.

SPECIAL TOOLS

	10018 - Clutch Alignment Tool (Originally Shipped In Kit Number(s) 10017, 10017A.)

BEARING, CLUTCH RELEASE

REMOVAL

CLUTCH RELEASE BEARING/SLAVE CYLINDER

NOTE: The clutch release bearing and slave cylinder are serviced as an assembly.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the transmission and place it on a workbench. For 5.7L & 6.4L, refer to **REMOVAL** . For 6.2L, refer to **REMOVAL** .

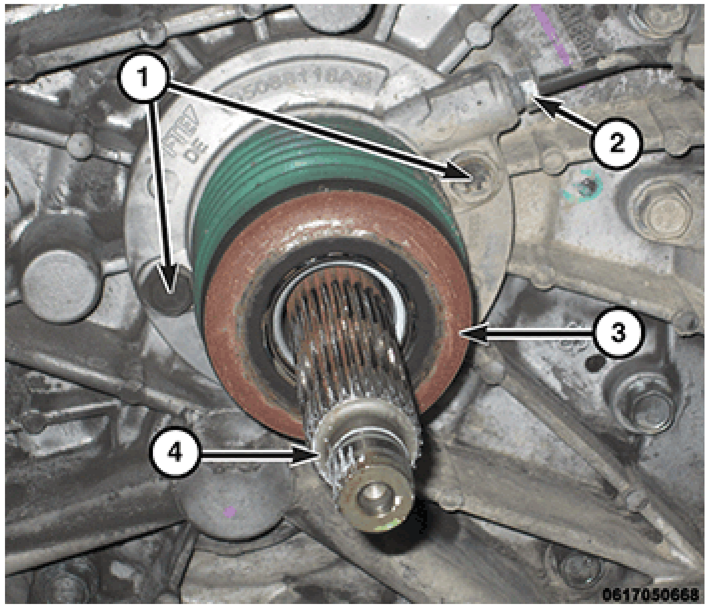

Fig. 1: Clutch Release Bearing/Slave Cylinder & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the clutch release bearing/slave cylinder bolts (1) and remove the clutch release bearing/slave cylinder (3).

INSTALLATION

CLUTCH RELEASE BEARING/SLAVE CYLINDER

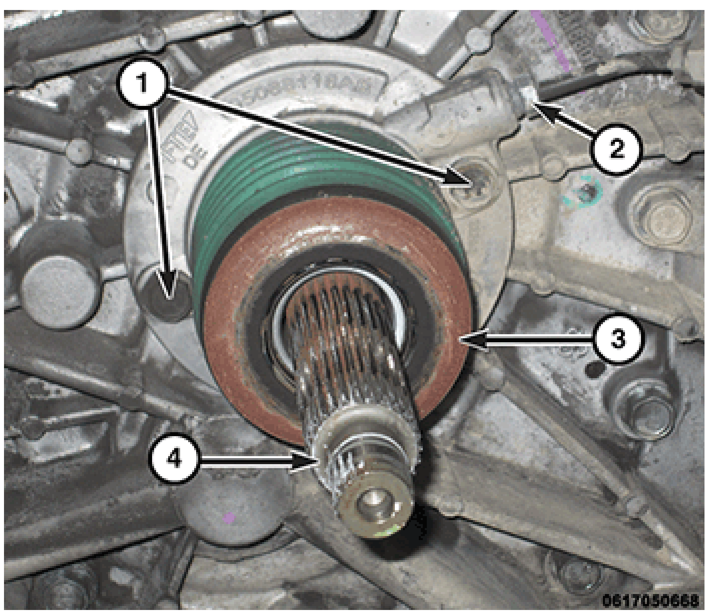

Fig. 2: Clutch Release Bearing/Slave Cylinder & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the clutch release bearing/slave cylinder (3) over input shaft (4).
2. Install the clutch release bearing/slave cylinder bolts (1) tighten to the proper specification. Refer to **SPECIFICATIONS**.
3. Install the transmission. For 5.7L & 6.4L, refer to **INSTALLATION** . For 6.2L, refer to

INSTALLATION .

4. Bleed the clutch system. Refer to STANDARD PROCEDURE.

BEARING, PILOT

REMOVAL

PILOT BEARING

1. Remove the clutch assembly. Refer to DISC, CLUTCH, REMOVAL.

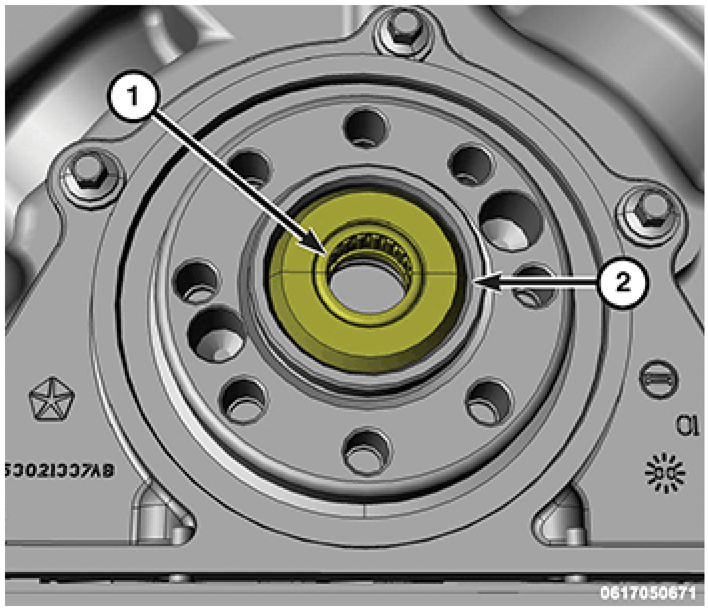

Fig. 3: Crankshaft & Pilot Bearing
Courtesy of CHRYSLER GROUP, LLC

2. Using a suitable blind hole puller, remove the pilot bearing (1) from the crankshaft (2).

INSTALLATION

PILOT BEARING

1. Clean the pilot bearing bore with solvent and wipe dry with shop towel.

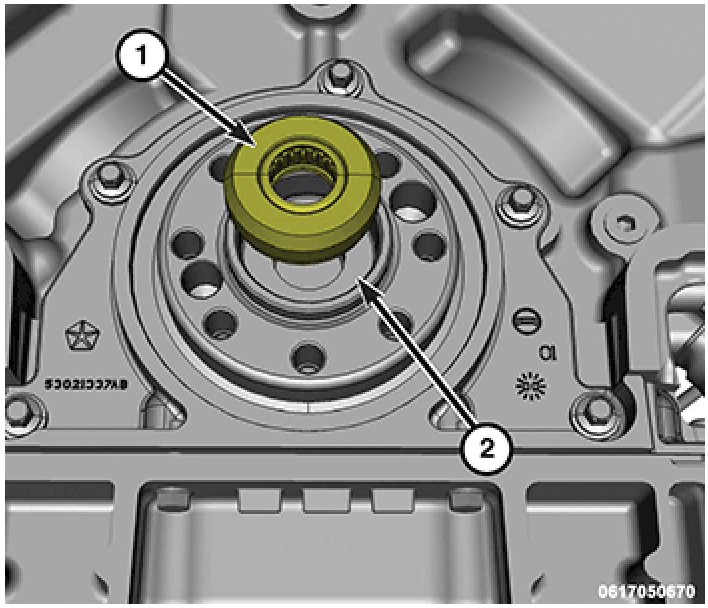

Fig. 4: Pilot Bearing Bore & Pilot Bearing
Courtesy of CHRYSLER GROUP, LLC

NOTE: Letter side of the pilot bearing must face the transmission.

2. Install the new the pilot bearing (1) with (special tool #10018, Clutch Alignment Tool). Keep the pilot bearing straight during installation. Do not allow the pilot bearing to become cocked. Tap the pilot bearing into place until it is flush with the edge of the pilot bearing bore (2). Do not recess the pilot bearing.
3. Install the clutch assembly. Refer to **DISC, CLUTCH, INSTALLATION**.

CYLINDER, CLUTCH MASTER

REMOVAL

CLUTCH MASTER CYLINDER

NOTE: The clutch master cylinder and clutch starter interlock switch are serviced as an assembly.

NOTE: Place towels or rags on the floor below the clutch master cylinder to prevent brake fluid from coming into contact with the carpet.

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Remove the push fasteners and the instrument panel closeout.
3. Remove the instrument panel steering column cover and reinforcement. Refer to **COVER, STEERING COLUMN OPENING, REMOVAL** .

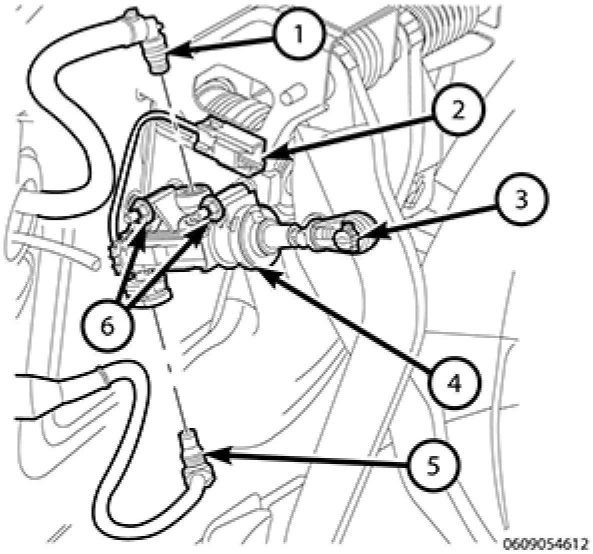

Fig. 5: Clutch Master Cylinder, Lines, Pushrod, Connector & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the clutch master cylinder pushrod (3) from the clutch pedal lever.
5. Disconnect the clutch starter interlock switch harness connector (2).
6. Disconnect the brake/clutch fluid reservoir supply line (1) and plug the line to prevent excessive leakage/loss of brake fluid from the brake master cylinder reservoir.
7. Disconnect the clutch slave cylinder hydraulic line (5).
8. Remove the two clutch master cylinder to the clutch/brake pedal assembly bolts (6) and remove the clutch master cylinder (4).

INSTALLATION

CLUTCH MASTER CYLINDER

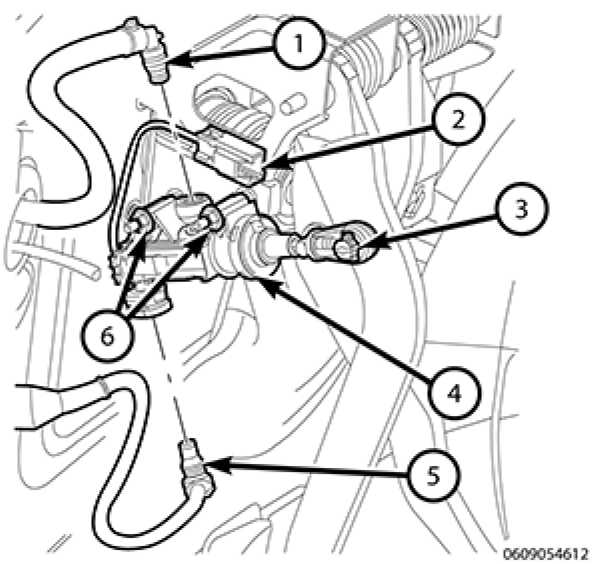

Fig. 6: Clutch Master Cylinder, Lines, Pushrod, Connector & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the clutch master cylinder (4) onto the clutch/brake pedal assembly and install the two bolts (6).

Tighten the nuts to the proper specification. Refer to **SPECIFICATIONS**.

2. Connect the clutch slave cylinder hydraulic line (5).
3. Remove the previously installed plug and connect the brake/clutch fluid reservoir supply line (1).
4. Connect the clutch starter interlock switch wire harness connector (2).
5. Connect the clutch master cylinder pushrod (3) to the clutch pedal lever.
6. Install the instrument panel reinforcement and steering column cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .
7. Install the instrument panel closeout and the push pin fasteners.
8. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.

NOTE: **While bleeding the clutch system be certain the clutch pedal returns to the most upright position. It may take as many as two hundred clutch strokes to bleed the system.**

9. Bleed the clutch system. Refer to **STANDARD PROCEDURE**.

DISC, CLUTCH

DESCRIPTION

DESCRIPTION

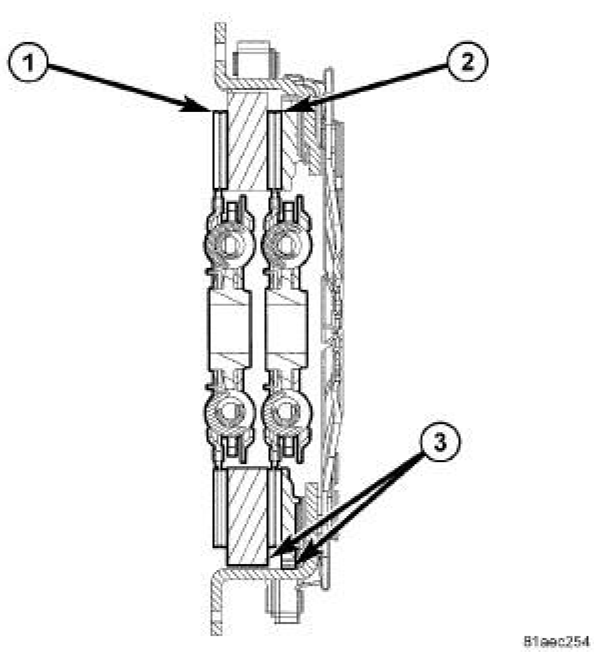

Fig. 7: Dual Disc Clutch
Courtesy of CHRYSLER GROUP, LLC

The clutch is a dual disc design. One disc (1) is independent of the pressure plate, located between the pressure plate and flywheel. The second disc (2) is an internal component located between the pressure plates (3) and cannot be serviced separately.

NOTE: **If either clutch discs or pressure plate is worn or damaged, the independent disc and pressure plate must be replaced as an assembly.**

REMOVAL

CLUTCH ASSEMBLY

1. Remove the transmission. For 5.7L & 6.4L, refer to **REMOVAL** . For 6.2L, refer to **REMOVAL** .
2. Mark pressure plate (1) and flywheel (2) for installation reference.

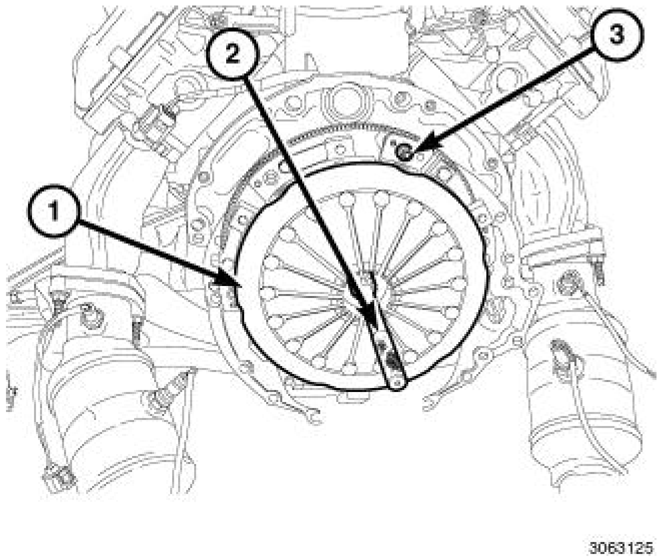

Fig. 8: Pressure Plate Assembly, Alignment Tool & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Insert (special tool #10018, Clutch Alignment Tool) (2) through the clutch discs into the pilot bearing.
4. Loosen the clutch pressure plate assembly (3) bolts evenly in a crisscross pattern. This will release spring pressure evenly and avoid pressure plate damage.
5. Remove the clutch pressure plate assembly (1).

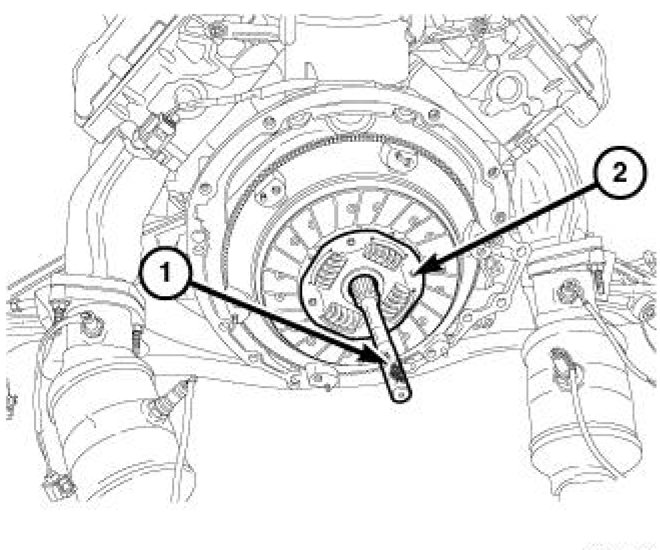

Fig. 9: Clutch Disc & Alignment Tool

Courtesy of CHRYSLER GROUP, LLC

6. Remove the independent disc (2) and clutch alignment tool (1).

CLEANING

CLEANING

Clean flywheel face with crocus cloth or 400-600 grade sandpaper, then wipe surface with mineral spirits.

NOTE: **If flywheel is severely scored, heat checked or warped replace flywheel.**

Wipe friction surface of the pressure plate with mineral spirits.

INSTALLATION

CLUTCH ASSEMBLY

NOTE: **If the flywheel is replaced or removed apply thread sealer to the flywheel retaining bolts. This will prevent engine oil from leaking onto the clutch.**

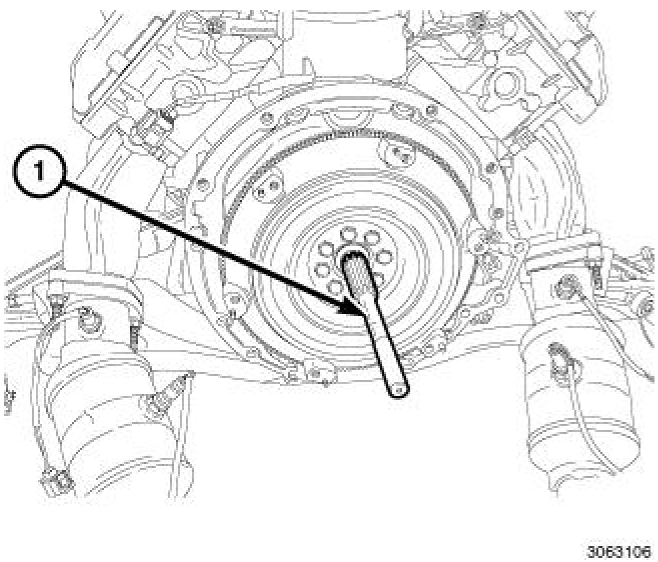

Fig. 10: Clutch Alignment Tool
Courtesy of CHRYSLER GROUP, LLC

1. Insert the (special tool #10018, Clutch Alignment Tool) (1) into the pilot bearing.

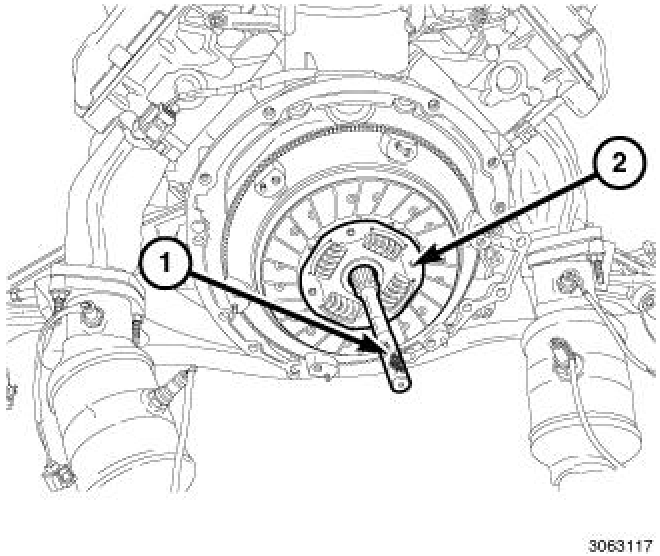

Fig. 11: Clutch Disc & Alignment Tool
Courtesy of CHRYSLER GROUP, LLC

2. Install the independent clutch disc (2) over the (special tool #10018, Clutch Alignment Tool) (1) and position against the flywheel.

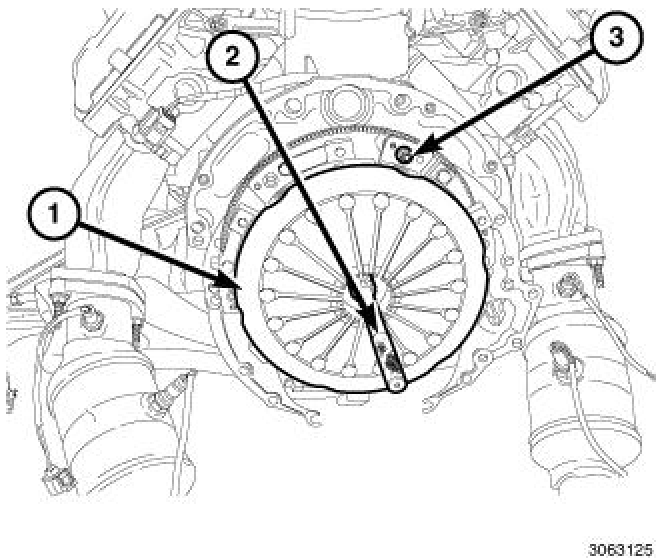

Fig. 12: Pressure Plate Assembly, Alignment Tool & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE:	**If a new clutch pressure plate assembly or flywheel is installed, align cover balance paint spot as close as possible to flywheel balance paint spot.**

3. Install the clutch pressure plate assembly (1) over the (special tool #10018, Clutch Alignment Tool) (2) up against the flywheel and onto the dowel pins.
4. Tighten the **NEW** clutch pressure plate assembly bolts (3) a few turns at a time in a star pattern until the bolts are seated. Then tighten the clutch pressure plate assembly bolts in star pattern to 75 Nm (55 ft.-lbs.).

CAUTION: Do not over lubricate shaft splines. This can result in grease contamination of the disc.

5. Remove the clutch disc alignment tool (2).
6. Apply.55 GRAMS Ā±.1 of GL261 Dupont Krytox Ā® XP2C5 to the splines of transmission input shaft and release bearing slide surface of the transmission front bearing retainer.
7. Install the transmission. For 5.7L & 6.4L, refer to **INSTALLATION** . For 6.2L, refer to **INSTALLATION** .

FLYWHEEL

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - FLYWHEEL

Common flywheel problems:

- Incorrect bolt tightening
- Mounting flywheel on dirty crankshaft flange
- Improper seating on crankshaft flange shoulder
- Heat warped
- Loose flywheel bolts

The flywheel should be replaced if warped or overheated. **Do not machine flywheel to correct a warped or overheated condition.**

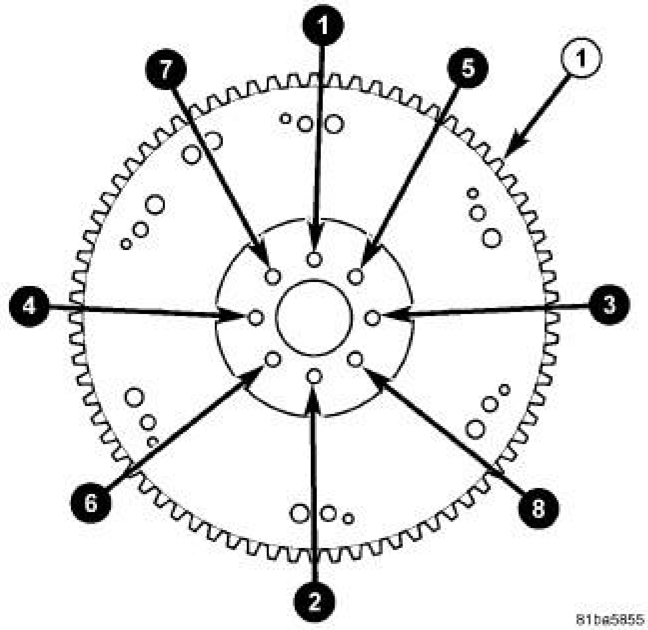
Clean the crankshaft flange and its mating surface on the flywheel before assembling. Dirt in this area could cause the flywheel to mis-align when installing.

Apply Mopar Lock AND Seal or equivalent to **NEW** flywheel bolts. Tighten the flywheel bolts to the proper specification. Refer to **SPECIFICATIONS**. Over tightening the bolts can distort the flywheel.

REMOVAL

FLYWHEEL

1. Remove the clutch assembly. Refer to **DISC, CLUTCH, REMOVAL**.



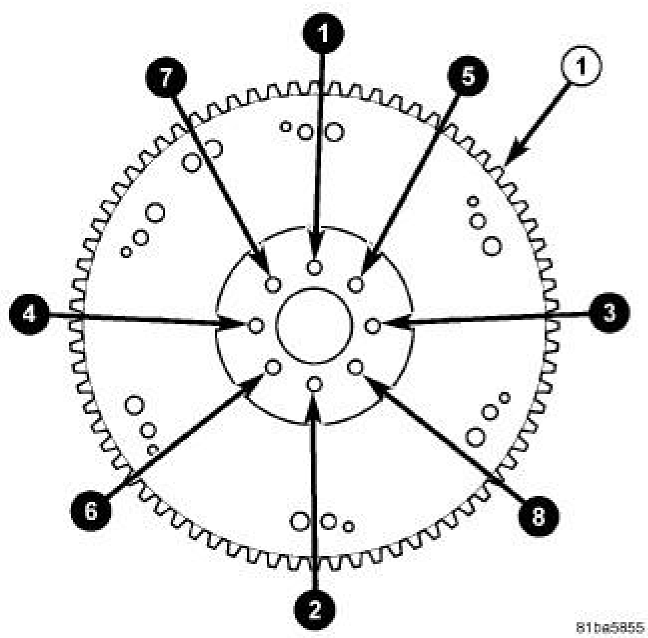
[Fig. 13: Flywheel Bolt Removing/Tightening Sequence]
Courtesy of CHRYSLER GROUP, LLC

2. Remove and discard the flywheel bolts and remove the flywheel (1) from the crankshaft.

INSTALLATION

FLYWHEEL

1. Apply MoparÂ® Lock AND Seal or equivalent to the **NEW** flywheel bolts.



[Fig. 14: Flywheel Bolt Removing/Tightening Sequence]

Courtesy of CHRYSLER GROUP, LLC

2. Install the flywheel (1) on the engine crankshaft and install the **NEW** flywheel bolts.
3. Tighten the **NEW** flywheel bolts in sequence shown in illustration to 75 Nm (55 ft.-lbs.).
4. Install the clutch assembly. Refer to **DISC, CLUTCH, INSTALLATION**.

PEDAL AND PAD, CLUTCH

REMOVAL

CLUTCH PEDAL

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Remove the push fasteners and the instrument panel closeout.
3. Remove the steering column opening cover. Refer to **REMOVAL** .

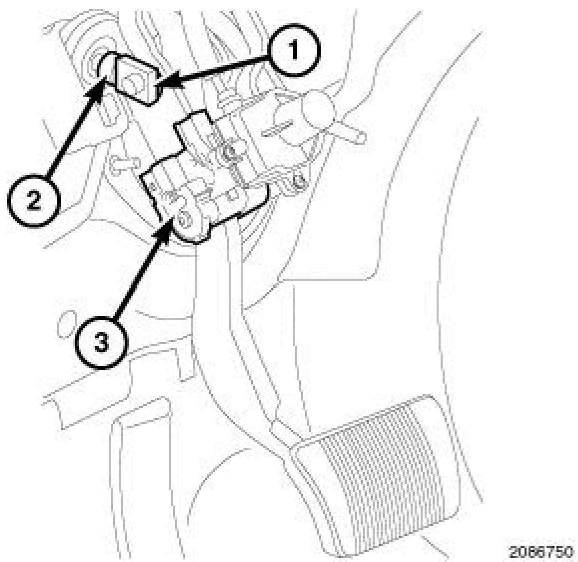


Fig. 15: Brake Booster Push Rod And Clip
Courtesy of CHRYSLER GROUP, LLC

4. Remove the clip (1), and disconnect the brake booster push rod (2).

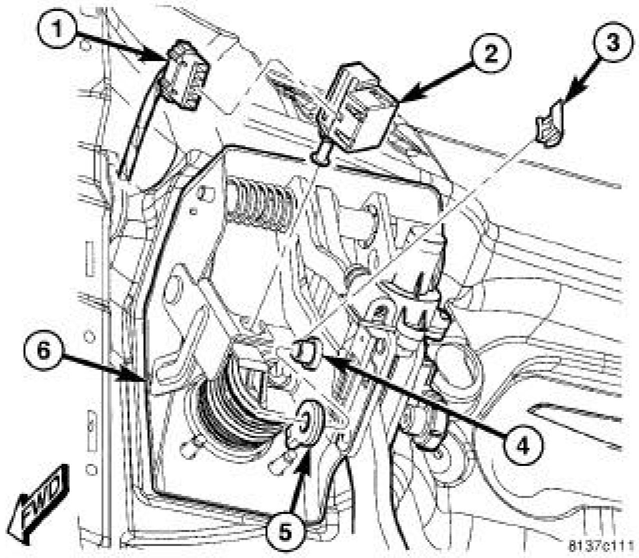

Fig. 16: Brake Lamp Switch & Pedal Rod
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the brake pedal sensor wire harness connector (1).

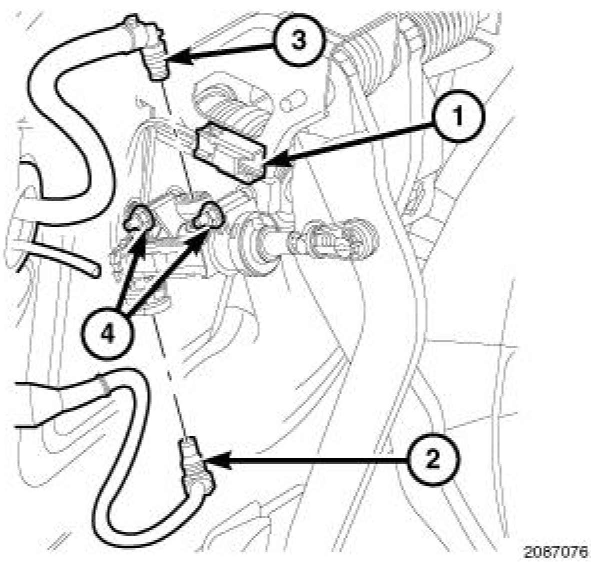

Fig. 17: Brake/Clutch Fluid Reservoir Tube, Clutch Hydraulic Line & Connector
Courtesy of CHRYSLER GROUP, LLC

6. Disconnect the clutch starter interlock switch wire harness connector (1).
7. Disconnect the brake/clutch fluid reservoir tube (3).
8. Disconnect the clutch hydraulic line (2).

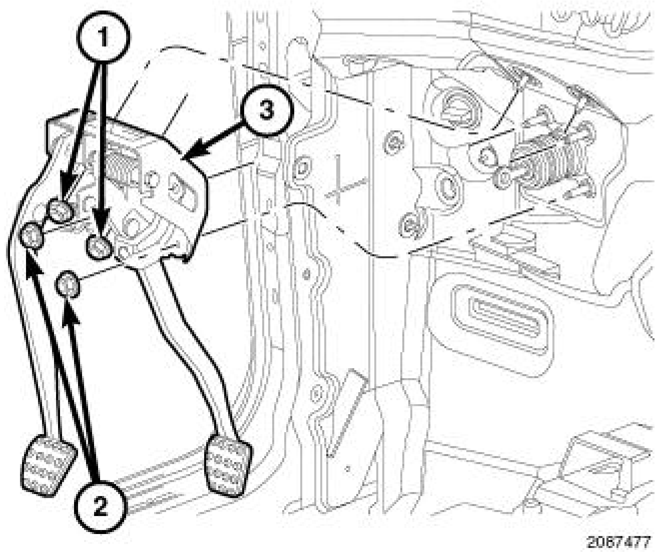

Fig. 18: Remove/Install Clutch/Brake Pedal Assembly & Mounting Nuts
Courtesy of CHRYSLER GROUP, LLC

9. Remove the clutch/brake pedal assembly mounting nuts (1) and (2), then remove the clutch/brake pedal assembly (3).

INSTALLATION

CLUTCH PEDAL

NOTE: **While bleeding the clutch system be certain the clutch pedal returns to the most upright position. It may take as many as two hundred clutch strokes to bleed the system. Do not let the brake/clutch fluid reservoir to empty out while bleeding the hydraulic system.**

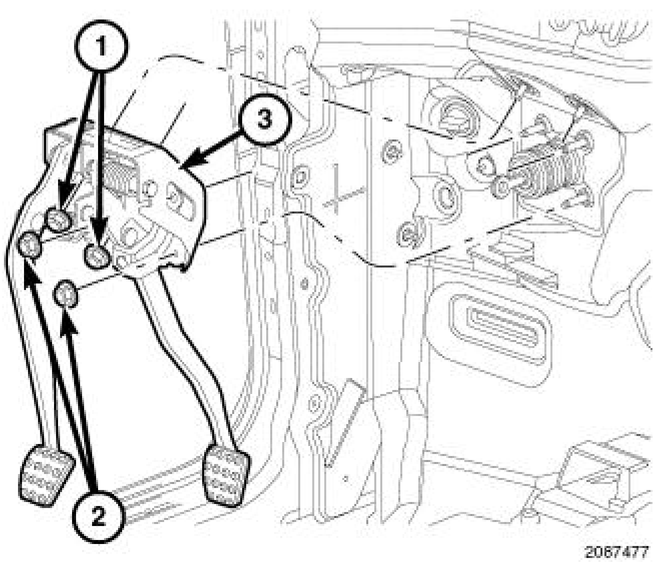

Fig. 19: Remove/Install Clutch/Brake Pedal Assembly & Mounting Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Install the clutch/brake pedal assembly (3), and the clutch/brake pedal assembly mounting nuts (1) and (2). Tighten the fasteners to the proper specification. Refer to SPECIFICATIONS.

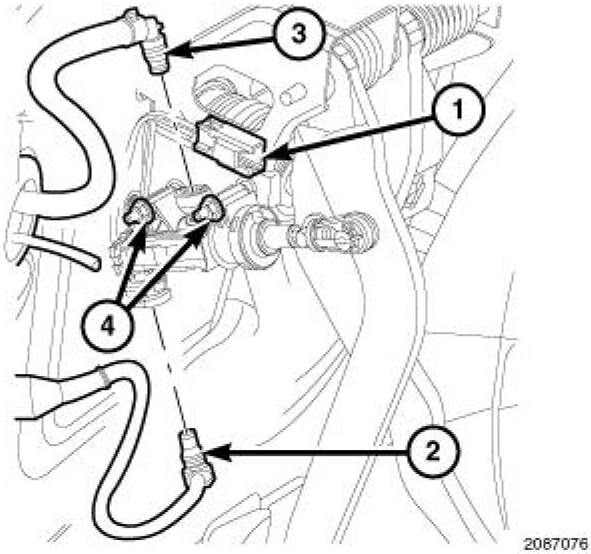

Fig. 20: Brake/Clutch Fluid Reservoir Tube, Clutch Hydraulic Line & Connector
Courtesy of CHRYSLER GROUP, LLC

2. Connect the clutch hydraulic line (2).
3. Connect the brake/clutch fluid reservoir tube (3).
4. Connect the clutch starter interlock switch wire harness connector (1).

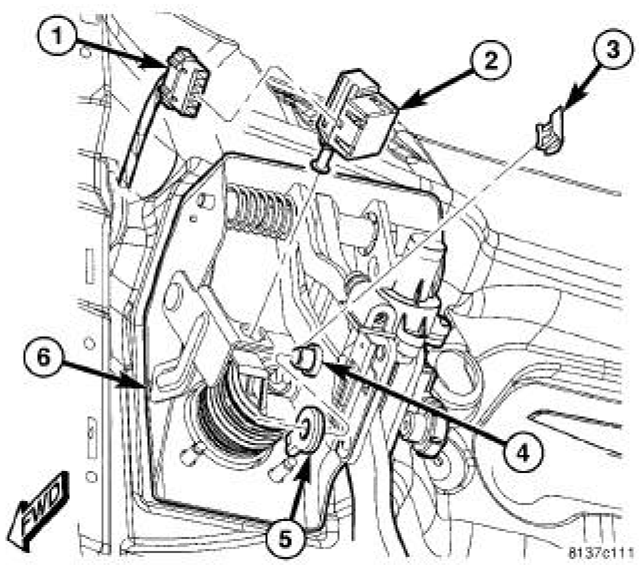

Fig. 21: Brake Lamp Switch & Pedal Rod
Courtesy of CHRYSLER GROUP, LLC

5. Connect the brake pedal sensor wire harness connector (1).

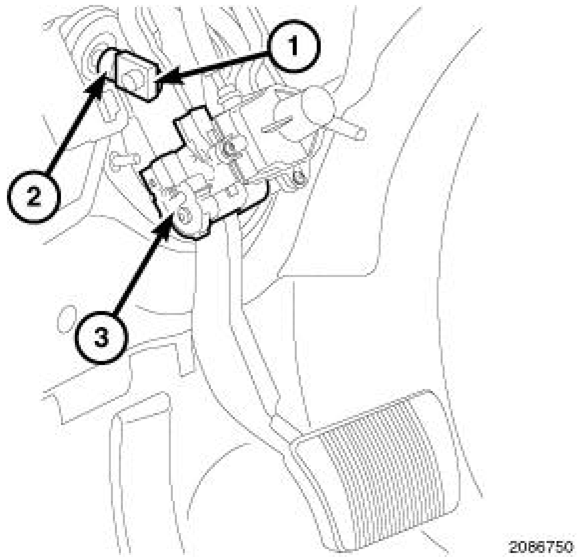

Fig. 22: Brake Booster Push Rod And Clip
Courtesy of CHRYSLER GROUP, LLC

WARNING: Always install a new clutch master cylinder pushrod retainer clip during installation of the clutch master cylinder. Failure to install a new retainer clip may result in loss of vehicle control and serious or fatal injury.

6. Connect the brake booster push rod (2), and install a **NEW** clip (1).
7. If necessary bleed the hydraulic system. Refer to **STANDARD PROCEDURE**.
8. Install steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .
9. Install the instrument panel closeout and the push pin fasteners.
10. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.

SWITCH, CLUTCH STARTER INTERLOCK

DESCRIPTION

DESCRIPTION

The clutch pedal position switch is attached to the side of the clutch master cylinder.

The clutch pedal position switch cannot be serviced independently, it is serviced with the clutch master cylinder.

For clutch pedal position switch removal and installation, refer to **CYLINDER, CLUTCH MASTER, REMOVAL**.

.

Article GUID: A00735953

DESCRIPTION

DESCRIPTION

Several combinations of radio receivers and speaker configurations are offered. The audio system operates on a non-switched fused B+ battery current source and is turned On or Off by electronic messages received over the Controller Area Network (CAN) data bus so that the system will only operate when the status of the ignition switch is Run or Accessory.

The radios can be identified by sales code RA2, RA3 and RA4. An optional navigation feature is also available in the RA3 radio for this vehicle. Navigation is standard in the RA4 radio for this vehicle. Refer to **DESCRIPTION** .

The RA2, RA3 and RA4 radios all have an internal Hands Free Module (HFM). There is no external HFM because all hands free functions are integrated into the Radio Receiver Module (RRM) (also known as the radio or the head unit).

The audio system includes the following components:

- **Antenna** - The base radio antenna is integrated into the back glass and includes an electronic antenna module located on the header above the back glass opening and concealed above the headliner. The base antenna is capable of receiving AM and FM signals. An optional body color, multifunction (satellite audio, GPS and cellular) antenna (also known as the shark fin style antenna) is located at the rear and center of the outer roof panel.
- **Power Amplifier** - One of three optional audio power amplifiers are available with certain premium audio systems only. Either amplifier is located on the instrument panel support structure under the driver side end of the instrument panel. Refer to **AMPLIFIER, DESCRIPTION**.
- **Radio Noise Suppression Components** - Devices designed to suppress Radio Frequency Interference (RFI) and ElectroMagnetic Interference (EMI) radio noise are used in this vehicle. Refer to **COMPONENTS, RADIO NOISE SUPPRESSION, DESCRIPTION**.
- **Radio Receiver Module** - Several optional Radio Receiver Modules (RRM) (also known as the radio or the head unit) are available for this vehicle. Refer to **RADIO, DESCRIPTION**.
- **Remote Radio Switches** - Optional remote radio switches located on the steering wheel are available in this vehicle. Refer to **SWITCH, REMOTE RADIO, OPERATION**.
- **Speakers** - Several optional speaker packages are offered in this vehicle. Refer to **SPEAKER, DESCRIPTION**.
- **Media Hub** - A media hub including a Secure Data (SD) card slot, a Universal Serial Bus (USB) port and an auxiliary cable input jack located within the storage bin of the center floor console is optional equipment. Refer to **MEDIA HUB, DESCRIPTION**.

Certain functions and features of the audio system rely upon resources shared with other electronic modules in the vehicle over the CAN data bus network. The RRM contains a microcontroller and programming that allows it to communicate with other electronic modules in the vehicle over the Controller Area Network - Interior High

Speed (CAN-IHS) data bus. The RRM can also receive electronic message inputs over the CAN-C data bus; however, the RRM is not a CAN gateway. All of the RRM electronic message outputs are through the CAN-IHS data bus. Refer to COMMUNICATION, DESCRIPTION .

Many of the audio system components cannot be adjusted or repaired. If they become damaged or ineffective, that component must be replaced. Those that can be repaired must be serviced by an authorized electronic warranty repair station. Refer to the appropriate warranty policies and procedures information.

OPERATION

OPERATION

The base audio system components are designed to provide audio entertainment and information through the reception, tuning and amplification of locally broadcast radio signals in Amplitude Modulating (AM) and Frequency Modulating (FM) commercial frequency ranges.

Some audio system components operate on battery current received through a fuse in the rear Power Distribution Center (PDC) on a fused B+ circuit and monitor electronic **ignition status** message inputs received over the Controller Area Network (CAN) data bus network so that certain functions remain active regardless of the ignition status. Other components operate on battery current received through the rear PDC on a fused ignition run-accessory circuit so that they will only operate when the status of the ignition switch is Run or Accessory.

Certain audio system components receive electronic message inputs over the CAN-Interior High Speed (IHS) data bus. While the Radio Receiver Module (RRM) (also known as the radio or the head unit) is also connected to the CAN-C data bus, the RRM is not a CAN gateway. All electronic message outputs of the RRM are carried over the CAN-IHS data bus. When the RRM monitors a problem in any of the audio system circuits and components, or in any of the Bluetooth™ transceiver circuits, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit.

The hard wired circuits between components related to the audio system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between modules and other devices that provide some features of the audio system. The most reliable, efficient and accurate means to diagnose the electronic controls and communication related to audio system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - AUDIO SYSTEM

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground)

cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

The hard wired circuits between components related to the audio system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between modules and other devices that provide some features of the audio system. The most reliable, efficient and accurate means to diagnose the audio system or the electronic controls and communication related to audio system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

NOTE: **The MIT019 Multi-Media Interface Tester special tool may also be used for testing where no Diagnostic Trouble Code (DTC) has been recorded, such as with Bluetooth™ reception and phone pairing issues. Refer to DIAGNOSIS AND TESTING .**

AUDIO SYSTEM DIAGNOSTIC TABLE		
CONDITION	**POSSIBLE CAUSES**	**CORRECTION**
AUDIO SYSTEM INOPERATIVE	1. Fuse ineffective.	1. Check audio system fuses. If fuse requires replacement, repair the shorted circuit or component as required.
	2. Open wiring circuit.	2. Perform the **No Response from Radio** test. Refer to **DIAGNOSIS AND TESTING** .
NO AUDIO - BUT RADIO LIGHTS UP	1. Antenna problem.	1. Perform the **Poor or No AM/FM Audio Reception** test. Refer to **DIAGNOSIS AND TESTING** .
Ā	2. Radio or Amplifier (if equipped) connector damaged.	2. Check for loose or corroded radio/amplifier connector. Repair, as required.
Ā	3. Open or shorted wiring circuit.	3. Check for shorted or open circuits. Repair wiring as required.
Ā	4. Open Radio or Amplifier (if equipped) ground circuit.	4. Check for continuity between radio chassis or amplifier and a known good ground. There should be continuity. Repair ground as required.
Ā	5. Amplifier (if equipped) ineffective.	5. Refer to **DIAGNOSIS AND TESTING** - Premium 1, **DIAGNOSIS AND TESTING** - Premium 2 or **DIAGNOSIS AND TESTING** - Premium 3 .
Ā	6. Speakers ineffective.	6. Refer to **DIAGNOSIS AND TESTING** .

AUDIO SYSTEM DIAGNOSTIC TABLE		
CONDITION	**POSSIBLE CAUSES**	**CORRECTION**
NO RADIO DISPLAY	1. Fuse ineffective.	1. Check audio system fuses. If fuse requires replacement, repair the shorted circuit or component as required.
Ā	2. Radio connector damaged.	2. Check for loose or corroded radio connector. Repair as required.
Ā	3. Open feed wiring circuit.	3. Check for battery voltage at radio connector. Repair wiring as required.
Ā	4. Open ground circuit.	4. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground as required.
Ā	5. Radio ineffective.	5. Perform the **No Response from Radio** test. Refer to **DIAGNOSIS AND TESTING** .
POOR AM/FM RADIO RECEPTION	1. Antenna ineffective.	1. Perform the **Poor or No AM/FM Audio Reception** test. Refer to **DIAGNOSIS AND TESTING** .
	2. Open ground circuit.	2. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground as required.
	3. Radio ineffective.	3. Refer to **DIAGNOSIS AND TESTING** or **DIAGNOSIS AND TESTING** .
POOR SDAR AUDIO RECEPTION	1. SDAR antenna ineffective. 2. Coax cable ineffective. 3.Head unit ineffective.	1. Perform the **Poor or No Satellite Audio Reception** test. Refer to **DIAGNOSIS AND TESTING** . 2. Perform the **Poor or No Satellite Audio Reception** test. Refer to **DIAGNOSIS AND TESTING** . 3. Perform the **Poor or No Satellite Audio Reception** test. Refer to **DIAGNOSIS AND TESTING** .
SOUND DISTORTION (VIBRATION FROM SPEAKER AREA, BUZZING - HUMMING)	1. Door trim panel loose or missing fasteners.	1. Inspect door trim panel and correct as necessary. Replace any missing fasteners.
Ā	2. Water shield loose or misaligned.	2. Inspect water shield and adjust as required.
Ā	3. Items placed in door trim panel map pockets vibrating or moving from side to side.	3. Remove items from door trim panel. Ensure that vibration is no longer present.

AMPLIFIER

DESCRIPTION

DESCRIPTION

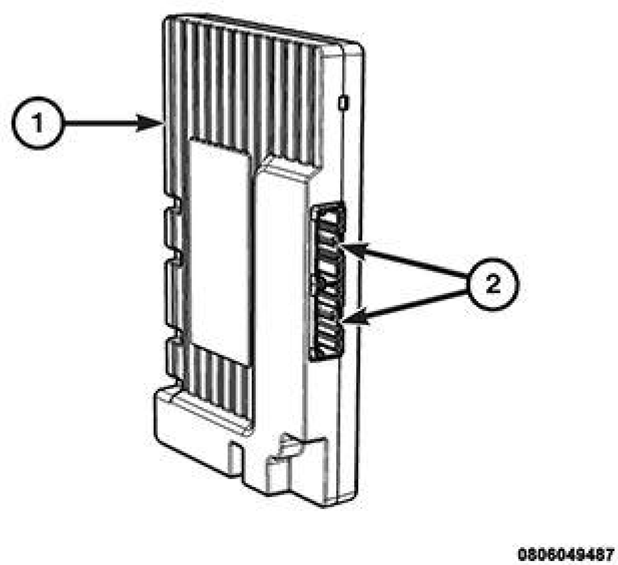

Fig. 1: Amplifier & Connector Receptacles
Courtesy of CHRYSLER GROUP, LLC

An audio power amplifier (1) is included with certain optional speaker packages. The amplifier is available in either 8 channels (Premium I Sound Group - Sales Code RCJ - 6 speakers - 276 watts), 12 channels (Premium II Sound Group - Sales Code RC3 - 10 speakers - 506 watts) and 12 channels (Premium III Sound Group - Sales Code RGE - 19 speakers - Class D amplifier), each of which is specific to the sound system installed in the vehicle.

The amplifier is secured by three screws to a vertical member of the instrument panel structural support to the left of the steering column opening under the instrument panel. Two integral connector receptacles (2) connect the amplifier to the vehicle electrical system through dedicated take outs and connectors of the body wire harness.

The amplifier cannot be adjusted or repaired. If damaged or ineffective, the amplifier must be replaced.

OPERATION

OPERATION

The audio power amplifier receives fused battery current from a fuse in the rear Power Distribution Center (PDC) and is grounded through a circuit of the body wire harness that is secured to the body sheet metal at all times. The internal circuitry of the amplifier switches the amplifier on or off based upon electronic messages that are received over the Controller Area Network (CAN) - Interior High Speed (IHS) data bus from the Radio Receiver Module (RRM) (also known as the radio or the head unit) whenever the RRM is turned on or off.

The amplifier receives analog sound signal inputs from the front and rear, left and right outputs of the RRM, then provides the amplified speaker outputs for each of those channels to the appropriate speakers through dedicated audio output circuits. The amplifier also receives electronic messages from the Body Control Module (BCM) (also known as the Common Body Controller/CBC) and the RRM over the CAN-IHS data bus that communicate the correct channel settings for optimum speaker sound and output.

The hard wired circuits between components related to the amplifier may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the amplifier or the electronic controls and communication between modules and other devices that provide some features of the audio system. The most reliable, efficient and accurate means to diagnose the amplifier or the electronic controls and communication related to audio system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - AUDIO POWER AMPLIFIER

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbags, airbag curtains, knee blocker, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect the IBS/negative battery cable assembly from the negative battery post, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

The audio power amplifier unit should be checked if there is no sound output noted from the speakers. Refer to SPEAKER, DIAGNOSIS AND TESTING.

The hard wired circuits between components related to the audio power amplifier may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the amplifier or the electronic controls and communication between modules and other devices that provide some features of the audio system. The most reliable, efficient and accurate means to diagnose the amplifier or the electronic

controls and communication related to audio system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

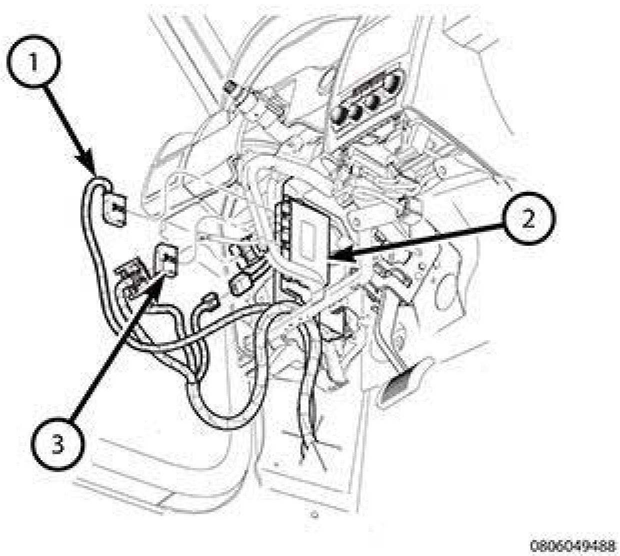

Fig. 2: Amplifier & Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery.
2. Remove the steering column opening cover from the instrument panel. Refer to **COVER, STEERING COLUMN OPENING, REMOVAL** .
3. If equipped, remove the Transmission Control Module (TCM) from the instrument panel support structure. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
4. Disconnect the wire harness connectors (1 and 3) from the audio power amplifier (2).
5. Loosen each of the three screws that secure the amplifier to the vertical bracket of the instrument panel support structure.
6. Slide the amplifier upward far enough to disengage the three mounting screws from the keyed holes in the vertical bracket.
7. Remove the amplifier from under the instrument panel.

INSTALLATION

INSTALLATION

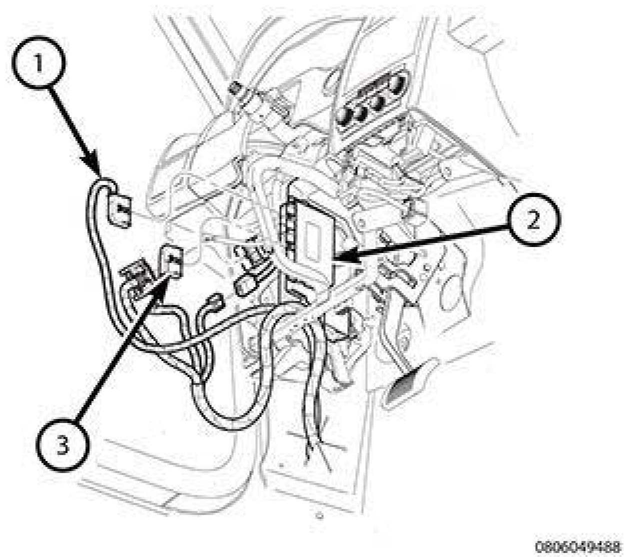

Fig. 3: Amplifier & Connectors
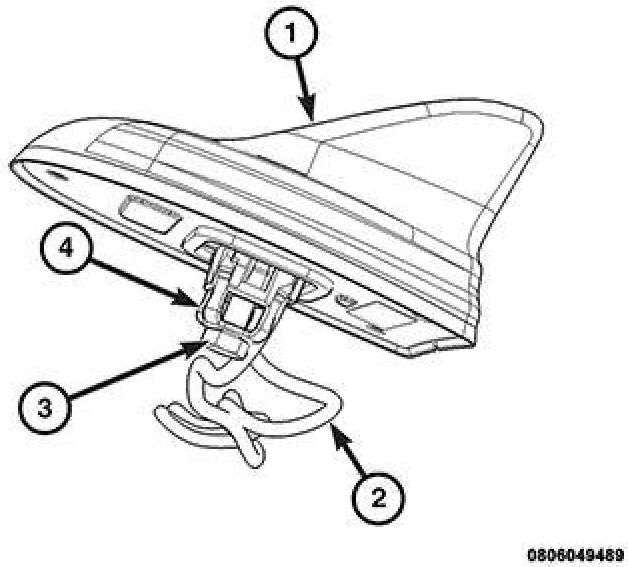
Courtesy of CHRYSLER GROUP, LLC

1. If the audio power amplifier is being replaced with a new unit, transfer the three mounting screws from the old amplifier to the new one.
2. Position the amplifier (2) to the vertical bracket of the support structure under the instrument panel.
3. Engage the three screws that secure the amplifier into the keyed holes of the instrument panel support structure.
4. Tighten the screws securely.
5. Reconnect the wire harness connectors (1 and 3) to the amplifier.
6. If equipped, reinstall the Transmission Control Module (TCM) onto the instrument panel support structure. Refer to **MODULE, TRANSMISSION CONTROL, INSTALLATION** .
7. Reinstall the steering column opening cover onto the instrument panel. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .
8. Reconnect the negative cable to the battery. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.

ANTENNA, SATELLITE

DESCRIPTION

DESCRIPTION



[Fig. 4: Antenna, Cable, Screw & Retainer]
Courtesy of CHRYSLER GROUP, LLC

In vehicles equipped with a Satellite Digital Audio Receiver (SDAR), a Global Positioning System (GPS) navigation radio, the Uconnect™ Hands Free cellular system or any combination of these systems a single combined antenna is used. Due to the appearance of this antenna (1), it is also known as the shark fin antenna.

The body color shark fin antenna is located at the rear and center of the outer roof panel. It is installed by pressing it with hand pressure into a mounting hole in the outer roof panel until each of the four legs of a spring steel retainer (4) secured to the underside of the antenna body by a single screw (3) snap into place. Antenna removal requires lowering the back of the headliner far enough to access and remove the screw and retainer as well as to disconnect the antenna cable (2) connector from the body wire harness near the right upper C-pillar.

The shark fin antenna cannot be adjusted or repaired. If the antenna is damaged or ineffective it must be replaced with a new unit.

OPERATION

OPERATION

The shark fin antenna includes the following capabilities:

- **Cellular** - The cellular antenna is an electromagnetic circuit component designed to effectively capture radiated frequency and transmit signals in the cellular broadcast bands.
- **Global Positioning System** - The Global Positioning System (GPS) antenna is capable of receiving eight satellite channels. The navigation system requires a minimum of three satellite channels to provide adequate information to the GPS navigation unit.
- **Satellite Digital Audio Receiver** - The Satellite Digital Audio Receiver (SDAR) antenna is part of the satellite audio system of the vehicle. This antenna enables the vehicle to receive signals from the Sirius XM satellite and delivers the signal to the satellite audio receiver.

The shark fin antenna must have open space in which to operate. Items carried on the roof, parking inside an enclosed structure or driving through a long tunnel can have an effect on the ability of the antenna to receive

signals.

For information on diagnosing the satellite antenna cables using the (special tool #9977-6, Kit, Radio Antenna Diagnostic), refer to **DIAGNOSIS AND TESTING** and perform the **Poor Or No Satellite Audio Reception** test.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SATELLITE ANTENNA

For information on diagnosing the satellite antenna cables using the (special tool #9977-6, Kit, Radio Antenna Diagnostic), refer to **DIAGNOSIS AND TESTING** and perform the **Poor Or No Satellite Audio Reception** test.

REMOVAL

REMOVAL

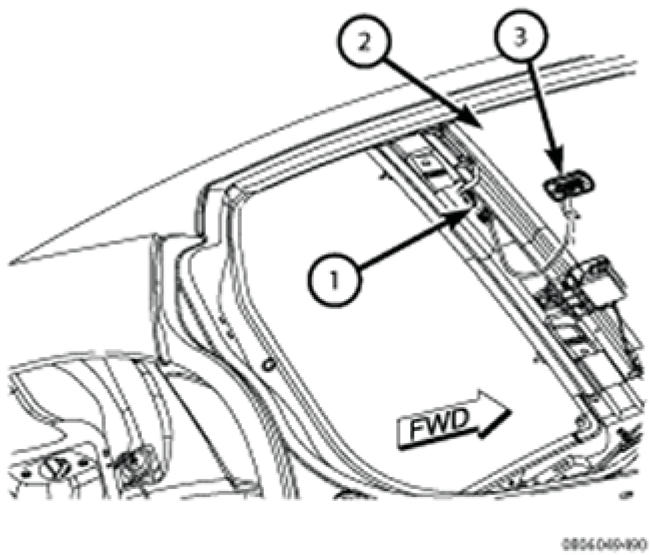


Fig. 5: Inner Roof Panel, Antenna Body, & Pigtail Wiring Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Remove the rear seat back from the vehicle. Refer to **SEAT BACK, REAR, REMOVAL** .
2. Fully recline both front seat backs.
3. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery.

NOTE: **Use the headliner removal procedure to lower the headliner from the inner roof panel. The headliner will NOT be removed from the vehicle interior; therefore, it is NOT necessary to remove the windshield.**

4. Lower the headliner from the inner roof panel and allow it to rest within the vehicle interior. Refer to **HEADLINER, REMOVAL** .
5. Reach between the headliner and the inner roof panel (2) to access and disconnect the antenna pigtail wiring connectors (1) from the body wire harness connectors.

6. Remove the screw and the spring retainer that secure the antenna body (3) to the inner roof panel.
7. From outside the vehicle remove the antenna and pigtail wiring from the roof panel.

INSTALLATION

INSTALLATION

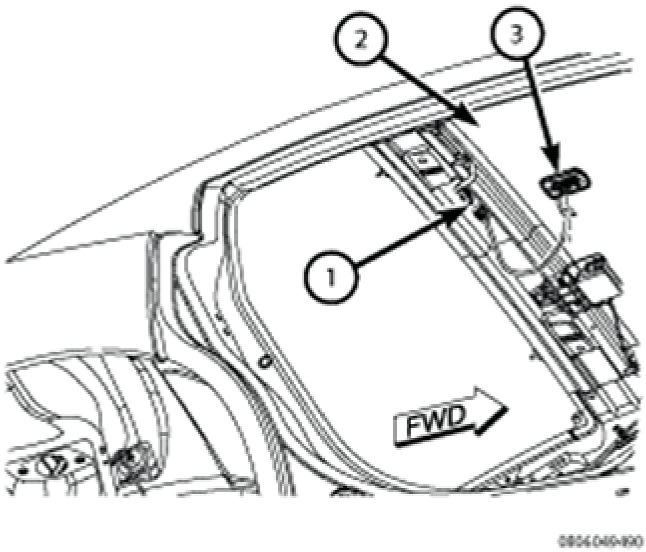

Fig. 6: Inner Roof Panel, Antenna Body, & Pigtail Wiring Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Position the spring retainer to the antenna body (3) then install and tighten the screw. Tighten the screw to 9 N.m (80 in. lbs.).
2. From the outside of the vehicle insert the antenna pigtail wiring through the mounting hole at the rear of the roof panel then position the antenna body over the mounting hole.
3. Use hand pressure to press the antenna down toward the mounting hole until the spring retainer snaps into position on the inner roof panel (2).
4. Reach between the headliner and the inner roof panel to access and reconnect the antenna pigtail wiring connectors (1) to the body wire harness connectors.
5. Reinstall the headliner onto the inner roof panel. Refer to **HEADLINER, INSTALLATION** .
6. Reinstall the rear seat back into the vehicle. Refer to **SEAT BACK, REAR, INSTALLATION** .
7. Reconnect the negative cable to the battery. If equipped with an Intelligent Battery Sensor (IBS), reconnect the IBS connector.

CABLE, ANTENNA

DESCRIPTION

DESCRIPTION

Coaxial antenna cables are used to connect both the AM/FM antenna module above the back glass opening and, if equipped, the combination shark fin antenna (Satellite Digital Audio Receiver (SDAR), Global Positioning System (GPS) navigation radio, Uconnect™ Hands Free cellular system) on the back of the roof outer panel to the Radio Receiver Module (RRM) (also known as the radio or the head unit) in the instrument panel. Each

cable consists of two pieces connected in series, one packaged within the instrument panel wire harness and the other packaged within the body wire harness.

The cables are each fitted with FAKRA (an acronym for the German terms: Fachnormenausschuss Kraftfahrzeugindustrie) coaxial cable connectors at each end. The connector insulators are color-coded to ensure proper connections are readily identifiable.

The antenna cables cannot be adjusted or repaired. If damaged or ineffective they must be replaced by routing and fastening a new coaxial cable along the outside of the respective body or instrument panel wire harness containing the cable or cables being replaced.

OPERATION

OPERATION

The coaxial antenna cables each contain a center copper conductor covered by an inner dielectric insulator. The dielectric insulator is then covered by a braided or woven copper shield, which is then covered by a protective outer plastic sheath. The center conductor carries the Radio Frequency (RF) signals from the antenna module or antenna to the receiver, while the braided copper shield is grounded through the radio chassis at one end and either the antenna module or the antenna base at the other end to help to protect the conductor from RF signal interference.

For more information on testing the coaxial cables using the (special tool #9977-6, Kit, Radio Antenna Diagnostic), refer to **DIAGNOSIS AND TESTING** and perform the procedure for **Poor or No AM/FM Audio Reception** or **Poor or No Satellite Audio Reception** as appropriate.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ANTENNA CABLE

For information on testing the coaxial antenna cables using the (special tool #9977-6, Kit, Radio Antenna Diagnostic), refer to **DIAGNOSIS AND TESTING** and perform the procedure for **Poor or No AM/FM Audio Reception** or **Poor or No Satellite Audio Reception** as appropriate.

REMOVAL

REMOVAL

The antenna cables cannot be adjusted or repaired. If damaged or ineffective they must be replaced by routing and fastening a new coaxial cable along the outside of the respective body or instrument panel wire harness containing the cable or cables being replaced.

INSTALLATION

INSTALLATION

The antenna cables cannot be adjusted or repaired. If damaged or ineffective they must be replaced by routing and fastening a new coaxial cable along the outside of the respective body or instrument panel wire harness containing the cable or cables being replaced.

DESCRIPTION

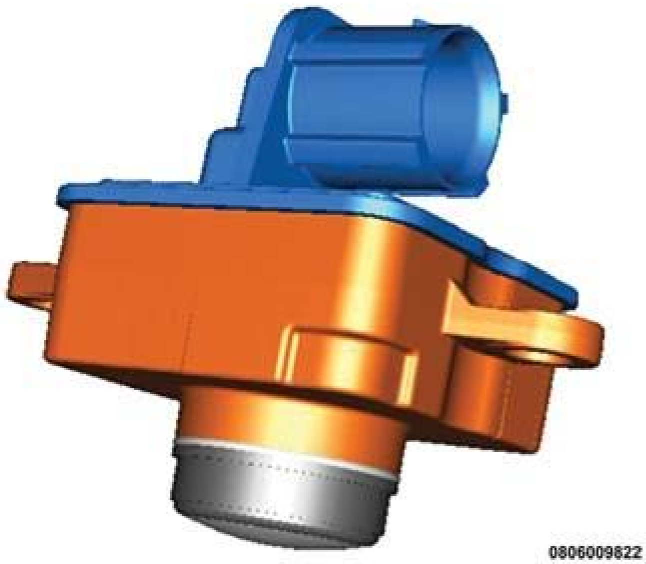

Fig. 7: Rear View Camera (RVC)
Courtesy of CHRYSLER GROUP, LLC

The Rear View Camera (RVC) (also known as ParkView™ Rear Back Up Camera) is an available option for this vehicle. The RVC is intended to be an auxiliary viewing aid and is not promoted as an obstacle detection or safety device. It does not remove vehicle operator responsibility to recognize and obey official traffic laws or regulations or to take sensible precautions and care to avoid pedestrians, other vehicle traffic or both fixed and moving obstacles through the habitual use of safe and defensive driving techniques.

The RVC is a camera on chip device utilizing Complementary Metal Oxide Semiconductor (CMOS) technology. CMOS technology supports the analog image sensor of the RVC. The RVC also contains a microcontroller and a Local Interface Network (LIN) data bus slave node that communicates over the LIN data bus network with the Body Control Module (BCM) (also known as the Common Body Controller), which is a LIN master node and a gateway to the Controller Area Network (CAN) data bus.

The RVC lens is visible on the vehicle center line of the rear vertical surface of the deck lid spoiler. The body of the RVC is concealed within the spoiler where it is secured with two screws to a mounting bracket integral to an access cover secured by four screws to the underside of the spoiler. A jumper wire harness is routed from the RVC connector through clearance holes in the spoiler and the deck lid to a dedicated take out and connector of the body wire harness on the underside of the deck lid. The spoiler is then mounted to the deck lid.

The RVC system uses the touchscreen of the Radio Receiver Module (RRM) near the center of the instrument panel to display the wide angle images captured through the lens of the RVC camera, which faces rearward. The video image includes an active guideline overlay to aid the perception of distance for the operator. These active guidelines change direction with the steering wheel position to indicate the path of the vehicle to aid in parking maneuvers.

The RVC uses hard wired video signal output circuits to provide the RRM video display with compatible National Television System Committee (NTSC) standard composite video M format data, or NTSC-M. These

camera output circuits run the entire length of the vehicle and are arranged in tandem as a twisted pair. Portions of these video signal wires are contained within the body wire harness, the jumper wire harness between the RVC in the deck lid spoiler and the body wire harness, and a second jumper wire harness located between the RRM and the body wire harness below the instrument panel at the right cowl side inner panel. Data signal protection from corruption and interference is provided by a grounded foil jacket shield which is terminated only at the video display of the RRM.

The RVC cannot be adjusted or repaired. If the RVC is damaged or ineffective, it must be replaced.

OPERATION

OPERATION

The Rear View Camera (RVC) receives battery current from a run relay located within the rear Power Distribution Center (PDC) through a fused ignition (run) circuit. The RVC has a path to ground at all times through a take out and eyelet terminal of the body wire harness secured to the body sheet metal. The RVC is activated whenever the status of the ignition is Run and the transmission gear selector is shifted into the Reverse (**R**) position. If the camera delay feature is enabled the RVC will remain active for 10 seconds, up to about 13 kilometers-per-hour (8 miles-per-hour) or until the touch screen display is pressed after the gear selector is shifted from Reverse (**R**) to Neutral (**N**) or Drive (**D**).

The Local Interface Network (LIN) slave node of the RVC microcontroller communicates using electronic messaging over the LIN data bus with the LIN master node of the Body Control Module (BCM) (also known as the Common Body Controller/CBC). The BCM continually monitors the condition of the LIN data bus and the RVC. The BCM will store a Diagnostic Trouble Code (DTC) for any fault that is detected.

The hard wired circuits between components related to the RVC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RVC or the electronic controls and communication between modules and other devices that provide some features of the RVC. The most reliable, efficient and accurate means to diagnose the RVC or the electronic controls and communication related to RVC operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - REAR CAMERA

The hard wired circuits of the Rear View Camera (RVC) and those between the RVC and the Radio Receiver Module (RRM) (also known as the radio or the head unit) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RVC, the RRM or

the electronic controls and communication between modules and other devices that provide some features of the RVC system. The most reliable, efficient and accurate means to diagnose the RVC, the RRM or the electronic controls and communication related to RVC system operation, as well as the retrieval or erasure of a Diagnostic Trouble Code (DTC) requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Before proceeding with the diagnostic steps below, use the scan tool to check the Body Control Module (BCM) for any RVC or LIN bus related Diagnostic Trouble Codes (DTC). Repair as necessary.

CONDITION	POSSIBLE CAUSES	CORRECTION
VIDEO IMAGE IS BLURRY OR OBSTRUCTED	1. Dirt, smears or fingerprints on RVC lens.	1. Inspect lens for foreign material and clean lens as required, using the lens cleaning procedure.
	2. Ineffective camera shield circuit.	2. Check for loose or damaged wiring connections at the RVC, the deck lid spoiler, the deck lid, the right cowl side inner panel and the RRM. Test and repair the open or shorted camera shield circuit if required.
	3. Moisture buildup on the inside of the lens.	3. Replace the ineffective camera if required.
NO VIDEO DISPLAY IN RADIO - DOES NOT DISPLAY **CHECK ENTIRE SURROUNDINGS** MESSAGE BRIEFLY AFTER SHIFTING INTO REVERSE	1. Incorrect radio software.	1. Check to be certain that the radio has the latest software update installed. Install the radio software update if required.
	2. Ineffective radio fuse.	2. Test and replace the radio fuses if required.
	3. Ineffective radio ground circuit.	3. Check for loose or damaged wiring connections at the radio. Test and repair the open radio ground circuit if required.
	4. Ineffective radio feed circuit.	4. Check for loose or damaged wiring connections at the radio. Test and repair the open radio feed circuit if required.
	5. Ineffective radio inputs or outputs.	5. Use a diagnostic scan tool to test the radio inputs and outputs including those received over the CAN bus. Refer to the appropriate diagnostic information.

CONDITION	POSSIBLE CAUSES	CORRECTION
	6. Ineffective radio.	6. Use a diagnostic scan tool to test the radio. Refer to the appropriate diagnostic information.
NO CAMERA IMAGE IN RADIO VIDEO DISPLAY - DOES DISPLAY **CHECK ENTIRE SURROUNDINGS** MESSAGE BRIEFLY AFTER SHIFTING INTO REVERSE AND BACKUP LAMPS DO OPERATE	1. Ineffective RVC ground circuit.	1. Check for loose or damaged wiring connections at the RVC, the deck lid spoiler and the deck lid. Test and repair the open camera ground circuit if required.
	2. Ineffective RVC feed (run relay) circuit.	2. Check for loose or damaged wiring connections at the RVC, the deck lid spoiler and the deck lid. Test and repair the open RVC feed (run relay) circuit if required.
	3. Ineffective RVC return circuit.	3. Check for loose or damaged wiring connections at the RVC, the deck lid spoiler, the deck lid, the right cowl side inner panel and the radio. Test and repair the open or shorted RVC feed circuit if required.
	4. Ineffective RVC signal circuit.	4. Check for loose or damaged wiring connections at the RVC, the deck lid spoiler, the deck lid, the right cowl side inner panel and the radio. Test and repair the open or shorted RVC signal circuit if required.
	5. Ineffective RVC.	5. Replace the ineffective RVC if required.
NO ACTIVE GRID LINES BEING OVERLAID ON IMAGE	1. Data bus communication ineffective.	1. Use a diagnostic scan tool for further diagnosis. Refer to the appropriate diagnostic information.
	2. Bus message received is incorrect.	2. Use a diagnostic scan tool for further diagnosis. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

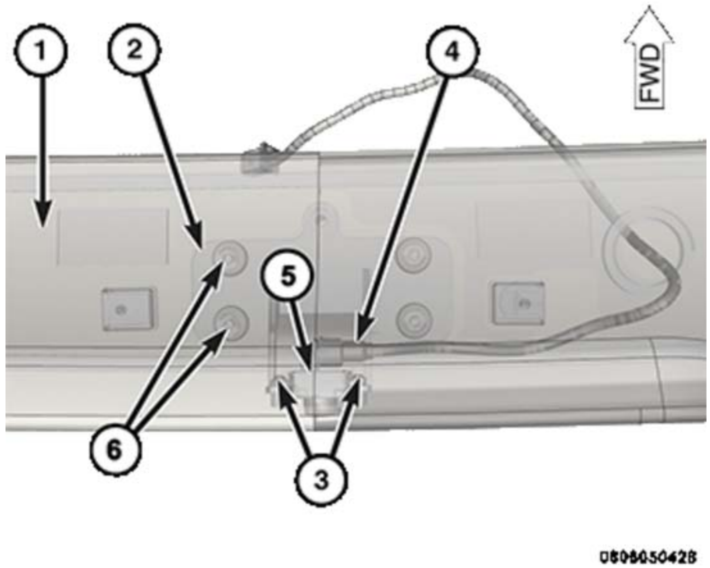

Fig. 8: Spoiler Assembly, Rear View Camera, Mounting Bracket, Connectors & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery.
2. Remove the spoiler assembly (1) from the outside of the deck lid. Refer to **SPOILER, DECKLID, REMOVAL** .
3. Place the spoiler assembly on a suitable work surface with the top surface facing down.

NOTE: **If the spoiler will be reused, be certain to take the proper precautions to prevent the spoiler from receiving cosmetic damage during the following procedures.**

4. Remove the four screws (6) that secure the access cover and mounting bracket (2) to the underside of the spoiler.
5. Remove the access cover, mounting bracket and Rear View Camera (RVC) as a unit from the spoiler.
6. Disconnect the jumper wire harness connector (4) from the RVC (5).
7. Remove the two screws (3) that secure the RVC mounting tabs to the mounting bracket on the access cover.
8. Remove the RVC.

CLEANING

CLEANING

NOTE: **The use of nylon gloves will prevent oil and debris on your hands from being transferred to the camera body or lens surface. While wearing the gloves, care should be taken not to contact exposed body parts such as the forehead, nose and arms. If contact is made accidentally, gloves should be changed to mitigate the risk of contaminant transfer from the surface of the gloves.**

1. Using compressed air, blow diagonally across the camera lens.

2. Use a microfiber lens tissue to gently wipe the lens.
3. Examine the lens to verify the cleaning process. Proceed to **Step #4** if the lens still shows signs of oil or debris.
4. Apply a lens cleaning solution to a section of an unused lens tissue.
5. Slowly wipe in a circular motion around the edges of the lens to remove any dirt or contamination from the periphery of the lens before cleaning the center.
6. Let the lens air dry.
7. Examine the lens to verify the cleaning process.

INSTALLATION

INSTALLATION

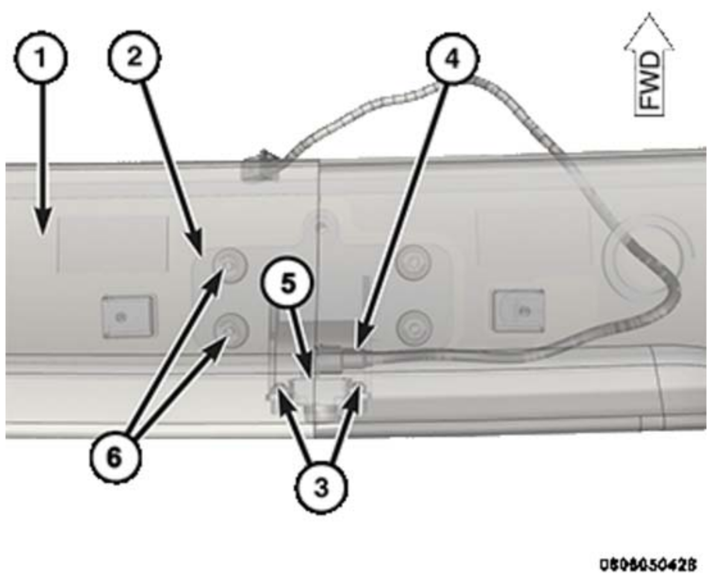

Fig. 9: Spoiler Assembly, Rear View Camera, Mounting Bracket, Connectors & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Position the Rear View Camera (RVC) (5) mounting tabs to the mounting bracket on the access cover (2).
2. Install and tighten the two screws (3) that secure the RVC mounting tabs to the mounting bracket. Tighten the screws securely.
3. Reconnect the jumper wire harness connector (4) to the RVC.
4. Position the access cover, mounting bracket and RVC into the spoiler (1) as a unit. Be certain the RVC lens is inserted through the clearance hole in the rear vertical surface of the spoiler.
5. Install and tighten the four screws (6) that secure the access cover and mounting bracket to the underside of the spoiler. Tighten the screws securely.
6. Reinstall the spoiler assembly onto the outside of the deck lid. Refer to SPOILER, DECKLID, INSTALLATION .
7. Reconnect the negative cable to the battery. If equipped with an Intelligent Battery Sensor (IBS), reconnect the IBS connector.

COMPONENTS, RADIO NOISE SUPPRESSION

DESCRIPTION

DESCRIPTION

Radio noise suppression devices are installed on this vehicle. Radio Frequency Interference (RFI) and ElectroMagnetic Interference (EMI) can be produced by any on-board or external source of electromagnetic energy. These electromagnetic energy sources can radiate electromagnetic signals through the air, or conduct them through the vehicle electrical system.

When the audio system converts RFI or EMI to an audible acoustic wave form, it is referred to as radio noise. This undesirable radio noise is generally manifested in the form of buzzing, hissing, popping, clicking, crackling or whirring sounds. In most cases, RFI and EMI radio noise can be suppressed using a combination of vehicle and component grounding, filtering and shielding techniques. This vehicle is equipped with radio noise suppression devices that were designed to minimize exposure to typical sources of RFI and EMI; thereby, minimizing radio noise complaints.

Radio noise suppression is accomplished primarily through circuitry or devices that are integral to the radios, audio power amplifiers and other on-board electrical components such as generators, wiper motors, blower motors and fuel pumps that have been found to be potential sources of RFI or EMI. External radio noise suppression devices that are used on this vehicle to control RFI or EMI, and can be serviced, include the following:

- **Ground Strap, Radio Ground Engine Left** - This length of braided ground strap has an eyelet terminal connector crimped to each end. One end is secured to the rear stud of the 3.6 liter engine mount. The other end is secured to the engine cradle.

OPERATION

OPERATION

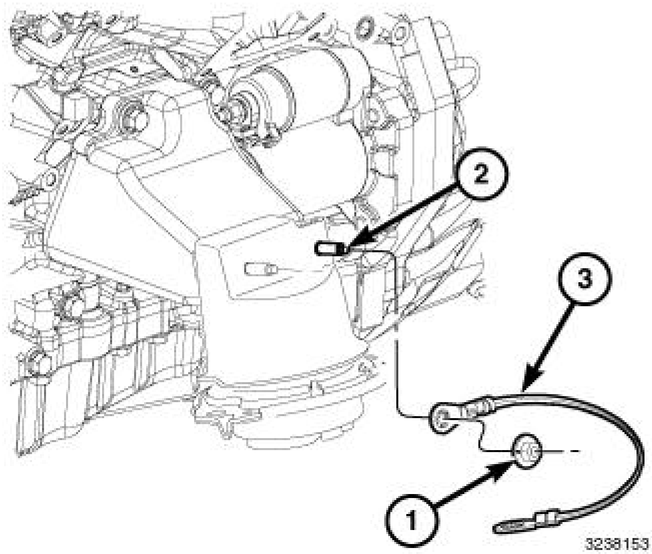
There are two common strategies that can be used to suppress Radio Frequency Interference (RFI) and ElectroMagnetic Interference (EMI) radio noise. The first suppression strategy involves preventing the production of RFI and EMI electromagnetic signals at their sources. The second suppression strategy involves preventing the reception of RFI and EMI electromagnetic signals by the audio system components.

The use of braided ground straps in key locations is part of the RFI and EMI prevention strategy. These ground straps ensure adequate ground paths, particularly for high current components such as many of those found in the starting, charging, ignition, engine control and transmission control systems. An insufficient ground path for any of these high current components may result in radio noise caused by induced voltages created as the high current seeks alternative ground paths through components or circuits intended for use by, or in close proximity to the audio system components or circuits.

Preventing the reception of RFI and EMI is accomplished by ensuring that the audio system components are correctly installed in the vehicle. Loose, corroded or improperly soldered wire harness connections, improperly routed wiring and inadequate audio system component grounding can all contribute to the reception of RFI and EMI. A properly grounded antenna body and radio chassis, as well as a shielded antenna coaxial cable with clean and tight connections will each help reduce the potential for reception of RFI and EMI.

REMOVAL

3.6L LEFT ENGINE MOUNT

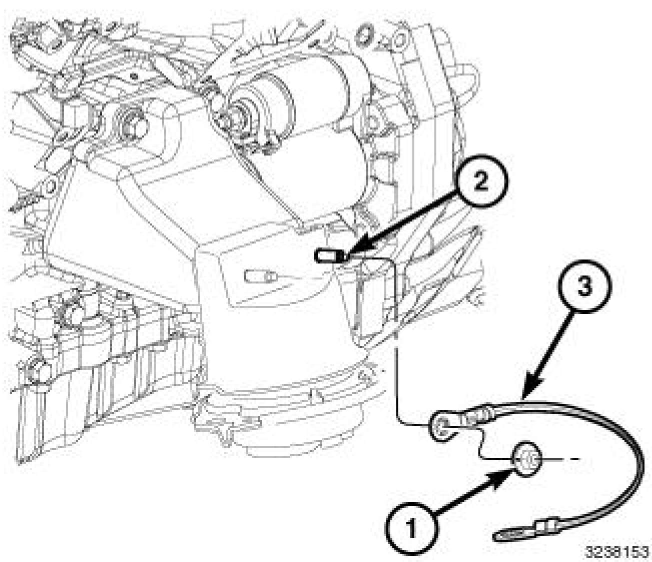


[Fig. 10: Suppression Retainer And Driver Side Engine Mount Stud](#)
Courtesy of CHRYSLER GROUP, LLC

1. Open the hood.
2. Remove the radio noise suppression retainer (1) from the driver side engine mount stud (2).
3. Remove the radio noise suppression retainer from the body side of the strap.
4. Remove the radio noise suppression strap from the vehicle.

INSTALLATION

3.6L LEFT ENGINE MOUNT



[Fig. 11: Suppression Retainer And Driver Side Engine Mount Stud](#)
Courtesy of CHRYSLER GROUP, LLC

1. Position the radio noise suppression strap (3) on the driver side engine mount stud (2).
2. Install the radio noise suppression strap retainer (1) to the engine mount stud (2).
3. Install the radio noise suppression strap to the body.

4. Install the radio noise suppression strap retainer to the body.
5. Close the hood.

MAST, ANTENNA

DESCRIPTION

DESCRIPTION

The on-glass AM-FM antenna elements consist of a grid pattern screened onto the inside of the back glass in this vehicle. A single snap-like terminal also integral to the back glass accepts the snap terminal of the pigtail wire integral to the antenna module.

Minor damage to the elements screened onto the glass can be repaired using a Mopar Rear Window Defogger Repair Kit. Refer to **GRID, DEFOGGER, STANDARD PROCEDURE** . Otherwise, the antenna element terminal and grid lines are serviced only as a unit with the back glass assembly.

OPERATION

OPERATION

The on-glass antenna elements screened onto the back glass capture various radiated Radio Frequency (RF) signals throughout the intended broadcast bands. Those RF signals captured are supplied to the antenna module for Radio Frequency Interference (RFI) filtering, amplification and transmission to the audio system tuner.

The on-glass antenna elements may be diagnosed using conventional diagnostic tools and procedures.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ON-GLASS ANTENNA

The antenna grid pattern is screened on the inside of the back glass above the Electric Back Light (EBL) grid. For circuit descriptions and diagrams, Refer to the appropriate SYSTEM WIRING DIAGRAMS article. To detect breaks in the antenna grid elements, the following procedure is required:

1. Disconnect the antenna module pigtail wire connector from the antenna terminal on the inside of the back glass. Refer to **MODULE, RADIO ANTENNA, REMOVAL**.
2. Using an ohmmeter, connect one lead to the antenna terminal and with the other lead check each end of the grid pattern for continuity.

   NOTE: The resistance should be below 2.4 Ohms on each grid line.

   Measure the resistance of each antenna grid line. The resistance should be exactly the same for each line.

3. If the resistance is not exactly the same for each grid line, check for a breaks or voids in the grid lines. They may be hard to find as all the grid lines are tied together.
4. Even if the resistance is the same for all lines, do a very close visual inspection of the grid for breaks or voids.
5. A break or void in the antenna grid can be repaired using a Mopar Rear Window Defogger Repair Kit or equivalent. Refer to **GRID, DEFOGGER, STANDARD PROCEDURE** .

REMOVAL

REMOVAL

The on-glass antenna elements screened onto the inside of the back glass are serviced as a unit with the back glass. Refer to **BACKLITE, REMOVAL** .

INSTALLATION

INSTALLATION

The on-glass antenna elements screened onto the inside of the back glass are serviced as a unit with the back glass. Refer to **BACKLITE, INSTALLATION** .

MEDIA HUB

DESCRIPTION

DESCRIPTION

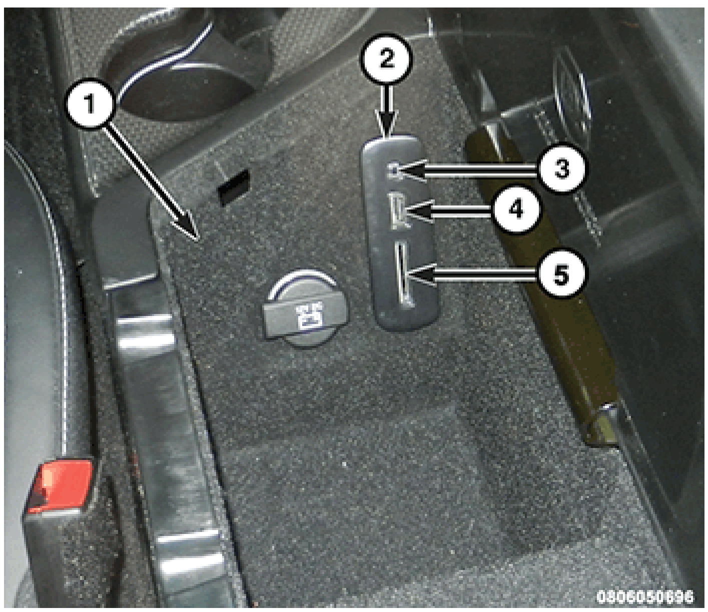


Fig. 12: Center Console Rear Storage Bin, Media Hub, Audio Input Jack, USB Port & SD Card Reader
Courtesy of CHRYSLER GROUP, LLC

The media hub (2) is located in the forward surface of the center console rear storage bin (1). The media hub is a centralized connection point in the vehicle that contains:

- a 3.5 millimeter auxiliary audio input jack (3)
- a powered Universal Serial Bus (USB) port (4)

NOTE: **The powered USB port provides 5 volts at 1.5 amperes to charge the battery of a connected media device.**

- a Secure Data (SD) card reader (5)

Only the molded plastic media hub faceplate and the connection ports are visible within the storage bin. The

media hub housing, wiring and connections to the vehicle electrical system are concealed on the underside of the console. Four latch tabs integral to the media hub housing secure the unit on the back side of the mounting hole in the console rear storage bin.

The media hub cannot be adjusted or repaired. If ineffective or damaged it must be replaced.

OPERATION

OPERATION

In vehicles so equipped, the media hub allows the audio content of various media devices to be connected to Radio Receiver Module (RRM) (also known as the radio or the head unit). Once connected the audio content of the media device may be accessed and played through the audio system components of the vehicle using the RRM controls.

The hard wired circuits between the media hub and the RRM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

REMOVAL

REMOVAL

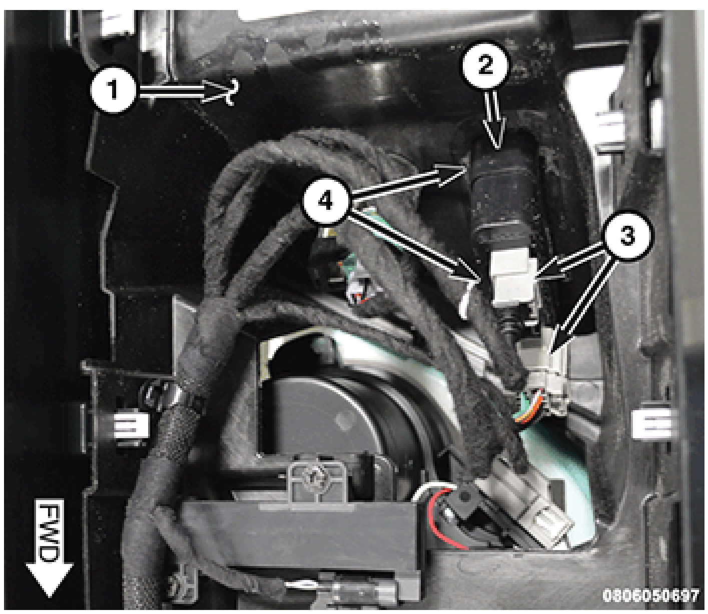

Fig. 13: Rear Storage Bin, Media Hub Housing, Wire Harness Connectors & Latch Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery.
2. Remove the floor console from the vehicle. Refer to **CONSOLE, FLOOR, REMOVAL** .
3. Place the floor console assembly on a suitable work surface with the top surface facing down.

NOTE: **Be certain to take the proper precautions to prevent the floor console from**

receiving cosmetic damage during the following procedures.

4. Locate the media hub housing (2) on the front of the console rear storage bin (1).
5. Disconnect the console wire harness connectors (3) from the media hub housing.
6. Compress each of the four latch tabs (4) integral to the media hub housing while pushing the housing out through the mounting hole in the floor console storage bin.

INSTALLATION

INSTALLATION

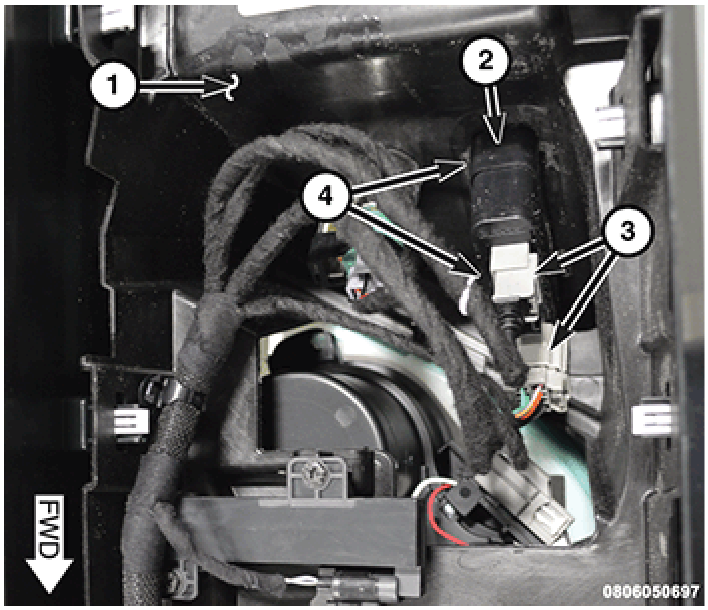

Fig. 14: Rear Storage Bin, Media Hub Housing, Wire Harness Connectors & Latch Tabs
Courtesy of CHRYSLER GROUP, LLC

1. From inside the floor console storage bin, align and insert the media hub housing (2) through the mounting hole until all four integral latch features (4) are fully engaged on the outer surface of the bin (1).
2. From the underside of the floor console, reconnect the console wire harness connectors (3) to the media hub housing.
3. Reinstall the floor console into the vehicle. Refer to **CONSOLE, FLOOR, INSTALLATION** .
4. Reconnect the negative cable to the battery. If equipped with an Intelligent Battery Sensor (IBS), reconnect the IBS connector.

MODULE, RADIO ANTENNA

DESCRIPTION

DESCRIPTION

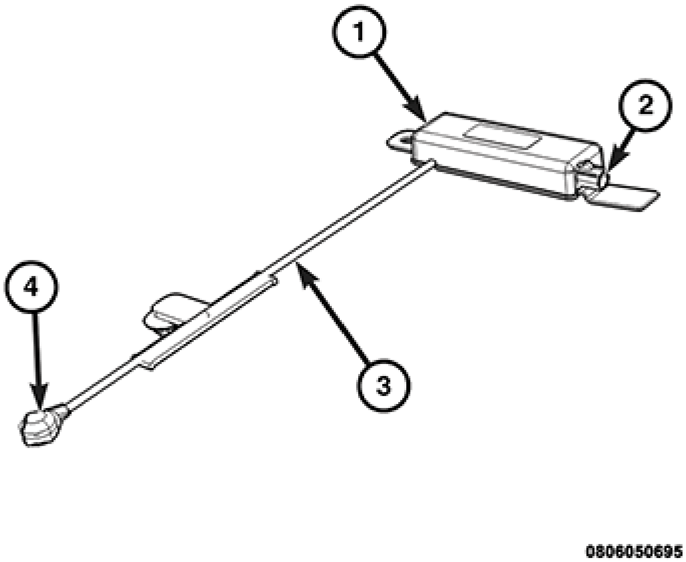

Fig. 15: Antenna Module, Short Pigtail Wire & Connectors
Courtesy of CHRYSLER GROUP, LLC

The antenna module (1) is an electronic circuit component designed to capture and enhance Radio Frequency (RF) signals in both the AM and FM broadcast bands. The antenna module is mounted to the upper header near the center of the back glass opening where it is concealed above the headliner. The module is grounded at all times through an integral mounting bracket that is secured by a nut to a weld stud on the header.

A short pigtail wire (3) and connector (4) on one end of the module snaps onto the antenna element grid terminal on the inside surface of the back glass, while a connector receptacle (2) on the other end of the module accepts the FAKRA (an acronym for the German terms: Fachnormenausschuss Kraftfahrzeugindustrie) connector of the coaxial cable routed to the Radio Receiver Module (RRM) (also known as the radio or the head unit). The RRM supplies a nine volt supply to the module through the coaxial cable.

The antenna module cannot be adjusted or repaired. If ineffective or damaged it must be replaced.

OPERATION

OPERATION

The antenna module is powered by a 9 volt output from the Radio Receiver Module (RRM) (also known as the radio or the head unit) through the coaxial cable whenever the radio receiver is active. The module receives both AM and FM Radio Frequency (RF) signals supplied by the on-glass antenna grid elements screened onto the inside of the back glass. The module selectively filters Radio Frequency Interference (RFI) from and amplifies the received signals. The amplified signal is then sent through the coaxial cable to the RRM AM/FM antenna input.

The hard wired inputs and outputs to the antenna module may be diagnosed using conventional diagnostic tools and procedures. However, the module itself is diagnosed by substituting a known good external antenna to compare reception performance.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - RADIO ANTENNA MODULE

1. Remove the rear seat back from the vehicle. Refer to **SEAT BACK, REAR, REMOVAL** .
2. Fully recline both front seat backs.
3. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery.

NOTE: **Use the headliner removal procedure to lower the headliner from the inner roof panel. The headliner will NOT be removed from the vehicle interior; therefore, it is NOT necessary to remove the windshield.**

4. Lower the headliner from the inner roof panel and allow it to rest within the vehicle interior. Refer to **HEADLINER, REMOVAL** .
5. Reach between the headliner and the roof rear header panel to access and check the connections to the antenna module and to the antenna grid terminal. If they are all right, continue. If they are not all right, clean and tighten the connections and retest the radio reception.
6. Disconnect the white AM/FM FAKRA coaxial cable connector from the antenna module and connect the (special tool #9977-6-FM, Antenna) to the coaxial cable in place of the antenna module.
7. Place the magnetic antenna on the roof of the vehicle.
8. Drive the vehicle outside to a clear, unobstructed overhead view.
9. Turn the radio On and try tuning several AM and FM stations, then proceed as follows:
   - **Audio Improved** - Check the antenna grid and repair if necessary. Refer to **MAST, ANTENNA, DIAGNOSIS AND TESTING**. If the grid checks good, replace the antenna module.
   - **Audio Did Not Improve** - Check the radio and coaxial cables. Refer to **MAST, ANTENNA, DIAGNOSIS AND TESTING**, or refer to **DIAGNOSIS AND TESTING** and perform the **Poor Or No AM/FM Audio Reception** test.

REMOVAL

CAPACITOR

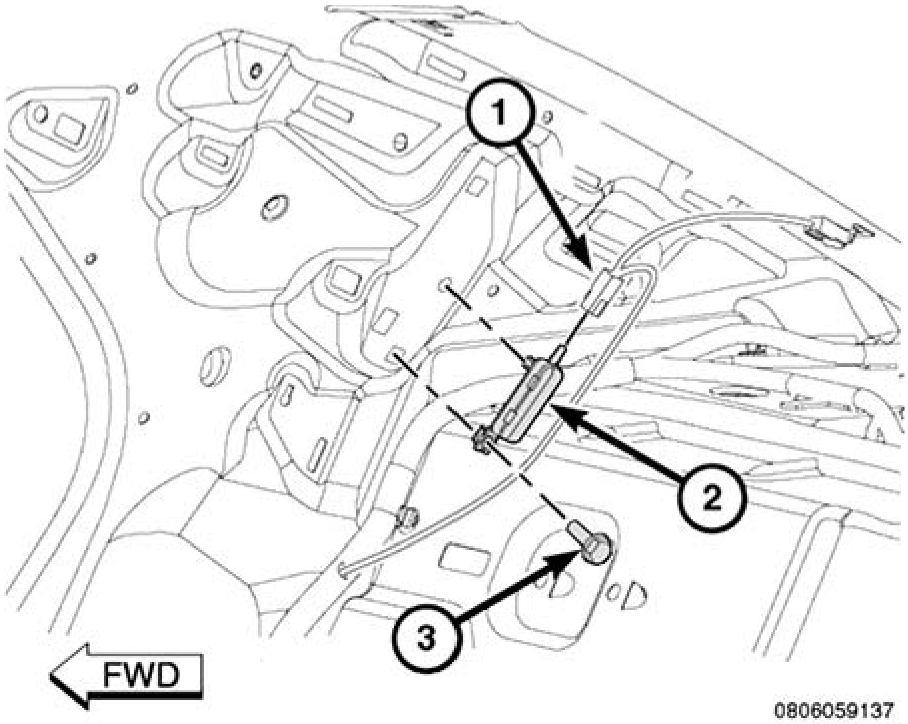

Fig. 16: Body Wire Harness Connector, Antenna Capacitor & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery.
2. Remove the trim from the upper right C-pillar. Refer to **PANEL, C-PILLAR TRIM, REMOVAL** .
3. Disconnect the body wire harness connector (1) from the antenna capacitor (2).
4. Remove the screw (3) that secures the antenna capacitor to the C-pillar.
5. Disengage the mounting tab of the antenna capacitor from the slotted hole in the C-pillar and remove the capacitor from the vehicle.

MODULE

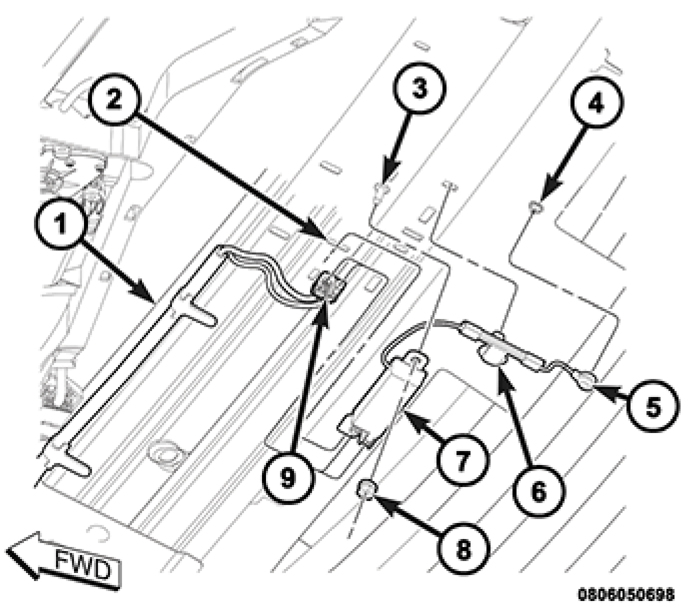

Fig. 17: Radio Antenna Module Components
Courtesy of CHRYSLER GROUP, LLC

1. Remove the rear seat back from the vehicle. Refer to **SEAT BACK, REAR, REMOVAL** .
2. Fully recline both front seat backs.
3. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery.

NOTE: **Use the headliner removal procedure to lower the headliner from the inner roof panel. The headliner will NOT be removed from the vehicle interior; therefore, it is NOT necessary to remove the windshield.**

4. Lower the headliner from the inner roof panel and allow it to rest within the vehicle interior. Refer to **HEADLINER, REMOVAL** .
5. Reach between the headliner and the roof rear header panel (1) to access and disconnect the body wire harness connections (9) to the antenna module (7).
6. Disconnect the antenna module pigtail wire connector (5) from the on-glass antenna grid terminal (4).
7. Disengage the antenna module pigtail wire retainer (6) from the slot in the roof rear header panel.
8. Remove the nut (8) that secures the left mounting tab of the antenna module to the weld stud (3) on the roof rear header panel.
9. Disengage the left mounting tab of the antenna module from the weld stud on the roof rear header panel.
10. Disengage the right mounting tab of the antenna module from the slot (2) in the roof rear header panel.
11. Remove the antenna module from the vehicle.

INSTALLATION

CAPACITOR

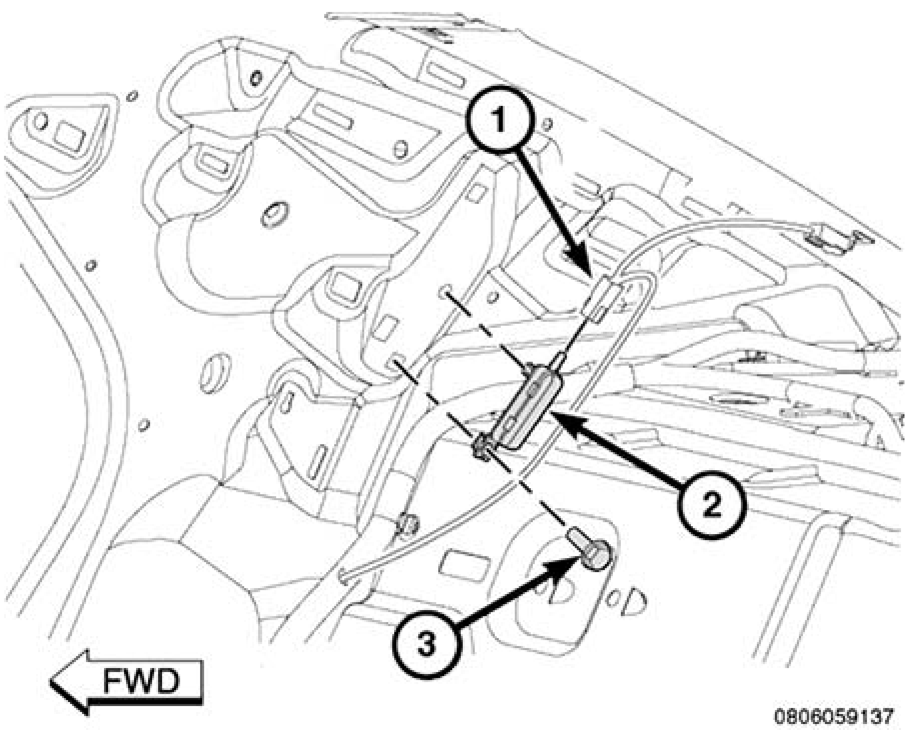

Fig. 18: Body Wire Harness Connector, Antenna Capacitor & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Engage the mounting tab of the antenna capacitor (2) into the slotted hole in the upper right C-pillar.
2. Install and tighten the screw (3) that secures the antenna capacitor to the C-pillar. Tighten the screw securely.
3. Reconnect the body wire harness connector (1) to the antenna capacitor.
4. Reinstall the trim onto the upper right C-pillar. Refer to **PANEL, C-PILLAR TRIM, INSTALLATION** .
5. Reconnect the negative cable to the battery. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.

MODULE

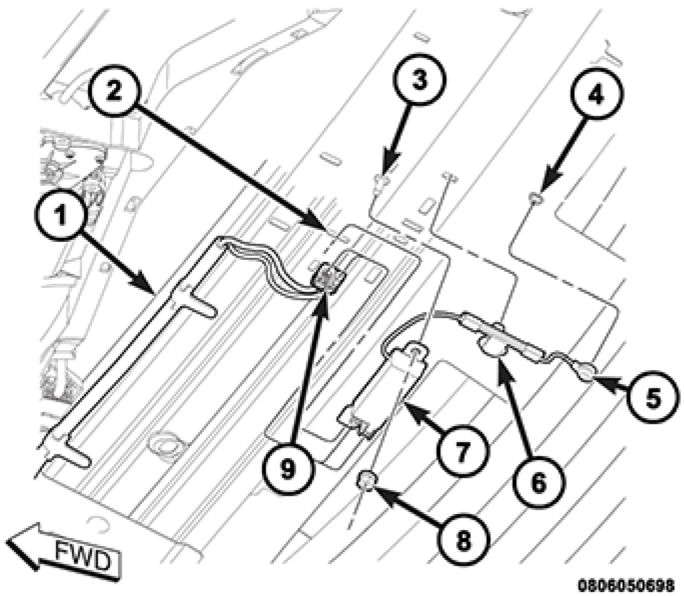

Fig. 19: Radio Antenna Module Components
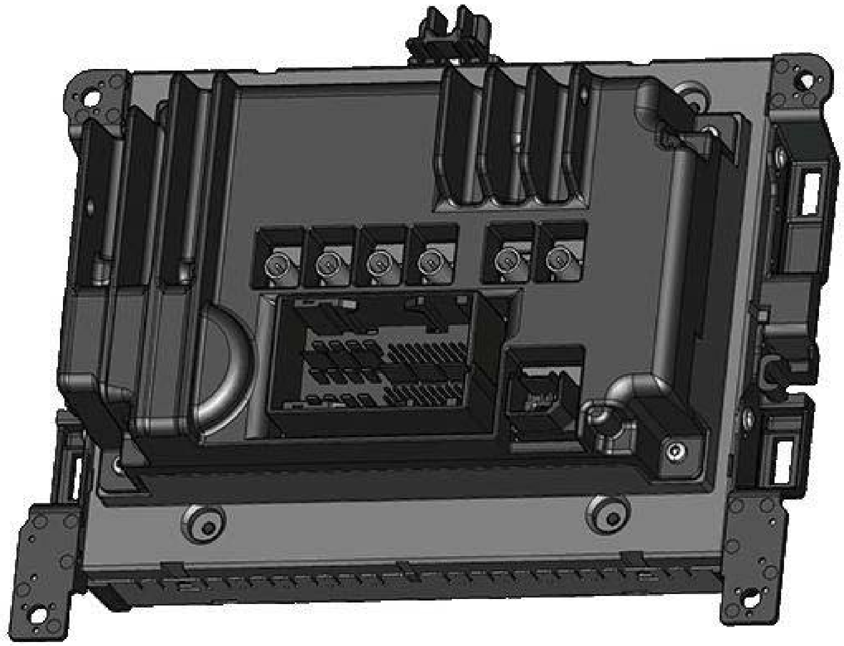
Courtesy of CHRYSLER GROUP, LLC

1. Position the antenna module (7) to the roof rear header panel (1) in the vehicle.
2. Engage the right mounting tab of the antenna module into the slot (2) in the roof rear header panel.
3. Engage the left mounting tab of the antenna module onto the weld stud (3) on the roof rear header panel.
4. Install and tighten the nut (8) that secures the left mounting tab of the antenna module to the weld stud on the roof rear header panel. Tighten the nut securely.
5. Engage the antenna module pigtail wire retainer (6) into the slot in the roof rear header panel.
6. Reconnect the antenna module pigtail wire connector (5) to the on-glass antenna grid terminal (4).
7. Reconnect the body wire harness connections (9) to the antenna module.
8. Reinstall the headliner onto the inner roof panel. Refer to **HEADLINER, INSTALLATION** .
9. Reinstall the rear seat back into the vehicle. Refer to **SEAT BACK, REAR, INSTALLATION** .
10. Reconnect the negative cable to the battery. If equipped with an Intelligent Battery Sensor (IBS), reconnect the IBS connector.

RADIO

DESCRIPTION

DESCRIPTION



[Fig. 20: Radio Receiver Module](#)
Courtesy of CHRYSLER GROUP, LLC

The radio (also known as the radio module) can be identified by sales codes RA2, RA3 or RA4. There is one distinct chassis design for all radios. The base radio (Sales Code RA2) and the premium radio (Sales Codes RA3 or RA4) have the electronics mounted parallel to the face plate in an aluminum chassis.

RA2 - The RA2 radio has a 127 millimeter (5 inch) touchscreen with hard keys on the faceplate. RA2 radios with control knobs have an integrated center stack that allows the HVAC system to be controlled with the touchscreen, or the redundant controls. There is no external hands free module, all hands free functions are integrated into the radio. An optional remote mounted media hub contains access ports for a 3.5 mm auxiliary audio plug, a powered Universal Serial Bus (USB) connector and a Secure Data (SD) card slot.

- 127 mm (5 inch) touchscreen
- AM/FM receiver
- satellite radio receiver (optional)
- Bluetooth™ connectivity for hands-free phone; streaming audio; voice commands

RA3 or RA4 - The RA3 or RA4 radio is identified by a 213.36 mm (8.4 inch) color touch screen display. There are no visible differences between the RA3 and RA4 with the unit turned off. However, on vehicles sold in the United States, the RA4 offers High Definition (HD) radio reception and can be identified by the HD symbol located on the screen when the radio is in radio mode. If the radio will not power up, the only way to identify the system is through a direct Single VIN inquiry using the TechConnect application on the DealerConnect web site.

- 213.36 mm (8.4 inch) color touchscreen display
- AM/FM/Remote Aux/USB/SD receiver
- satellite radio receiver (optional)
- dealer activated factory installed Global Positioning System (GPS) navigation option (RA3 only)
- factory installed GPS navigation (RA4)
- iPod support via USB
- remote steering wheel mounted controls
- Bluetooth™ connectivity for hands-free phone; streaming audio; voice commands
- climate control integration
- Electronic Vehicle Information Center (EVIC) personalization (optional)
- 3G Wi-Fi hot spot capability (subscription required)
- free form Short Message Service (SMS) dictation (subscription required)
- HD radio receiver (RA4 only)
- 911 - ASSIST automated calling
- remote CD player (optional)
- remote services - door lock/unlock, remote start, panic (subscription required)

The radio contains a microcontroller and programming that allows it to communicate with other electronic modules in the vehicle over the Controller Area Network - Interior High Speed (CAN-IHS) data bus. In vehicles equipped with the RA3 or RA4, the radio also uses electronic message communication with other electronic modules in the vehicle over the CAN-C data bus. Refer to **COMMUNICATION, DESCRIPTION** .

The radio cannot be adjusted or repaired. If an radio is damaged or ineffective, it must be replaced. The external AM/FM antenna and the external combination antenna can be repaired separately from the radio. The radio software is flash programmable through the USB port.

OPERATION

OPERATION

The radio (also known as the radio receiver module) becomes operational when it receives a wake up signal over the Controller Area Network (CAN) - Interior High Speed (IHS) data bus indicating the status of the ignition switch is On or Accessory. For further information on the operation of the radio and media systems in the vehicle, see the heading for the appropriate audio system option in the User Guide or the Owner Manual in the vehicle glove box. Also see the UconnectÂ® web site (**http://www.driveuconnect.com/**) for more information, or refer to the **Owners** link on the vehicle brand web site (**http://dodge.com/en/**) to view or download copies of those publications.

The radio uses a on-glass antenna screened onto the back glass for AM/FM signal reception and, depending upon optional vehicle equipment, a roof mounted shark fin combination antenna that can receive Global Positioning System (GPS), satellite radio and cellular telephone signals.

Depending upon the audio system options, a radio can play music from many different media sources. The media can be played by connecting the source to the audio system via a 3.5 millimeter auxiliary (AUX) audio port, a Universal Serial Bus (USB) port, a remote Secure Data (SD) card slot, a external Compact Disc (CD)

player or through wireless Bluetooth™ audio streaming. Refer to the UconnectĀ® web site (**http://www.driveuconnect.com/**) for compatibility.

NOTE: **USB devices (e.g.: camera memory, USB adaptors, etc. excluding Apple products) must comply with the Mass Storage Device (MSD) standard. This remote USB port can provide power to the connected device.**

REMOVAL

REMOVAL

Fig. 21: Instrument Panel Support Structure & Screws
Courtesy of CHRYSLER GROUP, LLC

NOTE: **If possible, an RA3 radio (also known as the radio module) with GPS navigation activated or any RA4 radio should have the version of the map and Point Of Interest (POI) data retrieved and noted before the original radio is replaced with a new unit. If the version of the map and POI data found on the new radio is not equal to or newer than the version that is found on the original radio, updated map and POI data will need to be downloaded and installed to the new radio at the expense of the dealer.**

Refer to STANDARD PROCEDURE .

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery.
2. Remove the instrument cluster bezel from the instrument panel. Refer to **BEZEL, INSTRUMENT CLUSTER, REMOVAL** .
3. Remove the four screws (1) that secure the radio to the instrument panel support structure (2).
4. Pull the radio out from the instrument panel far enough to access the connections at the back of the radio.

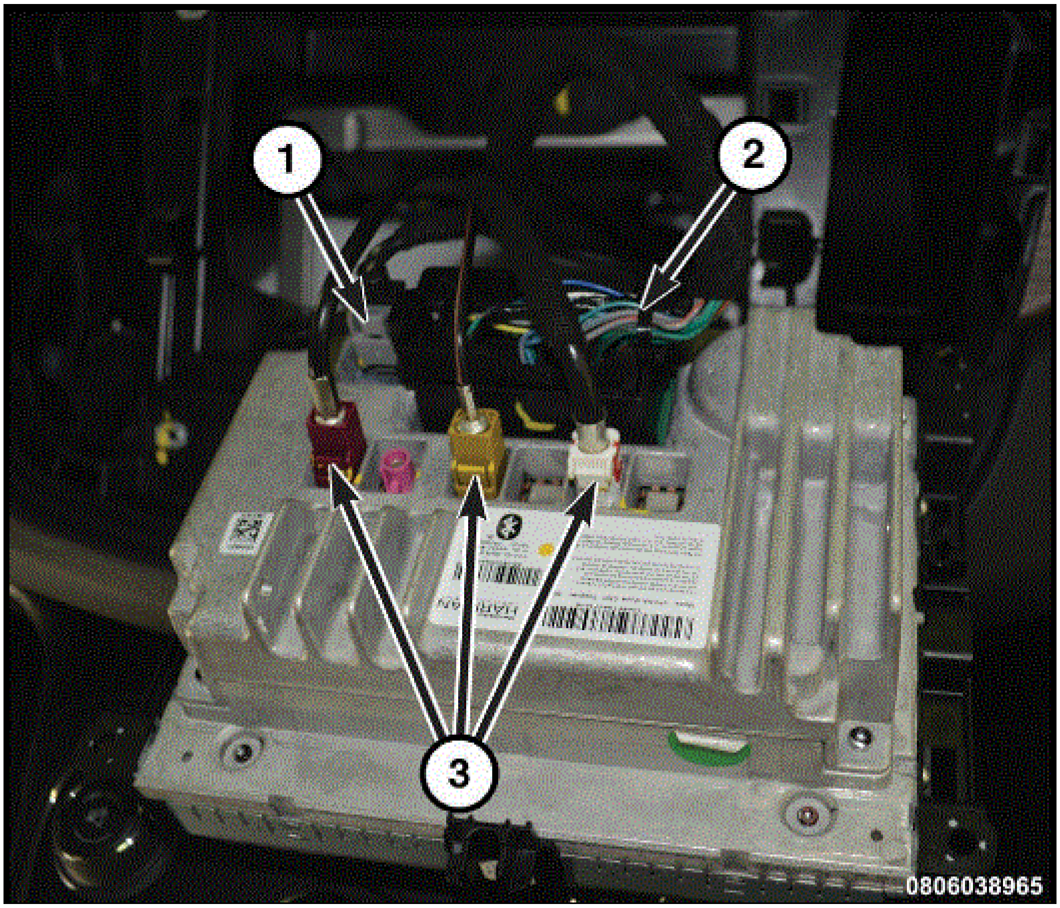


Fig. 22: Radio Receiver Module Connectors
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the antenna connectors (3) and the instrument panel wire harness connector (2) from the back of the radio.
6. If equipped, disconnect the Universal Serial Bus (USB) connector (1) from the back of the radio.
7. Remove the radio from the instrument panel.

INSTALLATION

INSTALLATION

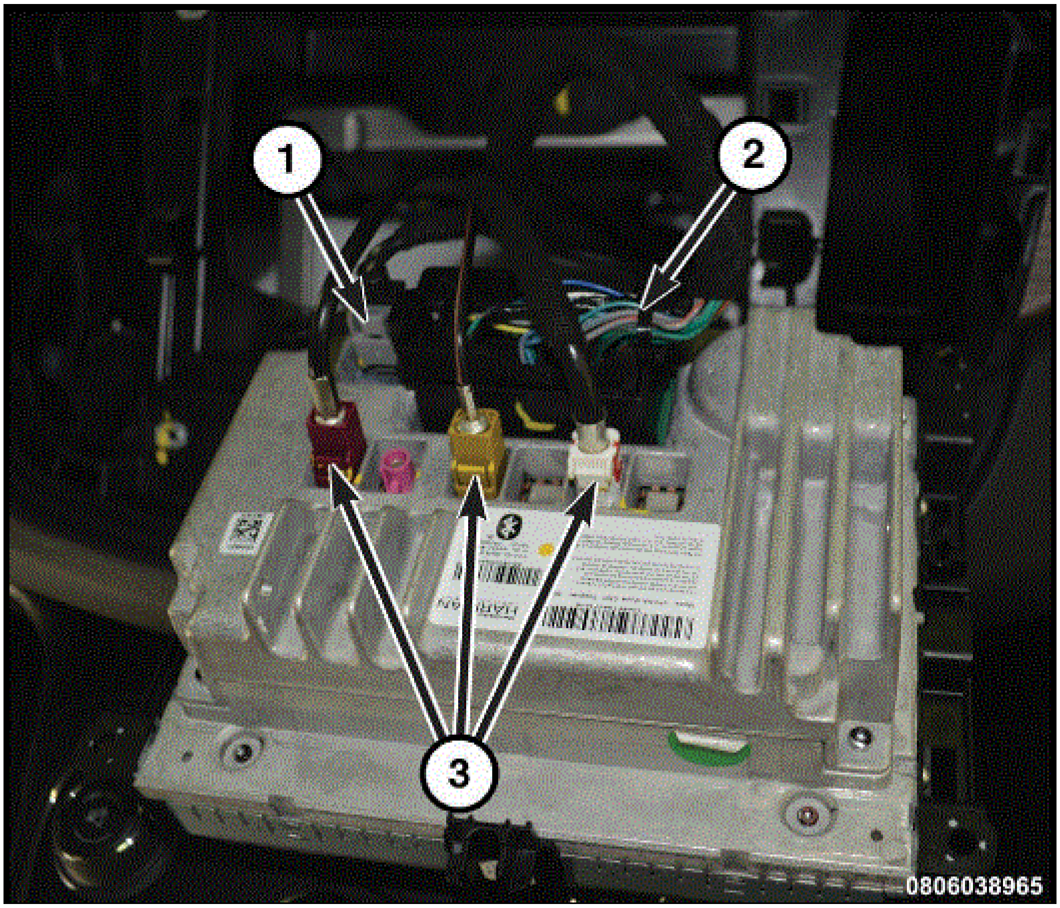

Fig. 23: Radio Receiver Module Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Position the Radio (also known as the Radio Module) near the radio mounting location of the instrument panel.
2. Reconnect the antenna connectors (3) and the instrument panel wire harness connector (2) to the back of the radio.
3. If equipped, reconnect the Universal Serial Bus (USB) connector (1) to the back of the radio.

Fig. 24: Instrument Panel Support Structure & Screws
Courtesy of CHRYSLER GROUP, LLC

4. Position the radio into the mounting location of the instrument panel support structure (2).
5. Install and tighten the four screws (1) that secure the radio to the instrument panel support structure. Tighten the screws securely.
6. Reinstall the instrument cluster bezel onto the instrument panel. Refer to **BEZEL, INSTRUMENT CLUSTER, INSTALLATION** .
7. Reconnect the negative cable to the battery. If equipped with an Intelligent Battery Sensor (IBS), reconnect the IBS connector.

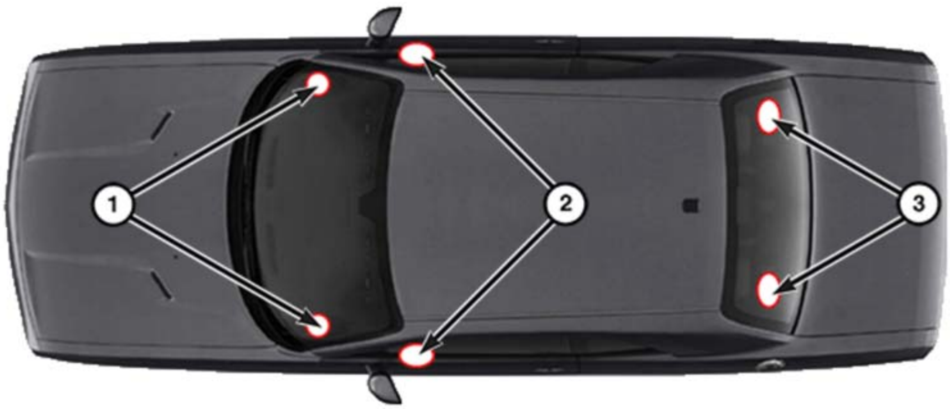
NOTE: **RA3 and RA4 Radio Uconnect Access Applications and WiFi hotspot will be automatically updated in the replacement radio through the embedded cellular phone of the radio based upon the current subscription status of the customer. This update process may take up to an hour, depending upon the number of apps and available cellular services access. The dealer is not expected to perform this process or to oversee it, but may need to explain to the vehicle owner or operator that some features and applications may not be fully restored and overall system response may be slowed until the process has completed.**

NOTE: **For RA3 radio only: If the radio has had the GPS navigation feature activated, any factory replacement radio for the same vehicle will be provided with the GPS navigation system already activated. Refer to DESCRIPTION .**

SPEAKER

DESCRIPTION

BASE



8808061219

Fig. 25: Speakers - Base
Courtesy of CHRYSLER GROUP, LLC

The base speaker system (Sales Code RCG) includes six speakers in six locations.

- Two 8.89 centimeter (3.5 inch) diameter midrange tweeters (1) located on the top of the instrument panel, one at each outboard end.
- Two 15.2 X 23 centimeter (6 X 9 inch) diameter speakers (2) located on the inner door panels, one at the lower front corner of each door.
- Two 16.5 centimeter (6.5 inch) diameter speakers (3) located on the package shelf, one at each outboard end.

The speakers cannot be adjusted or repaired. If ineffective or damaged they must be replaced.

PREMIUM I

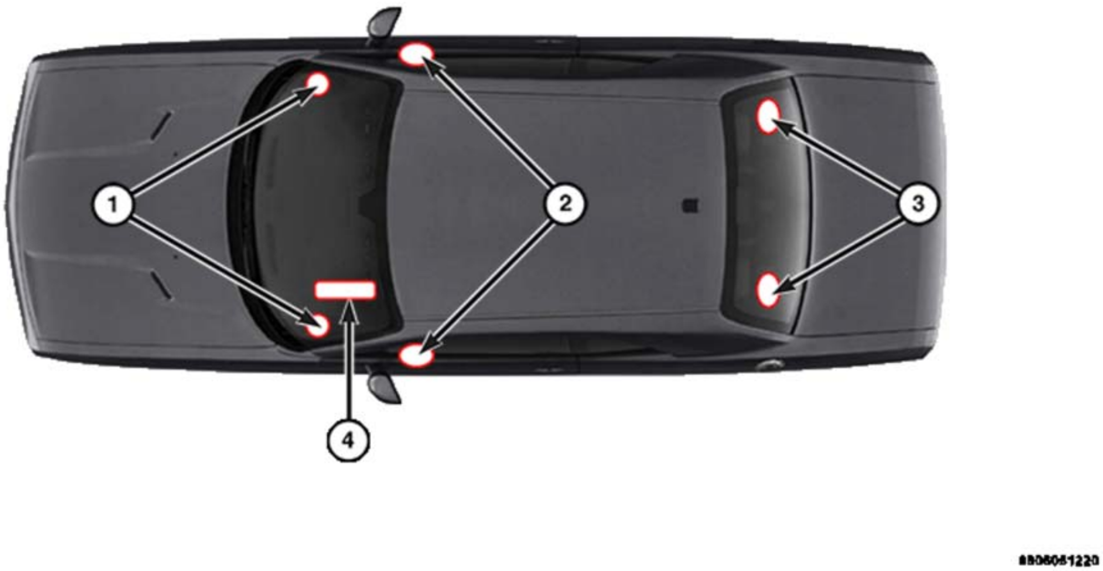


Fig. 26: Speakers - Premium 1
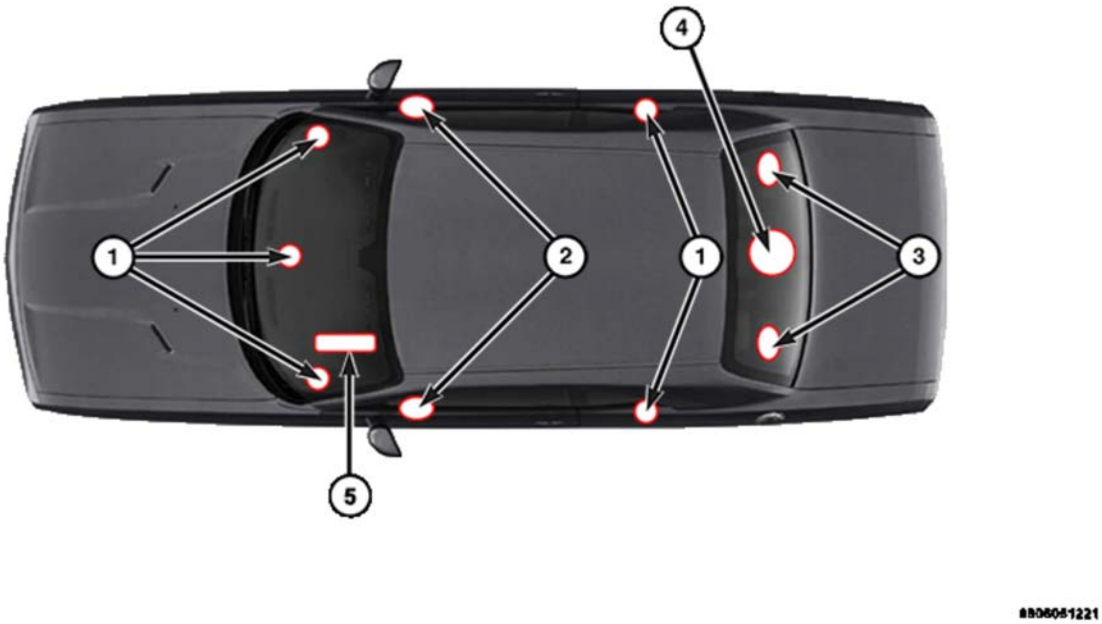
Courtesy of CHRYSLER GROUP, LLC

The Premium 1 speaker system (Sales Code RCJ) includes six speakers in six locations and an audio power amplifier.

- Two 8.89 centimeter (3.5 inch) diameter midrange tweeters (1) located on the top of the instrument panel, one at each outboard end.
- Two 15.2 X 23 centimeter (6 X 9 inch) diameter speakers (2) located on the inner door panels, one at the lower front corner of each door.
- Two 16.5 centimeter (6.5 inch) diameter speakers (3) located on the package shelf, one at each outboard end.
- An 8 channel, 276 watt amplifier (4) is located under the instrument panel to the left of the steering column. Refer to **AMPLIFIER, DESCRIPTION**.

The speakers cannot be adjusted or repaired. If ineffective or damaged they must be replaced.

PREMIUM II



[Fig. 27: Speakers - Premium 2](#)
Courtesy of CHRYSLER GROUP, LLC

The Premium II speaker system (Sales Code RC3) includes nine speakers in nine locations, a dual voice coil subwoofer and an audio power amplifier.

- Five 8.89 centimeter (3.5 inch) diameter midrange tweeters (1) located on the top of the instrument panel and on each quarter trim panel. One is at each outboard end and one in the center of the instrument panel, and one is at the upper front corner of each quarter trim panel.
- Two 15.2 X 23 centimeter (6 X 9 inch) diameter speakers (2) located on the inner door panels, one at the lower front corner of each door.
- Two 16.5 centimeter (6.5 inch) diameter speakers (3) located on the package shelf, one at each outboard end.
- One 20.32 centimeter (8 inch) diameter Dual Voice Coil (DVC) subwoofer (4) located on the package shelf, near the center.
- A 12 channel, 506 watt amplifier (5) is located under the instrument panel to the left of the steering column. Refer to **AMPLIFIER, DESCRIPTION**.

The speakers and subwoofer cannot be adjusted or repaired. If ineffective or damaged they must be replaced.

PREMIUM III

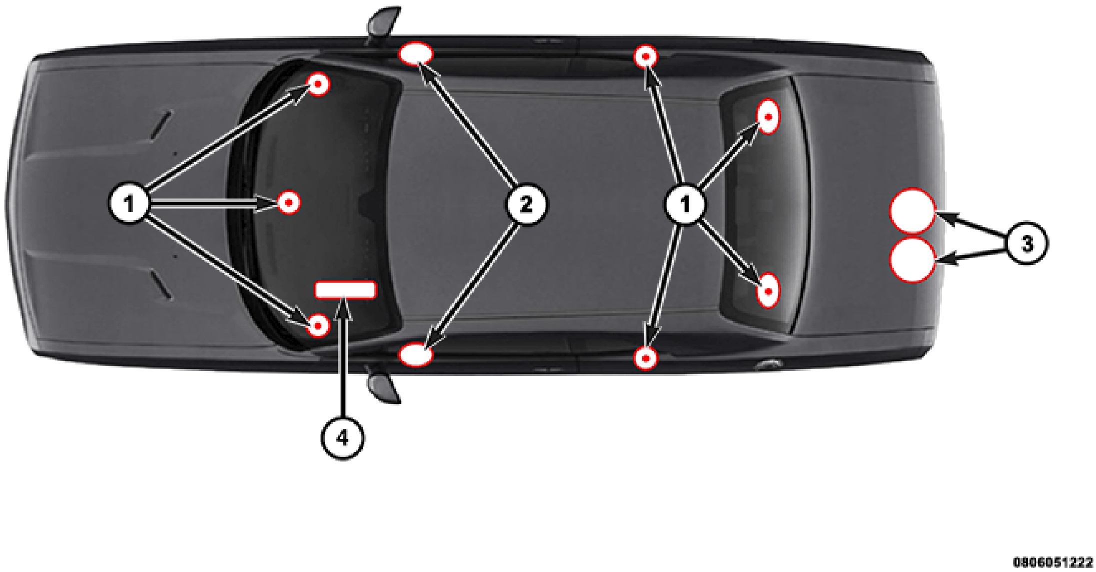


Fig. 28: Speakers - Premium 3
Courtesy of CHRYSLER GROUP, LLC

The Premium III speaker system (Sales Code RGE) includes 17 speakers in nine locations, dual subwoofers and an audio power amplifier.

- Seven 8.89 plus 2.54 centimeter (3.5 plus 1 inch) diameter coaxial speakers (1) located on the top of the instrument panel, on each quarter trim panel and on the package shelf. One is at each outboard end and one in the center of the instrument panel, one is at the upper front corner of each quarter trim panel, and one is at each outboard end of the package shelf.
- Two 15.2 X 23 centimeter (6 X 9 inch) diameter speakers (2) located on the inner door panels, one at the lower front corner of each door.
- Two 25.4 centimeter (10 inch) diameter Dual Voice Coil (DVC) subwoofers (3) located within the trunk compartment. The subwoofers are located within a special enclosure mounted in the spare tire well of the trunk and also includes a bin designed to store a tire inflation kit that replaces the spare tire.
- A 12 channel, Class D amplifier is located under the instrument panel to the left of the steering column. Refer to **AMPLIFIER, DESCRIPTION**.

The speakers and subwoofers cannot be adjusted or repaired. If ineffective or damaged they must be replaced.

OPERATION

BASE

Two wires connected to each speaker, one feed circuit (+) and one return circuit (-), allow the audio output signal electrical current from the amplifier section of the Radio Receiver Module (RRM) (also known as the radio or the head unit) to flow through each speaker voice coil.

The hard wired circuits between the RRM and the speakers may be diagnosed using conventional diagnostic

tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

PREMIUM I

Fig. 29: Speakers - Premium 1
Courtesy of CHRYSLER GROUP, LLC

Two wires connected to each speaker, one feed circuit (+) and one return circuit (-), allow the audio output signal electrical current from the appropriate channel of the audio power amplifier to flow through the speaker voice coil. The graphic above shows the mapping of the amplifier channels to the speakers. However, it should be noted that channels 5 and 6 of the 8 channel amplifier are unused.

The hard wired circuits between the audio power amplifier and the speakers, or between the Radio Receiver Module (RRM) (also known as the radio or the head unit) and the amplifier may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

PREMIUM II

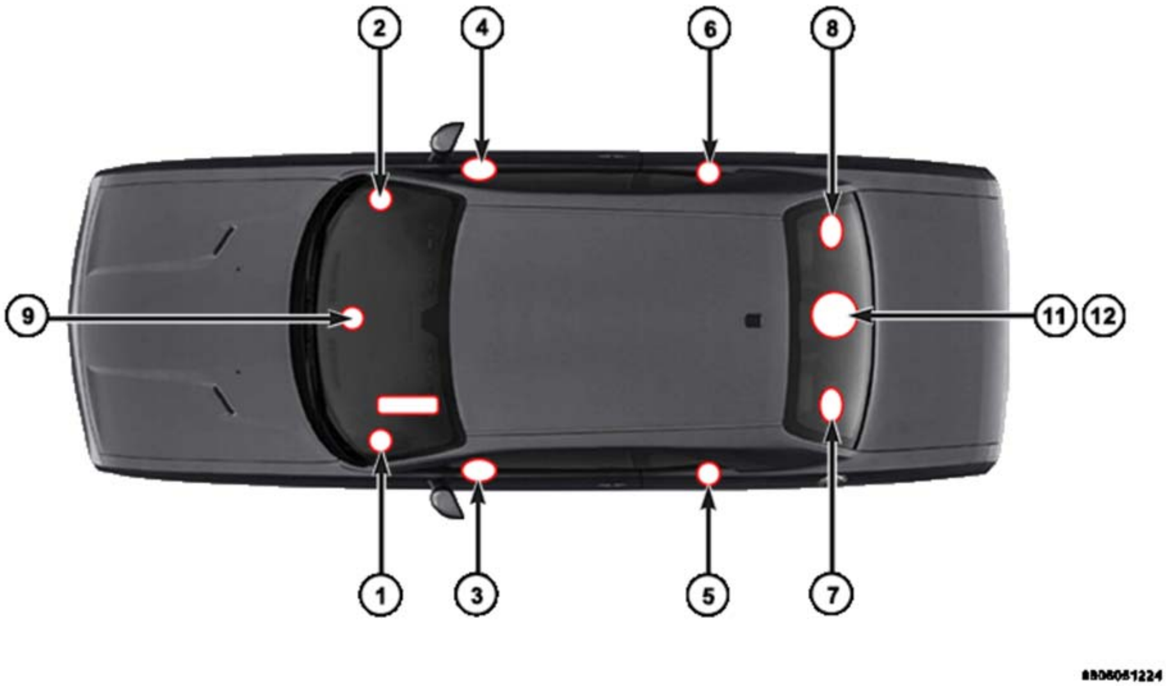

Fig. 30: Speakers - Premium 2
Courtesy of CHRYSLER GROUP, LLC

Two wires connected to each speaker, one feed circuit (+) and one return circuit (-), allow the audio output signal electrical current from the appropriate channel of the audio power amplifier to flow through the speaker voice coil or coils (subwoofer). The graphic above shows the mapping of the amplifier channels to the speakers and subwoofer. However, it should be noted that channel 10 of the 12 channel amplifier is unused.

The hard wired circuits between the audio power amplifier and the speakers and subwoofer, or between the Radio Receiver Module (RRM) (also known as the radio or the head unit) and the amplifier may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

PREMIUM III

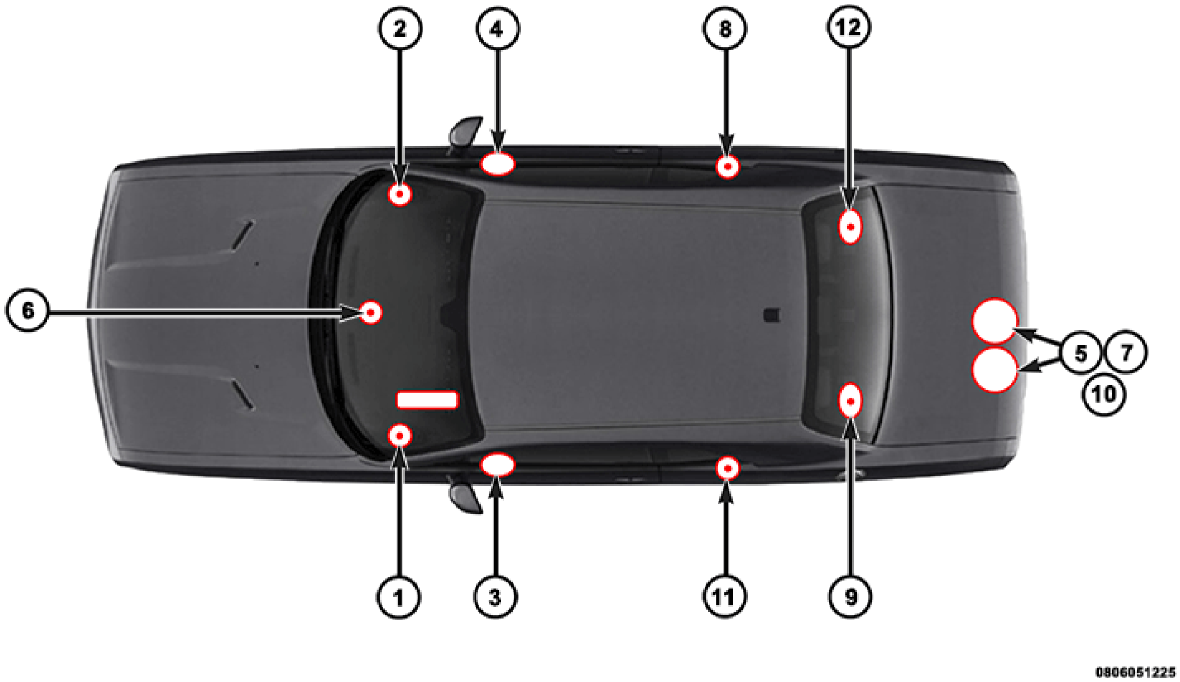

Fig. 31: Speakers - Premium 3
Courtesy of CHRYSLER GROUP, LLC

Two wires connected to each speaker, one feed circuit (+) and one return circuit (-), allow the audio output signal electrical current from the appropriate channel of the audio power amplifier to flow through the speaker voice coil or coils (subwoofer). The graphic above shows the mapping of the amplifier channels to the speakers and subwoofers.

The hard wired circuits between the audio power amplifier and the speakers or subwoofers, or between the Radio Receiver Module (RRM) (also known as the radio or the head unit) and the amplifier may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SPEAKER

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbags, airbag curtains, knee blocker, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect the IBS/negative battery cable assembly from the negative battery post, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

CAUTION: The speaker output of the radio is a "floating ground" system. Do not allow any speaker lead to short to ground, as damage to the radio may result.

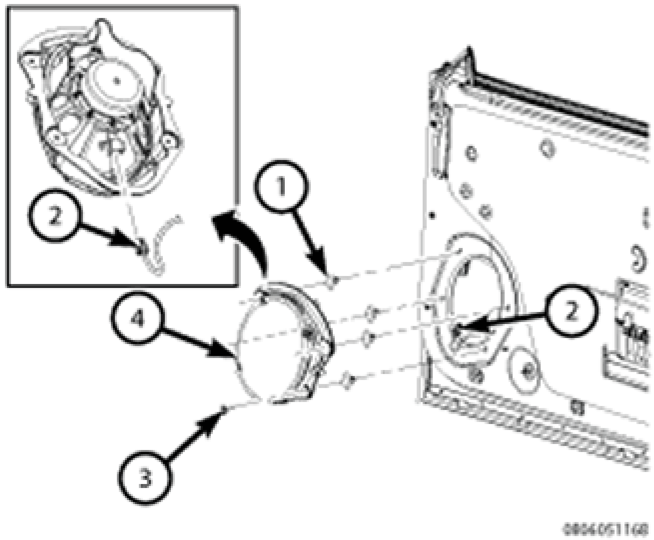
The hard wired circuits between components related to the audio system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the Radio Receiver Module (RRM), the audio power amplifier or the electronic controls and communication between modules and other devices that provide some features of the audio system. The most reliable, efficient and accurate means to diagnose the RRM, the audio power amplifier or the electronic controls and communication related to audio system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

1. If all speakers are inoperative, inspect all of the RRM related fuses. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the ineffective fuse.
2. If equipped with an audio power amplifier, check the fuse for the amplifier. If OK, go to Step 3. If not OK, repair the shorted circuit or component as required and replace the ineffective fuse.
3. Transition the ignition switch to the On status. Turn the RRM On. Adjust the balance and fader control controls to check the performance of each individual speaker. Note the speaker locations that are not performing correctly. Go to Step 4.
4. Turn the RRM Off. Transition the ignition switch to the Off status. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable. If vehicle is **not** equipped with an audio power amplifier, remove the RRM. If vehicle is equipped with an amplifier, disconnect wire harness connector at the output side of the amplifier. Go to Step 5.
5. Check both the speaker feed (+) circuit and return (-) circuit cavities for the inoperative speaker at the RRM wire harness connector for continuity to ground. There should be no continuity. If OK, go to Step 6. If not OK, repair the shorted speaker feed (+) and/or return (-) circuit(s) to the speaker as required.
6. Disconnect the wire harness connector at the inoperative speaker. Check for continuity between the speaker feed (+) circuit cavities of the RRM wire harness connector or, if equipped, the audio power amplifier wire harness connector and the speaker wire harness connector. Repeat the check between the speaker return (-) circuit cavities of the RRM wire harness connector and the speaker wire harness connector. In each case, there should be continuity. If OK, replace the ineffective speaker. If not OK, repair the open speaker feed (+) and/or return (-) circuit(s) as required.

REMOVAL

DOOR PANEL



[Fig. 32: Speaker, Wire Harness Connector & Fasteners]
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery.
2. Remove the trim panel from the inside of the door. Refer to **PANEL, DOOR TRIM, REMOVAL** .
3. Remove the four screws (3) that secure the speaker (4) to the door inner panel.

NOTE: **Support the speaker while disconnecting the wire harness connector. Do not let the speaker hang from the wire harness.**

4. Pull the speaker away from the door far enough to access and disconnect the wire harness connector (2) from the speaker.
5. Remove the speaker from the door.

INSTRUMENT PANEL

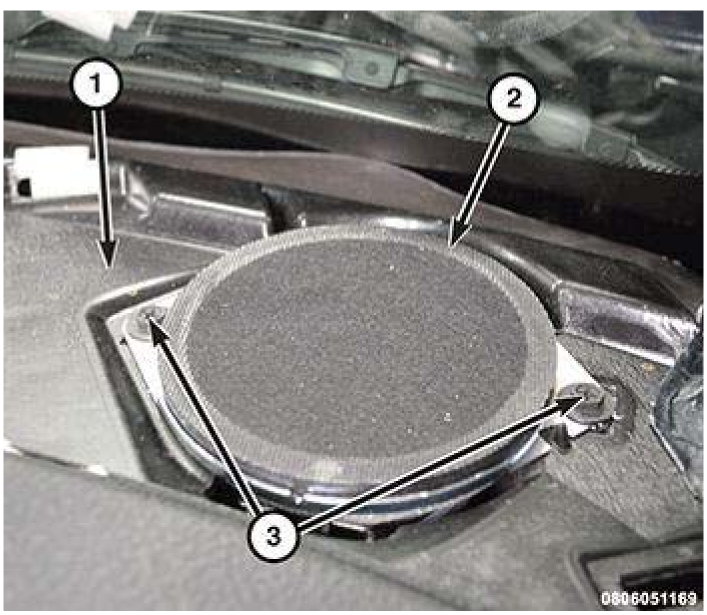


Fig. 33: Instrument Panel Support Structure, Speaker & Screws
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery.
2. Remove the defroster grille from the top of the instrument panel. Refer to **GRILLE, DEFROSTER, REMOVAL** .
3. Remove the two screws (3) that secure the speaker (2) to the top of the instrument panel support structure (1).
4. Pull the speaker out of the instrument panel far enough to access and disconnect the wire harness connector from the speaker.
5. Remove the speaker from the instrument panel.

QUARTER PANEL

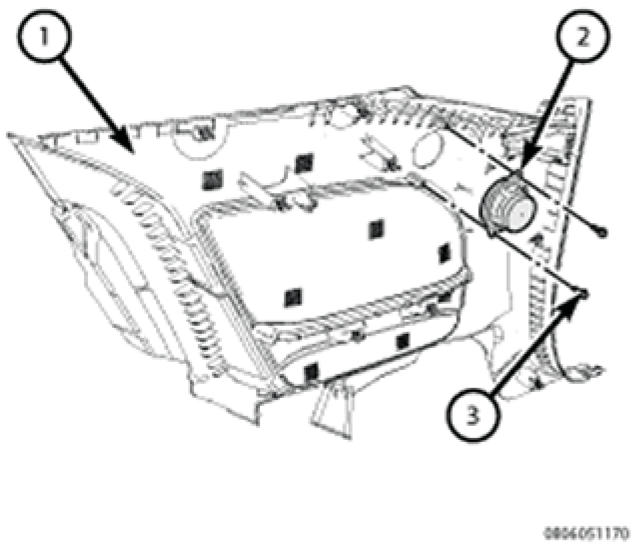

Fig. 34: Quarter Trim Panel, Speaker & Screws
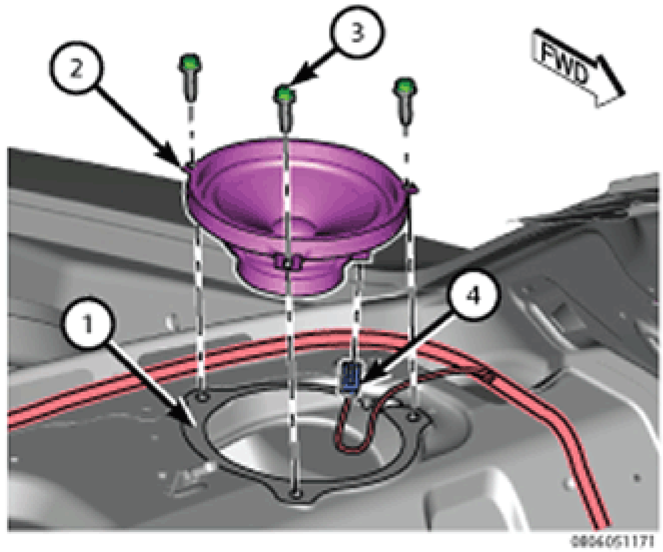
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery.
2. Remove the trim panel from the quarter inner panel. Refer to **PANEL, QUARTER TRIM, REMOVAL** .
3. Remove the two screws (3) that secure the speaker (2) to the back of the quarter trim panel (1).
4. Remove the speaker from the quarter trim panel.

SHELF PANEL



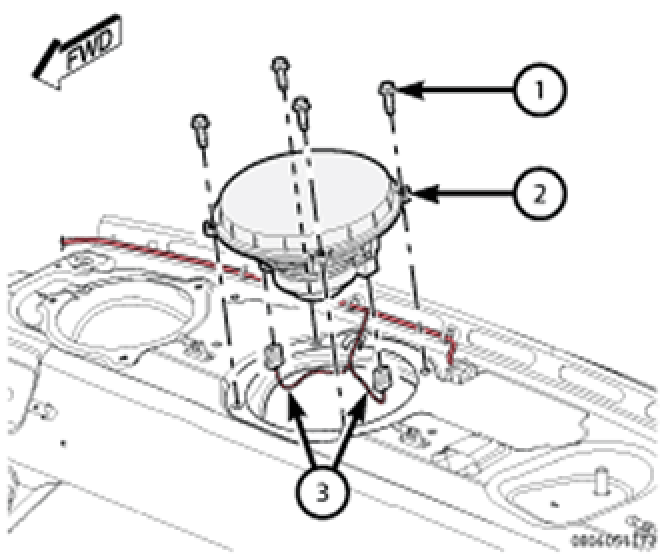
[Fig. 35: Shelf Panel Support, Speaker, Wire Harness Connector & Screws]

Courtesy of CHRYSLER GROUP, LLC

NOTE: **16.5 centimeter (6.5 inch) speaker shown, 8.89 centimeter (3.5 inch) similar.**

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery.
2. Remove the trim from the package shelf panel. Refer to PANEL, REAR SHELF, REMOVAL .
3. Remove the three screws (3) that secure the speaker (2) to the shelf panel support (1).
4. Lift the speaker up from the shelf panel support far enough to access and disconnect the wire harness connector (4) from the speaker.
5. Remove the speaker from the shelf panel.

SUBWOOFER - SHELF PANEL



[Fig. 36: Subwoofer, Wire Harness Connectors & Screws]

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery.
2. Remove the trim from the package shelf panel. Refer to **PANEL, REAR SHELF, REMOVAL** .
3. Remove the four screws (1) that secure the subwoofer (2) to the shelf panel support.
4. Lift the subwoofer up from the shelf panel support far enough to access and disconnect the two wire harness connectors (3) from the subwoofer.
5. Remove the subwoofer from the shelf panel.

SUBWOOFER - TRUNK

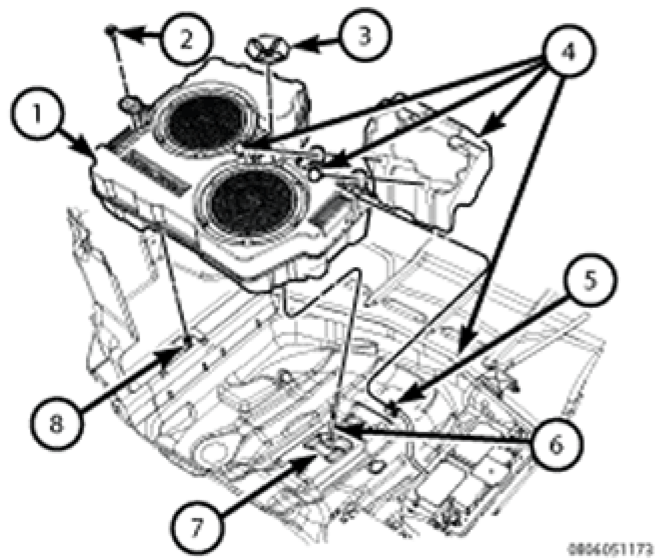


Fig. 37: Subwoofer Assembly
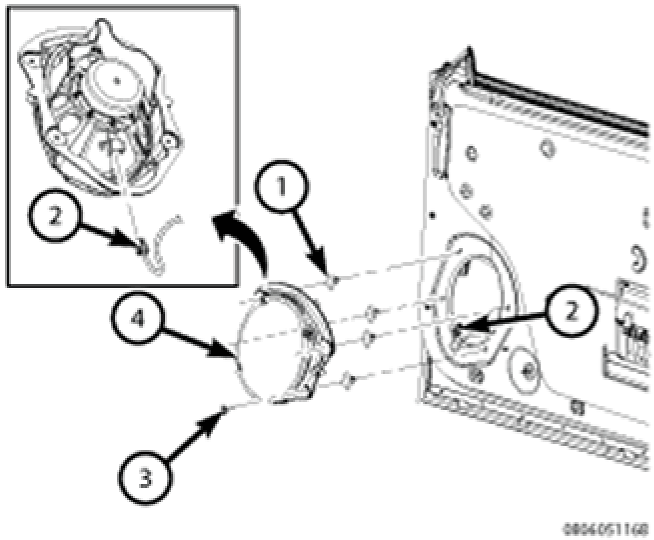
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery.
2. Remove the hold down retainer (3) that secures the subwoofer assembly (1) to the special bolt (6) in the hold down bracket (7) in the spare tire well of the trunk floor panel.
3. Remove the screw (2) that secures the subwoofer assembly to the rivet nut (8) in the left sill of the spare tire well.
4. Disconnect the wire harness connector (5) from the subwoofer assembly.
5. Remove the two push in plastic fasteners that secure the storage bin (4) to the subwoofer assembly.
6. Remove the subwoofer from the vehicle (2).

INSTALLATION

DOOR PANEL



[Fig. 38: Speaker, Wire Harness Connector & Fasteners]
Courtesy of CHRYSLER GROUP, LLC

1. Check to be certain all four spring nuts (1) are properly installed and in good condition in the door inner panel.

NOTE: **Support the speaker while connecting the wire harness connector. Do not let the speaker hang from the wire harness.**

2. Reconnect the wire harness connector (2) to the speaker (4).
3. Position the speaker onto the door inner panel.
4. Install and tighten the four screws (3) that secure the speaker to the door inner panel. Tighten the screws securely.
5. Reinstall the trim panel onto the inside of the door. Refer to PANEL, DOOR TRIM, INSTALLATION .
6. Reconnect the negative cable to the battery. If equipped with an Intelligent Battery Sensor (IBS), reconnect the IBS connector.

INSTRUMENT PANEL

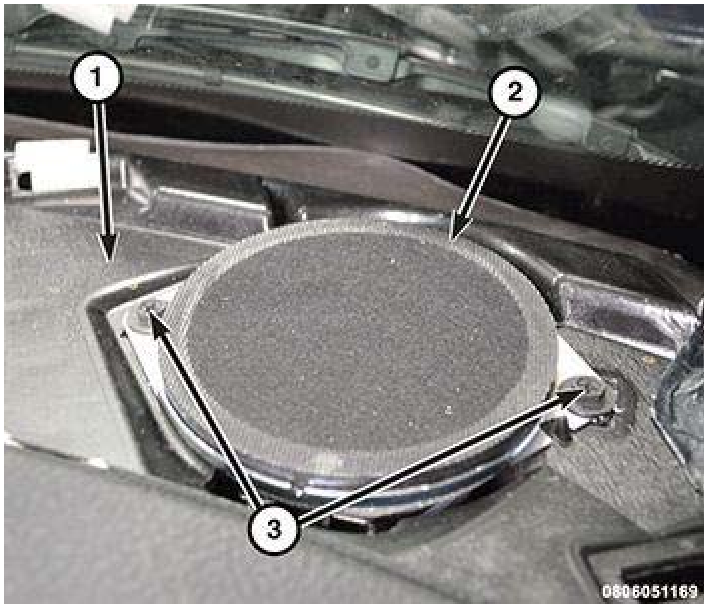


Fig. 39: Instrument Panel Support Structure, Speaker & Screws
Courtesy of CHRYSLER GROUP, LLC

1. Position the speaker (2) near the mounting hole in the top of the instrument panel structural support (1).
2. Reconnect the wire harness connector to the speaker and position it into the mounting hole of the instrument panel.
3. Install and tighten the two screws (3) that secure the speaker to the instrument panel structural support. Tighten the screws securely.
4. Reinstall the defroster grille onto the top of the instrument panel. Refer to **GRILLE, DEFROSTER, INSTALLATION** .
5. Reconnect the negative cable to the battery. If equipped with an Intelligent Battery Sensor (IBS), reconnect the IBS connector.

QUARTER PANEL

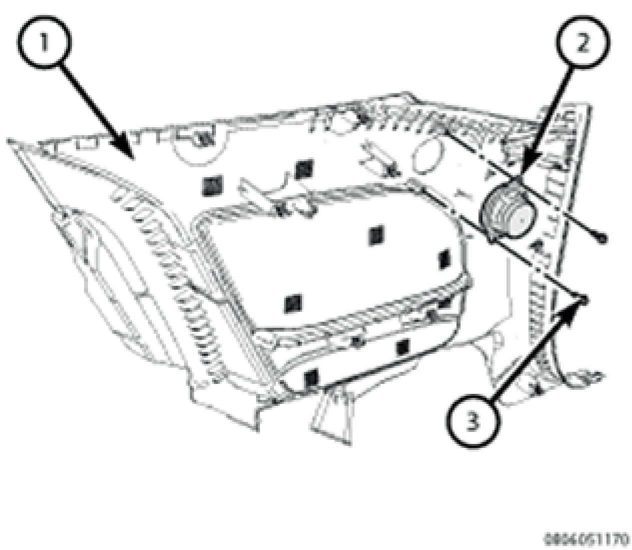

Fig. 40: Quarter Trim Panel, Speaker & Screws
Courtesy of CHRYSLER GROUP, LLC

1. Position the speaker (2) to the back of the quarter trim panel (1).
2. Install and tighten the two screws (3) that secure the speaker to the quarter trim panel. Tighten the screws securely.
3. Reinstall the trim panel onto the quarter inner panel. Refer to **PANEL, QUARTER TRIM, INSTALLATION** .
4. Reconnect the negative cable to the battery. If equipped with an Intelligent Battery Sensor (IBS), reconnect the IBS connector.

SHELF PANEL

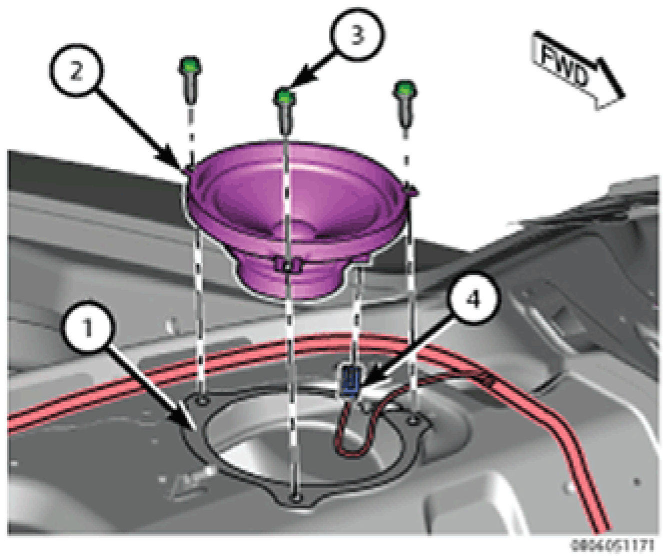

Fig. 41: Shelf Panel Support, Speaker, Wire Harness Connector & Screws
Courtesy of CHRYSLER GROUP, LLC

NOTE: 16.5 centimeter (6.5 inch) speaker shown, 8.89 centimeter (3.5 inch) similar.

1. Position the speaker (2) near the mounting hole in the package shelf panel support (1).
2. Reconnect the wire harness connector (4) to the speaker.
3. Position the speaker into the mounting hole of the shelf panel support.
4. Install and tighten the three screws (3) that secure the speaker to the shelf panel support. Tighten the screws securely.
5. Reinstall the trim onto the shelf panel support. Refer to **PANEL, REAR SHELF, INSTALLATION** .

   Reconnect the negative cable to the battery. If equipped with an Intelligent Battery Sensor (IBS), reconnect the IBS connector.

SUBWOOFER - SHELF PANEL

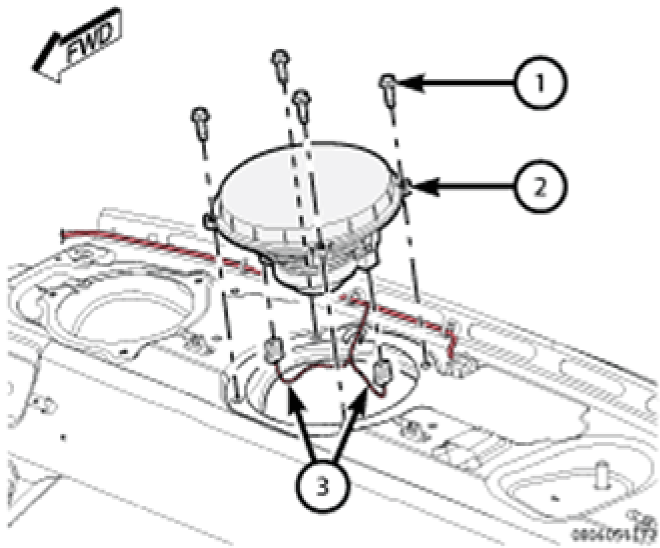

Fig. 42: Subwoofer, Wire Harness Connectors & Screws
Courtesy of CHRYSLER GROUP, LLC

1. Position the subwoofer (2) near the mounting hole in the package shelf panel support.
2. Reconnect the two wire harness connectors (3) to the subwoofer.
3. Position the subwoofer into the mounting hole of the shelf panel support.
4. Install and tighten the four screws (1) that secure the subwoofer to the shelf panel support. Tighten the screws securely.
5. Reinstall the trim onto the shelf panel support. Refer to **PANEL, REAR SHELF, INSTALLATION** .
6. Reconnect the negative cable to the battery. If equipped with an Intelligent Battery Sensor (IBS), reconnect the IBS connector.

SUBWOOFER - TRUNK

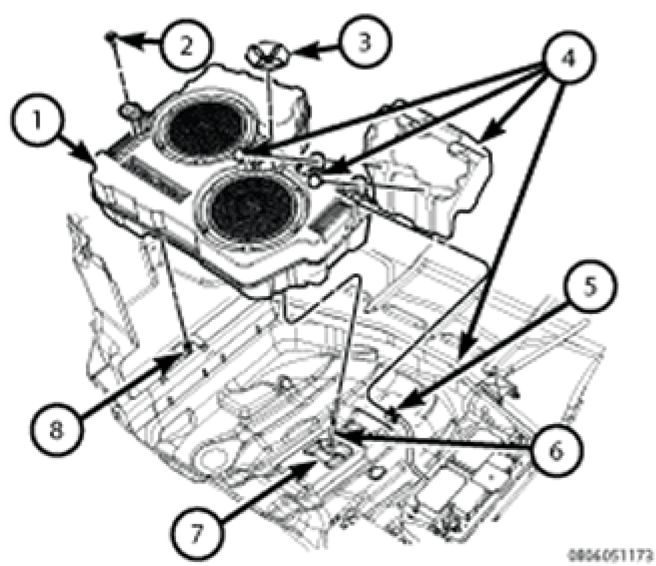

Fig. 43: Subwoofer Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Position the storage bin (4) into the right front corner of the spare tire well in the trunk.

2. Be certain that the special bolt (6) is properly positioned in the hold down bracket (7) in the spare tire well of the trunk floor panel.
3. Position the subwoofer assembly (1) over the special bolt and lower it into the spare tire well.
4. Align the subwoofer assembly with the rivet nut (8) in the left sill of the spare tire well and to the storage bin in the right front corner of the spare tire well.
5. Install the two push in plastic fasteners (4) that secure the storage bin to the subwoofer assembly.
6. Reconnect the wire harness connector (5) to the subwoofer assembly.
7. Install and tighten the screw (2) that secures the subwoofer assembly to the rivet nut in the left sill of the spare tire well. Tighten the screw to **SPECIFICATIONS**.
8. Install and tighten the hold down retainer (3) that secures the subwoofer assembly to the special bolt in the spare tire well of the trunk floor panel. Tighten the retainer securely.
9. Reconnect the negative cable to the battery. If equipped with an Intelligent Battery Sensor (IBS), reconnect the IBS connector.

SWITCH, REMOTE RADIO

DESCRIPTION

WITHOUT PADDLE SHIFT

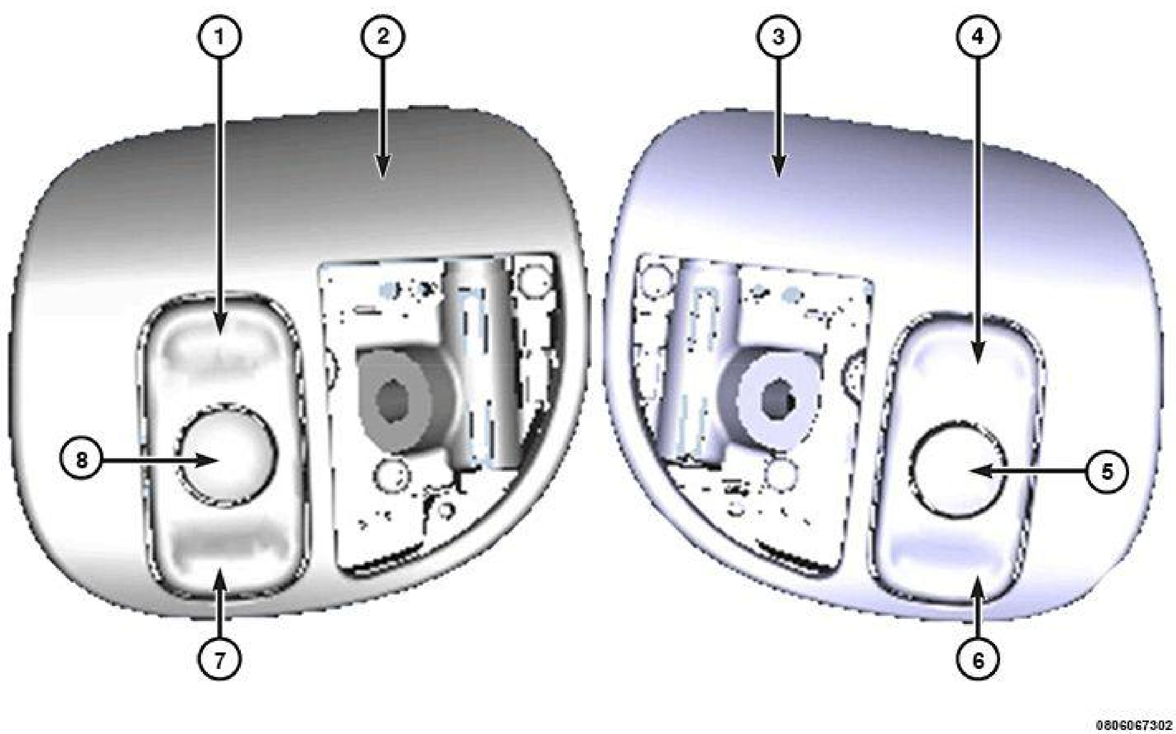

Fig. 44: Remote Radio Switches
Courtesy of CHRYSLER GROUP, LLC

The remote radio switches (2 and 3) are mounted to the back of the steering wheel. Each switch includes a momentary rocker with a momentary push button located in the center, between the two ends of the rocker. On vehicles not equipped with the steering wheel mounted paddle shift switches the right switch (1) includes the following functions:

- Volume Up (1)
- Mode (8)
- Volume Down (7)

On vehicles not equipped with the steering wheel mounted paddle shift switches the left switch (2) includes the following functions:

- Seek Up (4)
- Preset (5)
- Seek Down (6)

Refer to **SWITCH, REMOTE RADIO, OPERATION**.

WITH PADDLE SHIFT

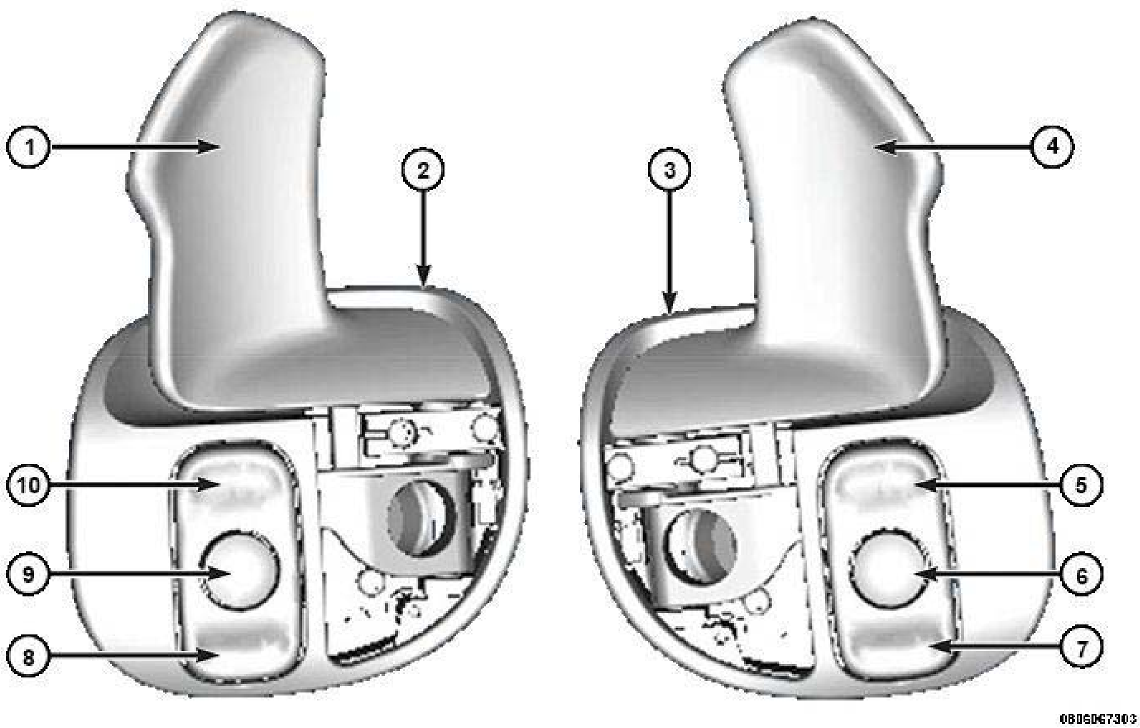

Fig. 45: Remote Radio Switches - With Paddle Shift
Courtesy of CHRYSLER GROUP, LLC

NOTE: SRT paddle shift switches shown. Non-SRT paddle shift switches similar.

The remote radio switches (2 and 3) are mounted to the back of the steering wheel. Each remote radio switch includes a momentary rocker with a momentary push button located in the center, between the two ends of the rocker in addition to the paddle shift switch. On vehicles equipped with the combined steering wheel mounted paddle shift and remote radio switches the right switch (2) includes the following functions:

- Upshift paddle shift switch (1)
- Volume Up (10)
- Mode (9)

- Volume Down (8)

On vehicles equipped with the combined steering wheel mounted paddle shift and remote radio switches the left switch (3) includes the following functions:

- Downshift paddle shift switch (4)
- Seek Up (5)
- Preset (6)
- Seek Down (7)

Refer to **SWITCH, REMOTE RADIO, OPERATION**.

OPERATION

WITHOUT PADDLE SHIFT

The remote radio switches on the backs of both horizontal steering wheel spokes are normally open, resistor multiplexed momentary switches that are hard wired to the left steering wheel switch module (electronic vehicle information center switch). The left steering wheel switch module contains a microcontroller and is a Local Interface Network (LIN) data bus slave node. The left steering wheel switch microcontroller provides a shared five volt signal and monitors shared returns from both remote radio switches. The left steering wheel switch microcontroller senses the status of the remote radio switches by reading the voltage drop on the signal circuit.

When the left steering wheel switch microcontroller senses an input (voltage drop) from any one of the remote radio switches, it communicates the switch status message via the LIN bus and through the clockspring and Steering Column Control Module (SCCM) microcontroller, which is a gateway to the Controller Area Network (CAN) data bus. The CAN bus then broadcasts switch status information to the audio system. The electronic circuitry within the audio system is programmed to respond to these remote radio switch status messages by adjusting the audio settings as requested.

The hard wired circuits between the remote radio switches and the left steering wheel switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the remote radio switches or the electronic communication between modules that provide the features of the remote radio switches. The most reliable, efficient and accurate means to diagnose the remote radio switches or the electronic communication related to remote radio switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

WITH PADDLE SHIFT

REMOTE RADIO SWITCHES

The remote radio switches on the backs of both horizontal steering wheel spokes are normally open, resistor multiplexed momentary switches that are hard wired to the left steering wheel switch module (electronic vehicle information center switch). The left steering wheel switch module contains a microcontroller and is a Local Interface Network (LIN) data bus slave node. The left steering wheel switch microcontroller provides a shared

five volt signal and monitors shared returns from both remote radio switches. The left steering wheel switch microcontroller senses the status of the remote radio switches by reading the voltage drop on the signal circuit.

When the left steering wheel switch microcontroller senses an input (voltage drop) from any one of the remote radio switches, it communicates the switch status message via the LIN bus and through the clockspring and Steering Column Control Module (SCCM) microcontroller, which is a gateway to the Controller Area Network (CAN) data bus. The CAN bus then broadcasts switch status information over the CAN bus to the audio system. The electronic circuitry within the audio system is programmed to respond to these remote radio switch status messages by adjusting the audio settings as requested.

PADDLE SHIFT SWITCHES

The paddle shift switches in the two remote radio switch units are normally open, resistor multiplexed momentary switches that are hard wired to the left steering wheel switch module (electronic vehicle information center switch). The left steering wheel switch module contains a microcontroller and is a Local Interface Network (LIN) data bus slave node. The left steering wheel switch microcontroller provides a shared five volt signal and monitors shared returns from both paddle shift switches. The left steering wheel switch microcontroller senses the status of the paddle shift switches by reading the voltage drop on the signal circuit.

When the left steering wheel switch microcontroller senses an input (voltage drop) from either of the paddle shift switches, it communicates the switch status message via the LIN bus and through the clockspring and Steering Column Control Module (SCCM) microcontroller, which is a gateway to the Controller Area Network (CAN) data bus. The CAN bus then broadcasts switch status information to the Transmission Control Module (TCM) communicating driver request for transmission upshift or downshift.

The hard wired circuits between the remote radio switches or the paddle shift switches and the left steering wheel switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the remote radio switches, the paddle shift switches or the electronic communication between modules that provide the features of the remote radio switches and paddle shift switches. The most reliable, efficient and accurate means to diagnose the remote radio switches, the paddle shift switches or the electronic communication related to remote radio switch and paddle shift switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbags, airbag curtains, knee blocker, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect the IBS/negative battery cable assembly from the negative battery post, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag**

deployment.

Fig. 46: Steering Wheel & Remote Radio Switch Cover
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Without paddle shift shown, with paddle shift similar.**

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery.
2. Remove the Driver air bag from the steering wheel. Refer to **AIR BAG, DRIVER, REMOVAL** .
3. Working from the back of the steering wheel (2), unsnap and remove the remote radio switch cover (1) (with or without paddle shift unit).

Fig. 47: Remote Radio Switch & Screw
Courtesy of CHRYSLER GROUP, LLC

4. Remove the screw (1) that secures the remote radio switch (2) (with or without paddle shift unit) to the steering wheel spoke armature.
5. Carefully pull the remote radio switch (2) away from the steering wheel spoke armature.

Fig. 48: EVIC Switch Screw - Back Of Steering Wheel

NOTE: **Without paddle shift shown, with paddle shift similar.**

1. From the back of the steering wheel, push the remote radio switch connector (1) through the opening in the steering wheel (2).

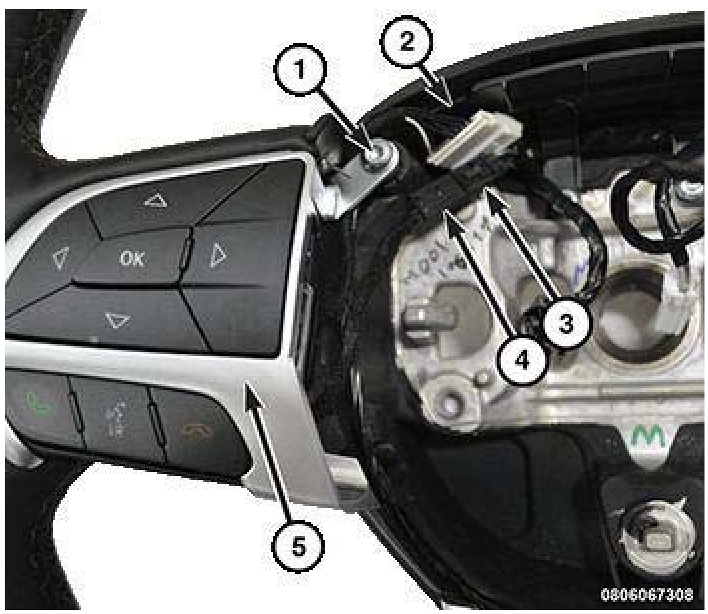

Fig. 52: EVIC Switch, Screw & Connectors
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Make sure that the wire harnesses for the remote radio switch (with or without paddle shift unit) and Electronic Vehicle Information Center (EVIC) switch wiring harness line up with the space provided, as noted during removal, for the wire harnesses before fully seating the EVIC switch in the steering wheel spoke armature.**

2. Connect the remote radio switch connector (4) to the steering wheel wire harness connector (3).
3. Position and carefully seat the EVIC switch (5) and wire harnesses to the steering wheel spoke armature.
4. Install and securely tighten the front screw (1) for the EVIC switch (5) to the steering wheel (2).

Fig. 53: EVIC Switch Screw - Back Of Steering Wheel
Courtesy of CHRYSLER GROUP, LLC

5. From the back of the steering wheel (1), install the rear EVIC switch screw (2) and securely tighten the screw.

Fig. 54: Remote Radio Switch & Screw
Courtesy of CHRYSLER GROUP, LLC

6. Position and carefully seat the remote radio switch (with or without paddle shift unit) to the steering wheel spoke armature.
7. Install and securely tighten the screw (1) that secures the remote radio switch (2) (with or without paddle

shift unit) to the steering wheel spoke armature.

Fig. 55: Steering Wheel & Remote Radio Switch Cover
Courtesy of CHRYSLER GROUP, LLC

8. Install the remote radio switch cover (1) (with or without paddle shift unit). Make sure that the cover is snapped securely into place.
9. Install the Driver air bag in the steering wheel. Refer to **AIR BAG, DRIVER, INSTALLATION** .
10. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.

.

Article GUID: A00735924

DESCRIPTION

HEATED STEERING WHEEL

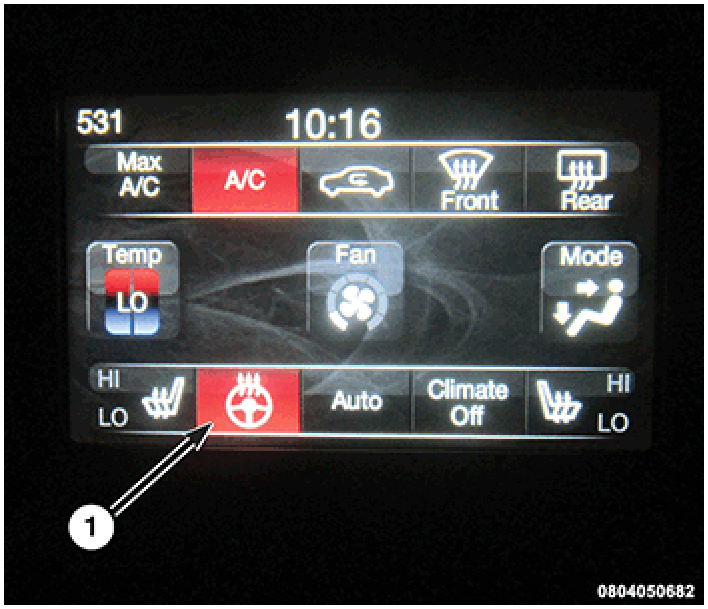

Fig. 1: Heated Steering Wheel Switch
Courtesy of CHRYSLER GROUP, LLC

The heated steering wheel system is designed to enhance the thermal comfort of the driver by heating the steering wheel, when desired. The steering wheel heating element is made of copper wire and is sandwiched between the leather and the substrate material of the steering wheel. A vehicle with a heated steering wheel can easily be identified by the heated steering wheel switch (1) located in the U-Connect Touch ™ screen module, at the center of the instrument panel. When the heated steering wheel switch is pressed on, the heated steering wheel switch illuminates.

The heated steering wheel system consists of the following major components

- **Heated Steering Wheel Switch** - Refer to **SWITCH, HEATED STEERING WHEEL, DESCRIPTION**.
- **Heated Seat Module** - Refer to **MODULE, HEATED SEAT, DESCRIPTION** .
- **Heated Steering Wheel** - Refer to **OPERATION**.

VENTED SEATS

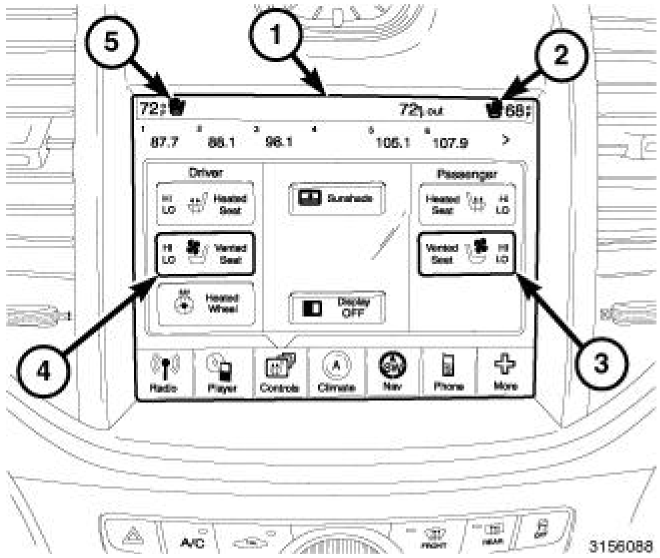

Fig. 2: U-Connect Touch (TM) Screen Module
Courtesy of CHRYSLER GROUP, LLC

The vented seat system is designed to enhance the thermal comfort of the driver and front seat occupant, when desired. Occupant comfort is achieved by pulling air from the outside of the seating surfaces into the seat back and cushion of the seat. Vehicles with the optional vented seat system can be visually identified by the two vented seat switches (3 and 4) located in the U-Connect Touch™ screen module (1), in the center of the instrument panel. The vented seat system allows a ventilated seat occupant to select from two different levels of seat venting (HI and LO).

The vented seat system consist of the following major components:

- **Vented Seat Motors** - Up to four vented seat motors are used per vehicle. Two vented seat motors for each front seat, one for the seat back cushion and the other for the seat bottom cushion.
- **Vented Seat Pads** - Up to four vented seat pads are used per vehicle. Two vented seat pads for each front seat, one on the seat back cushion and the other on the seat bottom cushion.
- **Vented Seat Switches** - Two vented seat switches are used per vehicle, one for each front seat. The vented seat switches are integral to the U-Connect Touch™ screen module and communicate over the Controller Area Network (CAN) data bus. Refer to **SWITCH, VENTED SEAT, DESCRIPTION**.
- **Heated Seat Module** - Refer to **MODULE, HEATED SEAT, DESCRIPTION** .

OPERATION

HEATED STEERING WHEEL

Steering Wheel Switch

- Once the switch is pressed, the switch will illuminate and an International Standards Organization (ISO) symbol appears in to top corner of the U-Connect Touch™ screen module, indicating that the heating element in the steering wheel is operating.
- Pressing the switch while the heated steering wheel is on, will turn the heating steering wheel off.
- When the heated steering wheel switch is pressed and a fault is present in the heated steering wheel system, the switch will illuminate for two seconds and then immediately turn off.

- The heated steering wheel switch located in the U-Connect Touch™ screen module cannot be adjusted or repaired. If a heated steering wheel switch or indicator lamp is inoperative or damaged, the entire U-Connect Touch™ screen module must be replaced.

Heated Seat Module (HSM)

- The HSM provides power to the heated steering wheel heating elements in the steering wheel. This output passes through the Steering Column Control Module (SCCM).
- The SCCM is the interface between the heated steering wheel and the vehicle.
- Body Control Module (BCM) gates messages between the CAN C bus and the CAN IHS bus. Additionally the BCM provides vehicle information to the HSM.
- A thermistor sensor feedback from the heated steering wheel element to the HSM is used to regulate the heat output to prevent the heated steering wheel temperature from rising above the set points.
- The heated steering wheel system will only operate when the vehicle engine is running approximately (RPM > 400).
- The HSM will automatically transition the output from On to Off after a period of 80 minutes has elapsed.

Steering Wheel Thermistor Feedback

- The steering wheel switch receives the steering wheel thermistor data from the heated steering wheel.
- The steering wheel switch transmits the steering wheel thermistor data signal via a LIN bus to the BCM.
- The BCM transmits the steering wheel thermistor data signal to the HSM on the CAN IHS bus.
- When the HSM heated steering wheel output is ON, if the thermistor feedback exceeds 122 degrees Fahrenheit the HSM will immediately turn the heated steering wheel output off.

Auto On Feature

- The "Auto On" feature is a customer configurable feature that, when enabled, will activate the driver heated seat and heated steering wheel on engine start based on ambient temperature.
- If Auto On feature is enabled, and the ambient temperature is at or below 4Â° C (40Â° F) the HSM will activate the driver heated seat and heated steering wheel feature at the high level after engine start.
- This feature also works with Remote Start.

The heated steering wheel system is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** . The steering wheel heating element is not serviced separately from the steering wheel and if inoperative or damaged, the entire steering wheel assembly must be replaced. Refer to **WHEEL, STEERING, REMOVAL** .

VENTED SEATS

Vented Seat Switch

- The vented seat switches located in the U-Connect Touch ™ screen module.
- When the vented seat switch is selected, a CAN-IHS message is delivered to the HSM to operate the vented seat system.
- The vented seats have two selectable speeds with a hidden intermediate speed.

- There are two selectable speeds for the vented motors. These speeds are selected by the driver and/or front passenger by pressing the vented seat switches, located in the U-Connect Touch™ screen module.

Heated Seat Module

- The HSM provides the vented seat motors with a variable Pulse Width Modulated (PWM) signal used to control the brushless fan seat motors.
- The HSM supplies a PWM control circuit to the motors for varied fan output levels.
- The vented seat system will only operate when the vehicle engine is running (EngRPM > 400).
- The HSM will not activate the vented seat output if the heated seat output is active for the same seat.
- The HSM has the ability to control the front left and front right seat outputs individually.
- **Auto On Feature** The Auto On feature is a customer configurable feature that when enabled will activate the driver vented seat on engine start based on ambient temperature. If Auto On feature is enabled, and the ambient temperature is at or above 27Â° C (80Â° F) the HSM will activate the driver vented seat in LOW mode. This feature also works when using remote start. During remote start operation, vented seat is ON in the HIGH mode. Once operator depresses ignition switch into RUN state, vented seat mode switches to LOW setting.

Vented Seat Motor

- The vented seat motor located in the seat bottom pan or in the seat back frame cannot be adjusted or repaired and must be replaced if inoperative or damaged. Refer to **MOTOR, VENTED SEAT, REMOVAL**.
- When the HSM determines a vent output is shorted or fully open the HSM immediately turns the affected vented seat outputs off and matures the appropriate diagnostic trouble code (DTC). Refer to **DIAGNOSIS AND TESTING** .

The vented seat system is diagnosed using a scan tool. The individual front vented seat switches located in the U-Connect Touch ™ screen module cannot be adjusted or repaired. If a front vented seat switch or indicator is inoperative or damaged, the entire U-Connect Touch ™ screen module must be replaced.

DIAGNOSIS AND TESTING

HEATED STEERING WHEEL

NOTE: **Vehicles equipped with the heated steering wheel option utilize a low voltage cut-off feature. This feature turns off power to the heated steering wheel anytime vehicle voltage is below 9.0 volts or above 16.0 volts. Be certain to check the vehicle electrical system for proper voltage anytime the heated steering wheel appears inoperative.**

NOTE: **If a Diagnostic Trouble Code (DTC) can not be verified, it is a good indication that an INTERMITTENT fault condition may be present. To help find an intermittent problem, move the steering wheel around while testing continuity. Also wiggle the heated steering wheel wire harness and electrical connectors while testing continuity.**

NOTE: **For complete circuit diagrams, refer to appropriate SYSTEM WIRING DIAGRAMS article . Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.**

NOTE: **The Auto On feature is designed to function at an ambient temperature of 40Â° F or below. Make sure this option is enabled in the customer programmable interface prior to diagnosis of an inoperative Auto On feature concern.**

Before testing any individual components in the heated steering wheel system, check the following:

- Check the ignition fuse in the Power Distribution Center (PDC). Repair as necessary.
- Using a scan tool, check for any Diagnostic Trouble Codes (DTCs) related to the Heated Seat Module (HSM), U-Connect Touch ™ screen module and the Electronic Gateway (EGW). If any DTCs are found, repair as necessary.
- Check the vehicles battery open-circuit voltage and charging system performance. If the vehicle's electrical system is defective or weak it may not be supplying sufficient energy to operate the heated steering wheel system.
- If there are no DTCs and the heated steering wheel system functions properly, but the heated steering wheel indicator does not illuminate, the entire U-Connect Touch ™ screen module must be replaced.

VENTILATED SEATS

NOTE: **Vehicles equipped with the ventilated seat option utilize a low voltage cut-off feature. This feature turns off power to the ventilated seat system anytime vehicle voltage is below 9.0 volts or above 16.0 volts. Be certain to check the vehicle electrical system for proper voltage anytime the ventilated seat system appears inoperative.**

NOTE: **If a Diagnostic Trouble Code (DTC) can not be verified, it is a good indication that an INTERMITTENT fault condition may be present. To help find an intermittent problem, sit in the seat in question and move around within the seat while testing continuity. Also wiggle the ventilated seat wire harness and electrical connectors while testing continuity.**

NOTE: **For complete circuit diagrams, refer to appropriate SYSTEM WIRING DIAGRAMS article . Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations.**

Before testing any individual components in the ventilated seat system, check the following:

- Check the ignition fuse in the Power Distribution Center (PDC). Repair as necessary.
- Using a scan tool, check for any Diagnostic Trouble Codes (DTCs) related to the Heated Seat Module (HSM), U-Connect Touch ™ screen module and the Electronic Gateway (EGW). If any DTCs are found, repair as necessary.
- Check the vehicles battery open-circuit voltage and charging system performance. If the vehicle's

electrical system is defective or weak it may not be suppling sufficient energy to operate the front vented seat system.

- If there are no DTCs and the front vented seat system functions properly, but a vented seat indicator does not illuminate, the entire U-Connect Touch ™ screen module must be replaced.

MOTOR, VENTED SEAT

DESCRIPTION

DESCRIPTION

When equipped, each front seat has two vented seat motors. One motor is mounted to the seat back frame and the second motor is mounted to the seat bottom pan. Each vented seat motor is attached to a vented seat pad. Each vented seat motor consists of a 12 volt Direct Current (DC) motor with an integral fan blade and a wire lead and connector. Each vented seat motor is attached to a metal mounting bracket. Each motor is serviced individually by replacement only.

OPERATION

OPERATION

Refer to **OPERATION**.

REMOVAL

SEAT BACK VENTED MOTOR

WARNING: Disable the airbag system before attempting any front seat diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury. Refer to WARNING .

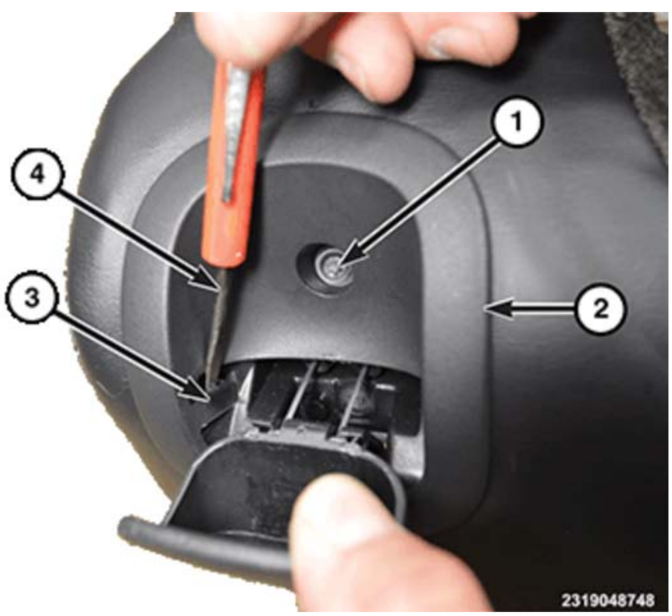

Fig. 3: Seat Back Release Cable Bezel, Tabs, Tool & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to **SEATS, FRONT, WARNING** .
2. Remove the front seat back. Refer to **SEAT BACK, FRONT, REMOVAL** .
3. Remove the front seat back panel. Refer to **PANEL, SEAT BACK, FRONT, REMOVAL** .
4. Remove the screw (1) from the seat back release cable bezel (2).
5. Using a small bladed tool (4), release the tabs (3) and remove the seat back release cable bezel.

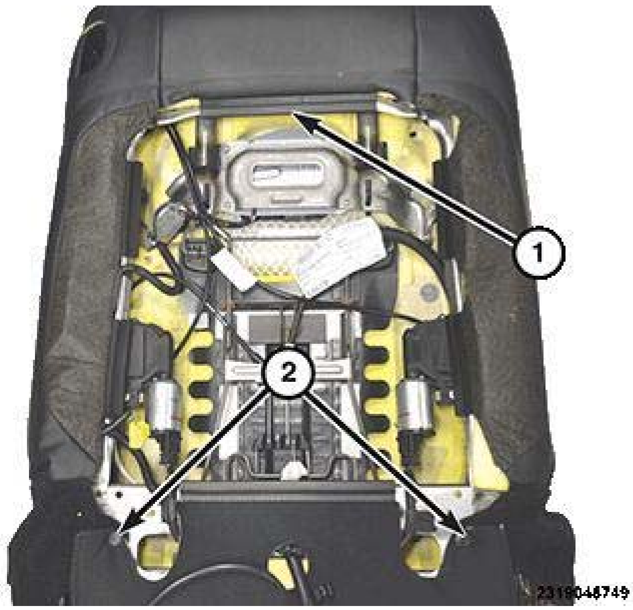

Fig. 4: J-Clip Retainers & Push Fasteners
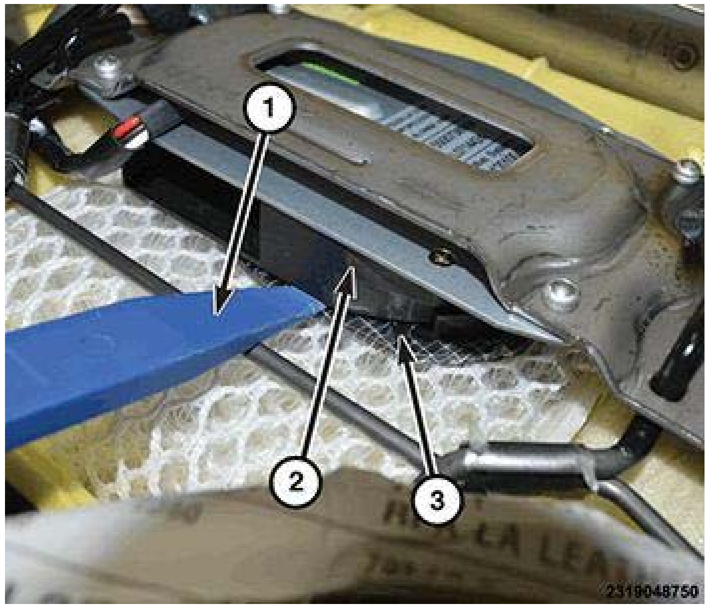
Courtesy of CHRYSLER GROUP, LLC

6. Remove the two push fasteners (2).
7. Release all the J-clip retainers (1).

[Fig. 5: Headrest Sleeve & Tab](#)
Courtesy of CHRYSLER GROUP, LLC

8. Reach up behind the seat back cover and push the tab (1) of the headrest sleeve (2) and pull out to remove.



[Fig. 6: Prying Seat Back Ventilation Plenum](#)
Courtesy of CHRYSLER GROUP, LLC

9. Using a trim stick (1) of equivalent, pry the seat back ventilation plenum (3) from the seat back blower (2), if equipped.
10. Remove the seat back foam and seat back cover as an assembly, from the seat back frame.

[Fig. 7: Vented Seat Motor Connector](#)
Courtesy of CHRYSLER GROUP, LLC

11. Disconnect the vented seat motor electrical connector (1) from the wiring harness.

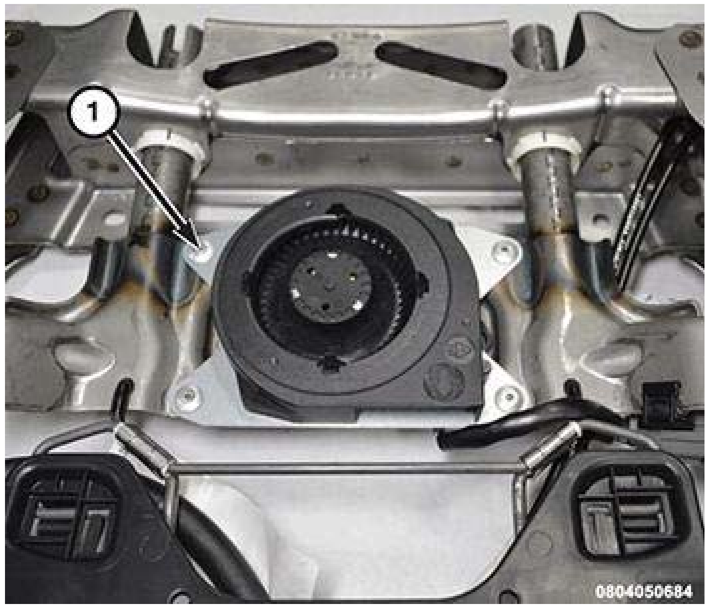


Fig. 8: Vented Seat Motor Rivet
Courtesy of CHRYSLER GROUP, LLC

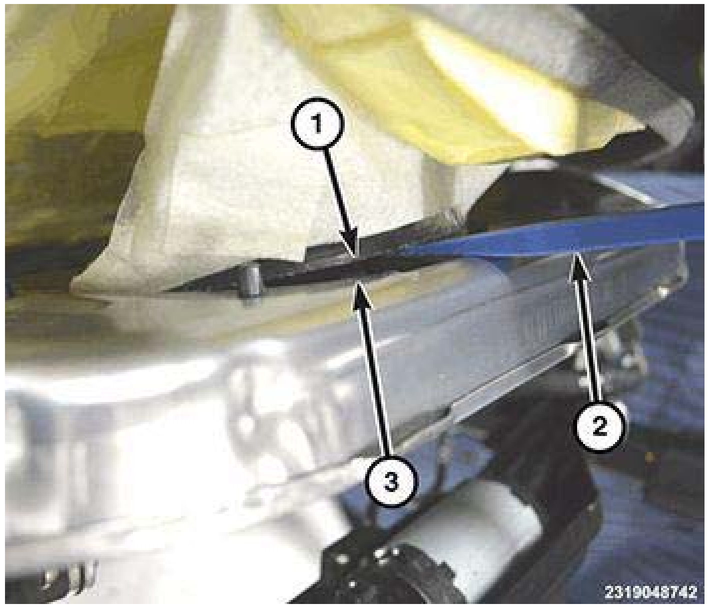
12. Drill out the four rivets (1) to remove the vented seat motor from the bracket mount.

SEAT BOTTOM VENTED MOTOR

WARNING: **Disable the airbag system before attempting any front seat diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury. Refer to WARNING .**

NOTE: **On all models, the front passenger seat contains an Occupant Detection Sensor (ODS) to provide information to the Occupant Restraint Controller (ORC). When servicing the front passenger seat, if required, remove the ODS from the seat bottom cushion and discard the sensor. Refer to SENSOR, OCCUPANT DETECTION, REMOVAL .**

1. Remove the seat bottom cover and cushion. Refer to **COVER, SEAT CUSHION, FRONT, REMOVAL** .

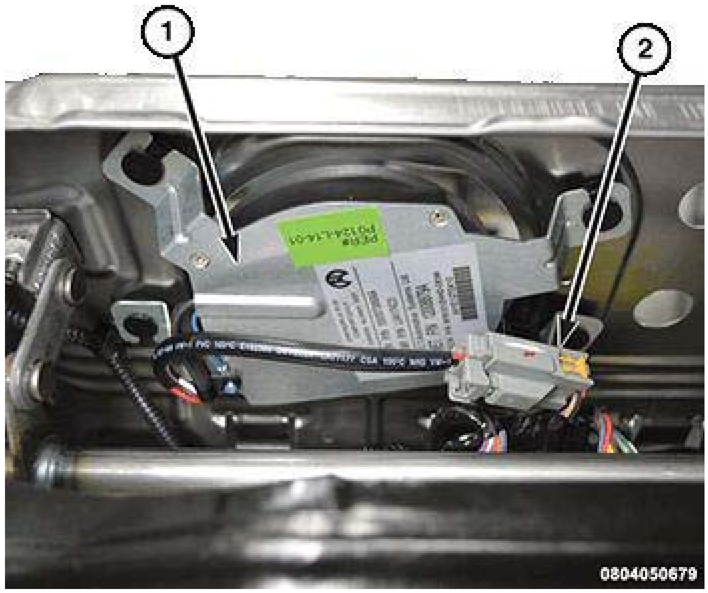


[Fig. 9: Prying Seat Cushion Ventilation Plenum From Seat Cushion Blower]
Courtesy of CHRYSLER GROUP, LLC

2. Carefully unwrap the cover and foam at the front of the seat cushion. Using a trim stick (2) or equivalent, release the seat cushion ventilation plenum (1) from the seat cushion blower (3), if equipped.

[Fig. 10: Seat Cushion Ventilation Plenum]
Courtesy of CHRYSLER GROUP, LLC

3. Lift the seat cushion ventilation plenum (1) away from the vented seat motor.



[**Fig. 11: Vented Seat Motor Electrical Connector**]
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the vented seat motor electrical connector (2) from the wiring harness.

[**Fig. 12: Vented Seat Motor Tabs**]
Courtesy of CHRYSLER GROUP, LLC

5. Break the four tabs (1) securing the vented seat motor to the seat bottom frame.

INSTALLATION

SEAT BACK VENTED MOTOR

WARNING: **Disable the airbag system before attempting any front seat diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further**

diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury. Refer to WARNING .

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to **SEATS, FRONT, WARNING** .

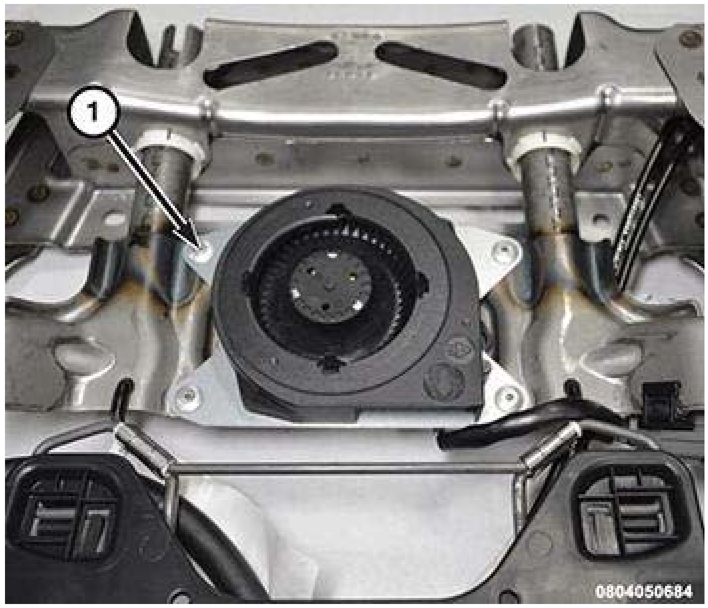


Fig. 13: Vented Seat Motor Rivet
Courtesy of CHRYSLER GROUP, LLC

2. Position the vented seat motor to the bracket. Using a rivet gun, secure the vented seat motor into position.

Fig. 14: Vented Seat Motor Connector
Courtesy of CHRYSLER GROUP, LLC

3. Connect the electrical harness connector (1) to the vented seat motor.

4. Install the seat back cushion and cover. Refer to **SEAT BACK, FRONT, INSTALLATION** .

SEAT BOTTOM VENTED MOTOR

WARNING: **Disable the airbag system before attempting any front seat diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury. Refer to WARNING .**

NOTE: **On all models, the front passenger seat contains an Occupant Detection Sensor (ODS) to provide information to the Occupant Restraint Controller (ORC).**

Fig. 15: Vented Seat Motor Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Install the vented seat motor to the seat bottom frame using the new plastic tabs (1).
2. Position the cushion assembly onto the seat adjuster.

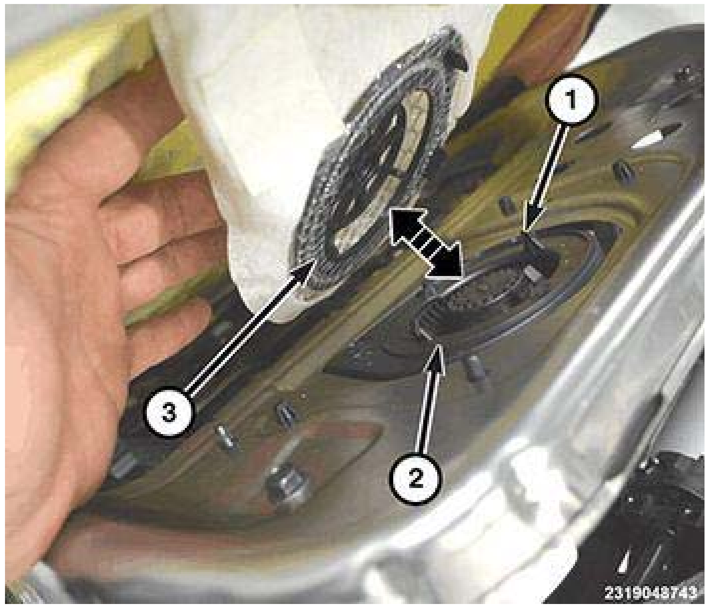

Fig. 16: Aligning Seat Cushion Ventilation Plenum With Tabs
Courtesy of CHRYSLER GROUP, LLC

3. Align the seat cushion ventilation plenum (3) with the tabs (1) on the seat cushion blower (2) and snap into place, if equipped.

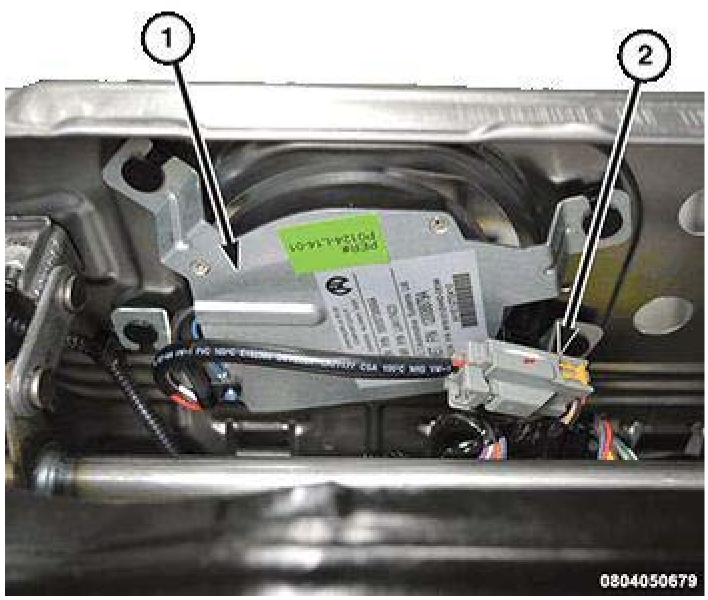

Fig. 17: Vented Seat Motor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

4. Connect the wiring harness to the vented seat connector (1).
5. Install the seat back cushion and cover. Refer to **COVER, SEAT CUSHION, FRONT, INSTALLATION** .

SWITCH, HEATED STEERING WHEEL

DESCRIPTION

DESCRIPTION

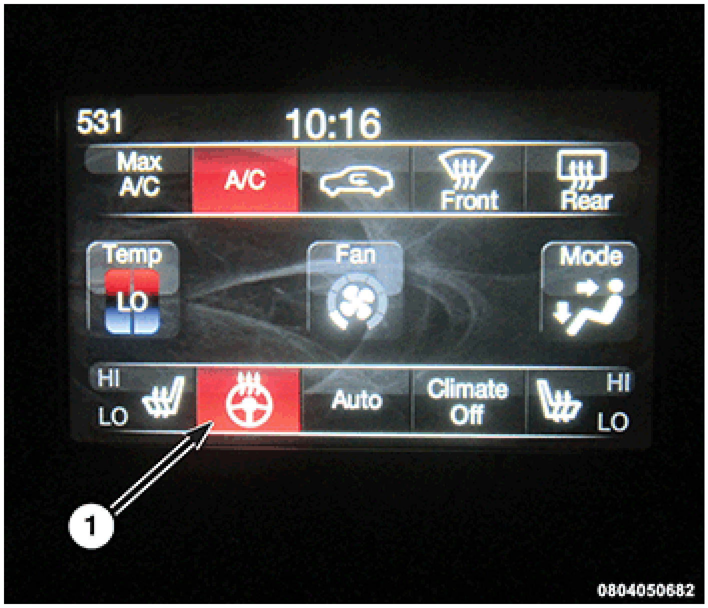

Fig. 18: Heated Steering Wheel Switch
Courtesy of CHRYSLER GROUP, LLC

The switch (1) for the optional heated steering wheel is located in the U-Connect Touch ™ screen module, at the center of the instrument panel. When the heated steering wheel switch is pressed on, the heated steering wheel switch illuminates.

OPERATION

OPERATION

Refer to OPERATION.

SWITCH, VENTED SEAT

DESCRIPTION

DESCRIPTION

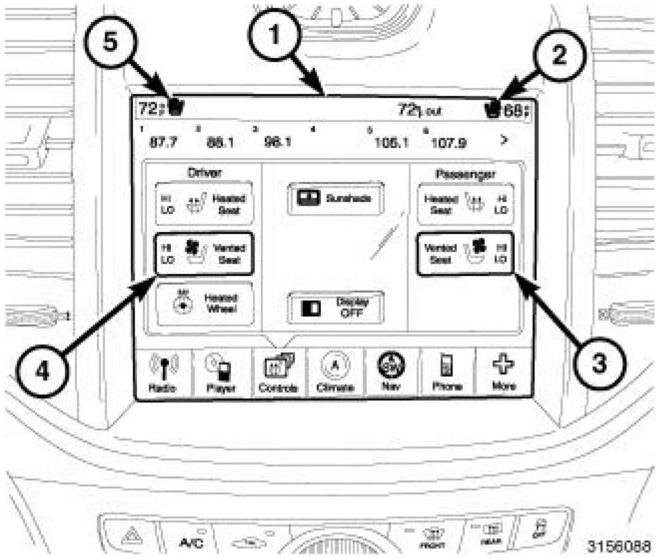

Fig. 19: U-Connect Touch (TM) Screen Module
Courtesy of CHRYSLER GROUP, LLC

The switches (3 and 4) for the optional front vented seat system are located in the U-Connect Touch ™ screen module (1), at the center of the instrument panel. The vented seat system allows the driver and front seat passenger to select from two different speed of electrical seat ventilation (HI and LO). When the vented seat switches are pressed on, each switch illuminates either HI or LO, and an International Standards Organization (ISO) symbol (2 and 5) appears at the top of the U-Connect Touch ™ screen module. Pressing a vented seat switch once will select HI. Pressing the same switch a second time will select LO. Pressing the switch a third time will turn the ventilating function of the seat off.

OPERATION

OPERATION

Refer to **OPERATION**.

Article GUID: A00735965

2015-16 ENGINE

Cooling System - Challenger

DESCRIPTION

DESCRIPTION

The engine cooling system regulates engine operating temperature. It allows the engine to reach normal operating temperature as quickly as possible, maintains normal operating temperature and prevents overheating.

The engine cooling system also provides a means of heating the passenger compartment. The cooling system is pressurized and uses a centrifugal water pump to circulate coolant throughout the system. A separate and remotely mounted coolant bottle is used.

The 6.2L engine has a secondary closed loop cooling system. For more information, refer to SUPERCHARGER SYSTEM, DESCRIPTION.

OPERATION

OPERATION

The cooling system regulates engine operating temperature. It allows the engine to reach normal operating temperature as quickly as possible. It also maintains normal operating temperature and prevents overheating.

The cooling system also provides a source of hot coolant for heating the passenger compartment and cooling the automatic transmission fluid (if equipped). The cooling system is pressurized and uses a centrifugal water pump to circulate coolant throughout the system.

- When engine is cold and the thermostat is closed, the cooling system has no flow through the radiator. The coolant flows through the engine, water pump, and heater.
- When engine is warm and the thermostat is open, coolant flows through the engine, radiator, heater, and water pump.

DIAGNOSIS AND TESTING

PRELIMINARY CHECKS

ENGINE COOLING SYSTEM OVERHEATING

Establish what driving conditions caused the complaint. Abnormal loads on the cooling system such as the following may be the cause:

- Prolonged idle
- Debris blocking the grill or cooling module
- Slight tail wind at idle
- Slow traffic
- Traffic jams

- High speed
- Trailer towing
- Steep grades
- Any accessory addition that fully or partially blocks the grille opening

RECENT SERVICE OR ACCIDENT REPAIR:

Determine if any recent service has been performed on vehicle that may effect cooling system. This may be:

- Slipping engine accessory drive belt(s)
- Brakes (possibly dragging)
- Changed parts. Incorrect water pump, or pump rotating in wrong direction due to belt not correctly routed
- Reconditioned radiator or cooling system refilling (possibly under filled or air trapped in system).

NOTE: **If investigation reveals none of the previous items as a cause for an engine overheating complaint, refer to the following COOLING SYSTEM DIAGNOSIS CHART.**

These charts are to be used as a quick-reference only. Refer to the appropriate service information text for information.

COOLING SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
TEMPERATURE GAUGE READS LOW	1. Has a Diagnostic Trouble Code (DTC) been set indicating a stuck open thermostat?	1. For On-Board Diagnostics and DTC information, refer to DESCRIPTION . Replace thermostat if necessary.
	2. Is the temperature sending unit connected?	2. Check the temperature sensor connector. Repair connector if necessary.
	3. Is the temperature gauge operating OK?	3. Check gauge operation. Repair as necessary.
	4. Coolant level low in cold ambient temperatures accompanied with poor heater performance.	4. Check coolant level in the coolant reserve/overflow tank and the radiator. Inspect system for leaks. Repair leaks as necessary.
TEMPERATURE GAUGE READS HIGH OR THE COOLANT LAMP ILLUMINATES. COOLANT MAY OR MAY NOT BE LOST OR LEAKING FROM THE COOLING SYSTEM	1. Trailer is being towed, a steep hill is being climbed, vehicle is operated in slow moving traffic, or engine is being idled with very high ambient (outside) temperatures and the air conditioning is on. Higher altitudes could aggravate these conditions.	1. This may be a temporary condition and repair is not necessary. Turn off the air conditioning and attempt to drive the vehicle without any of the previous conditions. Observe the temperature gauge. The gauge should return to the normal range. If the gauge does

CONDITION	POSSIBLE CAUSES	CORRECTION
		not return to the normal range, determine the cause for overheating and repair.
	2. Is the temperature gauge reading correctly?	2. Check gauge. Refer to **DIAGNOSIS AND TESTING** .
	3. Is the temperature warning illuminating unnecessarily?	3. Check warning lamp operation. Refer to **DIAGNOSIS AND TESTING** .
	4. Coolant low in coolant reserve/overflow tank and radiator?	4. Check for coolant leaks and repair as necessary. Refer to **DIAGNOSIS AND TESTING**.
	5. Pressure cap not installed tightly. If cap is loose, boiling point of coolant will be lowered. Also refer to the following STEP 6.	5. Tighten the pressure cap.
	6. Poor seals at the radiator cap.	6. (a) Check condition of cap and cap seals. Refer to **CAP, RADIATOR, DIAGNOSIS AND TESTING**.
		(b) Check condition of radiator filler neck. If neck is bent or damaged, replace radiator.
	7. Coolant level low in radiator but not in coolant reserve/overflow tank. This means the radiator is not drawing coolant from the coolant reserve/overflow tank as the engine cools.	7. (a) Check condition of radiator cap and cap seals. Refer to **CAP, RADIATOR, DIAGNOSIS AND TESTING**.
		(b) Check condition of radiator filler neck. If neck is bent or damaged, replace radiator.
		(c) Check condition of the hose from the radiator to the coolant tank. It should fit tight at both ends without any kinks or tears. Replace hose if necessary.
		(d) Check coolant reserve/overflow tank and tanks hoses for blockage. Repair as necessary.
	8. Incorrect coolant concentration.	8. Check coolant/water mixture ratio. Refer to **COOLANT, DESCRIPTION**.
	9. Coolant not flowing through system.	9. Check for coolant flow with some coolant removed, engine warm and thermostat open. If

CONDITION	POSSIBLE CAUSES	CORRECTION
		flow is not observed, determine area of obstruction and repair as necessary.
	10. Radiator or A/C condenser fins are dirty or clogged.	10. Remove insects and debris from radiator or A/C Condenser fins.
	11. Radiator core is corroded or plugged.	11. Have radiator re-cored or replaced.
	12. Aftermarket A/C installed without proper radiator.	12. Install proper radiator.
	13. Fuel or ignition system problems.	13. Refer to FUEL and/or IGNITION CONTROL for diagnosis. See **FUEL SYSTEM** or **IGNITION SYSTEM** .
	14. Dragging brakes.	14. Check and correct as necessary.
	15. Bug screen or cardboard is being used, reducing airflow.	15. Remove bug screen or cardboard.
	16. Thermostat partially or completely shut.	16. Check thermostat operation and replaces necessary.
	17. Cylinder head gasket leaking.	17. Check for cylinder head gasket leaks. Refer to **DIAGNOSIS AND TESTING**. For repair, refer to **CYLINDER HEAD, REMOVAL** for 3.6L, **CYLINDER HEAD, REMOVAL** for 5.7L, **CYLINDER HEAD, REMOVAL** for 6.2L or **CYLINDER HEAD, REMOVAL** for 6.4L.
	18. Cooling fan operation failure.	18. (a) Check for possible blow fuse. Replace as necessary.
		(b) Check for power at the fan. Repair as necessary.
		(c) Fan motor failure. Repair as necessary.
	19. Heater core leaking.	19. Check heater core for leaks. Refer to **CORE, HEATER, REMOVAL** . Repair as necessary.
TEMPERATURE GAUGE READING IS INCONSISTENT (FLUCTUATES, CYCLES OR IS ERRATIC)	1. During cold weather operation, with the heater blower in the high position, the	1. A normal condition. No correction is necessary.

CONDITION	POSSIBLE CAUSES	CORRECTION
	gauge reading may drop slightly.	
	2. Temperature gauge or engine mounted gauge sensor defective or shorted. Also, corroded or loose wiring in this circuit.	2. Check operation of gauge and repair if necessary. Refer to **DIAGNOSIS AND TESTING** .
	3. Gauge reading rises when vehicle is brought to a stop after heavy use (engine still running).	3. A normal condition. No correction is necessary. Gauge should return to normal range after vehicle is driven.
	4. Gauge reading high after re-starting a warmed up (hot) engine.	4. A normal condition. No correction is necessary. The gauge should return to normal range after a few minutes of engine operation.
	5. Coolant level low in radiator (air will build up in the cooling system causing the thermostat to open late).	5. Check and correct coolant leaks. Refer to **DIAGNOSIS AND TESTING**.
	6. Cylinder head gasket leaking allowing exhaust gas to enter cooling system causing a thermostat to open late.	6. (a) Check for cylinder head gasket leaks. Refer to **DIAGNOSIS AND TESTING**.
		(b) Check for coolant in the engine oil. Inspect for white steam emitting from the exhaust system. Repair as necessary.
	7. Water pump impeller loose on shaft.	7. Check water pump and replace as necessary.
	8. Loose accessory drive belt. (water pump slipping).	8. Check and repair as necessary. Refer to **BELT, SERPENTINE, DIAGNOSIS AND TESTING**.
	9. Air leak on the suction side of the water pump allows air to build up in cooling system causing thermostat to open late.	9. Locate leak and repair as necessary.
PRESSURE CAP IS BLOWING OFF STEAM AND/OR COOLANT TO COOLANT TANK. TEMPERATURE GAUGE READING MAY BE ABOVE NORMAL BUT NOT HIGH. COOLANT LEVEL MAY BE HIGH IN COOLANT RESERVE/OVERFLOW TANK	1. Pressure relief valve in radiator cap is defective.	1. Check condition of radiator cap and cap seals. Refer to **CAP, RADIATOR, DIAGNOSIS AND TESTING**.

CONDITION	POSSIBLE CAUSES	CORRECTION
COOLANT LOSS TO THE GROUND WITHOUT PRESSURE CAP BLOWOFF. GAUGE READING HIGH OR HOT	1. Coolant leaks in radiator, cooling system hoses, water pump or engine.	1. Pressure test and repair as necessary. Refer to **DIAGNOSIS AND TESTING**.
DETONATION OR PRE-IGNITION (NOT CAUSED BY IGNITION SYSTEM). GAUGE MAY OR MAY NOT BE READING HIGH	1. Engine overheating.	1. Check reason for overheating and repair as necessary.
	2. Freeze point of coolant not correct. Mixture is too rich or too lean.	2. Check coolant concentration and adjust ratio as required. Refer to **COOLANT, DESCRIPTION**.
HOSE OR HOSES COLLAPSE WHILE ENGINE IS RUNNING	1. Vacuum created in cooling system on engine cool-down is not being relieved through coolant reserve/overflow system.	1. (a) Radiator cap relief valve stuck. Refer to **CAP, RADIATOR, DIAGNOSIS AND TESTING**. Replace if necessary.
		(b) Hose between coolant reserve/overflow tank and radiator is kinked. Repair as necessary.
		(c) Vent at coolant reserve/overflow tank is plugged. Clean vent and repair as necessary.
		(d) Reserve/overflow tank is internally blocked or plugged. Check for blockage and repair as necessary.
INADEQUATE HEATER PERFORMANCE.	1. Thermostat failed in open position.	1. Check thermostat operation and replace if necessary.
	2. Has a Diagnostic trouble Code (DTC) been set?	2. Refer to the appropriate diagnostic service information.
	3. Coolant level low.	3. Refer to **DIAGNOSIS AND TESTING**.
	4. Obstructions in heater hose/fittings.	4. Remove heater hoses at both ends and check for obstructions
	5. Heater hose kinked.	5. Locate kinked area and repair as necessary
	6. Obstruction in the heater core. When the engine is fully warmed up, both heater hoses should be hot to the touch. If only one of the hoses is hot, the heater core may be plugged.	6. If heater core obstruction is detected, for cooling system reverse flushing. Refer to **STANDARD PROCEDURE**.

CONDITION	POSSIBLE CAUSES	CORRECTION
STEAM IS COMING FROM THE FRONT OF VEHICLE NEAR THE GRILL AREA WHEN WEATHER IS WET, ENGINE IS WARMED UP AND RUNNING, AND VEHICLE IS STATIONARY. TEMPERATURE GAUGE IS IN NORMAL RANGE	1. During wet weather, moisture (snow, ice or rain condensation) on the radiator will evaporate when the thermostat opens. This opening allows heated water into the radiator. When the moisture contacts the hot radiator, steam may be emitted. This usually occurs in cold weather with no fan or airflow to blow it away.	1. Occasional steam emitting from this area is normal. No repair is necessary.
COOLANT COLOR	1. Coolant color is not necessarily an indication of adequate corrosion or temperature protection. Do not rely on coolant color for determining condition of coolant.	1. for coolant concentration information. Refer to **COOLANT, DESCRIPTION**. Adjust coolant mixture as necessary.
COOLANT LEVEL CHANGES IN COOLANT RESERVE/OVERFLOW TANK. TEMPERATURE GAUGE IS IN NORMAL RANGE	1. Level changes are to be expected as coolant volume fluctuates with engine temperature. If the level in the tank was between the FULL and ADD marks at normal operating temperature, the level should return to within that range after operation at elevated temperatures.	1. A normal condition. No repair is necessary.
FAN RUNS ALL THE TIME	1. Fan control sensors inoperative.	1. Check for DTC's. Verify sensor readings.
	2. Fan control relay stuck "on".	2. Check fan operation speeds. Refer to the appropriate Electrical Diagnostic article. .
	3. Fan control relay harness damaged.	3. Check for DTC 1499. Repair as required.
	4. Transmission temperature too high.	4. Check for transmission over temp. DTC.
	5. Engine coolant temperature too high. **NOTE:** **When the A/C system is in use, the fans will**	5. (a) Check coolant level. Correct level as required.
		(b) Thermostat stuck. Replace thermostat.
		(c) Water pump failed. Replace water pump.
		(d) Coolant flow restricted. Clean radiator.

CONDITION	POSSIBLE CAUSES	CORRECTION
	remain on.	(e) Air flow over radiator obstructed. Remove obstruction.
	6. A/C compressor circuit ON.	6. Single fan may run continuously with A/C on or on dual fan systems both may be activated under certain conditions.

COOLING SYSTEM LEAKS

ULTRAVIOLET LIGHT METHOD

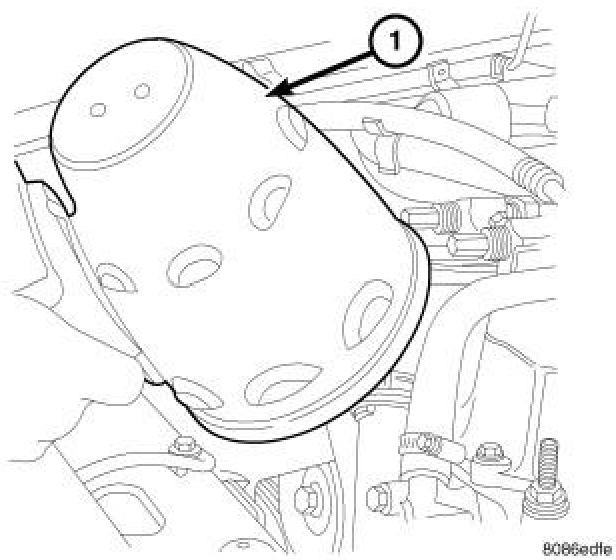

Fig. 1: Ultraviolet Light
Courtesy of CHRYSLER GROUP, LLC

1 - TYPICAL BLACK LIGHT TOOL

A leak detection additive is available through the parts department that can be added to cooling system. The additive is highly visible under ultraviolet light (black light). Pour one ounce of additive into cooling system. Place heater control unit in HEAT position. Start and operate engine until radiator upper hose is warm to touch. Aim the commercially available black light tool at components to be checked. If leaks are present, black light will cause additive to glow a bright green color.

The black light can be used in conjunction with a pressure tester to determine if any external leaks exist.

PRESSURE TESTER METHOD

The engine should be at normal operating temperature. Recheck the system cold if cause of coolant loss is not located during the warm engine examination.

WARNING: Hot, pressurized coolant can cause injury by scalding.

Carefully remove the radiator pressure cap and check the coolant level. Wipe the inside of the filler neck and

examine the lower inside sealing seat for nicks, cracks, paint, dirt and residue. Inspect the coolant hoses for internal obstructions. Insert a wire through the hose to be sure it is not obstructed.

Inspect the outside of the filler neck. If damaged, seating of the pressure cap valve and tester seal will be affected.

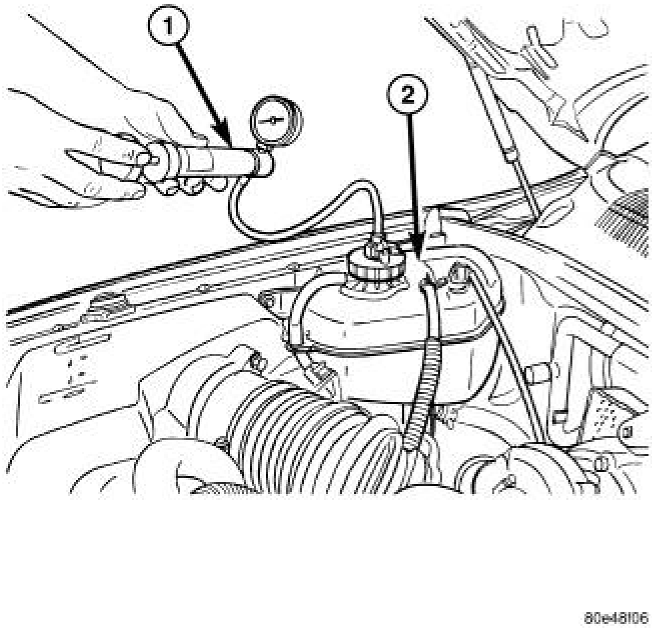

Fig. 2: Cooling Pressure Tester & Pressurized Coolant Bottle
Courtesy of CHRYSLER GROUP, LLC

Attach the SVT275 cooling pressure tester (1) available from MoparÃ® Service Equipment, or an equivalent pressure tester to the pressurized coolant bottle (2).

Operate tester pump to apply 103.4 kPa (15 psi) pressure to system. If hoses enlarge excessively or bulges while testing, replace as necessary. Observe gauge pointer and determine condition of cooling system according to following criteria:

Holds Steady: If pointer remains steady for two minutes, serious coolant leaks are not present in system. However, there could be an internal leak that does not appear with normal system test pressure. If it is certain that coolant is being lost and leaks cannot be detected, inspect for interior leakage or perform Internal Leakage Test. Refer to **INTERNAL LEAKAGE INSPECTION**.

Drops Slowly: Indicates a small leak or seepage is occurring. Examine all connections for seepage or slight leakage with a flashlight. Inspect radiator, hoses, gasket edges and heater. Seal small leak holes with a Sealer Lubricant (or equivalent). Repair leak holes and inspect system again with pressure applied.

Drops Quickly: Indicates that serious leakage is occurring. Examine system for external leakage. If leaks are not visible, inspect for internal leakage.

INTERNAL LEAKAGE INSPECTION

Remove engine oil pan drain plug and drain a small amount of engine oil. If coolant is present in the pan, it will drain first because it is heavier than oil.

WARNING: With radiator pressure tester tool installed on radiator, do not allow pressure to exceed 110 kPa (20 psi). Pressure will build up quickly if a combustion leak is present. To release pressure, rock tester from side to side. When removing tester, do not turn tester more than 1/2 turn if system is under pressure.

- Operate engine without pressure cap on radiator until thermostat opens. Attach a Pressure Tester to filler neck. If pressure builds up quickly it indicates a combustion leak exists. This is usually the result of a cylinder head gasket leak or crack in engine. Repair as necessary.
- If there is not an immediate pressure increase, pump the Pressure Tester. Do this until indicated pressure is within system range. Fluctuation of gauge pointer indicates compression or combustion leakage into cooling system.
- If the needle on dial of pressure tester does not fluctuate, race engine a few times to check for an abnormal amount of coolant or steam. This would be emitting from exhaust pipe. Coolant or steam from exhaust pipe may indicate a faulty cylinder head gasket, cracked engine cylinder block or cylinder head.
- A convenient check for exhaust gas leakage into cooling system is provided by a commercially available Block Leak Check tool. Follow manufacturers instructions when using this product.

COMBUSTION LEAKAGE TEST - WITHOUT PRESSURE TESTER

DO NOT WASTE reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

WARNING: Do not remove cylinder block drain plugs or loosen radiator draincock with system hot and under pressure. Serious burns from coolant can occur.

Drain sufficient coolant to allow thermostat removal. Refer to THERMOSTAT, REMOVAL. Remove accessory drive belt, refer to BELT, SERPENTINE, REMOVAL.

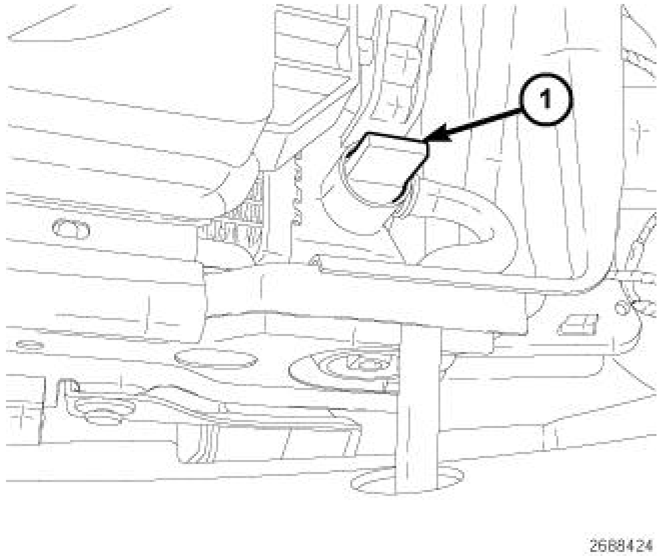
Add coolant to radiator to bring level to within 6 mm (1/4 in) of top of thermostat housing.

CAUTION: Avoid overheating. Do not operate engine for an excessive period of time. Open draincock immediately after test to eliminate boil over.

Start engine and accelerate rapidly three times, to approximately 3000 RPM while observing coolant. If internal engine combustion gases are leaking into cooling system, bubbles will appear in coolant. If bubbles do not appear, internal combustion gas leakage is not present.

STANDARD PROCEDURE

DRAINING ENGINE RADIATOR



[**Fig. 3: Radiator Drain Plug**]()
Courtesy of CHRYSLER GROUP, LLC

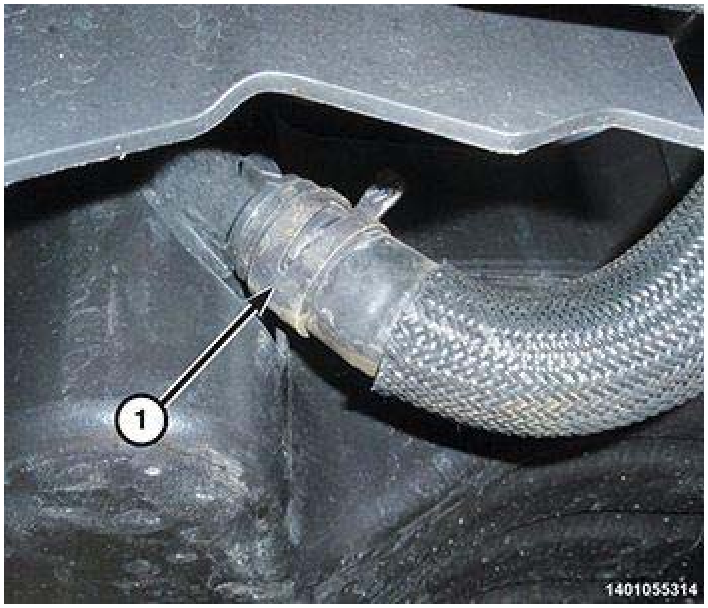
WARNING: Do not remove cylinder block drain plugs or loosen radiator draincock with system hot and under pressure. Serious burns from coolant can occur.

DO NOT WASTE reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

1. Remove radiator pressure cap.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. If equipped, remove the underbody splash shield.
4. Loosen radiator petcock.
5. Drain coolant into a clean container.
6. If necessary, to perform a complete coolant drain of the engine, remove the drain plug from the engine block.

DRAINING LOW TEMPERATURE RADIATOR

NOTE: Do not remove or loosen reservoir cap or coolant hose with system hot and under pressure.



[**Fig. 4: Outlet Coolant Hose**]
Courtesy of CHRYSLER GROUP, LLC

1. Remove the reservoir cap.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** or **BELLY PAN, ENGINE, REMOVAL** .
4. Remove the outlet coolant hose (1) from the auxiliary low temperature radiator and drain the coolant into a clean container.

COOLANT AIR EVACUATION

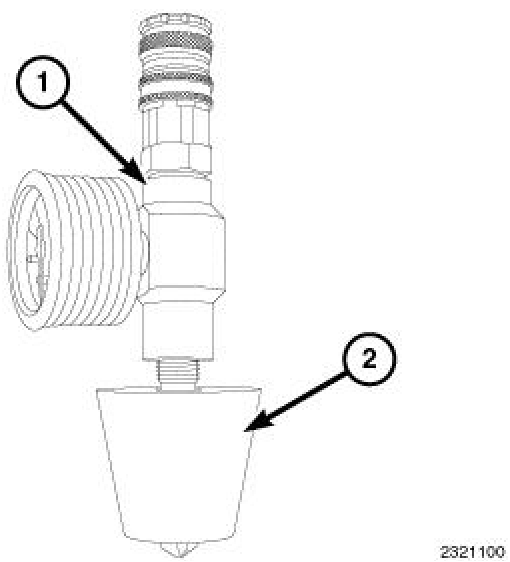


Fig. 5: Adapter Cone And Vacuum Gauge
Courtesy of CHRYSLER GROUP, LLC

Evacuating or purging air from the cooling system involves the use of a pressurized air operated vacuum generator. The vacuum created allows for a quick and complete coolant refilling while removing any airlocks present in the system components.

WARNING: **ANTIFREEZE IS AN ETHYLENE GLYCOL BASE COOLANT AND IS HARMFUL IF SWALLOWED OR INHALED. IF SWALLOWED, DRINK TWO GLASSES OF WATER AND INDUCE VOMITING. IF INHALED, MOVE TO FRESH AIR AREA. SEEK MEDICAL ATTENTION IMMEDIATELY. DO NOT STORE IN OPEN OR UNMARKED CONTAINERS. WASH SKIN AND CLOTHING THOROUGHLY AFTER COMING IN CONTACT WITH ETHYLENE GLYCOL. KEEP OUT OF REACH OF CHILDREN. DISPOSE OF GLYCOL BASED COOLANT PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA. DO NOT OPEN A COOLING SYSTEM WHEN THE ENGINE IS AT OPERATING TEMPERATURE OR HOT UNDER PRESSURE; PERSONAL INJURY CAN RESULT. AVOID RADIATOR COOLING FAN WHEN ENGINE COMPARTMENT RELATED SERVICE IS PERFORMED; PERSONAL INJURY CAN RESULT.**

WARNING: **WEAR APPROPRIATE EYE AND HAND PROTECTION WHEN PERFORMING THIS PROCEDURE.**

NOTE: **The service area where this procedure is performed should have a minimum shop air requirement of 80 PSI (5.5 bar) and should be equipped with an air dryer system.**

NOTE: **For best results, the radiator should be empty. The vehicle's heater control should be set to the heat position (ignition may need to be turned to the on position but do not start the engine).**

1. Refer to the Chrysler Pentastar Service Equipment (Chrysler PSE) Coolant Refiller #85-15-0650 or equivalent tool's operating manual for specific assembly steps.
2. Choose an appropriate adapter cone that will fit the vehicle's radiator filler neck or reservoir tank.
3. Attach the adapter cone (2) to the vacuum gauge (1).

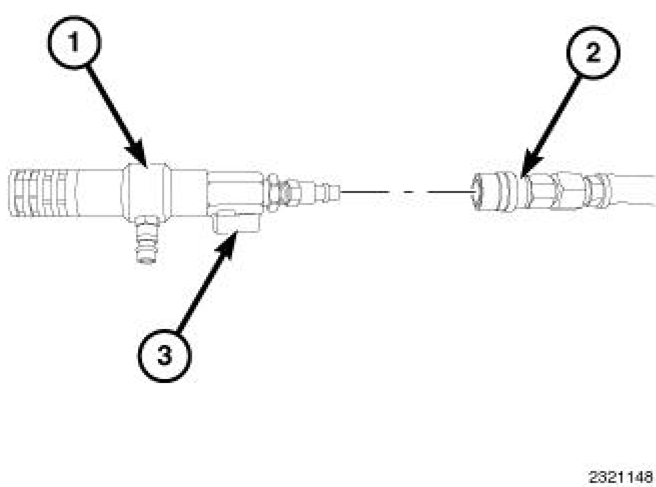

Fig. 6: Vacuum Generator/Venturi, Ball Valve & Airline Hose
Courtesy of CHRYSLER GROUP, LLC

4. Make sure the vacuum generator/venturi ball valve (3) is closed and attach an airline hose (2) with a minimum shop air requirement of 80 PSI (5.5 bar) to the vacuum generator/venturi (1).
5. Position the adaptor cone/vacuum gauge assembly into the radiator filler neck or reservoir tank. Ensure that the adapter cone is sealed properly.

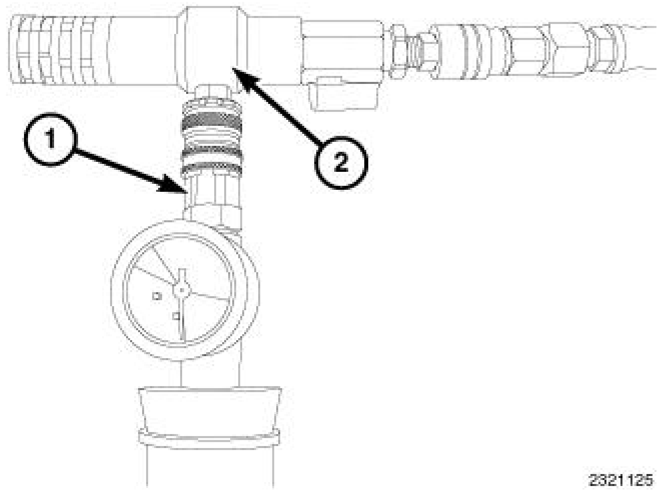

Fig. 7: Vacuum Generator/Venturi & Cone/Vacuum Gauge Assembly
Courtesy of CHRYSLER GROUP, LLC

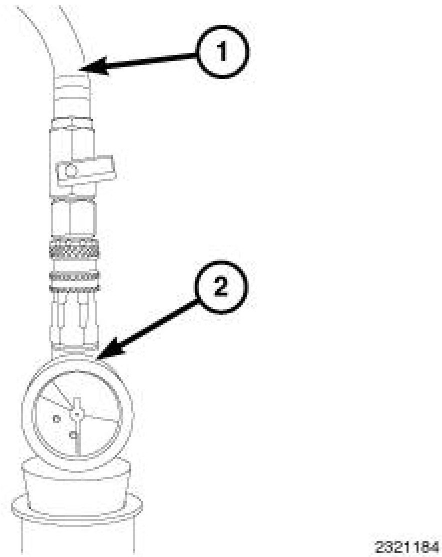
6. Connect the vacuum generator/venturi (2) to the positioned adaptor cone/vacuum gauge assembly (1).
7. Open the vacuum generator/venturi ball valve.

NOTE: **Do not bump or move the assembly as it may result in loss of vacuum. Some radiator overflow hoses may need to be clamped off to obtain vacuum.**

8. Let the system run until the vacuum gauge shows a good vacuum through the cooling system. Refer to the tool's operating manual for appropriate pressure readings.

NOTE: **If a strong vacuum is being created in the system, it is normal to see the radiator hoses collapse.**

9. Close the vacuum generator/venturi ball valve.



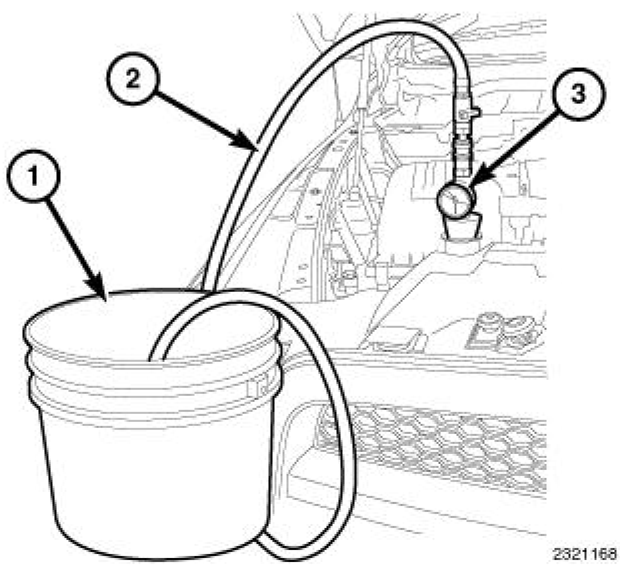
[Fig. 8: Vacuum Generator/Venturi And Air Line]

Courtesy of CHRYSLER GROUP, LLC

10. Disconnect the vacuum generator/venturi and airline from the adaptor cone/vacuum gauge assembly.
11. Wait approximately 20 seconds, if the pressure readings do not move, the system has no leaks. If the pressure readings move, a leak could be present in the system and the cooling system should be checked for leaks and the procedure should be repeated.
12. Place the tool's suction hose into the coolant's container.

NOTE:	**Ensure there is a sufficient amount of coolant, mixed to the required strength/protection level available for use. For best results and to assist the refilling procedure, place the coolant container at the same height as the radiator filler neck. Always draw more coolant than required. If the coolant level is too low, it will pull air into the cooling system which could result in airlocks in the system.**

13. Connect the tool's suction hose (1) to the adaptor cone/vacuum gauge assembly (2).



[Fig. 9: Suction Hose Ball Valve]

Courtesy of CHRYSLER GROUP, LLC

NOTE: **View typical**

14. Open the suction hose's ball valve to begin refilling the cooling system.
15. When the vacuum gauge reads zero, the system is filled.

NOTE: **On some remote pressurized tanks, it is recommended to stop filling when the proper level is reached.**

16. Close the suction hose's ball valve and remove the suction hose from the adaptor cone/vacuum gauge assembly.
17. Remove the adaptor cone/vacuum gauge assembly from the radiator filler neck or reservoir tank.
18. With heater control unit in the HEAT position, operate engine with container cap in place.
19. After engine has reached normal operating temperature, shut engine off and allow it to cool. When engine is cooling down, coolant will be drawn into the radiator from the pressure container.
20. Add coolant to the recovery bottle/container as necessary. **Only add coolant to the container when the engine is cold. Coolant level in a warm engine will be higher due to thermal expansion.** Add necessary coolant to raise container level to the COLD MINIMUM mark after each cool down period.
21. Once the appropriate coolant level is achieved, attach the radiator cap or reservoir tank cap.

ADDING ADDITIONAL COOLANT

When additional coolant is needed, it should be added to the Pressurized Coolant Bottle. With the engine cold, add enough coolant to set the level between the add and full indicators on the bottle.

For the proper type of coolant, refer to CAPACITIES AND RECOMMENDED FLUIDS, DESCRIPTION .

CAUTION: **Do not use coolant additives that are claimed to improve engine cooling.**

COOLANT LEVEL CHECK

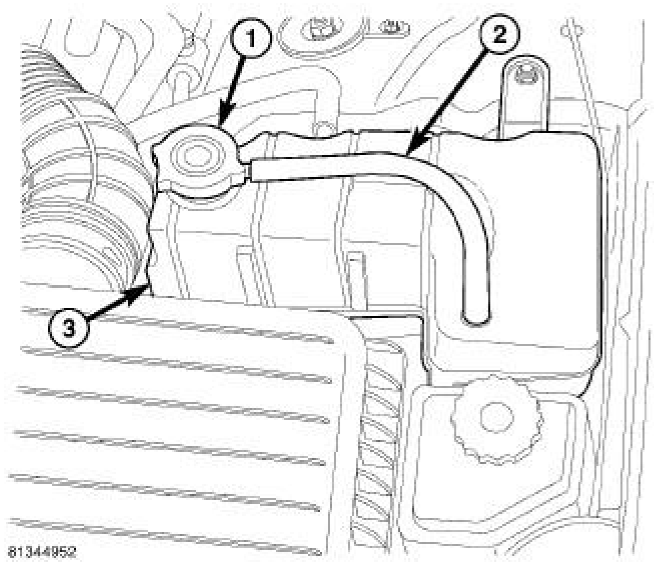


Fig. 10: Coolant Recovery Container
Courtesy of CHRYSLER GROUP, LLC

1 - COOLANT RECOVER CONTAINER PRESSURE CAP
2 - COOLANT RECOVERY CONTAINER
3 - ADD/FULL MARKS

NOTE: **Do not remove radiator cap for routine coolant level inspections. The coolant level can be checked at coolant recovery bottle (2).**

The coolant reserve/overflow system provides a quick method for determining coolant level. With engine not running, the coolant level should be between MIN and MAX marks (3). If the coolant level is at or below the MIN mark, fill the recovery bottle with a 50/50 mixture of antifreeze and water ONE QUART AT A TIME. Repeat this procedure until the coolant level is at the FULL mark.

CLEANING/REVERSE FLUSHING

CLEANING

Drain cooling system and refill with water. Run engine with radiator cap installed until upper radiator hose is hot. Stop engine and drain water from system. If water is dirty, fill system with water, run engine and drain system. Repeat until water drains clean.

REVERSE FLUSHING

Reverse flushing of cooling system is the forcing of water through the cooling system. This is done using air pressure in the opposite direction of normal coolant flow. It is usually only necessary with very dirty systems with evidence of partial plugging.

REVERSE FLUSHING RADIATOR

Disconnect radiator hoses from radiator inlet and outlet. Attach a section of radiator hose to radiator bottom outlet fitting and insert flushing gun. Connect a water supply hose and air supply hose to flushing gun.

CAUTION: **Internal radiator pressure must not exceed 138 kPa (20 psi) as damage to radiator may result.**

Allow radiator to fill with water. When radiator is filled, apply air in short blasts. Allow radiator to refill between blasts. Continue this reverse flushing until clean water flows out through rear of radiator cooling tube passages.

REVERSE FLUSHING ENGINE

Drain cooling system. Remove thermostat housing and thermostat. Install thermostat housing. Disconnect radiator upper hose from radiator and attach flushing gun to hose. Disconnect radiator lower hose from water pump and attach a lead-away hose to water pump inlet fitting.

CAUTION: **On vehicles equipped with a heater water control valve, be sure heater control valve is closed (heat off). This will prevent coolant flow with scale and other deposits from entering heater core.**

Connect water supply hose and air supply hose to flushing gun. Allow engine to fill with water. When engine is filled, apply air in short blasts, allowing system to fill between air blasts. Continue until clean water flows through the lead away hose.

Remove lead away hose, flushing gun, water supply hose and air supply hose. Remove thermostat housing and install thermostat. Install thermostat housing with a replacement gasket. Refer to Thermostat Replacement, see **THERMOSTAT**. Connect radiator hoses, refill cooling system with correct antifreeze/water mixture. Refer to Refilling the Cooling System, see **STANDARD PROCEDURE**.

CHEMICAL CLEANING

In some instances, use a radiator cleaner (Mopar Radiator Kleen or equivalent) before flushing. This will soften scale and other deposits and aid flushing operation.

CAUTION: Follow manufacturers instructions when using these products.

ACCESSORY DRIVE

BELT, SERPENTINE

DESCRIPTION

DESCRIPTION

The accessory drive belt is a serpentine type belt. Satisfactory performance of these belts depends on belt condition and proper belt tension.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ACCESSORY DRIVE BELT

NOISE DIAGNOSIS

Noises generated by the accessory drive belt are most noticeable at idle. Before replacing a belt to resolve a noise condition, inspect all of the accessory drive pulleys for alignment, glazing, or excessive end play.

ACCESSORY DRIVE BELT DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
RIB CHUNKING (One or more ribs has separated from belt body)	1. Foreign objects imbedded in pulley grooves.	1. Remove foreign objects from pulley grooves. Replace belt.
	2. Installation damage	2. Replace belt
RIB OR BELT WEAR	1. Pulley misaligned	1. Align pulley(s)
	2. Abrasive environment	2. Clean pulley(s). Replace belt if necessary
	3. Rusted pulley(s)	3. Clean rust from pulley(s)

CONDITION	POSSIBLE CAUSES	CORRECTION
	4. Sharp or jagged pulley groove tips	4. Replace pulley. Inspect belt.
	5. Belt rubber deteriorated	5. Replace belt
BELT SLIPS	1. Belt slipping because of insufficient tension	1. Inspect/Replace tensioner if necessary
	2. Belt or pulley exposed to substance that has reduced friction (belt dressing, oil, ethylene glycol)	2. Replace belt and clean pulleys
	3. Driven component bearing failure (seizure)	3. Replace faulty component or bearing
	4. Belt glazed or hardened from heat and excessive slippage	4. Replace belt.
LONGITUDINAL BELT CRACKING	1. Belt has mis-tracked from pulley groove	1. Replace belt
	2. Pulley groove tip has worn away rubber to tensile member	2. Replace belt
"GROOVE JUMPING" (Belt does not maintain correct position on pulley)	1. Incorrect belt tension	1. Inspect/Replace tensioner if necessary
	2. Pulley(s) not within design tolerance	2. Replace pulley(s)
	3. Foreign object(s) in grooves	3. Remove foreign objects from grooves
	4. Pulley misalignment	4. Align component
	5. Belt cord line is broken	5. Replace belt
BELT BROKEN (Note: Identify and correct problem before new belt is installed)	1. Incorrect belt tension	1. Replace Inspect/Replace tensioner if necessary
	2. Tensile member damaged during belt installation	2. Replace belt
	3. Severe misalignment	3. Align pulley(s)
	4. Bracket, pulley, or bearing failure	4. Replace defective component and belt
NOISE (Objectionable squeal, squeak, or rumble is heard or felt while drive belt is in operation)	1. Incorrect belt tension	1. Inspect/Replace tensioner if necessary
	2. Bearing noise	2. Locate and repair
	3. Belt misalignment	3. Align belt/pulley(s)
	4. Belt to pulley mismatch	4. Install correct belt
	5. Driven component induced vibration	5. Locate defective driven component and repair
	6. Belt flat surface coming apart	6. Replace belt
TENSION SHEETING FABRIC FAILURE	1. Tension sheeting contacting stationary object	1. Correct rubbing condition

CONDITION	POSSIBLE CAUSES	CORRECTION
(Woven fabric on outside, circumference of belt has cracked or separated from body of belt)	2. Excessive heat causing woven fabric to age	2. Replace belt
	3. Tension sheeting splice has fractured	3. Replace belt
CORD EDGE FAILURE (Tensile member exposed at edges of belt or separated from belt body)	1. Incorrect belt tension	1. Inspect/Replace tensioner if necessary
	2. Belt contacting stationary object	2. Replace belt
	3. Pulley(s) out of tolerance	3. Replace pulley
	4. Insufficient adhesion between tensile member and rubber matrix	4. Replace belt

VISUAL DIAGNOSIS

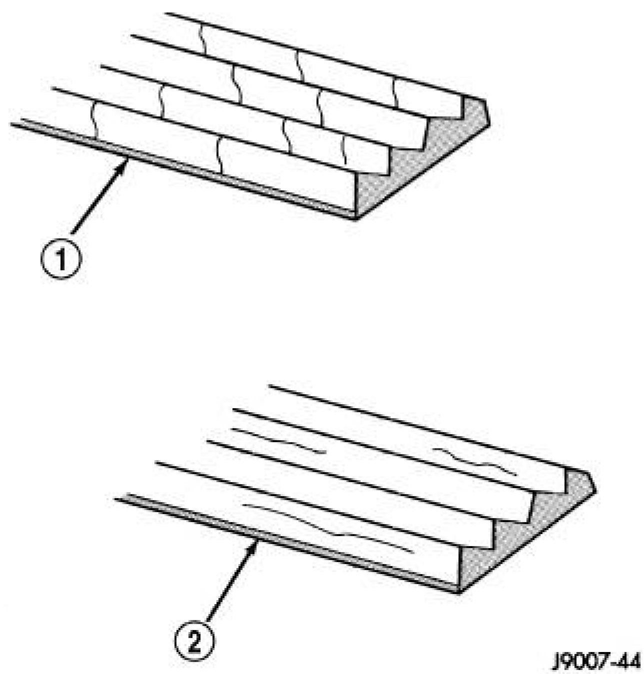

Fig. 11: Belt Wear Patterns
Courtesy of CHRYSLER GROUP, LLC

When diagnosing serpentine accessory drive belts, small cracks (1) that run across the ribbed surface of the belt from rib to rib, are considered normal. These are not a reason to replace the belt. However, cracks (2) running along a rib (not across) are **not** normal. Any belt with cracks running along a rib must be replaced. Also replace the belt if it has excessive wear, frayed cords, severe glazing or chunking.

Any belt with bumps, surface coming apart, or any other uneven indications along the flat surface of the belt must be remove and inspected and replaced if necessary.

Refer to **ACCESSORY DRIVE BELT DIAGNOSIS CHART** for further belt diagnosis.

REMOVAL

3.6L

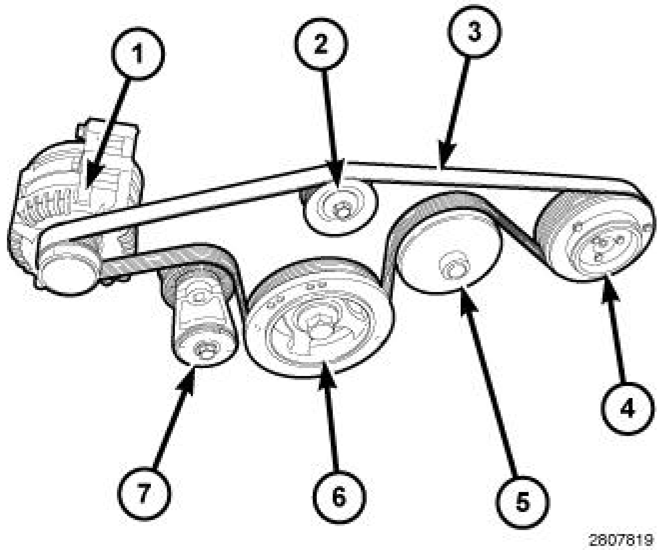

Fig. 12: New Belt, Idler Pulley, Tensioner Arm, Belt, Idler & Tensioner
Courtesy of CHRYSLER GROUP, LLC

CAUTION: **Do not let the tensioner arm snapback to the fully extended position, severe damage may occur to the tensioner.**

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** .
3. Rotate belt tensioner (7) until it contacts its stop. Remove belt (3), then slowly rotate the tensioner (7) into the freearm position.

6.2L

CAUTION: **Do not let tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.**

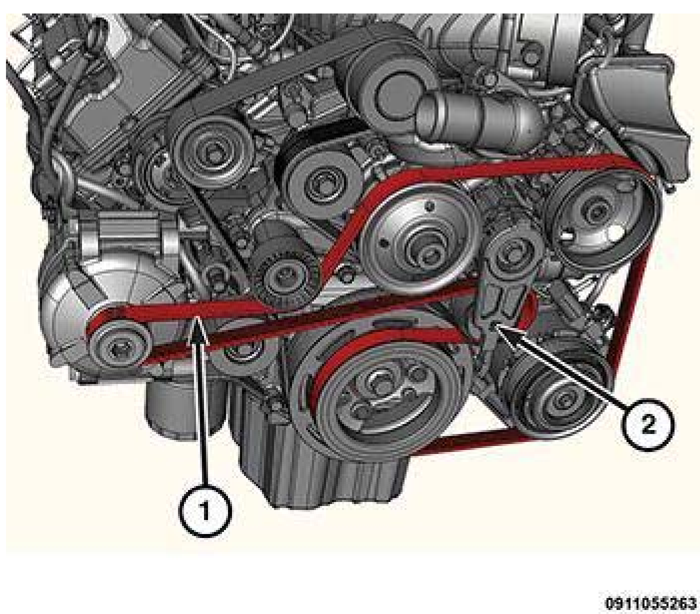

Fig. 13: Serpentine Belt, Belt Tensioner & Belt Routing
Courtesy of CHRYSLER GROUP, LLC

1. Using a suitable square drive tool, release the belt tension by rotating the tensioner (2) **clockwise** . Rotate the belt tensioner (2) until the serpentine belt (1) can be removed from pulleys.
2. Remove the serpentine belt (1).
3. Gently release the belt tensioner (2).

5.7L/6.4L ELECTRONIC POWER STEERING

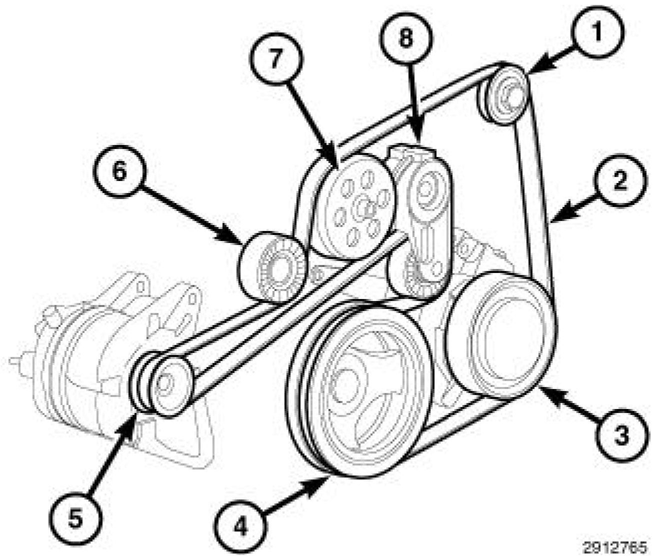

Fig. 14: Drive Belt Tensioner And Drive Belt Routing
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the air intake tube between intake manifold and air cleaner body.
3. Using a suitable square drive tool, Rotate the belt tensioner (8) clockwise and remove the serpentine belt (2).
4. Gently release the tensioner (8).

INSTALLATION

3.6L

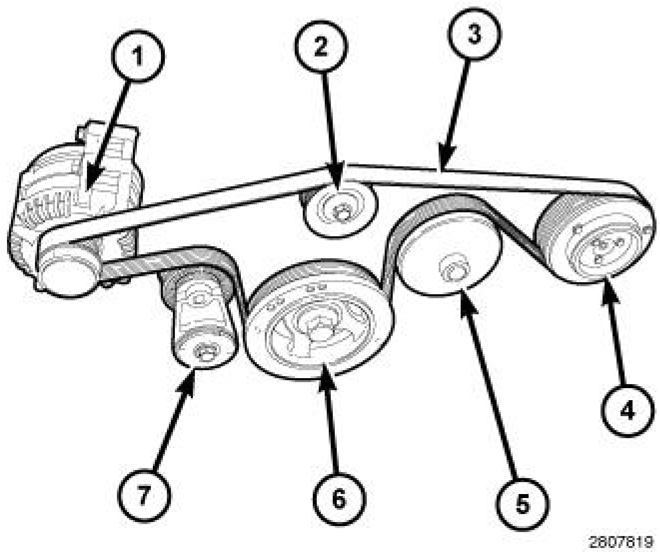

Fig. 15: New Belt, Idler Pulley, Tensioner Arm, Belt, Idler & Tensioner
Courtesy of CHRYSLER GROUP, LLC

1. Check the condition of all of the pulleys.

CAUTION: When installing the serpentine accessory drive belt, the belt MUST be routed correctly. If not, the engine may overheat due to the water pump rotating in the wrong direction.

2. Install the new belt (3). Route the belt around all pulleys except the idler pulley (2). Rotate the tensioner arm (7) until it contacts its stop position. Route the belt (3) around the idler (2) and slowly let the tensioner (7) rotate into the belt. Make sure the belt (3) is seated onto all pulleys.

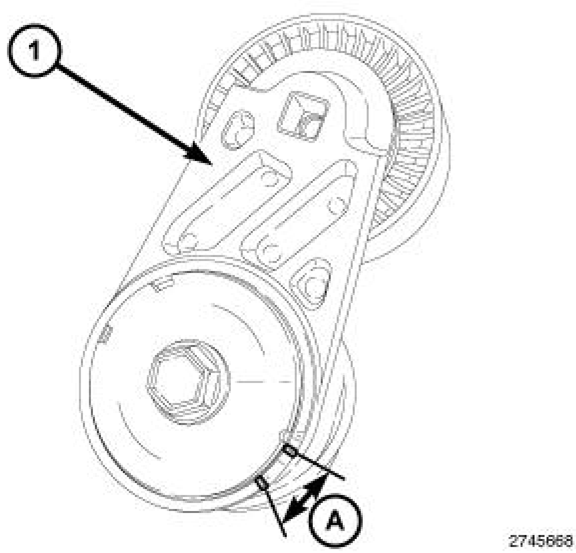

Fig. 16: Belt Wear Indicator (Measurement A)
Courtesy of CHRYSLER GROUP, LLC

3. With the drive belt installed, inspect the belt wear indicator. The gap between the tang and the housing stop (measurement A) must not exceed 24 mm (.94 inches).
4. Install the air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION** .

6.2L

CAUTION: Do not let tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.

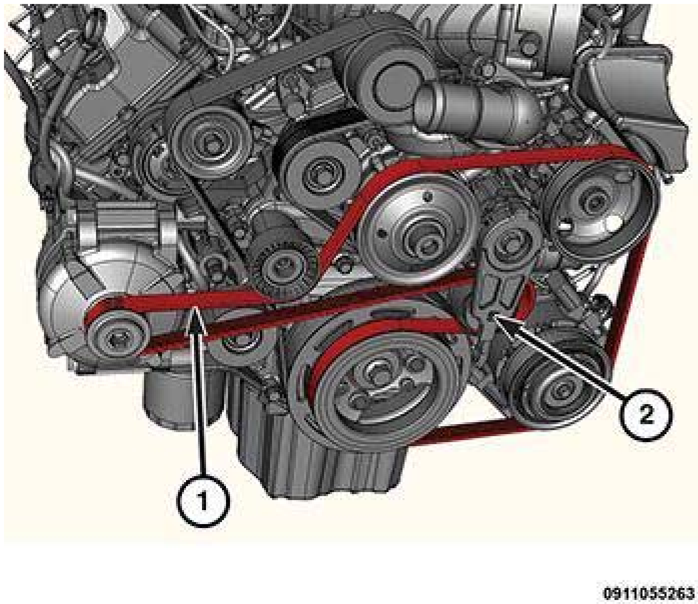

Fig. 17: Serpentine Belt, Belt Tensioner & Belt Routing
Courtesy of CHRYSLER GROUP, LLC

NOTE: When installing accessory drive belt onto pulleys, make sure that belt is properly routed and all V-grooves make proper contact with pulleys.

1. Position the serpentine belt (1) over all pulleys except for the water pump pulley.
2. Rotate the tensioner (2) **clockwise** and slip the serpentine belt (1) over the water pump pulley.
3. Gently release the belt tensioner (2).

5.7L/6.4L ELECTRONIC POWER STEERING

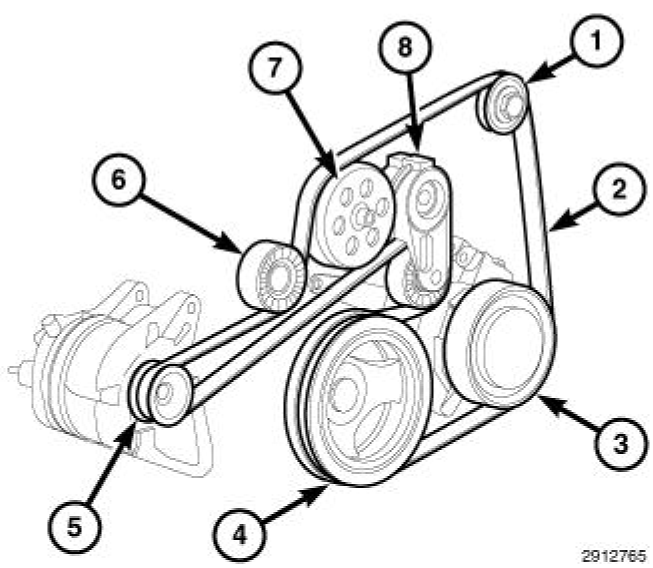

Fig. 18: Drive Belt Tensioner And Drive Belt Routing

Courtesy of CHRYSLER GROUP, LLC

NOTE:	**When installing accessory drive belt onto pulleys, make sure that belt is properly routed and all V-grooves make proper contact with pulleys.**

1. Position the drive belt (2) over all pulleys except for the water pump pulley (7).
2. Rotate the tensioner (8) **clockwise** and slip the belt (2) over the water pump pulley (7).
3. Gently release tensioner (8).
4. Install the air intake tube between intake manifold and the air cleaner body.
5. Connect the negative battery cable.

PULLEY, IDLER

REMOVAL

3.6L

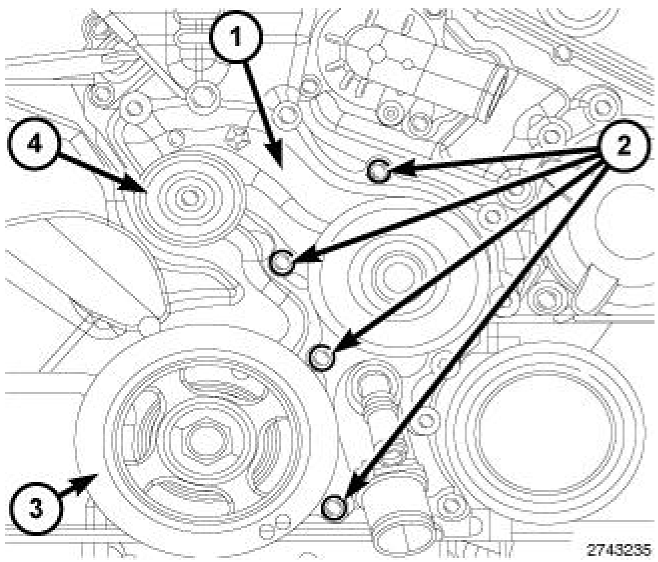

Fig. 19: Idler Pulley, Water Pump & Bolts
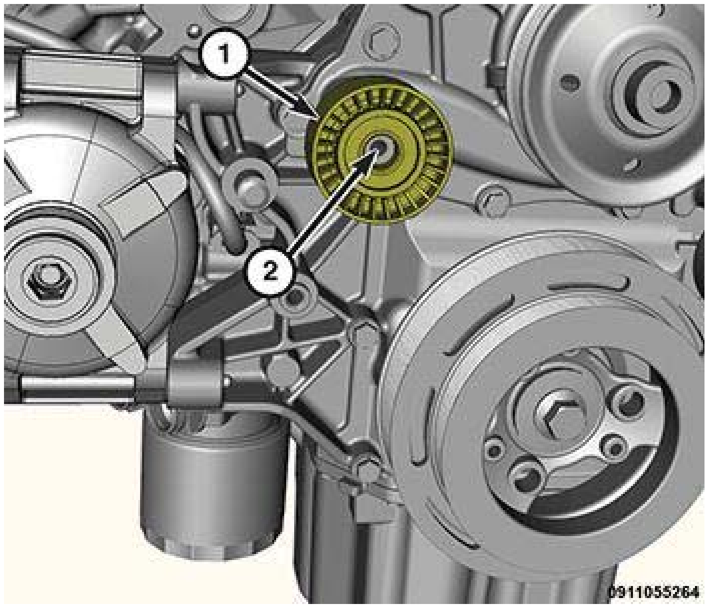
Courtesy of CHRYSLER GROUP, LLC

1. Remove the serpentine belt. Refer to BELT, SERPENTINE, REMOVAL.
2. Remove bolt and the idler pulley (4).

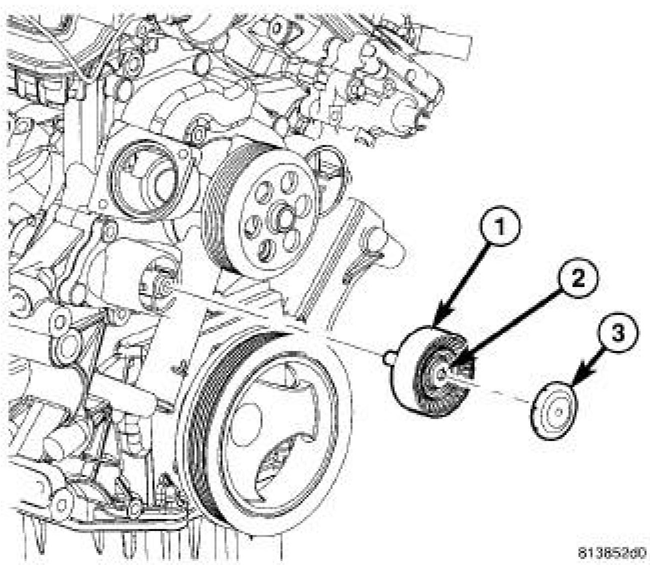
6.2L



[Fig. 20: Idler Pulley & Bolt]
Courtesy of CHRYSLER GROUP, LLC

1. Remove accessory drive belt. Refer to **TENSIONER, BELT, REMOVAL**.
2. Remove bolt (2) and idler pulley (1).

5.7L/6.4L



[Fig. 21: Idler Pulley, Bolt & Cover]
Courtesy of CHRYSLER GROUP, LLC

1 - IDLER PULLEY	
2 - BOLT (PART OF PULLEY)	
3 - COVER	

1. Remove accessory drive belt. Refer to **TENSIONER, BELT, REMOVAL**.

2. Remove the cover (3).
3. Remove bolt (2) and idler pulley (1).

5.7L IDLER BRACKET

NOTE: **The idler bracket takes the place of the power steering pump on the vehicles that use electronic power steering.**

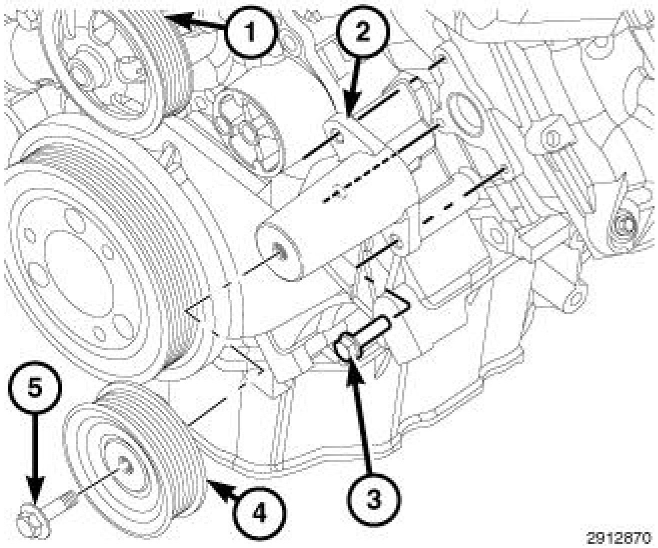


Fig. 22: Idler Pulley, Idler Bracket & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Remove the serpentine drive belt. Refer to **BELT, SERPENTINE, REMOVAL**.
2. Remove bolt (6) and the idler pulley (4) from bracket (2).
3. Remove bolts (3) and the idler pulley bracket (2).

INSTALLATION

3.6L

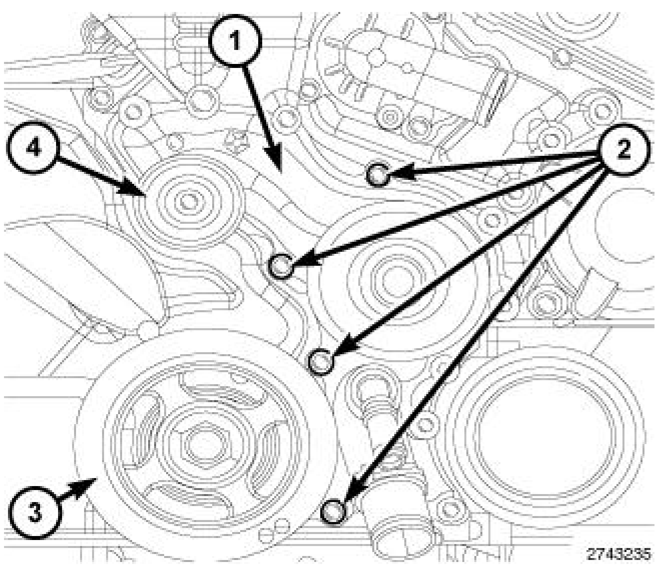

Fig. 23: Idler Pulley, Water Pump & Bolts

Courtesy of CHRYSLER GROUP, LLC

1. Install the idler pulley (4) and tighten bolt to the proper torque specification. Refer to **SPECIFICATIONS**.
2. Install main drive belt. Refer to **BELT, SERPENTINE, INSTALLATION**.

6.2L

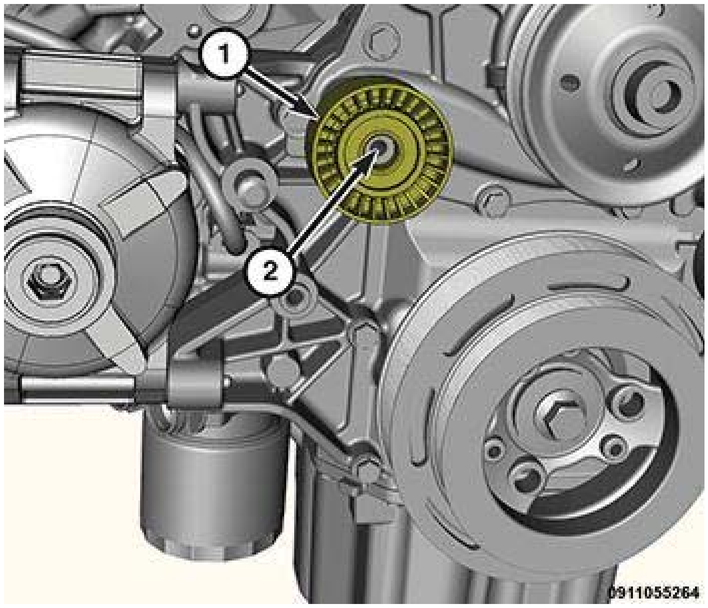

Fig. 24: Idler Pulley & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Install the idler pulley (1). Tighten bolt (2) to the proper torque specification. Refer to **SPECIFICATIONS**.
2. Install accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION**.

5.7L/6.4L

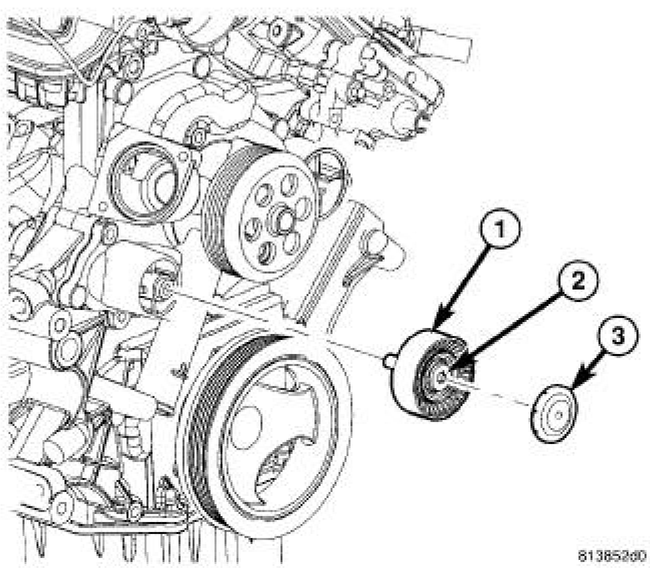

Fig. 25: Idler Pulley, Bolt & Cover
Courtesy of CHRYSLER GROUP, LLC

1 - IDLER PULLEY
2 - BOLT (PART OF PULLEY)
3 - COVER

1. Install the idler pulley (1). Tighten the idler pulley bolt (2) to the proper torque specification. Refer to **SPECIFICATIONS**.
2. Install the cover (3).
3. Install accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION**.

5.7L IDLER BRACKET

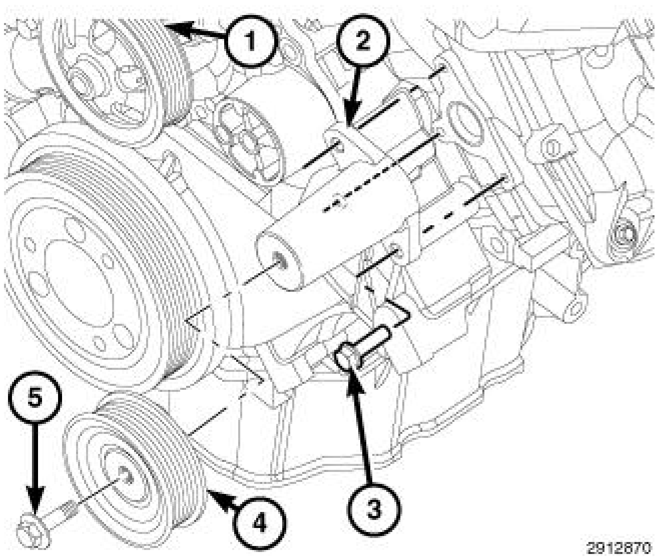

Fig. 26: Idler Pulley, Idler Bracket & Mounting Bolts
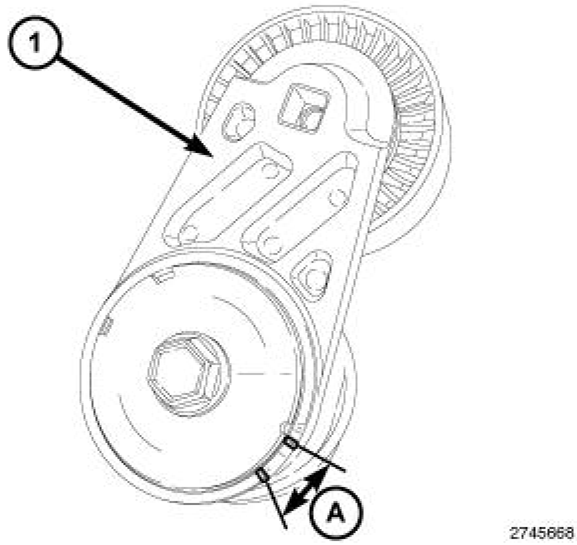
Courtesy of CHRYSLER GROUP, LLC

1. Install the idler bracket bolts (2). Tighten the idler bracket bolts (3) to the proper torque specification. Refer to **SPECIFICATIONS**.
2. Install the idler pulley (4). Tighten the idler pulley bolt (5) to the proper torque specification. Refer to **SPECIFICATIONS**.
3. Install the serpentine drive belt. Refer to **BELT, SERPENTINE, INSTALLATION**.

TENSIONER, BELT

DESCRIPTION

DESCRIPTION



[**Fig. 27: Belt Wear Indicator (Measurement A)**]
Courtesy of CHRYSLER GROUP, LLC

Correct drive belt tension is required to ensure optimum performance of the belt driven engine accessories. If specified tension is not maintained, belt slippage may cause engine overheating, loss of air conditioning capacity, reduced generator output rate, and greatly reduced belt life.

It is not necessary to adjust belt tension. All engines are equipped with an automatic belt tensioner. The tensioner maintains correct accessory drive belt tension at all times.

REMOVAL

3.6L

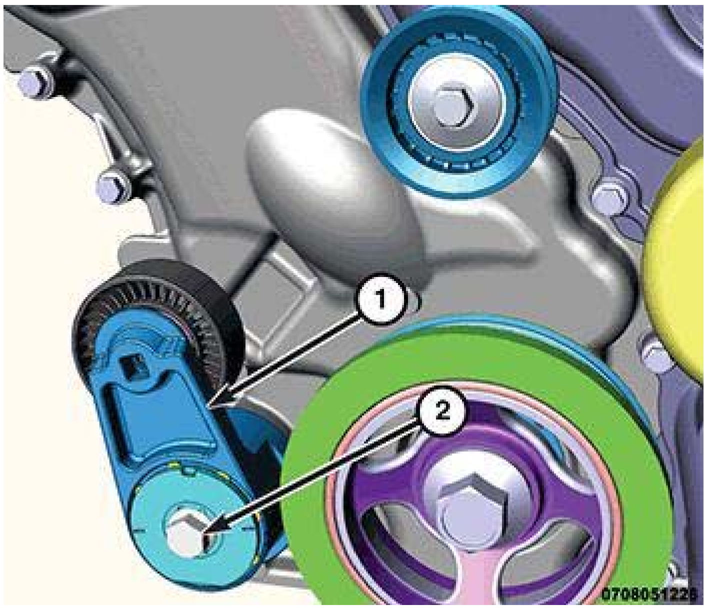


Fig. 28: Belt Tensioner & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the air intake system. Refer to **BODY, AIR CLEANER, REMOVAL** .

3. Remove the serpentine belt. Refer to **BELT, SERPENTINE, REMOVAL**.
4. Remove bolt (2) and the belt tensioner.

6.2L

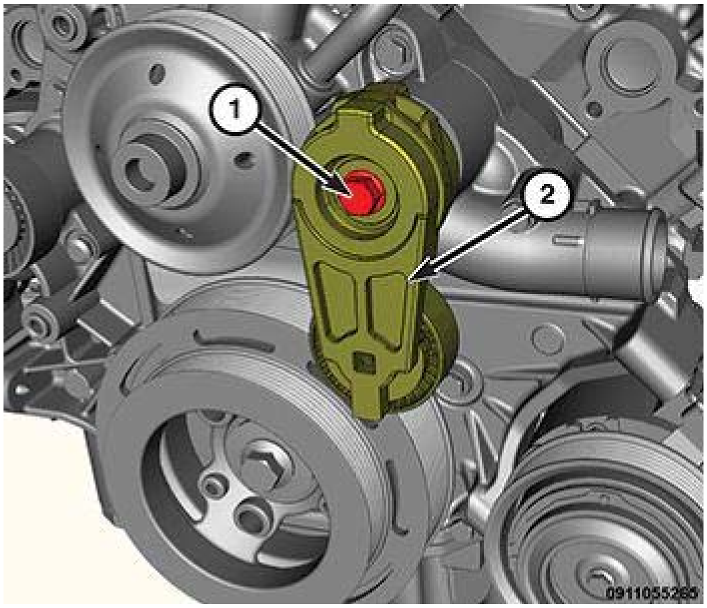

Fig. 29: Belt Tensioner & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** .
3. Remove the serpentine belt. Refer to **BELT, SERPENTINE, REMOVAL**.
4. Remove the bolt (1) and the belt tensioner (2).

5.7L/6.4L

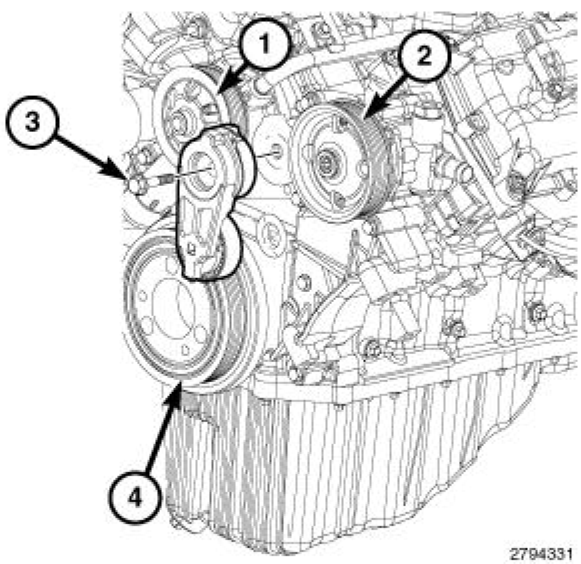

Fig. 30: Tensioner Assembly & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** for 5.7L or **BODY, AIR CLEANER, REMOVAL** for 6.4L .
3. Remove the serpentine belt. Refer to **BELT, SERPENTINE, REMOVAL**.
4. Remove bolt (3) and the belt tensioner.

INSTALLATION

3.6L

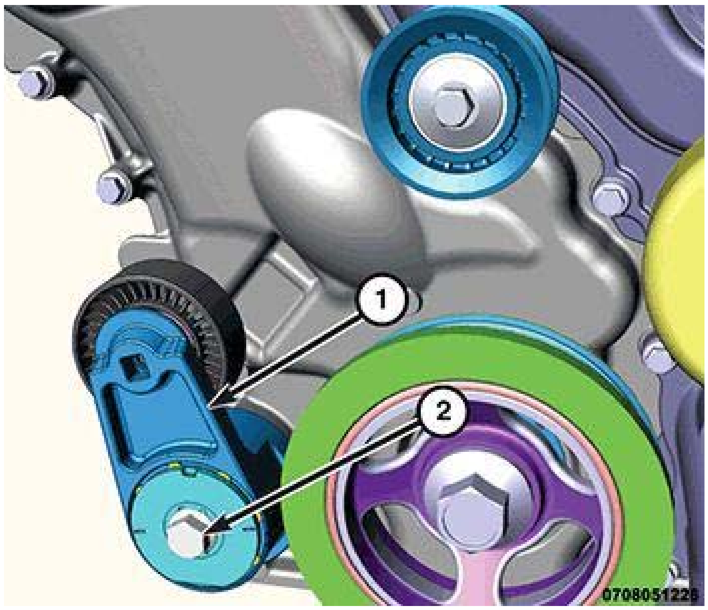

Fig. 31: Belt Tensioner & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Install the belt tensioner (1). Tighten bolt (2) to the proper torque specification. Refer to **SPECIFICATIONS**.
2. Install the serpentine belt. Refer to **BELT, SERPENTINE, INSTALLATION**.
3. Install the air intake system. Refer to **BODY, AIR CLEANER, INSTALLATION** .
4. Connect the negative battery cable.

6.2L

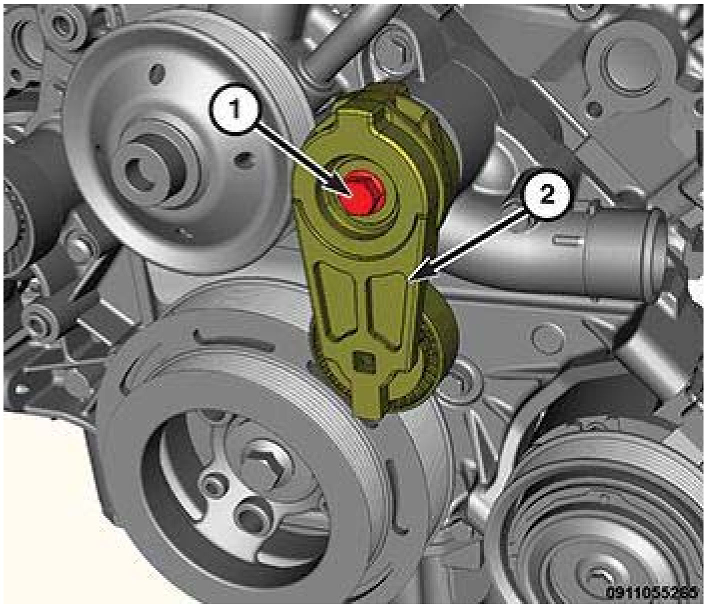

Fig. 32: Belt Tensioner & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Align the locator tang and install the belt tensioner (2). Tighten the bolt (1) to the proper torque specification. Refer to **SPECIFICATIONS**.
2. Install the serpentine belt. Refer to **BELT, SERPENTINE, INSTALLATION**.
3. Install the air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION** .
4. Connect the negative battery cable.

5.7L/6.4L

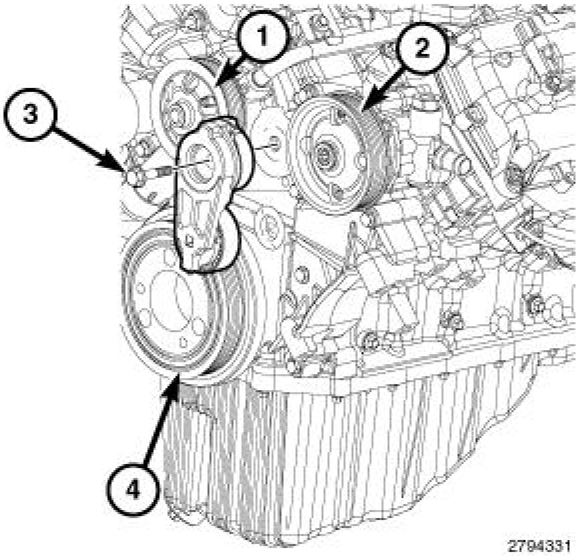

Fig. 33: Tensioner Assembly & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Align the locator tang and install the belt tensioner. Tighten the bolt (3) to the proper torque specification. Refer to **SPECIFICATIONS**.
2. Install the serpentine belt. Refer to **BELT, SERPENTINE, INSTALLATION**.

3. Install the air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION** for 5.7L or **BODY, AIR CLEANER, INSTALLATION** for 6.4L. .
4. Connect the negative battery cable.

ENGINE

BOTTLE, PRESSURIZED COOLANT

REMOVAL

REMOVAL

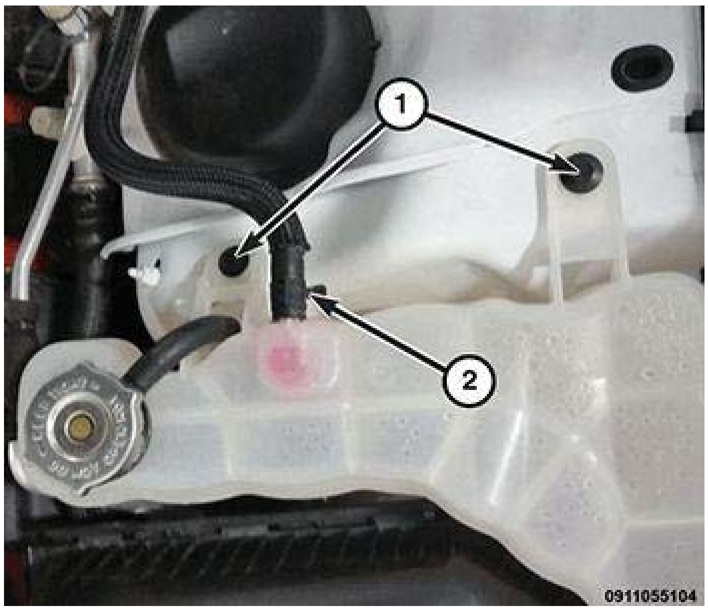

Fig. 34: Bolts & Coolant Hose
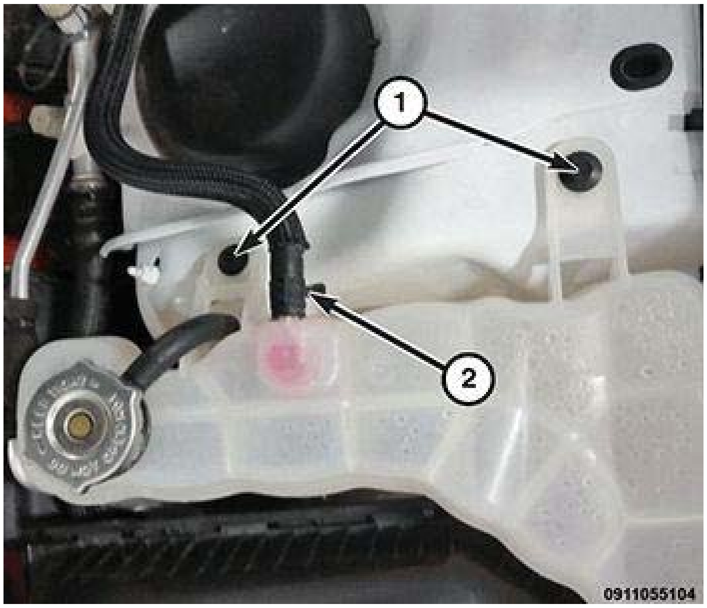
Courtesy of CHRYSLER GROUP, LLC

1. Partially drain the cooling system. Refer to **STANDARD PROCEDURE**.
2. Remove and plug coolant hose (2).
3. Remove and plug the lower coolant hose.
4. Remove the bolts (1) and the pressurized coolant bottle.

INSTALLATION

INSTALLATION



[Fig. 35: Bolts & Coolant Hose](#)
Courtesy of CHRYSLER GROUP, LLC

1. Install the lower coolant hose.
2. Install the pressurized coolant bottle. Tighten bolts (1) to the proper torque specification. Refer to **SPECIFICATIONS**.
3. Install the coolant hose (2).
4. Fill cooling system. Refer to **STANDARD PROCEDURE**.

CAP, RADIATOR

DESCRIPTION

DESCRIPTION

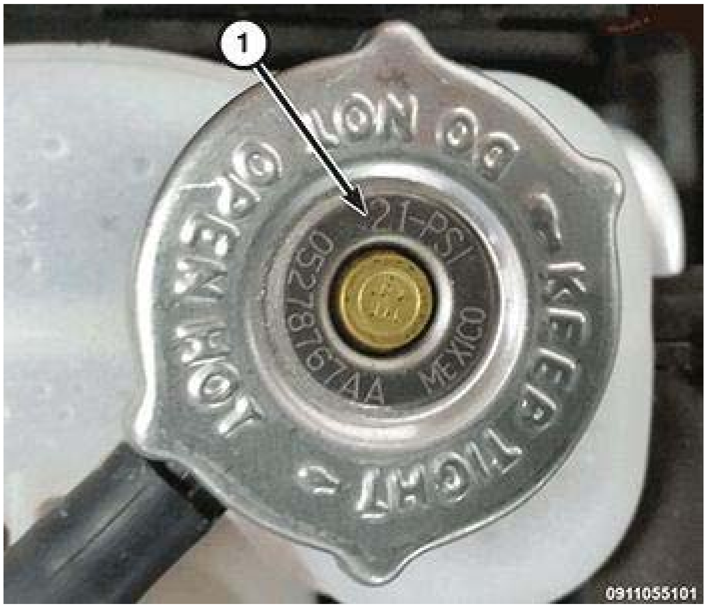


Fig. 36: Typical Pressure Cap - Pressures May Vary
Courtesy of CHRYSLER GROUP, LLC

The engine cooling system is equipped with a pressure cap on the pressurized coolant bottle. This cap releases pressure at some point within a range indicated on the cap. The pressure relief point is engraved on top of the cap (1).

The cooling system will operate at pressures slightly above atmospheric pressure. This results in a higher coolant boiling point allowing increased radiator cooling capacity. The cap contains a spring-loaded pressure relief valve. This valve opens when system pressure reaches the release range indicated on the cap.

A rubber gasket seals the radiator filler neck. This is done to maintain vacuum during coolant cool-down and to prevent leakage when system is under pressure.

DIAGNOSIS AND TESTING

PRESSURE CAP-TO-FILLER NECK SEAL

The pressure cap upper gasket (seal) pressure relief can be tested by removing overflow hose from radiator filler neck nipple. Attach hose of pressure tester tool (special tool #7700, Tester, Cooling System) (or equivalent) to nipple. It will be necessary to disconnect hose from its adapter for filler neck. Pump air into radiator. The pressure cap upper gasket should relieve at the pressure indicated on the cap.

WARNING: The warning words "DO NOT OPEN HOT" on radiator pressure cap, are a safety precaution. When hot, pressure builds up in cooling system. To prevent scalding or injury, radiator cap should not be removed while system is hot and/or under pressure.

Do not remove radiator cap at any time **except** for the following purposes:

1. Check and adjust antifreeze freeze point.
2. Refill system with new antifreeze.
3. Conducting service procedures.
4. Checking for vacuum leaks.

WARNING: If vehicle has been run recently, wait at least 15 minutes before removing radiator cap. With a rag, squeeze radiator upper hose to check if system is under pressure. Place a rag over cap and without pushing cap down, rotate it counter-clockwise to first stop. Allow fluid to escape through the coolant reserve/overflow hose into reserve/overflow tank. Squeeze radiator upper hose to determine when pressure has been released. When coolant and steam stop being pushed into tank and system pressure drops, remove radiator cap completely.

PRESSURE CAP

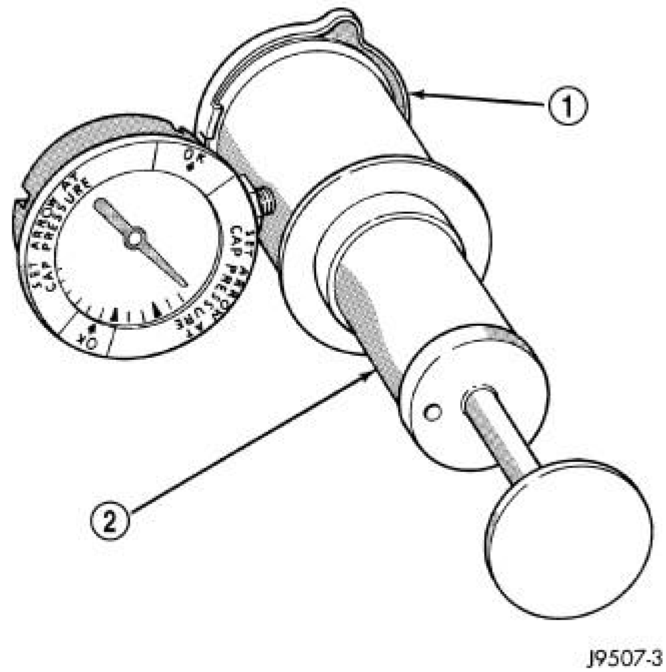

Fig. 37: Pressure Testing Radiator Pressure Cap
Courtesy of CHRYSLER GROUP, LLC

Remove the pressure cap (1). Be sure that sealing surfaces are clean. Moisten rubber gasket with water and install cap (1) on pressure tester (special tool #7700, Tester, Cooling System) (2) or an equivalent.

Operate tester pump to bring pressure to 124 kPa (18 psi) on gauge. If pressure cap (1) fails to hold pressure of at least 110 kPa (16 psi) replace cap. Refer to the following **CAUTION** .

The pressure cap may test properly while positioned on tool (special tool #7700, Tester, Cooling System) (or equivalent). It may not hold pressure or vacuum when installed on radiator. If so, inspect radiator filler neck and cap's top gasket for damage. Also inspect for dirt or distortion that may prevent cap from sealing properly.

CAUTION: Radiator pressure testing tools are very sensitive to small air leaks, which will not cause cooling system problems. A pressure cap that does not have a history of coolant loss should not be replaced just because it leaks slowly when tested with this tool. Add water to tool. Turn tool upside down and recheck pressure cap to confirm that cap needs replacement.

INSPECTION

INSPECTION

Hold cap at eye level, right side up. The vent valve at bottom of cap should open. If rubber gasket has swollen and prevents vent valve from opening, replace cap.

Hold cap at eye level, upside down. If any light can be seen between vent valve and rubber gasket, replace cap. **Do not use a replacement cap that has a spring to hold vent shut.** A replacement cap must be the type designed for a coolant reserve/overflow system with a completely sealed diaphragm spring and a rubber gasket. This gasket is used to seal to radiator filler neck top surface. Use of proper cap will allow coolant return to radiator.

COOLANT

DESCRIPTION

DESCRIPTION

WARNING: Antifreeze is an ethylene-glycol base coolant and is harmful if swallowed or inhaled. If swallowed, drink two glasses of water and induce vomiting. If inhaled, move to fresh air area. Seek medical attention immediately. Do not store in open or unmarked containers. Wash skin and clothing thoroughly after coming in contact with ethylene-glycol. Keep out of reach of children. Dispose of glycol base coolant properly, contact your dealer or government agency for location of collection center in your area. Do not open a cooling system when the engine is at operating temperature or hot under pressure, personal injury can result. Avoid radiator cooling fan when engine compartment related service is performed, personal injury can result.

CAUTION: Mixing of engine coolant (antifreeze) other than specified Organic Additive Technology (OAT) engine coolant (antifreeze), may result in engine damage and may decrease corrosion protection. Organic Additive Technology (OAT) engine coolant is different and should not be mixed with Hybrid Organic Additive Technology (HOAT) engine coolant (antifreeze). If a non-OAT engine coolant (antifreeze) is introduced into the cooling system in an emergency, it should be replaced with the specified engine coolant (antifreeze) as soon as possible.

To find the coolant needed. Refer to CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS
.

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. MoparĀ® Antifreeze/Coolant, or the equivalent ethylene-glycol base coolant with organic corrosion inhibitors (called OAT, for Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% ethylene-glycol and 50% distilled water to obtain a freeze point of -37Ā°C (-35Ā°F). If it becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - COOLANT CONCENTRATION TESTING

Coolant concentration should be checked when any additional coolant was added to system or after a coolant drain, flush and refill. The coolant mixture offers optimum engine cooling and protection against corrosion when mixed to a freeze point of -37Ā°C (-35Ā°F) to -46Ā°C (-51Ā°F). The use of a hydrometer or a refractometer can be used to test coolant concentration.

A hydrometer will test the amount of glycol in a mixture by measuring the specific gravity of the mixture. The higher the concentration of ethylene glycol, the larger the number of balls that will float, and higher the freeze protection (up to a maximum of 60% by volume glycol).

A refractometer Tool (special tool #8286, Refractometer)

Refer to **SPECIAL TOOLS**.

Some coolant manufactures use other types of glycols into their coolant formulations. Propylene glycol is the most common new coolant. However, propylene glycol based coolants do not provide the same freezing protection and corrosion protection and is not recommended.

CAUTION: Do not mix types of coolant - corrosion protection will be severely reduced.

FAN, COOLING

REMOVAL

3.6L SINGLE FAN

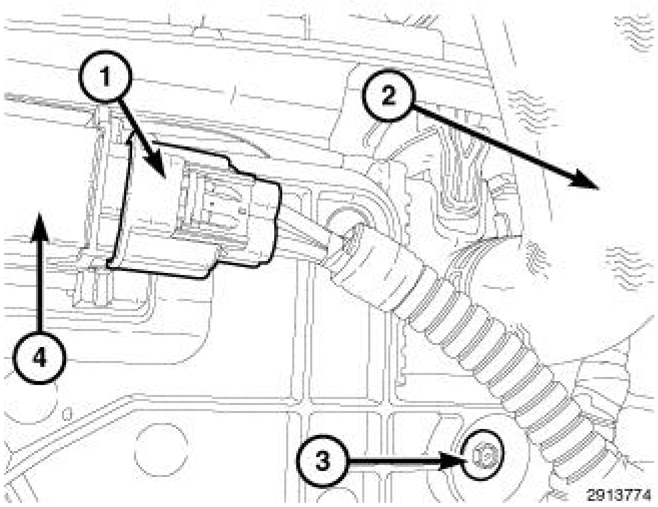

Fig. 38: Cooling Fan Electrical Connector & Upper Cooling Fan Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: If replacing the fan blades. The dual fan blades can be replaced separately from the motor. Single motor fan blades are balanced to the motor and must be replaced as a fan/motor assembly.

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** .
3. Disconnect the cooling fan wire harness connector (1).
4. Remove the upper cooling fan bolts (3).
5. Remove the cooling fan assembly.

6.2L SINGLE FAN

NOTE: If replacing the fan blades. The dual fan blades can be replaced separately from the motor. Single motor fan blades are balanced to the motor and must be replaced as a fan/motor assembly.

1. Disconnect and isolate the negative battery cable.
2. Remove the water pump. Refer to **PUMP, WATER, REMOVAL**.

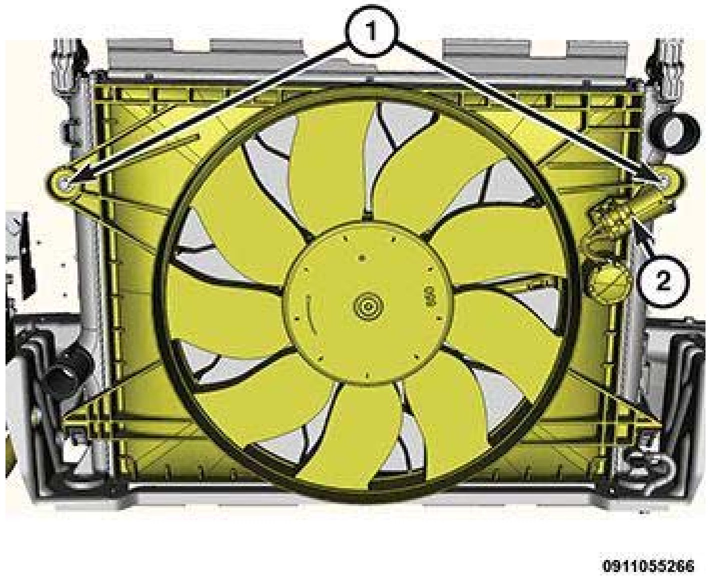

Fig. 39: Cooling Fan Wire Harness Connector & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the cooling fan wire harness connector (2).
4. Remove the bolts (1) and the cooling fan assembly.

5.7L SINGLE FAN

NOTE:	**If replacing the fan blades. The dual fan blades can be replaced separately from the motor. Single motor fan blades are balanced to the motor and must be replaced as a fan/motor assembly.**

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** .
3. Disconnect the cooling fan wire harness connector (1).
4. Remove the upper cooling fan mounting bolts (3).
5. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
6. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** or **BELLY PAN, ENGINE, REMOVAL** .
7. **Loosen** the lower radiator support bolts.

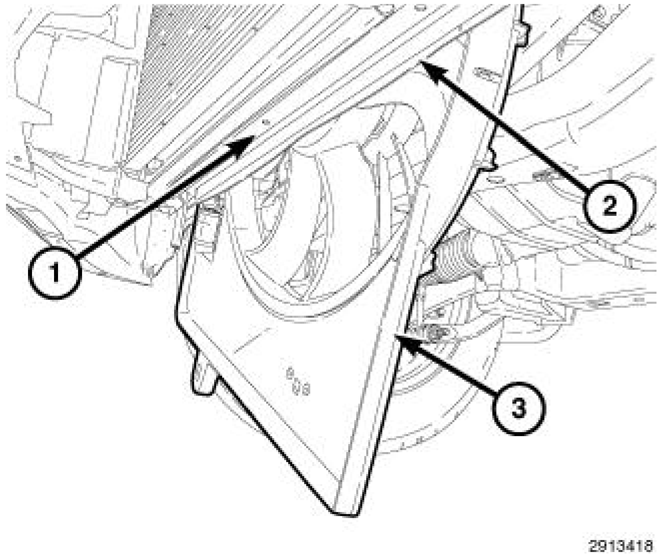

Fig. 41: Radiator Fan Assembly
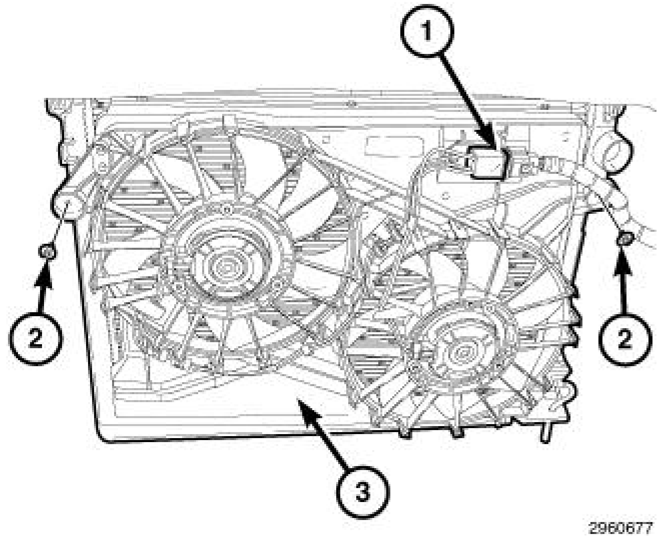
Courtesy of CHRYSLER GROUP, LLC

8. Remove the radiator cooling fan assembly (1) from the radiator by pushing up and away from the radiator mounts.
9. While moving the lower core support forward, slowly lower the left side of the cooling fan assembly from the bottom of the vehicle.
10. Remove the cooling fan assembly.

3.6L DUAL FAN

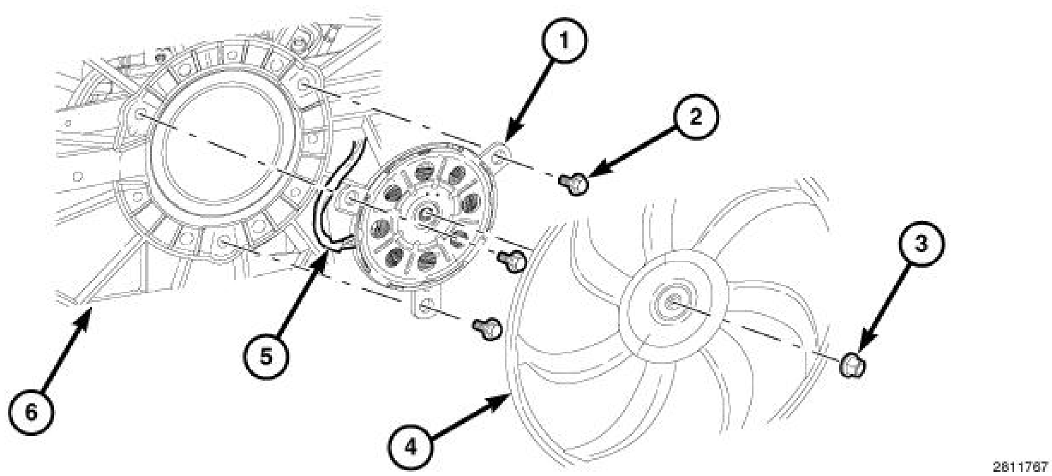
NOTE: **If replacing the fan blades. The dual fan blades can be replaced separately from the motor. Single motor fan blades are balanced to the motor and must be replaced as a fan/motor assembly.**

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** .



[Fig. 42: Cooling Fan Electrical Connector, Cooling Fan Mounting Bolts & Radiator Cooling Fan Assembly]()
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the cooling fan wire harness connector (1).
4. Remove the cooling fan mounting bolts (2).
5. Remove the radiator cooling fan assembly (3) from vehicle.



[Fig. 43: Fan Motor Wiring Harness, Fan Shroud, Fan Blade & Bolts]()

7. Install the upper radiator hose (2).
8. Install the oil cooler supply line (4) to the thermostat housing.
9. Install the throttle body. Refer to **THROTTLE BODY, INSTALLATION** .
10. Install the air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION** .
11. Fill the cooling system. Refer to **STANDARD PROCEDURE**.
12. Operate the engine until it reaches normal operating temperature.

HEATER, ENGINE BLOCK

DESCRIPTION

3.6L

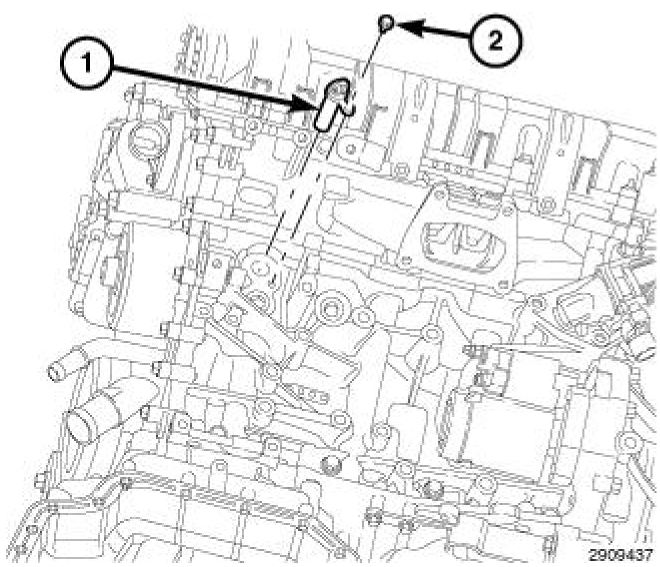

Fig. 66: Block Heater & Screw
Courtesy of CHRYSLER GROUP, LLC

The 3.6L engine block heater (1) is mounted in the cylinder block, near the front drivers side corner. The engine block heater (1) is a dry cylinder type design and is powered by 110 volt AC.

5.7L/6.4L

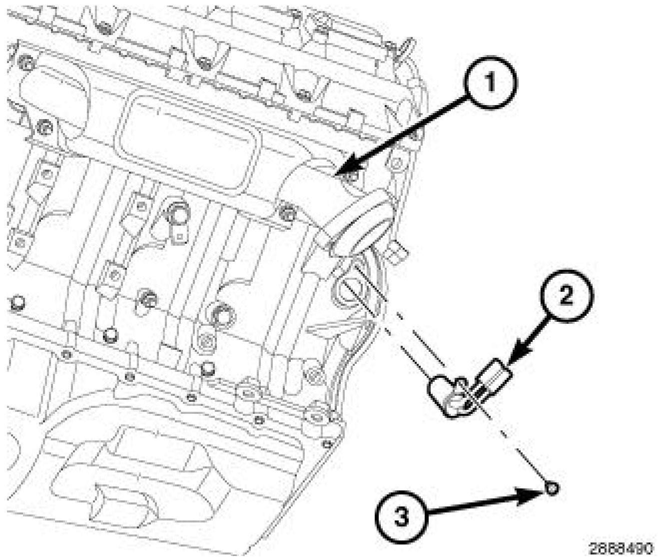

Fig. 67: Heater, Exhaust And Bolt
Courtesy of CHRYSLER GROUP, LLC

The 5.7L engine block heater (1) is mounted in the cylinder block, near the left rear corner. The engine block heater (1) is a dry cylinder type design and is powered by 110 volt AC.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ENGINE BLOCK HEATER

If unit does not operate, trouble can be in either the power cord or the heater element. Test power cord for continuity with a 110-volt voltmeter or 110-volt test light; test heater element continuity with an ohmmeter or 12-volt test light.

REMOVAL

3.6L

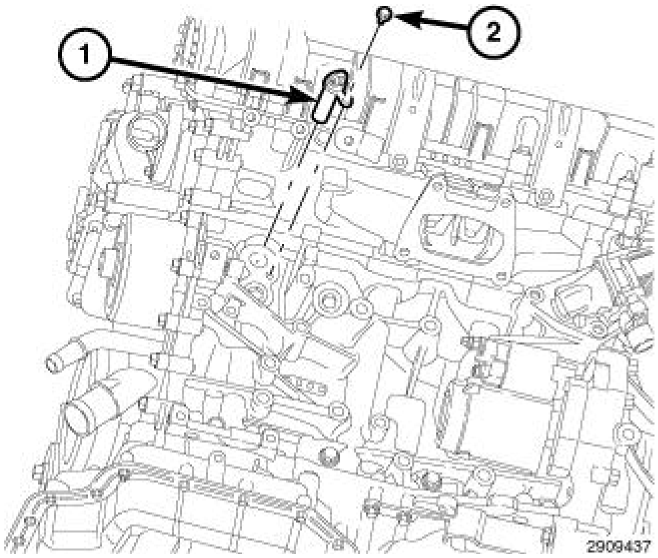

Fig. 68: Block Heater & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the A/C compressor. Refer to **COMPRESSOR, A/C, REMOVAL** .
3. Detach the power cord plug from the block heater (1).
4. Remove the bolt (2) and the engine block heater (1).

5.7L/6.2L/6.4L

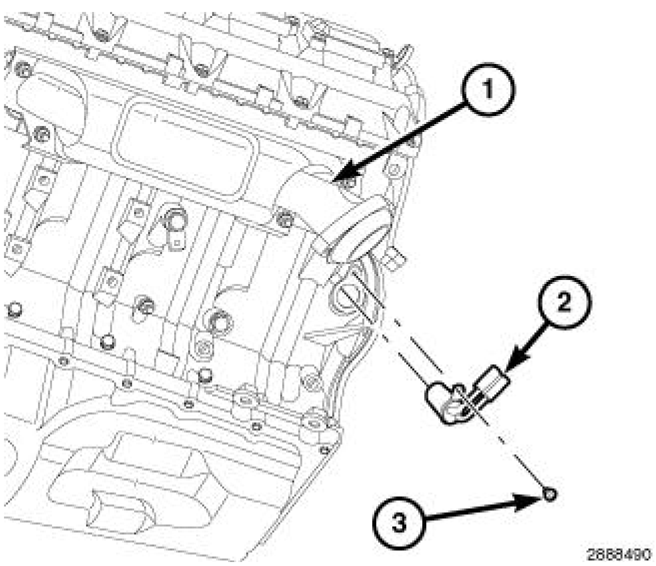

Fig. 69: Heater, Exhaust And Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** or **BELLY PAN, ENGINE, REMOVAL** .
3. Remove the power cord from the block heater.
4. Remove the bolt (3) and the block heater assembly (2).

INSTALLATION

3.6L

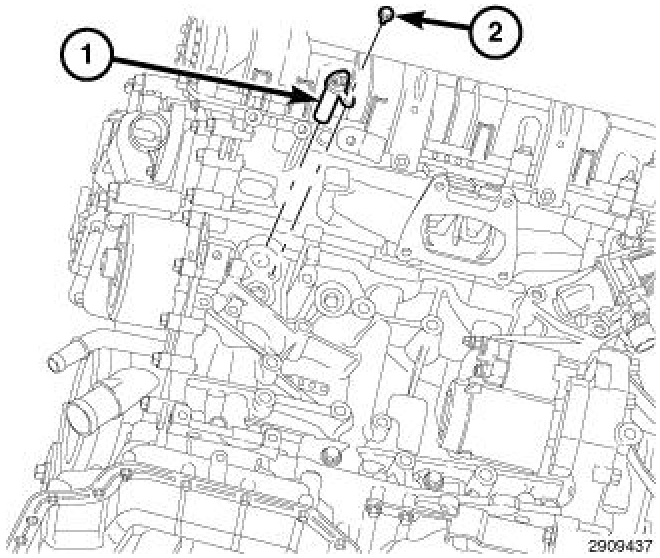

Fig. 70: Block Heater & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Thoroughly clean the cylinder block heater cavity.
2. Insert the engine block heater assembly (1) Tighten the bolt (2) to the proper torque specification. Refer to **SPECIFICATIONS**.

CAUTION: To prevent damage, the power cord must be secured in its retainer clips, and not positioned so it could contact linkages or exhaust manifolds.

3. Attach the power cord to heater.
4. Install the A/C compressor. Refer to **COMPRESSOR, A/C, INSTALLATION** .
5. Remove support and lower the vehicle.

5.7L/6.2L/6.4L

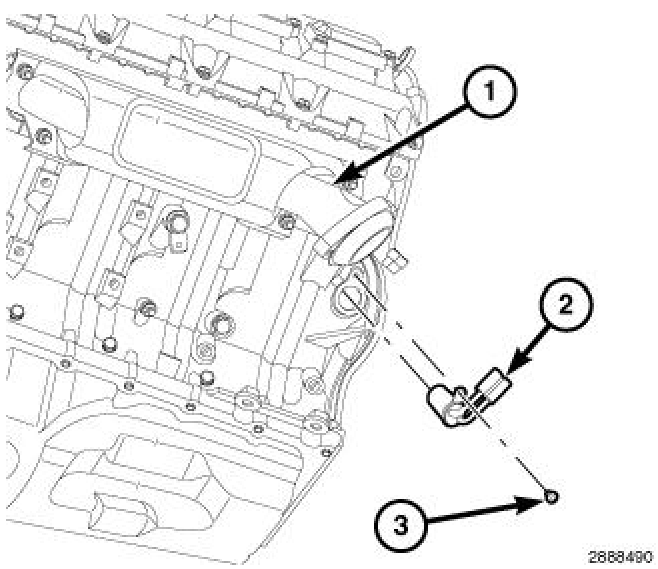

Fig. 71: Heater, Exhaust And Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Thoroughly clean the cylinder block core hole and the block heater seat.
2. Insert the block heater assembly (2) into the engine block.
3. Tighten the bolt (3) to the proper torque specification. Refer to **SPECIFICATIONS**.
4. Connect the power cord to the block heater.
5. Install the belly pan. Refer to **BELLY PAN, INSTALLATION** or **BELLY PAN, ENGINE, INSTALLATION** .

PUMP, WATER

DESCRIPTION

DESCRIPTION

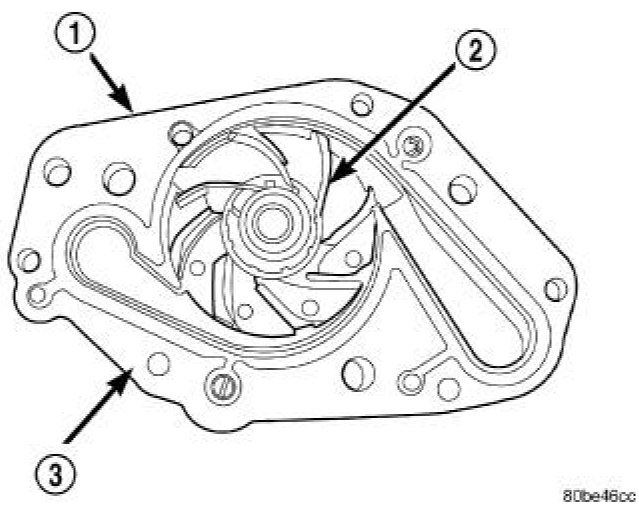

Fig. 72: Water Pump
Courtesy of CHRYSLER GROUP, LLC

A centrifugal water pump (2) circulates coolant through the water jackets, passages, intake manifold, radiator core, cooling system hoses and heater core. The pump is driven from the engine crankshaft by a single serpentine main drive belt.

The water pump impeller is pressed onto the rear of a shaft that rotates in bearings pressed into the housing. The housing has two small holes to allow seepage to escape. The water pump seals are lubricated by the antifreeze in the coolant mixture. No additional lubrication is necessary.

The water pump (1) is mounted directly to the timing chain cover and is equipped with a non serviceable integral pulley.

REMOVAL

3.6L

NOTE:	**The water pump on 3.6L engines is bolted directly to the engine timing chain case cover.**

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** .
3. Drain the cooling system. Refer to **STANDARD PROCEDURE**.
4. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL**.

WARNING: **Constant tension hose clamps are used on most cooling system hoses. When removing or installing, use only tools designed for servicing this type of clamp. Always wear safety glasses when servicing constant tension clamps.**

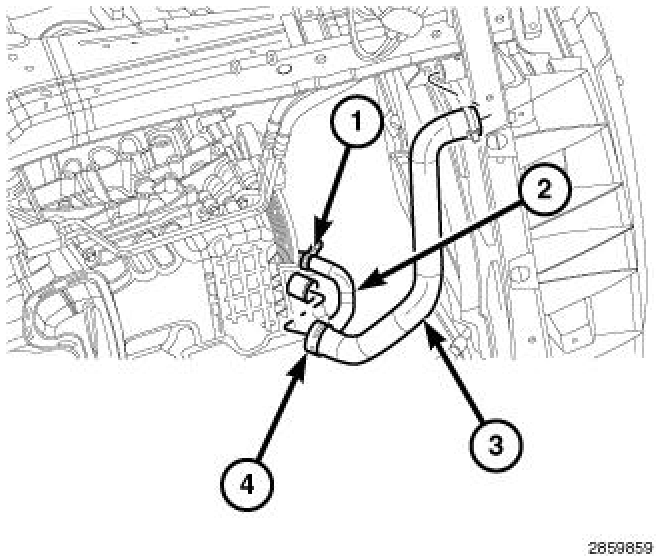

Fig. 73: Lower Heater Hose, Lower Radiator Hose & Tension Clamps
Courtesy of CHRYSLER GROUP, LLC

CAUTION: **A number or letter is stamped into the tongue of constant tension clamps (4). If replacement is necessary, use only an original equipment clamp with matching number or letter.**

5. Remove the lower heater hose (1) from the water pump.
6. Remove the lower radiator hose (3) from the water pump.

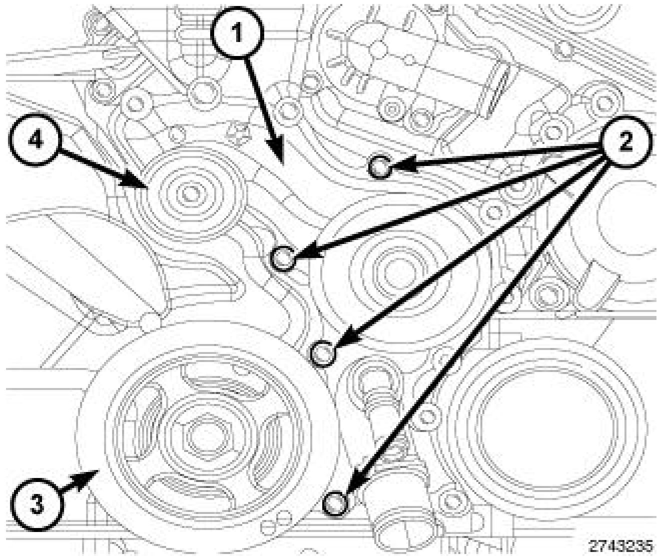

Fig. 74: Idler Pulley, Water Pump & Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Remove idler pulley (4). Refer to **PULLEY, IDLER, REMOVAL**.
8. Remove the eleven water pump mounting bolts. Take notice to the four water pump M6 bolts (2) that bolt directly to the timing cover.

CAUTION: **Do not pry on the water pump at the timing chain case/cover. The machined surfaces may be damaged resulting in leaks.**

9. Remove water pump (1) and discard gasket.

6.2L

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** .
3. Remove the cooling fan assembly. Refer to **FAN, COOLING, REMOVAL**.
4. Drain the cooling system. Refer to **STANDARD PROCEDURE**.

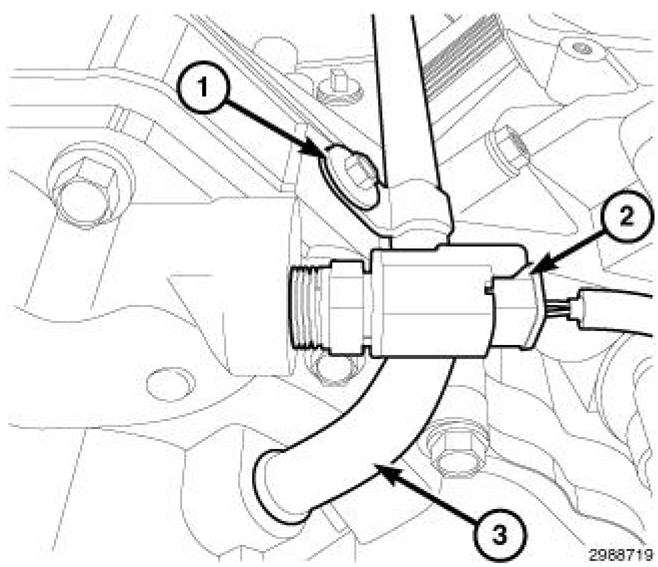

Fig. 75: Coolant Temperature (ECT) Sensor Electrical Connector, Heater Tube & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

5. Remove the serpentine belt. Refer to **BELT, SERPENTINE, REMOVAL**.
6. Remove bolt (1) and the heater tube (3) from the water pump.
7. Disconnect the Engine Coolant Temperature (ECT) sensor wire harness connector (2).

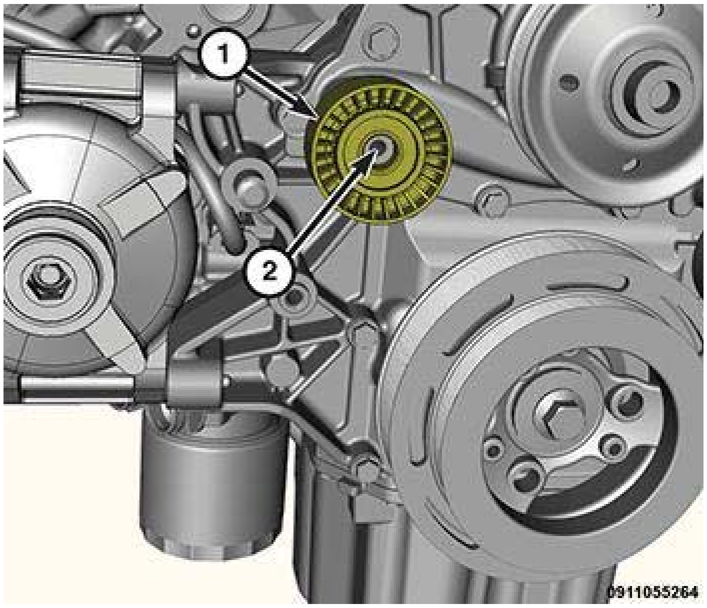

Fig. 76: Idler Pulley & Bolt
Courtesy of CHRYSLER GROUP, LLC

8. Remove the bolt (1) and the idler pulley (2).

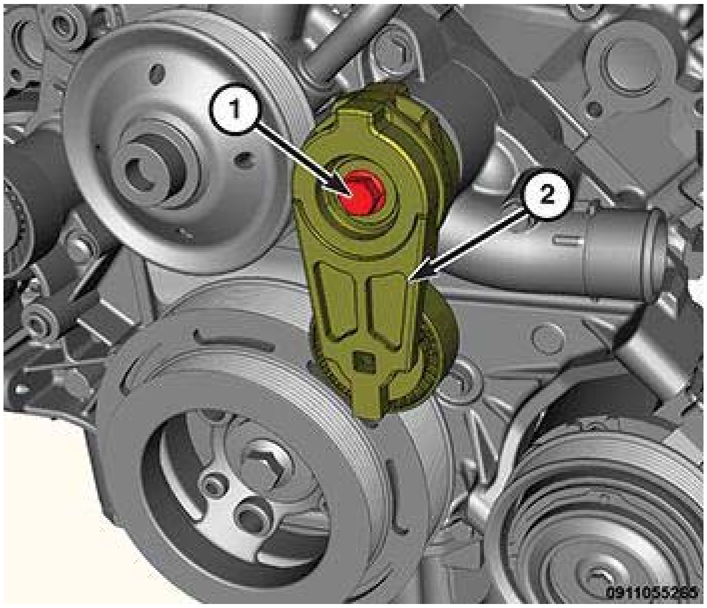

Fig. 77: Belt Tensioner & Bolt
Courtesy of CHRYSLER GROUP, LLC

9. Remove the bolt (1) and the belt tensioner assembly.

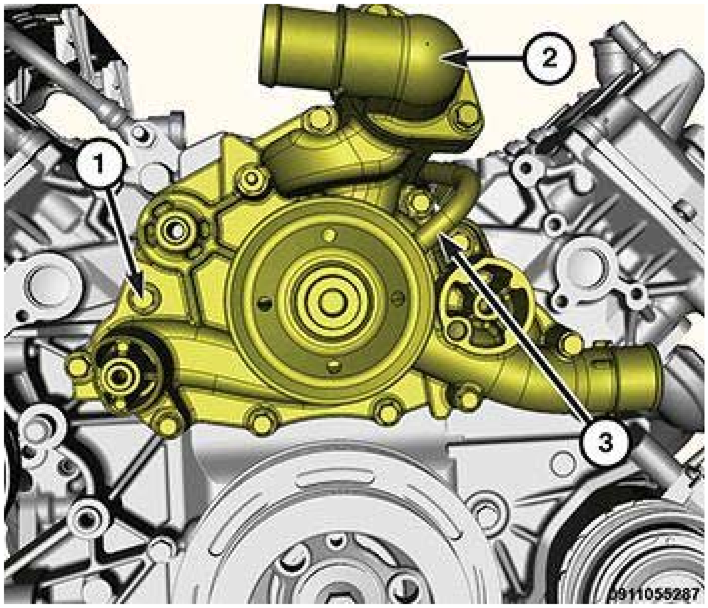

Fig. 78: Water Pump Mounting Bolt & Thermostat Housing
Courtesy of CHRYSLER GROUP, LLC

10. Remove the upper radiator hose from the thermostat housing (2) and position aside.
11. Remove lower radiator hose from the water pump and position aside.
12. Remove the upper stud bolt.
13. Remove the water pump mounting bolts (1) and carefully remove pump.

5.7L/6.4L

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** for 5.7L or **BODY, AIR CLEANER, REMOVAL** for 6.4L .
3. Remove the resonator mounting bracket.
4. Remove cooling fan assembly. Refer to **FAN, COOLING, REMOVAL**.
5. Drain cooling system. Refer to **STANDARD PROCEDURE**.

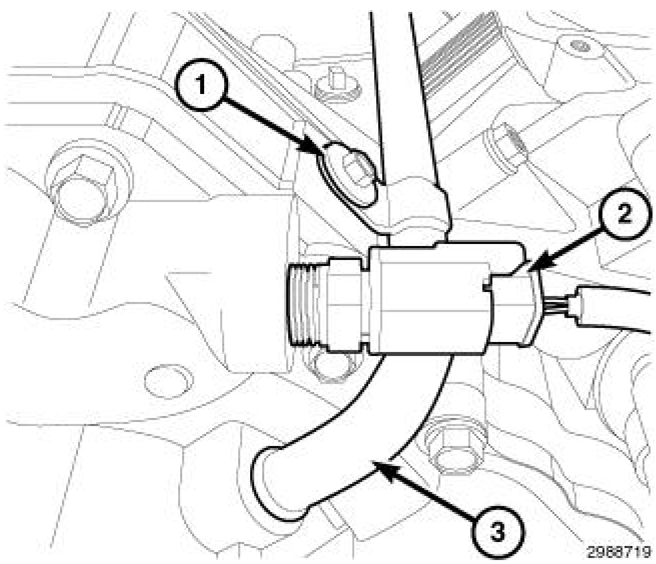

Fig. 79: Coolant Temperature (ECT) Sensor Electrical Connector, Heater Tube & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

6. Remove the serpentine belt. Refer to **BELT, SERPENTINE, REMOVAL**.
7. Remove bolt (1) and the heater tube (3) from the water pump.
8. Disconnect the Engine Coolant Temperature (ECT) sensor wire harness connector (2).

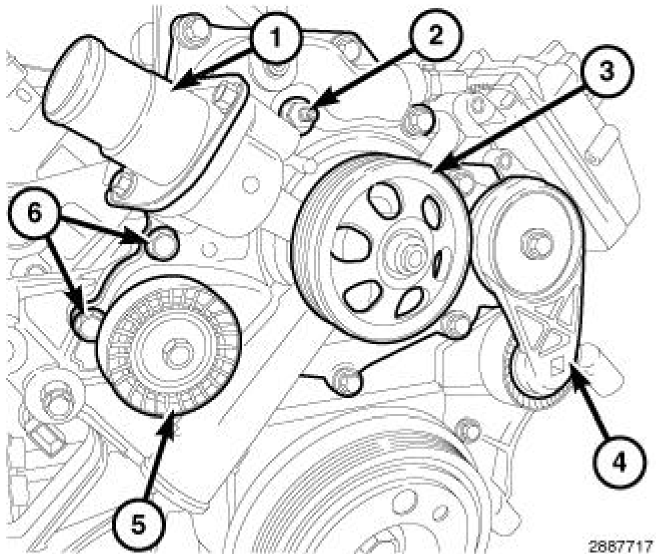

Fig. 80: Thermostat Housing, Water Pump, Belt Tensioner, & Idler Pulley
Courtesy of CHRYSLER GROUP, LLC

9. Remove the upper radiator hose from the thermostat housing (1) and position aside.
10. Remove bolt and the idler pulley (5).
11. Remove belt tensioner assembly (4). Refer to **TENSIONER, BELT, REMOVAL**.
12. Remove the lower radiator hose from the water pump and position aside.
13. Remove the upper stud bolt (2).
14. Remove the water pump mounting bolts (6) and carefully remove pump (3) from the cover while removing the metal bypass tube.

INSPECTION

INSPECTION

Inspect and replace the water pump if it has any of the following defects:

1. Damage or cracks on the pump body.
2. Coolant leaks: If the shaft seal is leaking, this will be evident by traces of thick deposits of dried glycol running down from the pump primary weep passage. A thin black stain below the pump primary weep hole/passage is considered normal operation.
3. Coolant leaks: If the pump primary weep passage is plugged, coolant may come from the secondary weep passage and collect in the valley of the engine. The coolant will eventually run out the back side of the engine. Leakage from the secondary weep passage may give false indications that core plug(s) may be leaking on the back side of the engine block. If this condition is found, clean the primary weep passage of debris.

NOTE: **It is normal for the water pump to weep a small amount of coolant from the primary weep hole (black stain at weep passage). Do not replace the water pump if this condition exists. Replace the water pump if a heavy deposit or a steady flow of engine coolant is evident from the primary weep passage. This indicates a shaft seal failure and pump must be replaced. Coolant may leak from the secondary weep passage and fill the valley of the engine. If this condition is found, clean the primary weep passage of debris. Be sure to perform a thorough analysis before replacing water pump.**

4. Impeller rubs inside of cylinder block.
5. Excessively loose or rough turning bearing.

INSTALLATION

3.6L

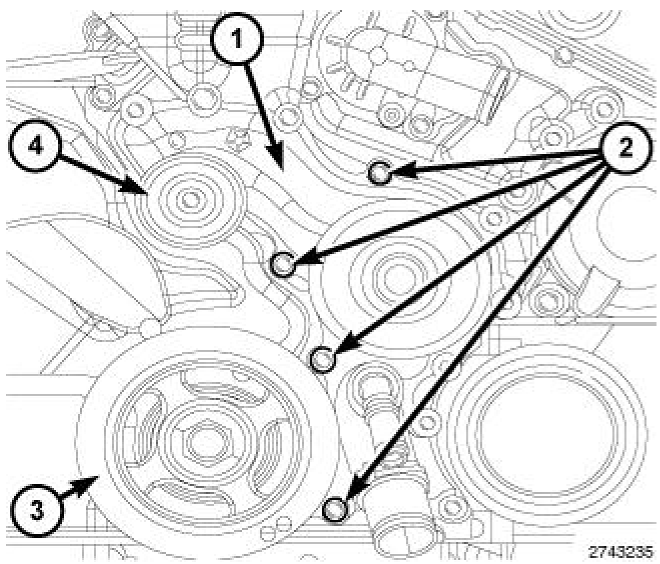

Fig. 81: Idler Pulley, Water Pump & Bolts
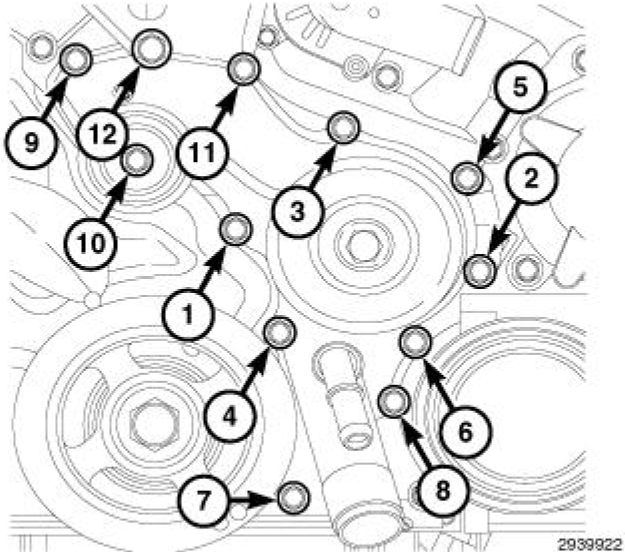
Courtesy of CHRYSLER GROUP, LLC

1. Clean the gasket mating surfaces.

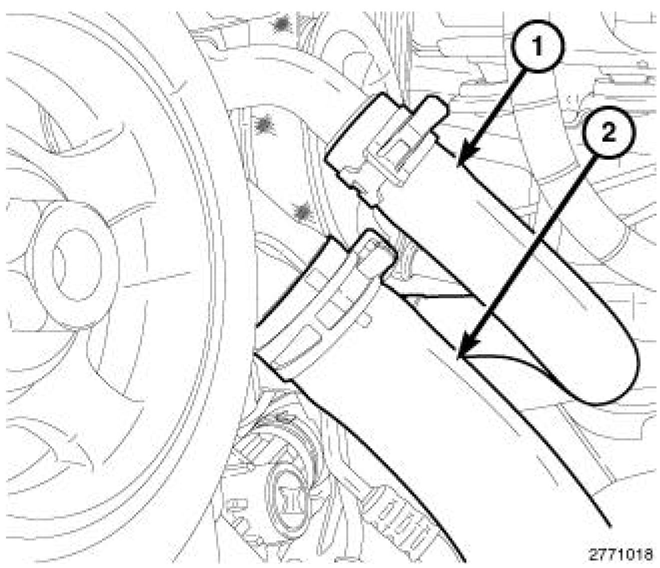
NOTE: **Take notice to the lengths of the mounting bolts. Some M6 bolts mount directly to the timing cover (2).**

2. Using a new gasket, Install water pump (1) and tighten the M6, M8, and M10 bolts finger tight.



[Fig. 82: Water Pump Fasteners Tightening Sequence]
Courtesy of CHRYSLER GROUP, LLC

3. Using the sequence shown in the illustration, tighten the bolts 1 - 12 to their proper torque:
   - Tighten the M6 bolts to the proper torque specification. Refer to **SPECIFICATIONS**.
   - Tighten the M8 bolts (10, 11) to the proper torque specification. Refer to **SPECIFICATIONS**.
   - Tighten the M10 bolt (12) to the proper torque specification. Refer to **SPECIFICATIONS**.
4. Install the idler pulley. Refer to **PULLEY, IDLER, INSTALLATION**.



[Fig. 83: Radiator Hose & Heater Hose]
Courtesy of CHRYSLER GROUP, LLC

CAUTION: A number or letter is stamped into the tongue of constant tension clamps (4). If replacement is necessary, use only an original equipment clamp with matching number or letter.

5. Install the lower radiator hose (2).
6. Install the lower return heater hose (1).

CAUTION: **When installing the serpentine accessory drive belt, belt must be routed correctly. If not, engine may overheat due to water pump rotating in wrong direction.**

7. Install accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION**.
8. Evacuate air and the refill cooling system. Refer to **STANDARD PROCEDURE**.
9. Install the air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION** .
10. Connect the negative battery cable.
11. Check the cooling system for leaks. Refer to **DIAGNOSIS AND TESTING**.

6.2L

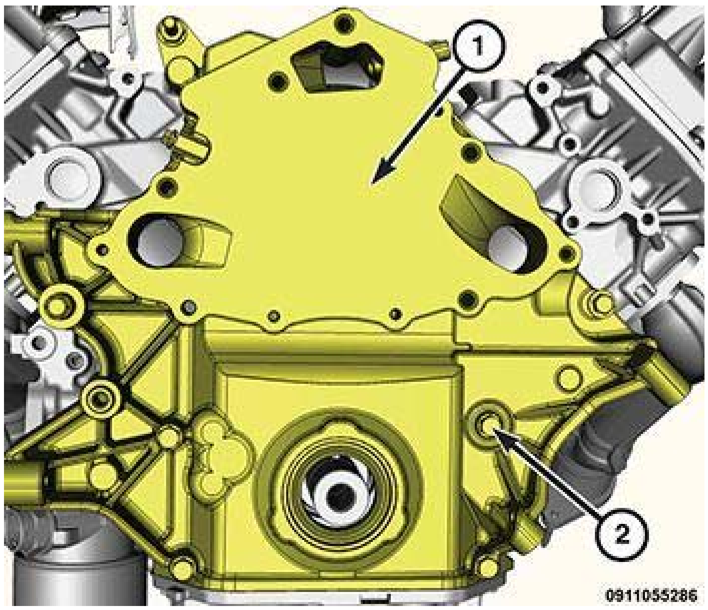


Fig. 84: Timing Chain Cover & Bolt

1. Clean and inspect the mating surfaces of the timing chain cover (1) and the water pump.

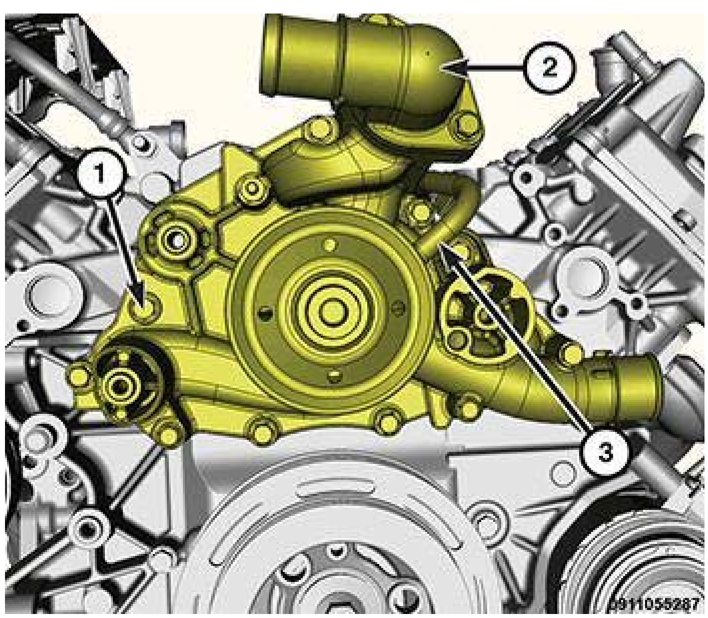

Fig. 85: Water Pump Mounting Bolt & Thermostat Housing
Courtesy of CHRYSLER GROUP, LLC

2. Install the water pump and tighten the bolts (1) to the proper torque specification. Refer to **SPECIFICATIONS**.
3. Install the lower radiator hose.
4. Install the upper radiator hose to the thermostat housing (2).

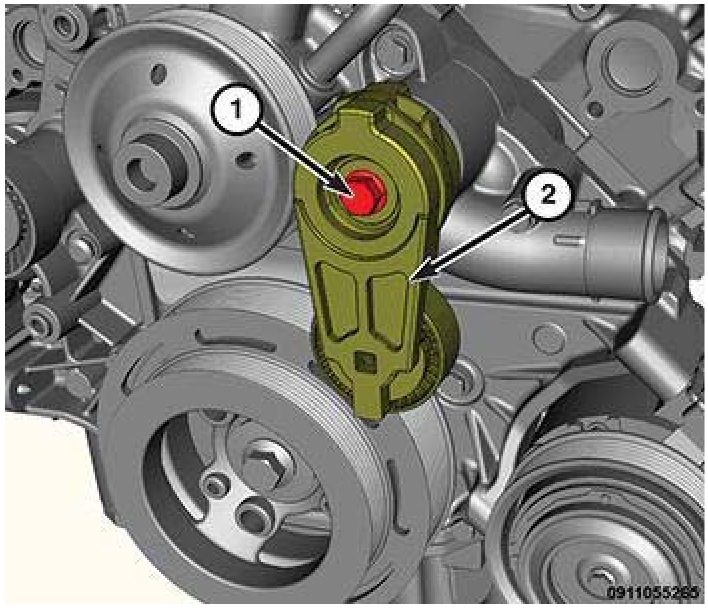

Fig. 86: Belt Tensioner & Bolt
Courtesy of CHRYSLER GROUP, LLC

5. Install the belt tensioner assembly (2) and tighten the bolt (1) to the proper torque specification. Refer to **SPECIFICATIONS**.

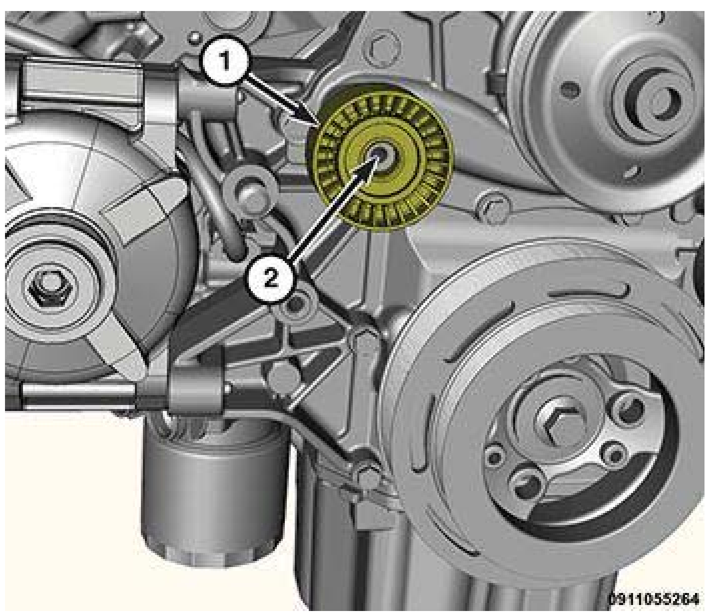

Fig. 87: Idler Pulley & Bolt
Courtesy of CHRYSLER GROUP, LLC

6. Install the idler pulley (1) and tighten the bolt (2) to the proper torque specification. Refer to **SPECIFICATIONS**.

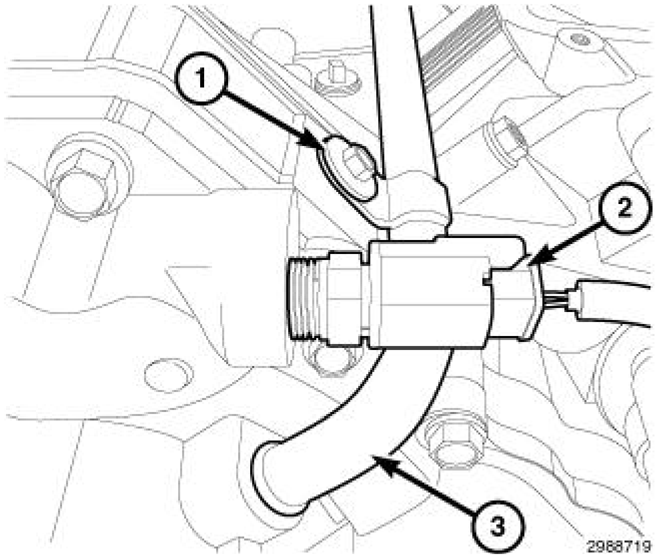

Fig. 88: Coolant Temperature (ECT) Sensor Electrical Connector, Heater Tube & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

7. Connect the temperature sensor (2) wire hire harness connector (5).
8. Using a new O-ring seal, install heater tube (3). Tighten the bolt (1) to the proper torque specification. Refer to **SPECIFICATIONS**.
9. Install serpentine belt. Refer to **BELT, SERPENTINE, INSTALLATION**.
10. Install cooling fan assembly. Refer to **FAN, COOLING, INSTALLATION**.
11. Install the air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION** .
12. Connect the negative battery cable.
13. Evacuate air and refill cooling system. Refer to **STANDARD PROCEDURE**.
14. Check cooling system for leaks. Refer to **DIAGNOSIS AND TESTING**.

5.7L/6.4L

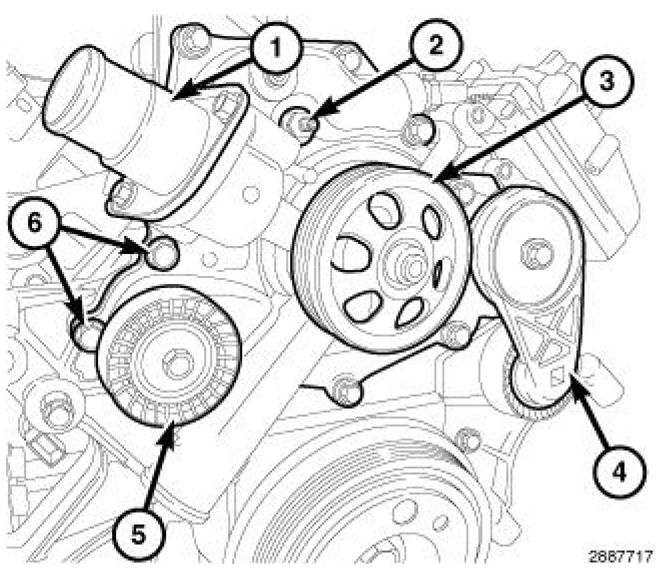

Fig. 89: Thermostat Housing, Water Pump, Belt Tensioner, & Idler Pulley
Courtesy of CHRYSLER GROUP, LLC

1. Clean and inspect the mating surfaces of the timing chain cover (1) and the water pump.
2. Install the water pump (3). Tighten bolts (6) to the proper torque specification. Refer to **SPECIFICATIONS**.
3. Install the upper stud bolt (2). Tighten bolt to the proper torque specification. Refer to **SPECIFICATIONS**.
4. Install the lower radiator hose to the water pump.
5. Install the upper radiator hose to the thermostat housing (1).
6. Install the belt tensioner assembly (4). Tighten the bolt to the proper torque specification. Refer to **SPECIFICATIONS**.
7. Install the idler pulley (5). Tighten the bolt to the proper torque specification. Refer to **SPECIFICATIONS**.

Courtesy of CHRYSLER GROUP, LLC

8. Connect the temperature sensor wire hire harness connector (2).
9. Using a new O-ring seal, install heater tube (3). Tighten bolt (1) to the proper torque specification. Refer to **SPECIFICATIONS**.
10. Install the serpentine belt. Refer to **BELT, SERPENTINE, INSTALLATION**.
11. Install the cooling fan assembly. Refer to **FAN, COOLING, INSTALLATION**.
12. Install the air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION** for 5.7L or **BODY, AIR CLEANER, INSTALLATION** for 6.4L .
13. Connect the negative battery cable.
14. Evacuate the air and refill cooling system. Refer to **STANDARD PROCEDURE**.
15. Check the cooling system for leaks. Refer to **DIAGNOSIS AND TESTING**.

RADIATOR, ENGINE COOLING

REMOVAL

3.6L

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** .
3. Drain the cooling system. Refer to **STANDARD PROCEDURE**.
4. Remove the upper radiator hose.
5. Remove the cooling fan assembly. Refer to **FAN, COOLING, REMOVAL**.
6. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
7. Remove bolts (1) and the belly pan.

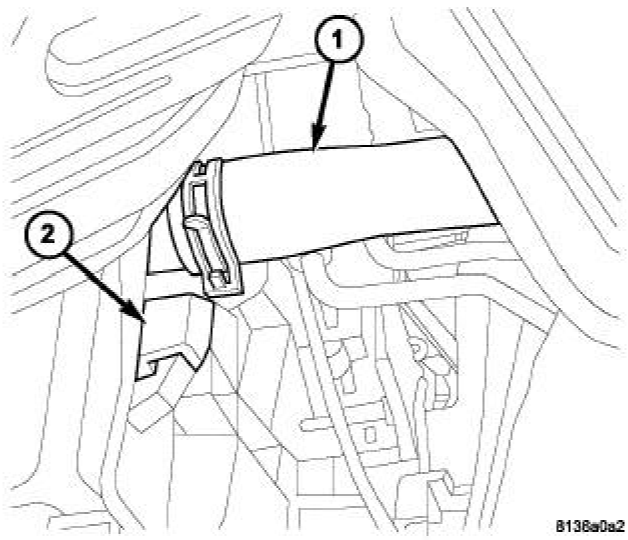

Fig. 91: Lower Radiator Hose
Courtesy of CHRYSLER GROUP, LLC

8. Remove the lower radiator hose (1).
9. Remove support and lower the vehicle.
10. Remove the front fascia. Refer to **FASCIA, FRONT, REMOVAL** .

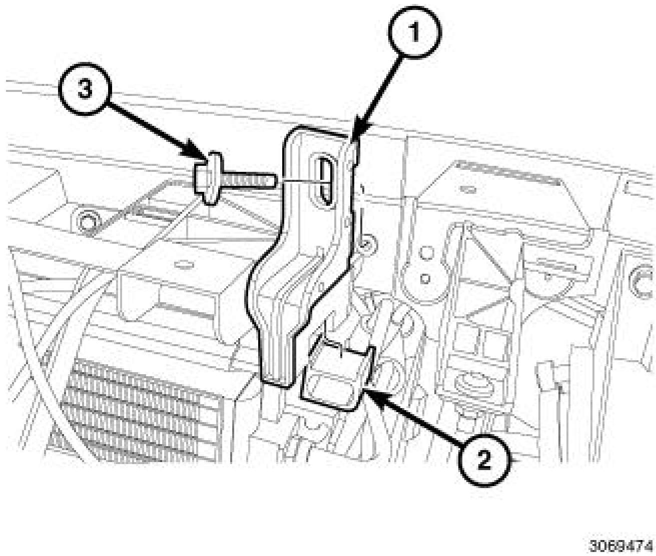

Fig. 92: Upper Radiator Mounting Brackets & Bolt
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Bolts are installed with threadlocker. Use hand tools to remove the upper radiator mounting bolts.

11. Remove the bolts (3) and the upper radiator isolator (1).

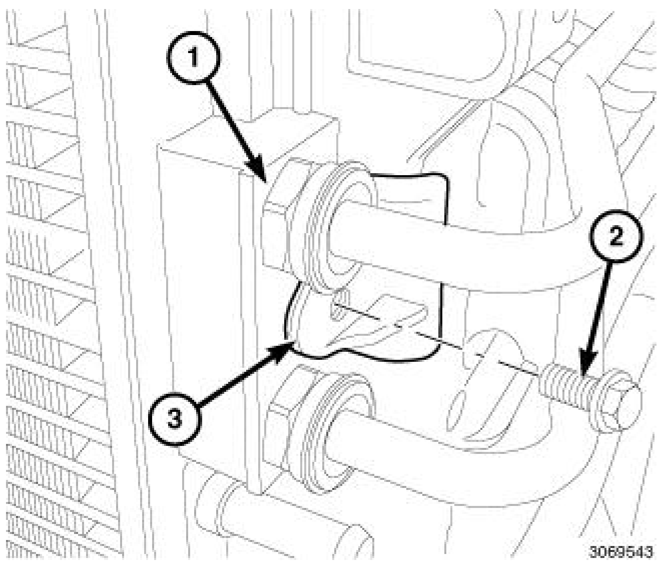

Fig. 93: Mounting & Support Bolt
Courtesy of CHRYSLER GROUP, LLC

12. Remove the lower condenser mounting bolts.
13. Remove the bolt (2) located between the cooler lines.
14. Using a suitable hanger. Support the condenser and remove the right side upper bolt.
15. Separate the condenser assembly from radiator.
16. Tilt the radiator toward engine and remove the radiator from vehicle.

6.2L

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Drain the cooling system. Refer to **STANDARD PROCEDURE**.
4. Remove the Low Temperature Radiator (LTR). Refer to **RADIATOR, LOW TEMPERATURE, REMOVAL**.
5. Remove the upper radiator hose.

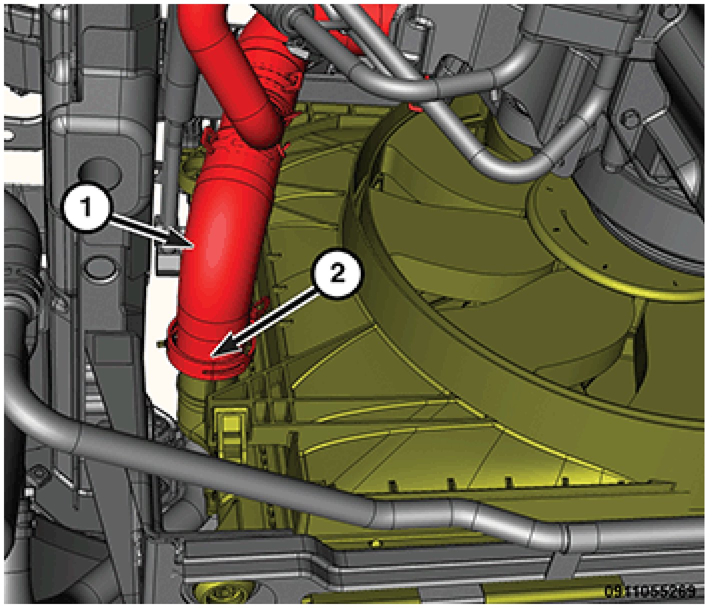

Fig. 94: Lower Radiator Hose & Clamp
Courtesy of CHRYSLER GROUP, LLC

6. Remove the lower radiator hose (1).
7. Disconnect the cooling fan wire harness connector.

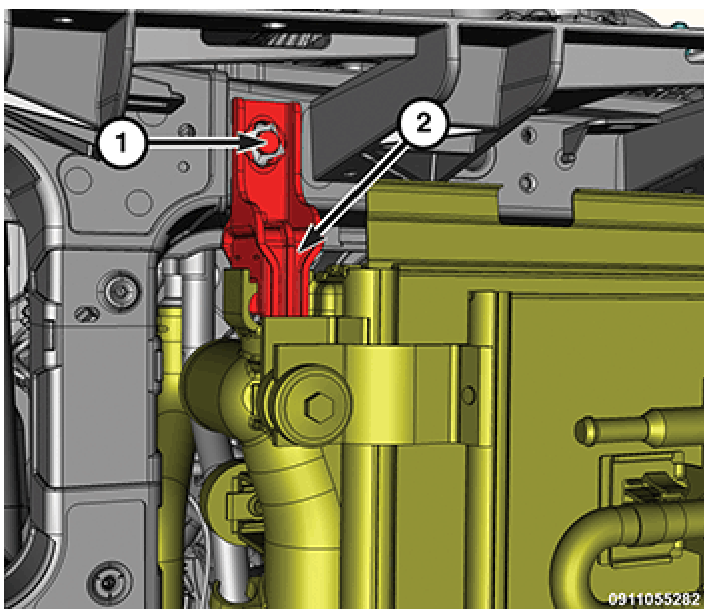

Fig. 95: Upper Radiator Isolator & Bolt
Courtesy of CHRYSLER GROUP, LLC

8. Remove bolts (1) and the upper radiator isolator (2).

CAUTION: Bolts are installed with threadlocker. Use hand tools to remove the upper radiator mounting bolts.

9. Tilt radiator toward the front of the vehicle and remove the radiator and cooling fan.

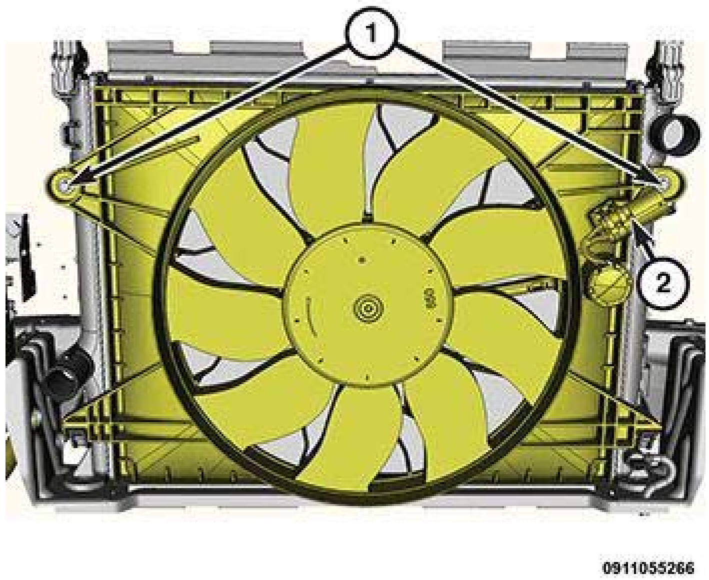

Fig. 96: Cooling Fan Wire Harness Connector & Bolts
Courtesy of CHRYSLER GROUP, LLC

10. If necessary, remove the mounting bolts (1) and separate the cooling fan from the radiator.

5.7L/6.4L

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

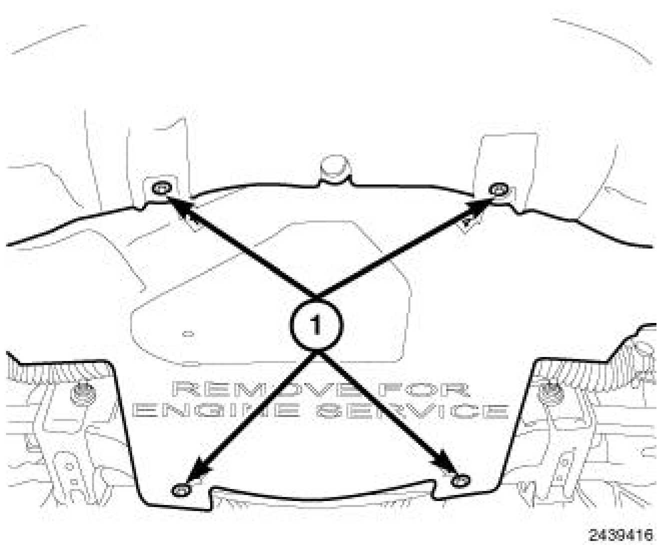

Fig. 97: Belly Pan & Fasteners

Courtesy of CHRYSLER GROUP, LLC

3. Remove bolts (1) and the belly pan.
4. Drain the cooling system. Refer to **STANDARD PROCEDURE**.
5. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** for 5.7L or **BODY, AIR CLEANER, REMOVAL** for 6.4L .
6. Remove the upper radiator hose.

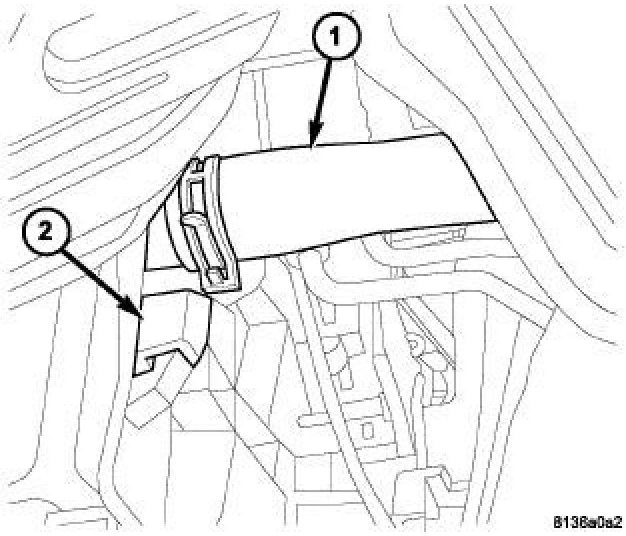

Fig. 98: Lower Radiator Hose
Courtesy of CHRYSLER GROUP, LLC

7. Remove the lower radiator hose (1).
8. Remove the radiator fan assembly. Refer to **FAN, COOLING, REMOVAL**.
9. Remove the front fascia. Refer to **FASCIA, FRONT, REMOVAL** .
10. Remove support and lower the vehicle.

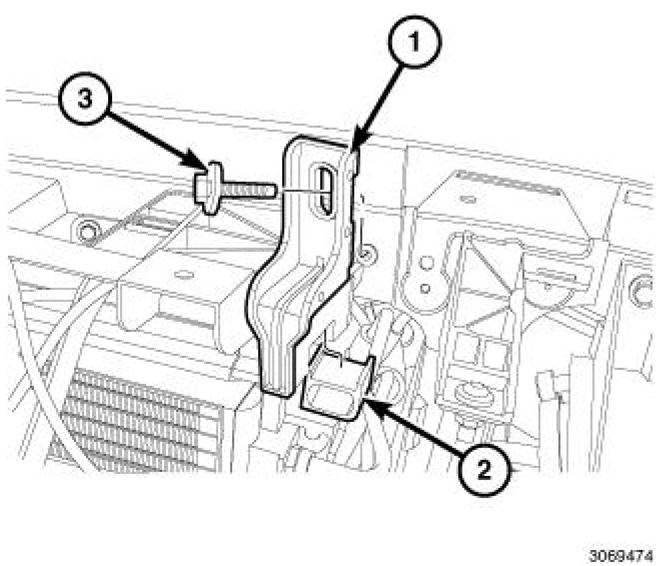

Fig. 99: Upper Radiator Mounting Brackets Bolts

Courtesy of CHRYSLER GROUP, LLC

CAUTION: Bolts are installed with threadlocker. Use hand tools to remove the upper radiator mounting bolts.

11. Remove bolts (3) and the upper radiator isolator (1).

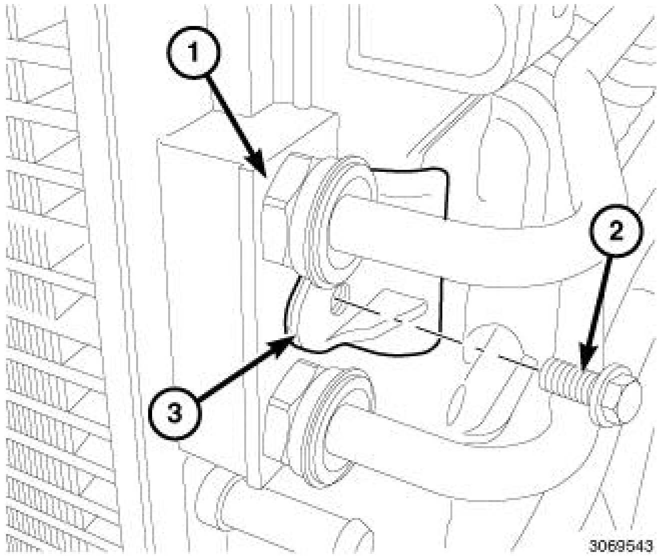

Fig. 100: Mounting & Support Bolt
Courtesy of CHRYSLER GROUP, LLC

12. Remove the lower condenser mounting bolts.
13. Remove the bolt (2) located between the cooler lines.
14. Using a suitable hanger. Support the condenser and remove the right side upper mounting bolt.

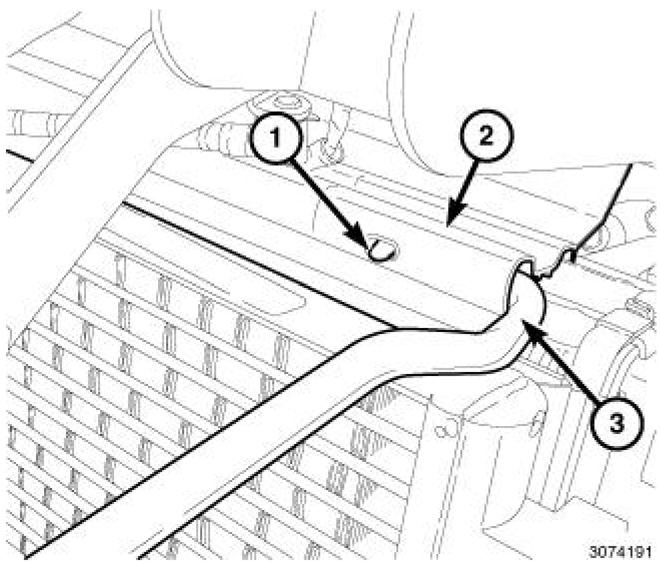

Fig. 101: Upper Shroud Cover, Pick & Clip
Courtesy of CHRYSLER GROUP, LLC

15. Carefully remove the upper shroud cover (2) by using a pick (3) to pull the cover retaining hole away from the clip (1) along the edge.

16. Tilt radiator toward engine and remove the radiator from vehicle.

INSPECTION

INSPECTION

Inspect the radiator tanks for cracks, broken or missing fittings also inspect the joint where the tanks seam up to the radiator core for signs of leakage and/or deteriorating seals.

Inspect radiator core for corroded, bent or missing cooling fins. Inspect the core for bent or damaged cooling tubes.

INSTALLATION

3.6L

1. Install the radiator into engine compartment and seat the lower rubber isolators into the mounting holes of the lower radiator support.

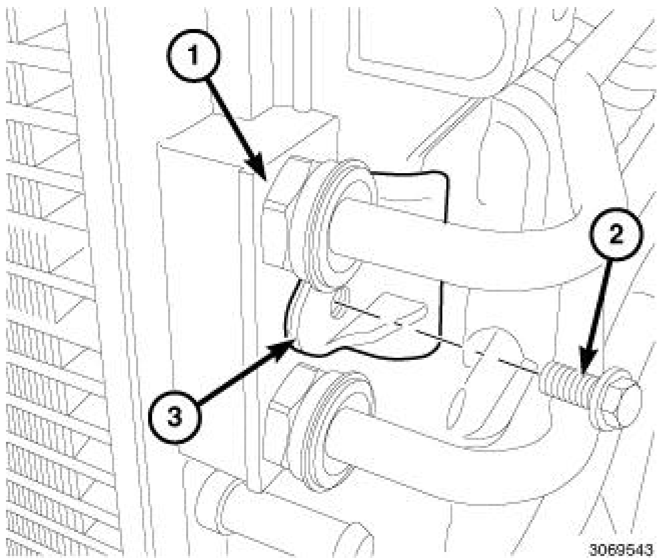

Fig. 102: Mounting & Support Bolt
Courtesy of CHRYSLER GROUP, LLC

2. Position the condenser on radiator and loosely install the right side upper bolt. Tighten bolts to the proper torque specification. Refer to **TORQUE SPECIFICATIONS** .
3. Install the lower mounting bolt. Tighten the bolts to the proper torque specification. Refer to **TORQUE SPECIFICATIONS** .
4. Tighten bolt (2) located between the cooler lines to the proper torque specification. Refer to **TORQUE SPECIFICATIONS** .

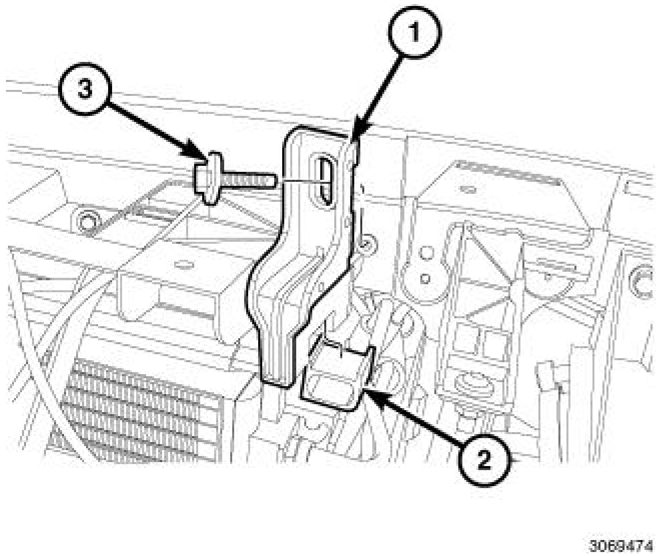

Fig. 103: Upper Radiator Mounting Brackets Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Install the radiator isolator (1). Tighten the bolts (3) to the proper torque specification. Refer to **TORQUE SPECIFICATIONS** .
6. Install the front fascia. Refer to **FASCIA, FRONT, INSTALLATION** .
7. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

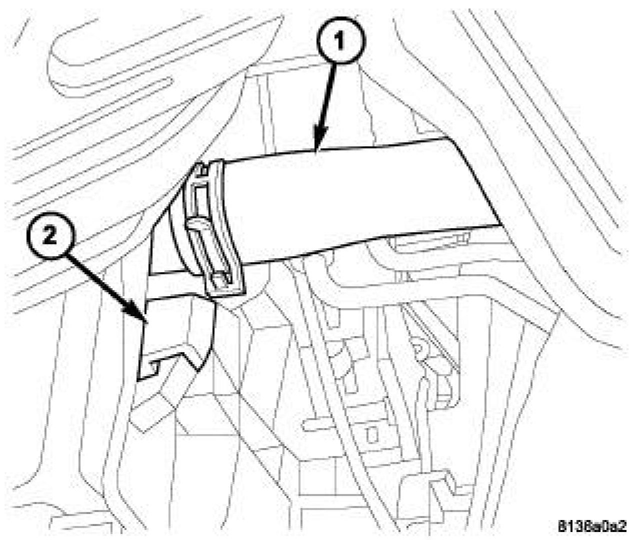

Fig. 104: Lower Radiator Hose
Courtesy of CHRYSLER GROUP, LLC

8. Install the lower radiator hose (1).

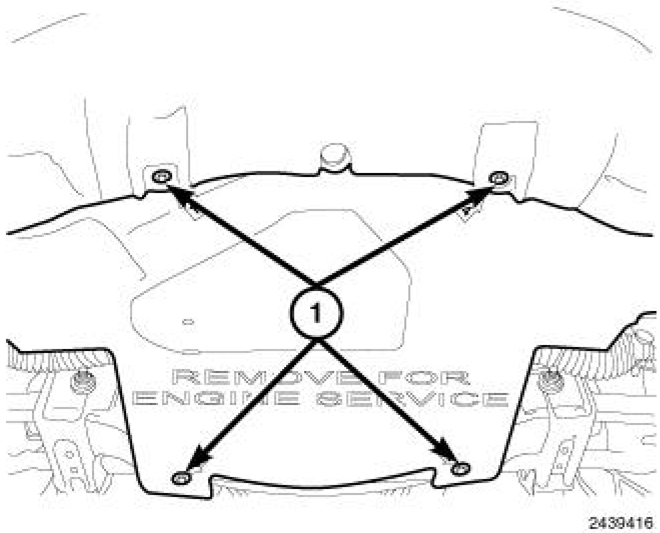

Fig. 105: Belly Pan & Fasteners
Courtesy of CHRYSLER GROUP, LLC

9. Install the belly pan and securely tighten bolts (1).
10. Remove support and lower vehicle.
11. Install the cooling fan. Refer to **FAN, COOLING, INSTALLATION**.
12. Install the upper radiator upper hose.
13. Fill the cooling system with coolant. Refer to **STANDARD PROCEDURE**.
14. Connect the negative battle cable.
15. Operate the engine until it reaches normal operating temperature. Check the cooling system and automatic transmission for the correct fluid levels.

6.2L

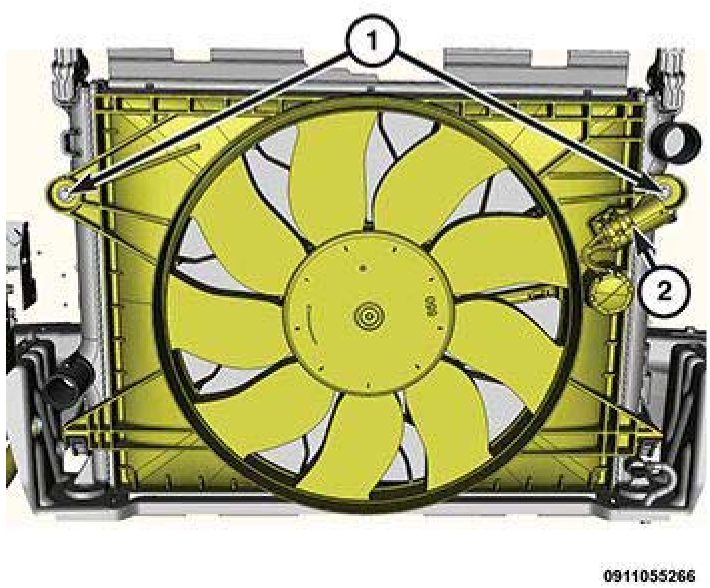

Fig. 106: Cooling Fan Wire Harness Connector & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Engage the cooling fan assembly into lower tabs on the radiator.
2. Install the cooling fan assembly to radiator mounting bolts (1) and tighten to the proper torque specification. Refer to **SPECIFICATIONS**.
3. Install the radiator into engine compartment and seat the radiator assembly lower rubber isolators into the mounting holes in radiator lower support.

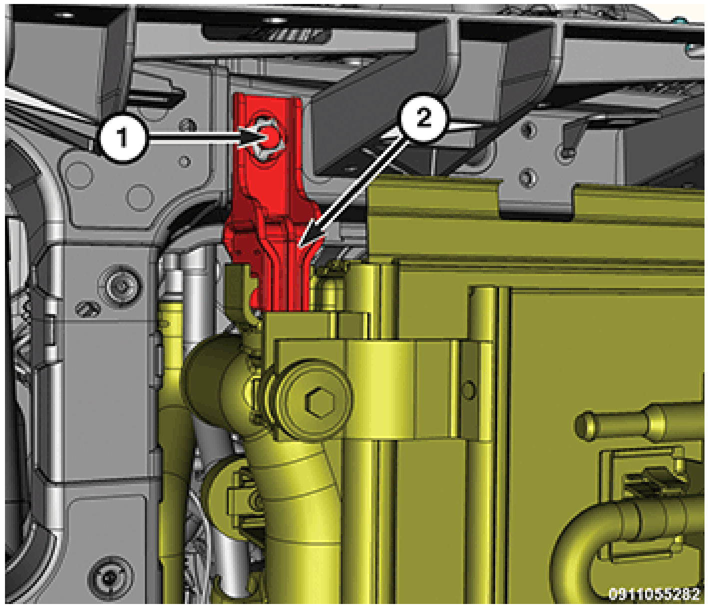

Fig. 107: Upper Radiator Isolator & Bolt
Courtesy of CHRYSLER GROUP, LLC

4. Install the upper radiator isolator (2) and tighten the bolts (1) to the proper torque specification. Refer to **SPECIFICATIONS**.
5. Install the Low Temperature Radiator (LTR). Refer to **RADIATOR, LOW TEMPERATURE, INSTALLATION**.

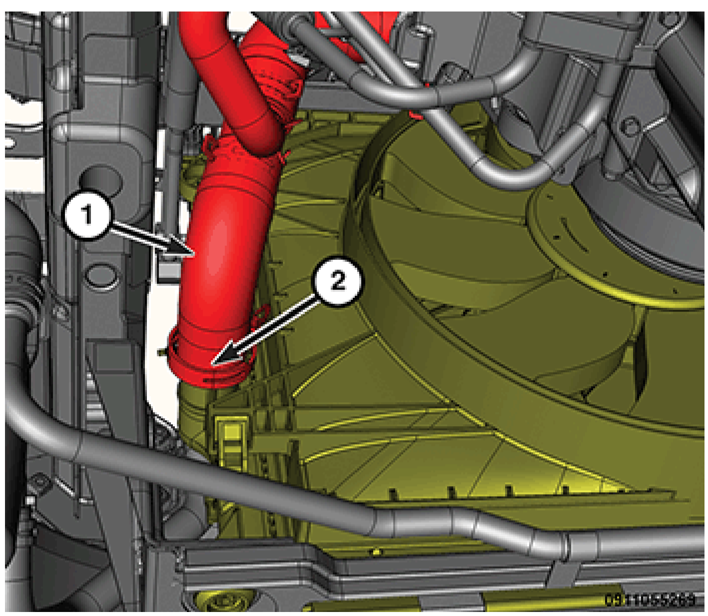

Fig. 108: Lower Radiator Hose & Clamp
Courtesy of CHRYSLER GROUP, LLC

6. Install the lower radiator hose (1) and secure the clamp (2).

NOTE: **Ensure that the hose is fully seated on the radiator port and that the clamp in not resting on the port bead.**

7. Install the upper radiator hose and secure the clamp.

NOTE: **Ensure that the hose is fully seated on the radiator port and that the clamp in not resting on the port bead.**

8. Connect the wire harness connector to the cooling fan.
9. Fill the cooling system with coolant. Refer to **STANDARD PROCEDURE**.
10. Connect the negative battery cable.
11. Operate the engine until it reaches normal operating temperature. Check the cooling system and automatic transmission for the correct fluid levels.

5.7L/6.4L

NOTE: **Assistance may be required for radiator placement into vehicle till the lower radiator core support has been installed.**

1. Install the radiator into engine compartment and seat the radiator assembly lower rubber isolators into the mounting holes in radiator lower support.

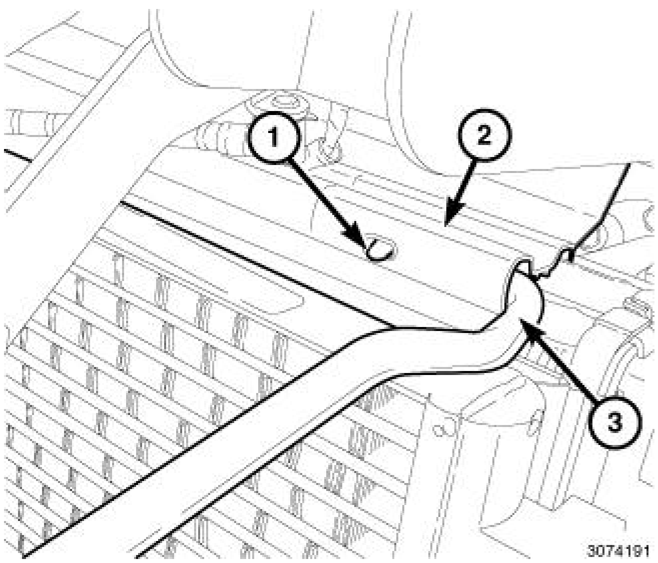

Fig. 109: Upper Shroud Cover, Pick & Clip
Courtesy of CHRYSLER GROUP, LLC

2. Install the upper shroud cover (2) by applying pressure downwards till the snap into place.

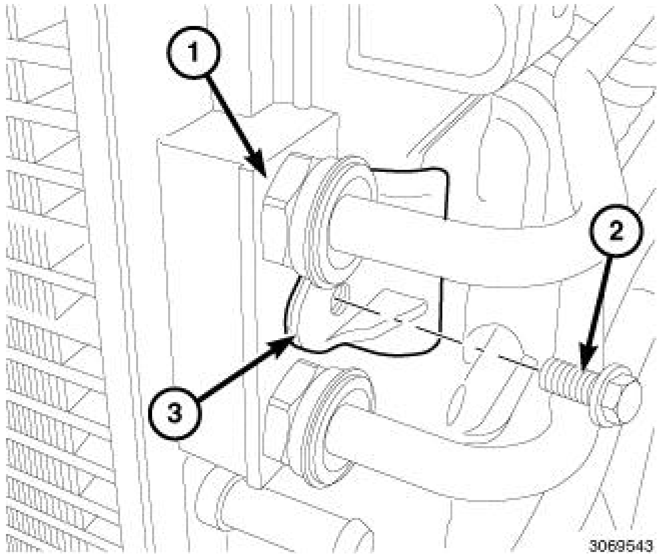

Fig. 110: Mounting & Support Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Position the condenser on radiator and loosely install the support bolt (3). Tighten bolt (3) to the proper torque specification. Refer to **SPECIFICATIONS**.
4. Install the lower mounting bolts. Tighten bolts to the proper torque specification. Refer to **SPECIFICATIONS**.
5. Tighten the bolt (2) located between the cooler lines to the proper torque specification. Refer to **SPECIFICATIONS**.

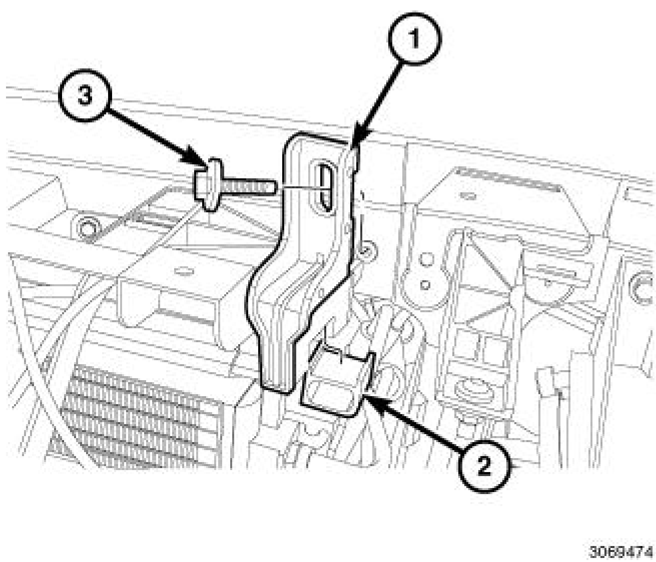

Fig. 111: Upper Radiator Mounting Brackets Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Install the upper radiator isolator (1). Tighten the bolts (2) to the proper torque specification. Refer to **SPECIFICATIONS**.
7. Install the front bumper fascia. Refer to **FASCIA, FRONT, INSTALLATION** .
8. Install the radiator fan. Refer to **FAN, COOLING, INSTALLATION**.

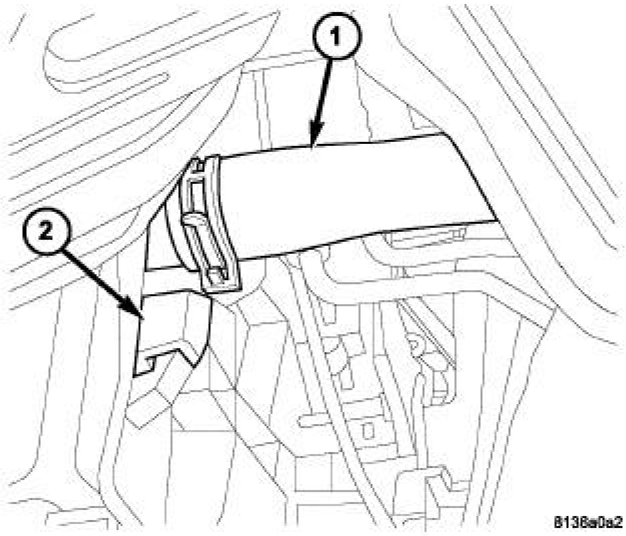

Fig. 112: Lower Radiator Hose
Courtesy of CHRYSLER GROUP, LLC

9. Install the lower radiator hose (1).

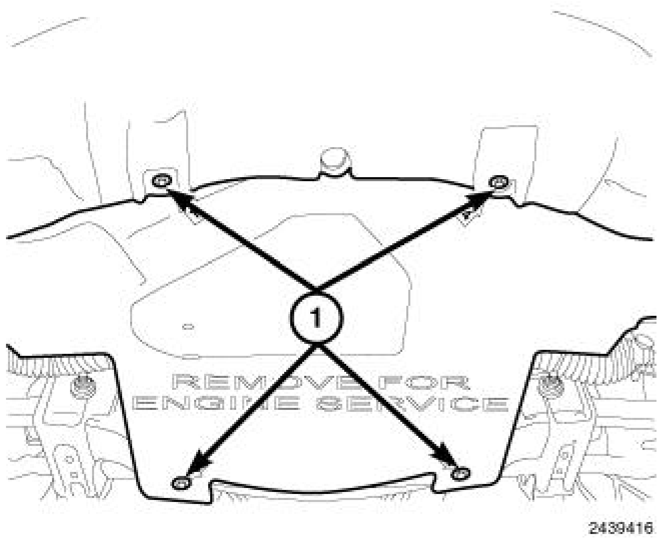

Fig. 113: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

10. Install the belly pan and securely tighten bolts (1).
11. Remove support and lower the vehicle.
12. Install the upper radiator hose.
13. Install the air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION** for 5.7L or **BODY, AIR CLEANER, INSTALLATION** for 6.4L .
14. Fill the cooling system with coolant. Refer to **STANDARD PROCEDURE**.
15. Connect the negative battery cable.
16. Operate the engine until it reaches normal operating temperature. Check the cooling system and

automatic transmission for the correct fluid levels.

SENSOR, COOLANT TEMPERATURE

REMOVAL

3.6L

The Engine Coolant Temperature (ECT) sensor on the 3.6L engine is installed into a water jacket at rear of the cylinder head on the left side of the engine.

WARNING: Hot, pressurized coolant can cause injury by scalding. Cooling system must be partially drained before removing the coolant temperature sensor.

1. Disconnect and isolate the negative battery cable.
2. Remove the engine cover.
3. Partially drain the cooling system. Refer to **STANDARD PROCEDURE**.

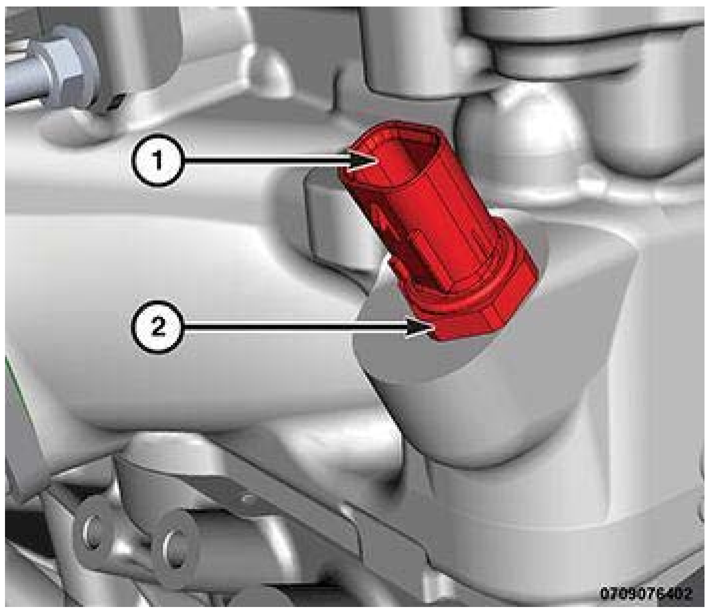

Fig. 114: ECT Sensor & Connector
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the ECT sensor wire harness connector (1).
5. Remove the ECT sensor (2) from the cylinder head.

6.2L

The Engine Coolant Temperature (ECT) sensor is located on the upper portion of the water pump housing. It is installed into a water jacket in-line with the thermostat.

WARNING: Hot, pressurized coolant can cause injury by scalding. Cooling system must be partially drained before removing the coolant temperature sensor.

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** .

3. Drain the cooling system. Refer to **STANDARD PROCEDURE**.

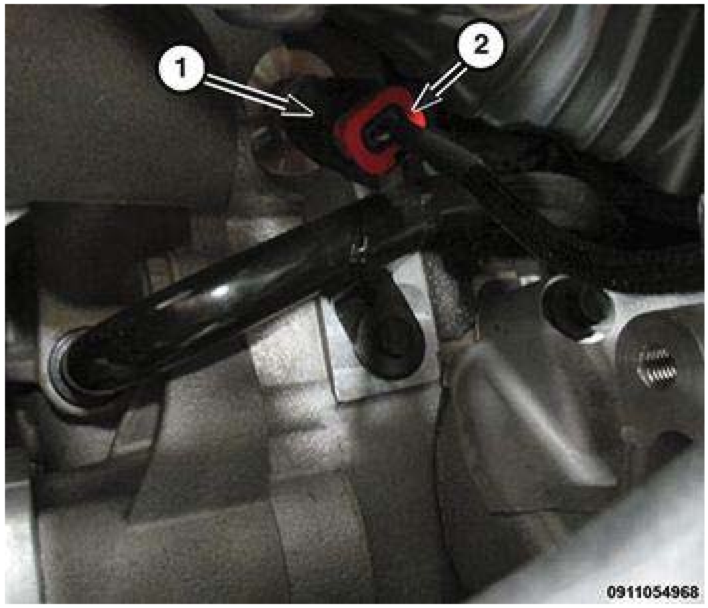

Fig. 115: ECT Sensor & Connector
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the ECT sensor wire harness connector (2).
5. Remove the ECT sensor (1) sensor.

5.7L/6.4L

The Engine Coolant Temperature (ECT) sensor is located on the upper portion of the water pump housing. It is installed into a water jacket in-line with the thermostat.

WARNING: Hot, pressurized coolant can cause injury by scalding. Cooling system must be partially drained before removing the coolant temperature sensor.

1. Disconnect and isolate the negative battery cable.
2. Remove the engine cover.
3. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** for 5.7L or **BODY, AIR CLEANER, REMOVAL** for 6.4L .
4. Drain the cooling system. Refer to **STANDARD PROCEDURE**.

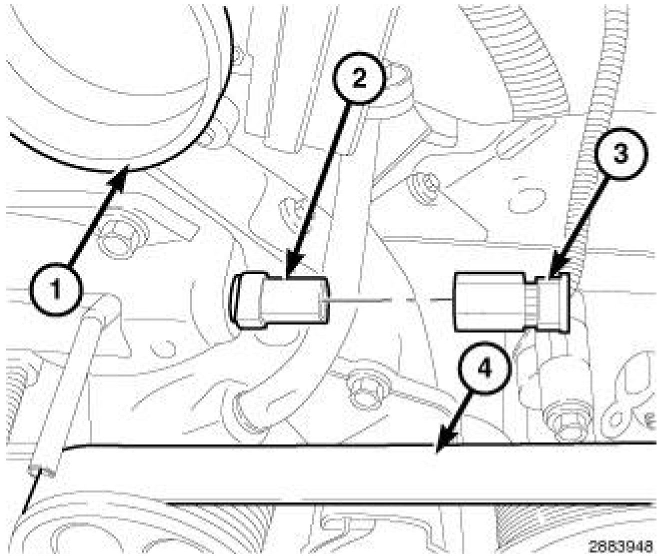

Fig. 116: Electrical Connector, Sensor & Water Pump Housing
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the ECT sensor wire harness connector (3).
6. Remove ECT sensor (2) sensor from the water pump housing.

INSTALLATION

3.6L

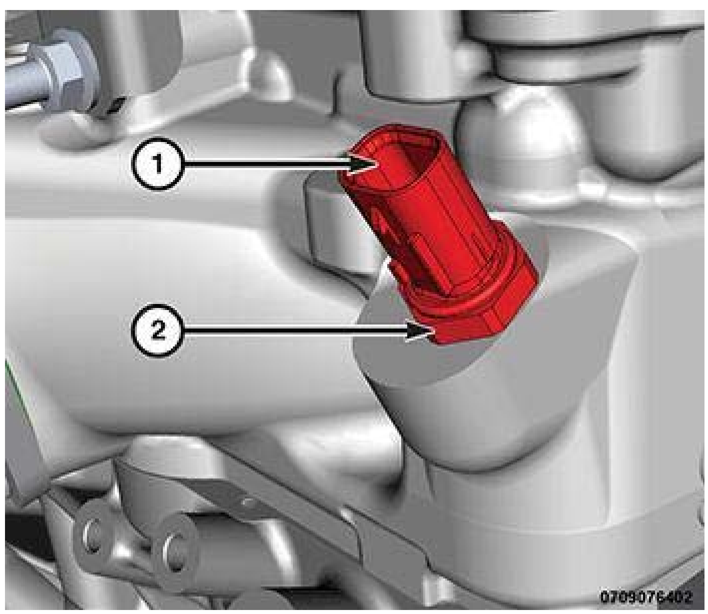

Fig. 117: ECT Sensor & Connector
Courtesy of CHRYSLER GROUP, LLC

1. Install the ECT sensor (2) to the cylinder head and tighten to the proper torque specification. Refer to **SPECIFICATIONS**.
2. Connect the ECT sensor wire harness connector (1).
3. Fill the cooling system. Refer to **STANDARD PROCEDURE**.
4. Install the engine cover.

5. Connect the negative battery cable.

6.2L

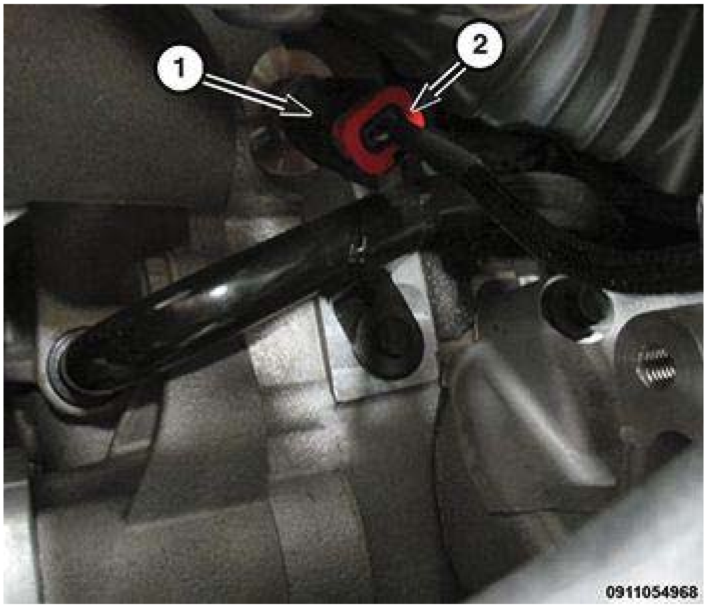

Fig. 118: ECT Sensor & Connector
Courtesy of CHRYSLER GROUP, LLC

1. Apply MOPARĀ® thread sealant with PFTE to the Engine Coolant Temperature (ECT) sensor threads.
2. Install the ECT sensor (1) and tighten to the proper torque specification. Refer to **SPECIFICATIONS**.
3. Connect the ECT sensor wire harness connector (2).
4. Install air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION** .
5. Fill the cooling system. Refer to **STANDARD PROCEDURE**.
6. Connect the negative battery cable.

5.7L/6.4L

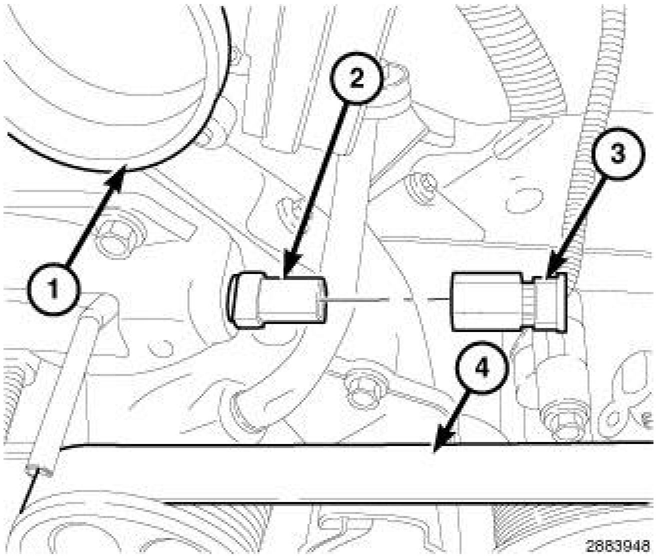

Fig. 119: Electrical Connector, Sensor & Water Pump Housing

Courtesy of CHRYSLER GROUP, LLC

1. Apply MOPARÂ® thread sealant with PFTE to the Engine Coolant Temperature (ECT) sensor threads.
2. Install the ECT sensor (2) and tighten to the proper torque specification. Refer to **SPECIFICATIONS**.
3. Connect the ECT sensor wire harness connector (3).
4. Install air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION** for 5.7L or **BODY, AIR CLEANER, INSTALLATION** for 6.4L .
5. Install the engine cover.
6. Fill the cooling system. Refer to **STANDARD PROCEDURE**.
7. Connect the negative battery cable.

THERMOSTAT

DESCRIPTION

DESCRIPTION

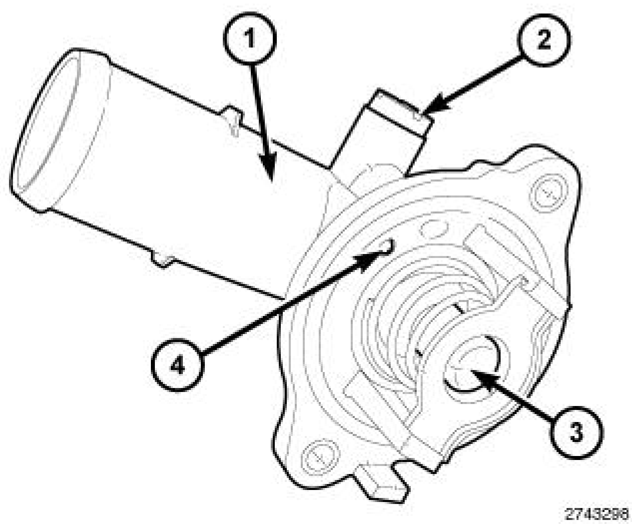

Fig. 120: Thermostat Housing & Thermostat
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not operate an engine without a thermostat, except for servicing or testing.

A pellet-type thermostat controls the operating temperature of the engine by controlling the amount of coolant flow to the radiator. On all engines the thermostat is closed below 195Â°F (90Â°C). Above this temperature, coolant is allowed to flow to the radiator. This provides quick engine warm up and overall temperature control.

The same thermostat is used for winter and summer seasons. An engine should not be operated without a thermostat, except for servicing or testing. Operating without a thermostat causes other problems. These are: longer engine warm-up time, unreliable warm-up performance, increased exhaust emissions and crankcase condensation. This condensation can result in sludge formation.

OPERATION

OPERATION

WARM-UP PHASE

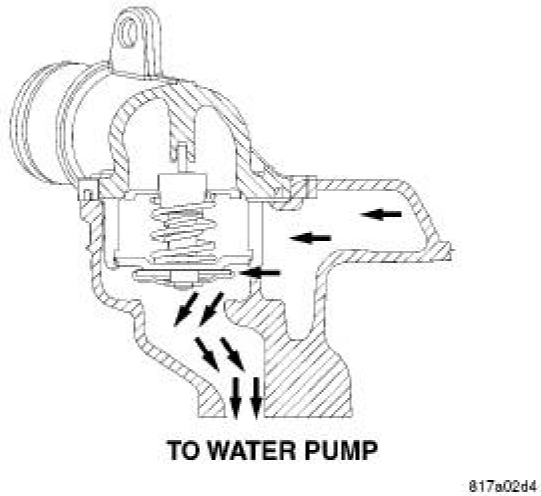

Fig. 121: Thermostat Warm-Up Phase
Courtesy of CHRYSLER GROUP, LLC

Up to a coolant temperature of approximately 87Â° C (189Â° F), the main valve is closed and the bypass valve fully open. The flow through the radiator is interrupted and coolant flows through the bypass passage directly to the inlet side of the water pump.

PARTIAL-LOAD PHASE

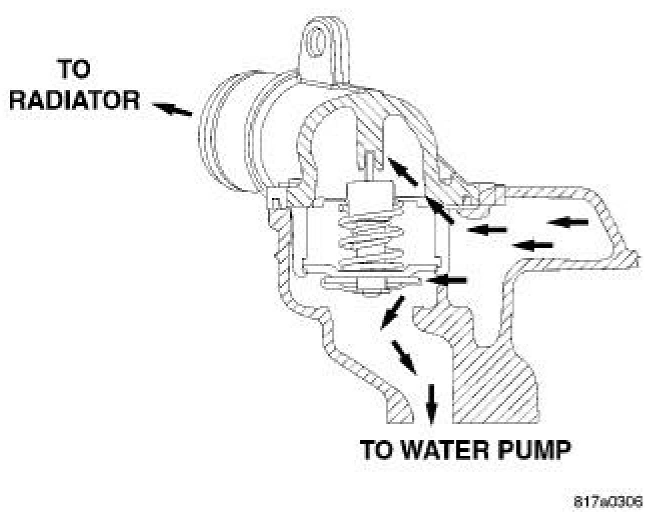

Fig. 122: Thermostat Partial-Load Phase
Courtesy of CHRYSLER GROUP, LLC

The main valve begins to open at a coolant temperature of 86Â° C (189Â° F), and a small amount of coolant flows through the radiator. As the engine temperature increases, the main valve opens further and the bypass valve gradually closes. More coolant flows through the radiator and less coolant flows through the bypass

passage.

FULL-LOAD PHASE

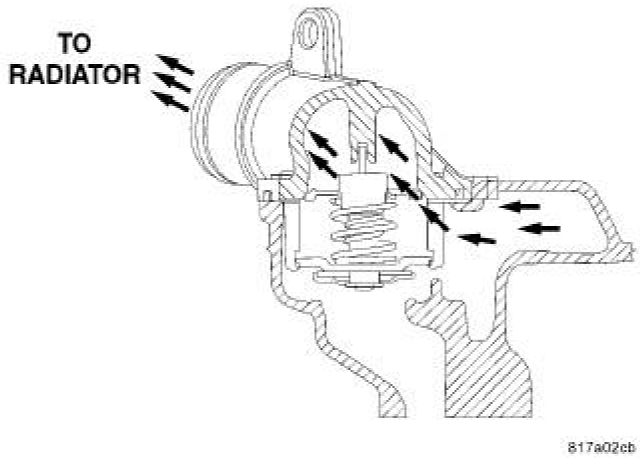

Fig. 123: Thermostat Full-Load Phase
Courtesy of CHRYSLER GROUP, LLC

The main valve is fully open at a coolant temperature above 102Â° C (216Â° F). The bypass plate seals off the bypass passage. The entire quantity of coolant flows through the radiator.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ENGINE COOLANT THERMOSTAT

The thermostat is operated by a wax filled chamber (pellet) which is sealed. When heated coolant reaches a predetermined temperature the wax pellet expands enough to overcome the closing spring and water pump pressure, which forces the valve to open. Coolant leakage into the pellet will cause a thermostat to fail open. Do not attempt to free up a thermostat with a screwdriver.

Thermostat diagnostics is included in powertrain control module's (PCM) programing for on-board diagnosis. The malfunction indicator light (MIL) will illuminate and a diagnostic trouble code (DTC) will be set when an "open too soon" condition occurs. Do not change a thermostat for lack of heater performance or temperature gauge position, unless a DTC is present. For other probable causes, refer to **DIAGNOSIS AND TESTING**. Thermostat failing shut is the normal long term mode of failure, and normally, only on high mileage vehicles. The temperature gauge will indicate this, refer to **DIAGNOSIS AND TESTING**.

REMOVAL

3.6L

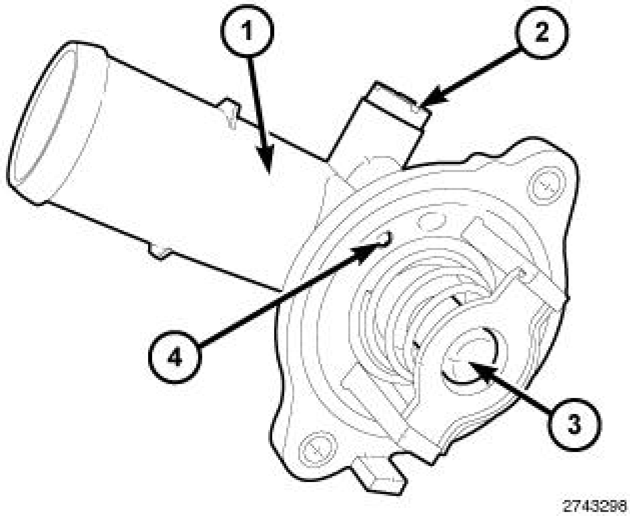

Fig. 124: Thermostat Housing & Thermostat
Courtesy of CHRYSLER GROUP, LLC

WARNING: Do not loosen radiator draincock with system hot and pressurized. Serious burns from coolant can occur.

CAUTION: The Thermostat and housing is serviced as an assembly. Do not remove the thermostat from the housing, damage to the thermostat may occur.

1. Disconnect and isolate the negative battery cable.
2. Remove the engine cover.
3. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** .
4. Drain the cooling system. Refer to **STANDARD PROCEDURE**.
5. Remove the upper radiator hose from the thermostat housing (1).
6. Remove bolts and thermostat housing (1) with thermostat (3).
7. Remove and discard the thermostat housing gasket.

3.6L COOLANT CROSSOVER

1. Remove the thermostat housing. Refer to **THERMOSTAT, REMOVAL**.

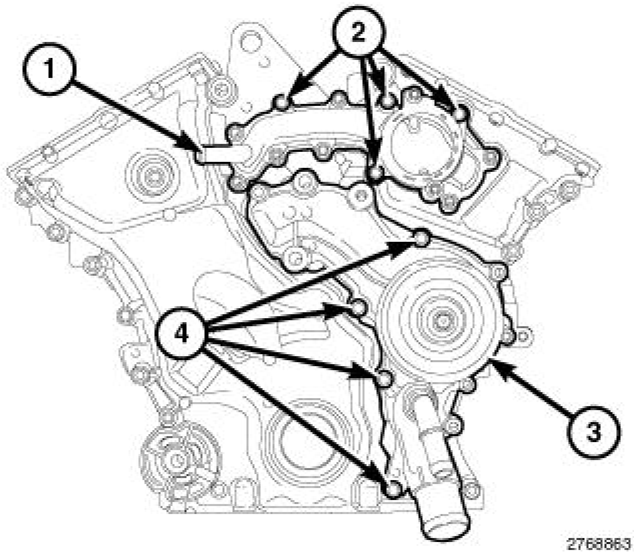

Fig. 125: Coolant Outlet Housing, Water Pump & Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Remove the heater supply hose from the coolant crossover (1).
3. Remove the coolant crossover mounting bolts. Take notice to the four bolts (2) that bolt directly to the timing cover.
4. Remove the coolant crossover and discard the gaskets.

6.2L

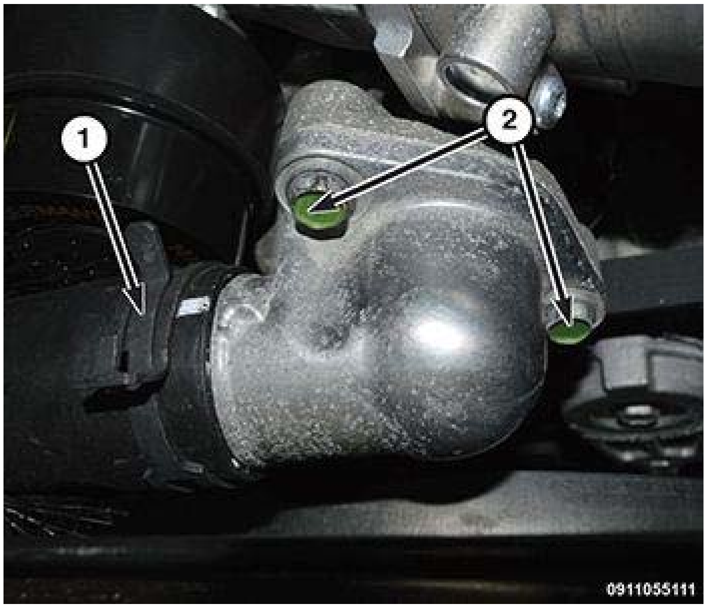

Fig. 126: Upper Radiator Hose & Bolts
Courtesy of CHRYSLER GROUP, LLC

WARNING: Do not loosen the radiator draincock with the cooling system hot and pressurized. Serious burns from the coolant can occur.

If the thermostat is being replaced, be sure that the replacement is the specified thermostat for the vehicle model and engine type.

1. Drain the cooling system. Refer to **STANDARD PROCEDURE**.
2. Remove the upper radiator hose (1) from the thermostat housing and position aside.
3. Remove bolts (2), thermostat housing and thermostat.

5.7/6.4L

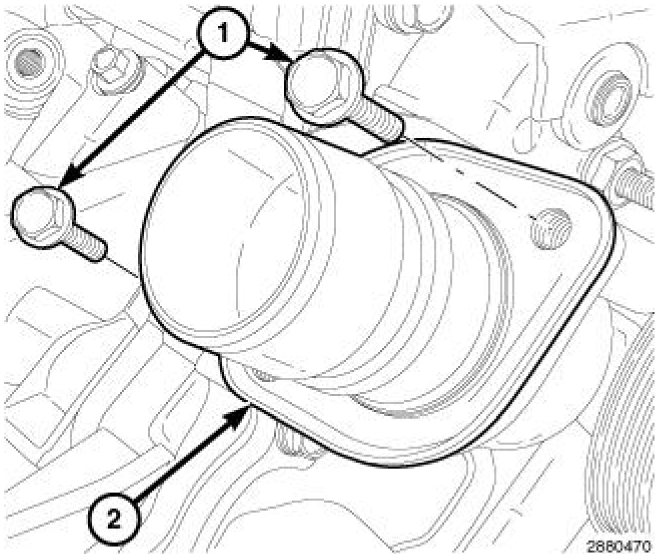

Fig. 127: Thermostat Housing & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

WARNING: Do not loosen the radiator draincock with the cooling system hot and pressurized. Serious burns from the coolant can occur.

If the thermostat is being replaced, be sure that the replacement is the specified thermostat for the vehicle model and engine type.

1. Disconnect the and isolate negative battery cable.
2. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** for 5.7L or **BODY, AIR CLEANER, REMOVAL** for 6.4L. .
3. Drain the cooling system. Refer to **STANDARD PROCEDURE**.
4. Remove the upper radiator hose from the thermostat housing (2) and position aside.
5. Remove bolts (1), thermostat housing (2) and thermostat.

INSTALLATION

3.6L

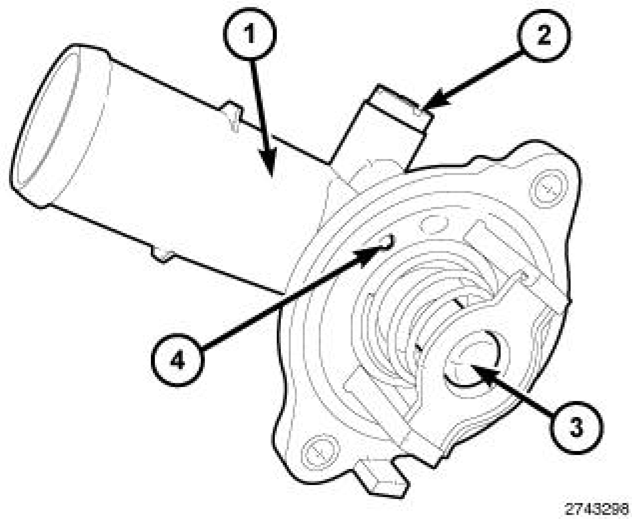

Fig. 128: Thermostat Housing & Thermostat
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The Thermostat and housing is serviced as an assembly. Do not remove the thermostat from the housing, damage to the thermostat may occur.

1. Clean mating areas of timing chain cover and thermostat housing (1).
2. Install a new gasket on to the thermostat housing.
3. Install the thermostat housing (1). Tighten bolts to the proper torque specification. Refer to **SPECIFICATIONS**.
4. Install the upper radiator hose to the thermostat housing (1).
5. Fill the cooling system. Refer to **STANDARD PROCEDURE**.
6. Install the air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION** .
7. Install the engine cover.
8. Connect the negative battery cable.
9. Start and check for leaks.

3.6L COOLANT CROSSOVER

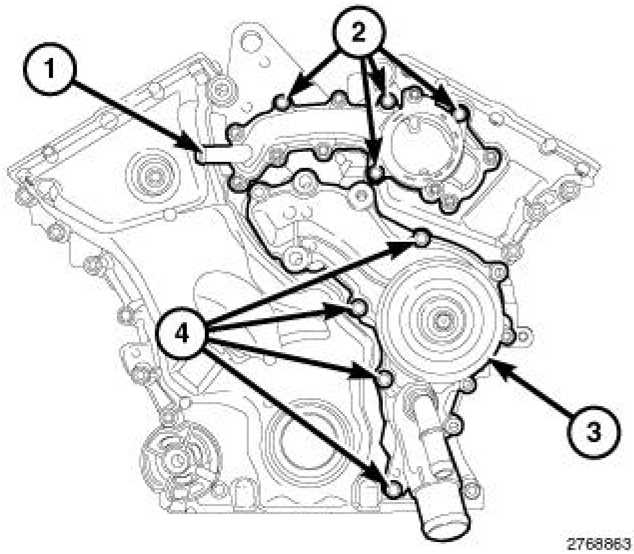

Fig. 129: Coolant Outlet Housing, Water Pump & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Clean gasket sealing surfaces.
2. Install new gasket onto the coolant crossover.

NOTE: **The shorter M6 mounting bolts (2), bolt directly to the engine timing cover.**

3. Install the coolant crossover. Tighten bolts in a criss cross pattern to the proper torque specification. Refer to **SPECIFICATIONS**.
4. Install the heater supply hose to the coolant crossover (1).
5. Install the thermostat housing. Refer to **THERMOSTAT, INSTALLATION**.

6.2L

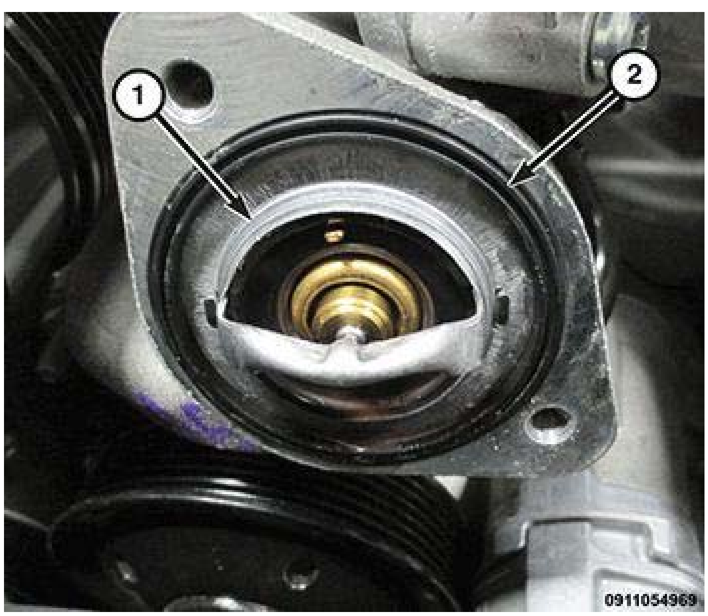

Fig. 130: Thermostat & Seal
Courtesy of CHRYSLER GROUP, LLC

1. Position the thermostat (1) with the vent at the 12 o'clock position and the gasket seal (2) is fully seated.

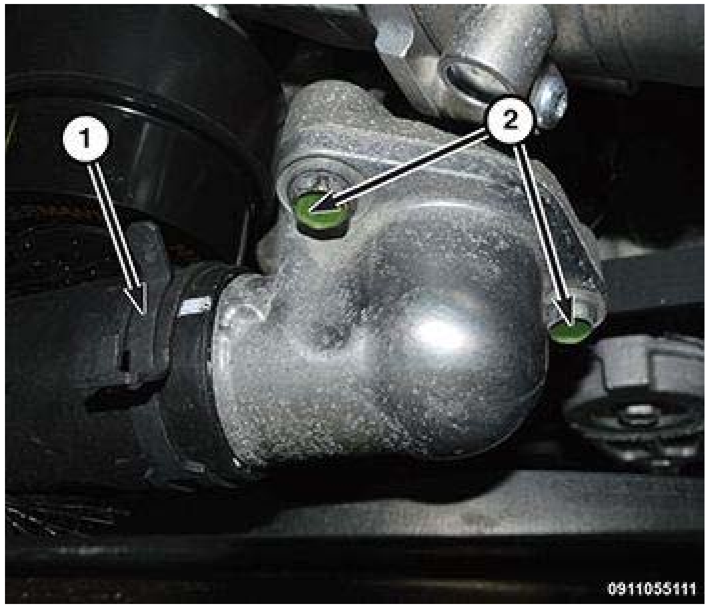

Fig. 131: Upper Radiator Hose & Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Install the thermostat housing. Tighten the bolts (2) to the proper torque specification. Refer to **SPECIFICATIONS**.
3. Install the radiator hose (1) onto the thermostat housing.
4. Fill the cooling system. Refer to **STANDARD PROCEDURE**.
5. Start and warm the engine. Check for leaks. Refer to **DIAGNOSIS AND TESTING**.

5.7/6.4L

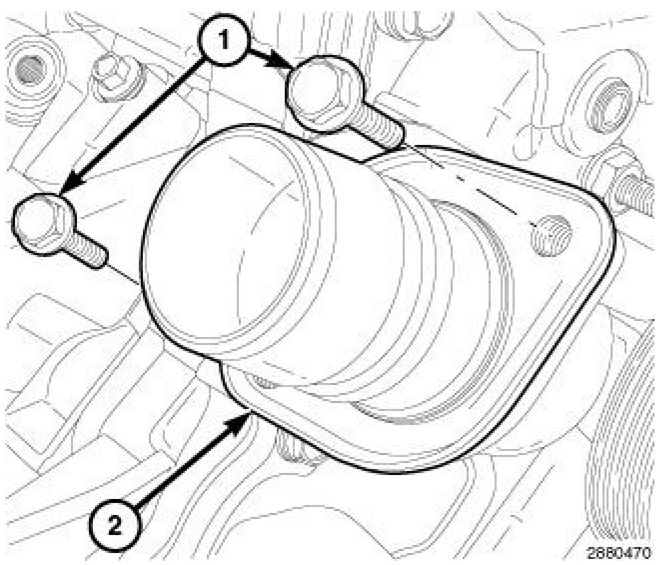

Fig. 132: Thermostat Housing & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the thermostat on the front cover with the vent at the 12 o'clock position.

2. Install the thermostat housing (2). Tighten the bolts (1) to the proper torque specification. Refer to **SPECIFICATIONS**.
3. Install the radiator hose onto the thermostat housing.
4. Fill the cooling system. Refer to **STANDARD PROCEDURE**.
5. Install the cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION** for 5.7L or **BODY, AIR CLEANER, INSTALLATION** for 6.4L.
6. Connect the negative battery cable.
7. Start and warm the engine. Check for leaks, refer to **DIAGNOSIS AND TESTING**.

TUBE, HEATER HOSE, SUPPLY

REMOVAL

6.2L

1. Disconnect and isolate the negative battery cable.
2. Drain the cooling system. Refer to **STANDARD PROCEDURE**.
3. Remove the supercharger. Refer to **SUPERCHARGER, REMOVAL** .
4. Remove heater hoses from heater tubes.

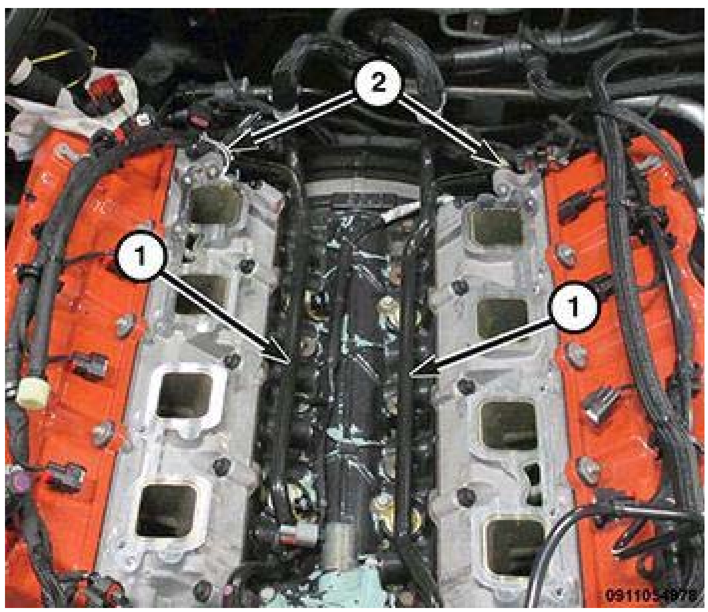

Fig. 133: Heater Tubes & Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Remove the bolt(s) (2) securing heater tube(s) (1) to the back of cylinder head.
6. Remove the bolt securing the right side heater tube (1), from the timing cover.
7. Remove the right side heater tube from water pump housing.

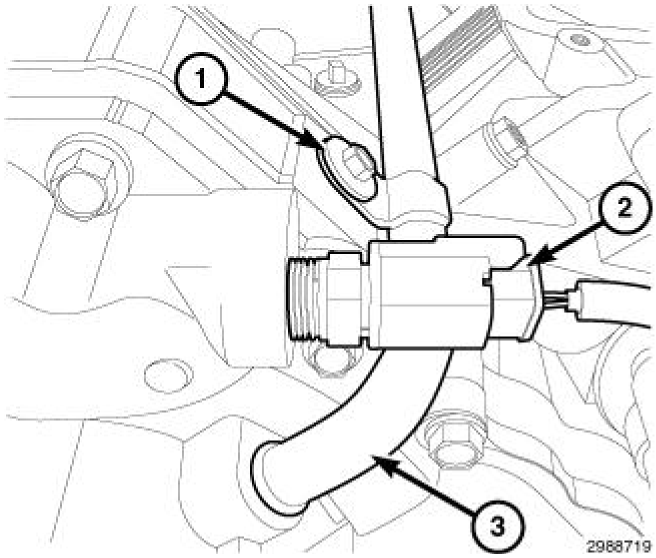

Fig. 134: Coolant Temperature (ECT) Sensor Electrical Connector, Heater Tube & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

8. Remove the bolt (1) and the left side heater tube (3) from water pump housing and remove the heater tube from vehicle.

5.7L/6.4L

1. Disconnect and isolate the negative battery cable.
2. Drain the cooling system. Refer to **STANDARD PROCEDURE**.
3. Remove the intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL** for 5.7L or **MANIFOLD, INTAKE, REMOVAL** for 6.4L.

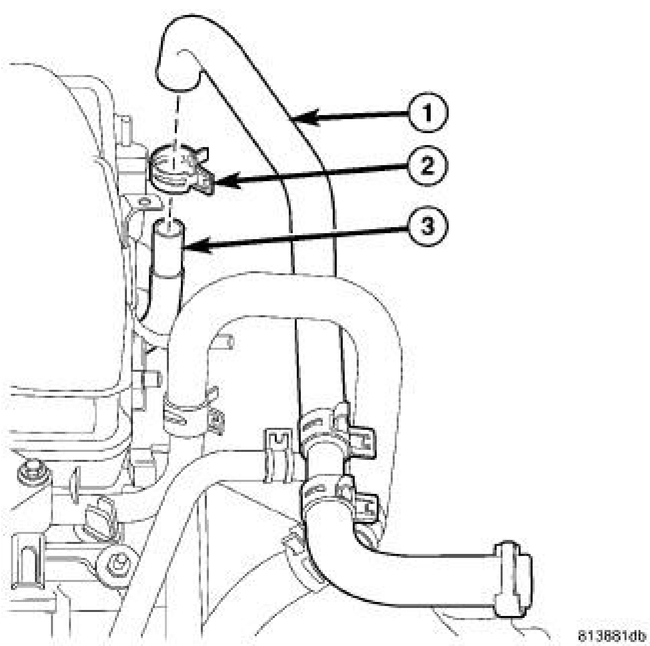

Fig. 135: Heater Hose, Clamp, & Tube
Courtesy of CHRYSLER GROUP, LLC

4. Remove the heater hose (1) from the heater tube.

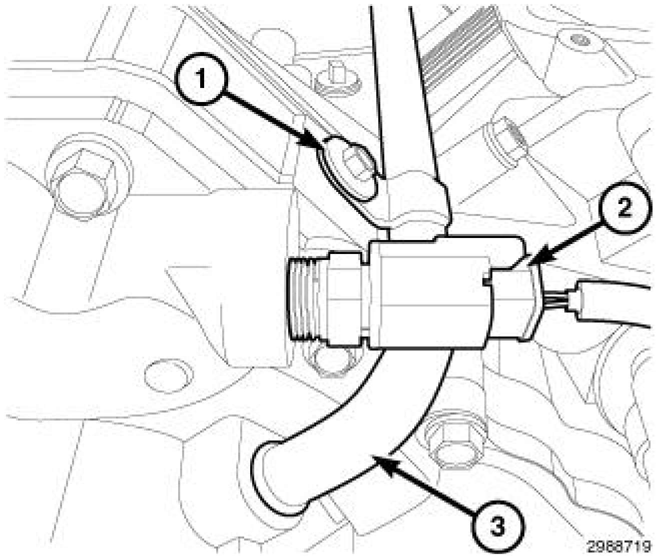

Fig. 136: Coolant Temperature (ECT) Sensor Electrical Connector, Heater Tube & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

5. Remove the heater tube mounting bolt (1).
6. Remove the heater tube (3) from water pump housing and remove from vehicle.

INSTALLATION

6.2L

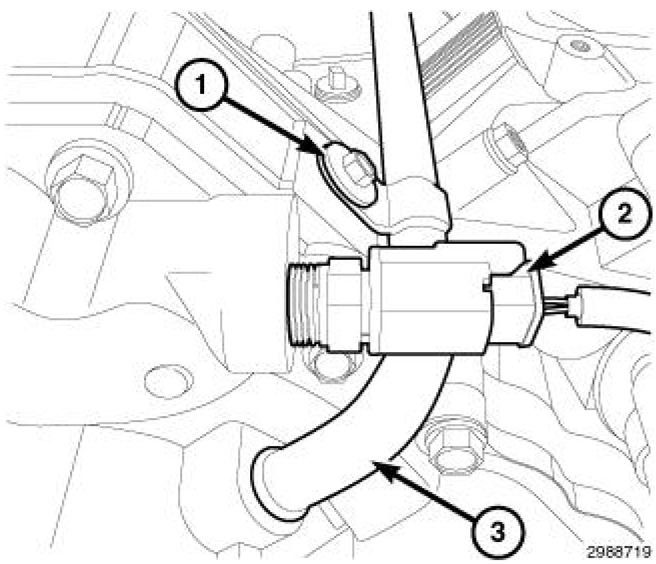

Fig. 137: Coolant Temperature (ECT) Sensor Electrical Connector, Heater Tube & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Using a new O-ring seal, install left side heater tube (3) into water pump housing and tighten the bolt (1) to the proper torque specification. Refer to **SPECIFICATIONS**.

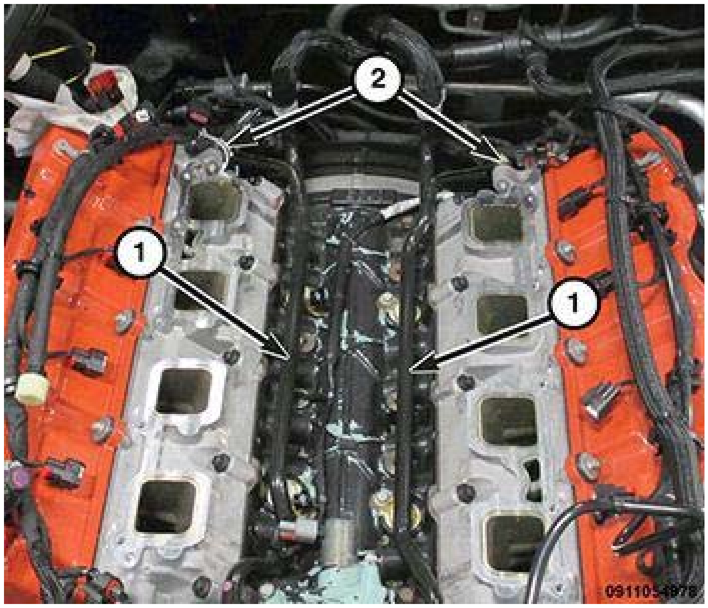

Fig. 138: Heater Tubes & Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Using a new O-ring seal, install the right side heater tube (1) into water pump housing.
3. Install the right side heater tube retaining bolt and tighten to the proper torque specification. Refer to **SPECIFICATIONS**.
4. Install the bolt(s) (2) securing heater tube(s) (1) to the back of cylinder head and tighten to the proper torque specification. Refer to **SPECIFICATIONS**.
5. Install the heater hoses onto the heater tubes.
6. Install the supercharger. Refer to **SUPERCHARGER, INSTALLATION** .
7. Fill the cooling system. Refer to **STANDARD PROCEDURE**.
8. Connect the negative battery cable.
9. Start the engine and check for cooling system leaks.

5.7L/6.4L

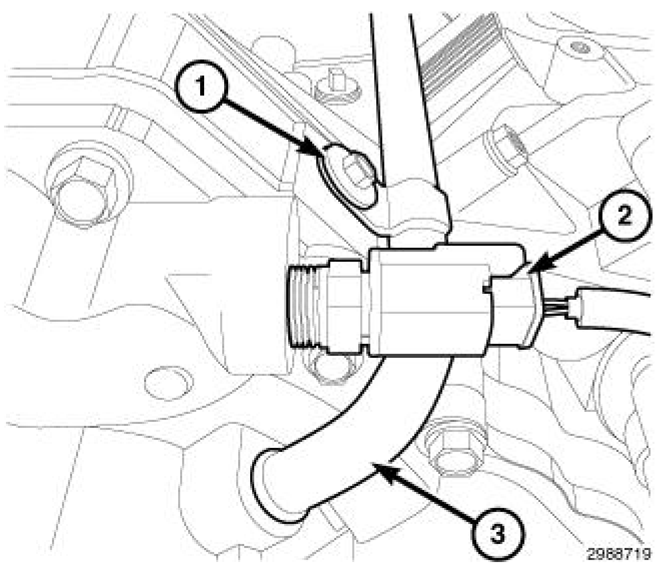

Fig. 139: Coolant Temperature (ECT) Sensor Electrical Connector, Heater Tube & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Install the heater tube (3) into water pump housing. Tighten the bolt (2) to the proper torque specification. Refer to **SPECIFICATIONS**.

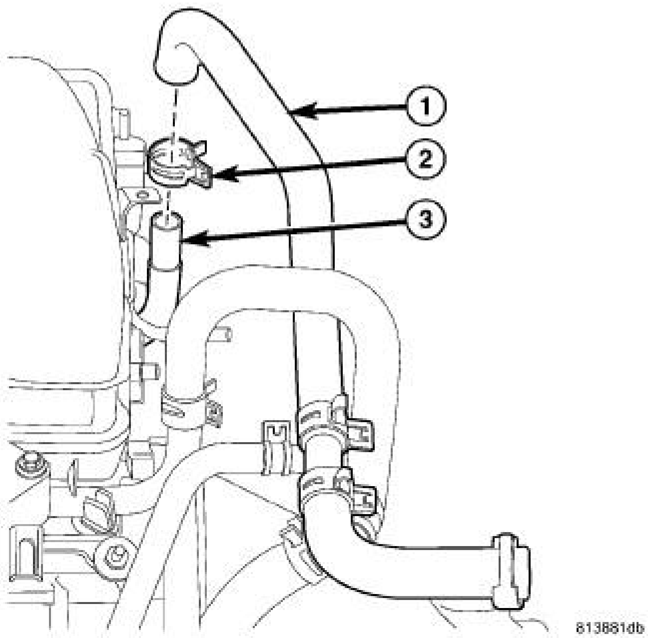

Fig. 140: Heater Hose, Clamp, & Tube
Courtesy of CHRYSLER GROUP, LLC

2. Install the heater hose (1) onto heater tube.
3. Install the intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION** for 5.7L or **MANIFOLD, INTAKE, INSTALLATION** for 6.4L.
4. Fill the cooling system. Refer to **STANDARD PROCEDURE**.
5. Connect the negative battery cable.
6. Start the engine and check for cooling system leaks.

SUPERCHARGER SYSTEM

DESCRIPTION

DESCRIPTION

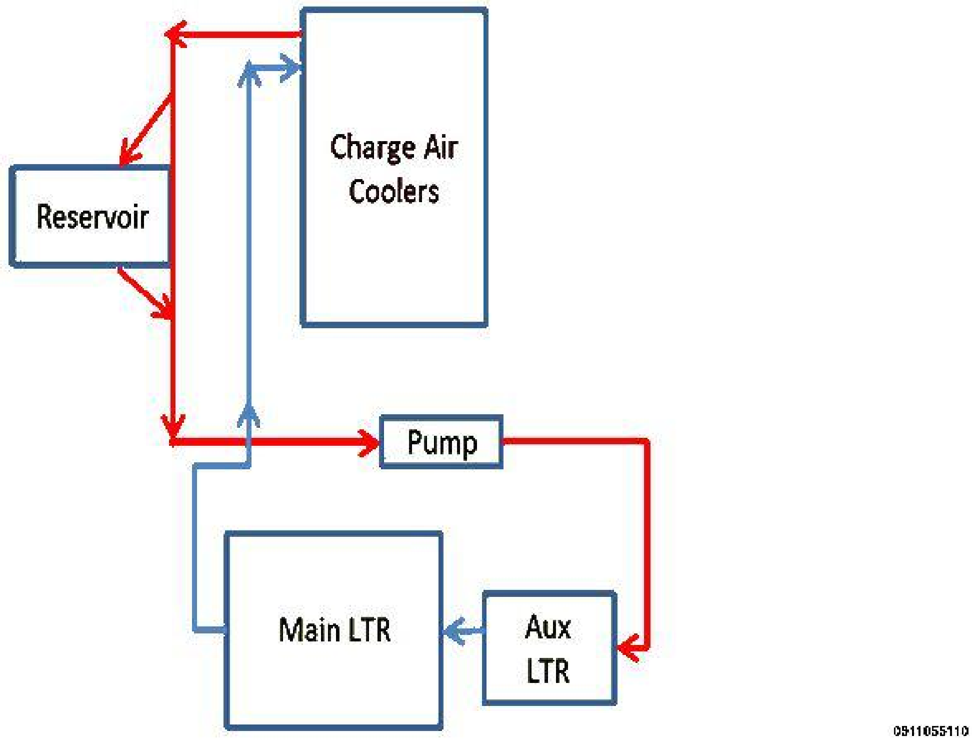

Fig. 141: Supercharger System
Courtesy of CHRYSLER GROUP, LLC

The Low Temperature Radiator (LTR) cooling system is a closed secondary system that regulates charge air cooler operating temperature.

- The system must be vacuum filled. Refer to **STANDARD PROCEDURE**.
- The LTR system has a 18 psi reservoir cap, the engine cooling system has a 21 psi reservoir cap.
- The LTR system uses a 250 watt electric coolant pump.

COOLER, CHARGE AIR

DESCRIPTION

DESCRIPTION

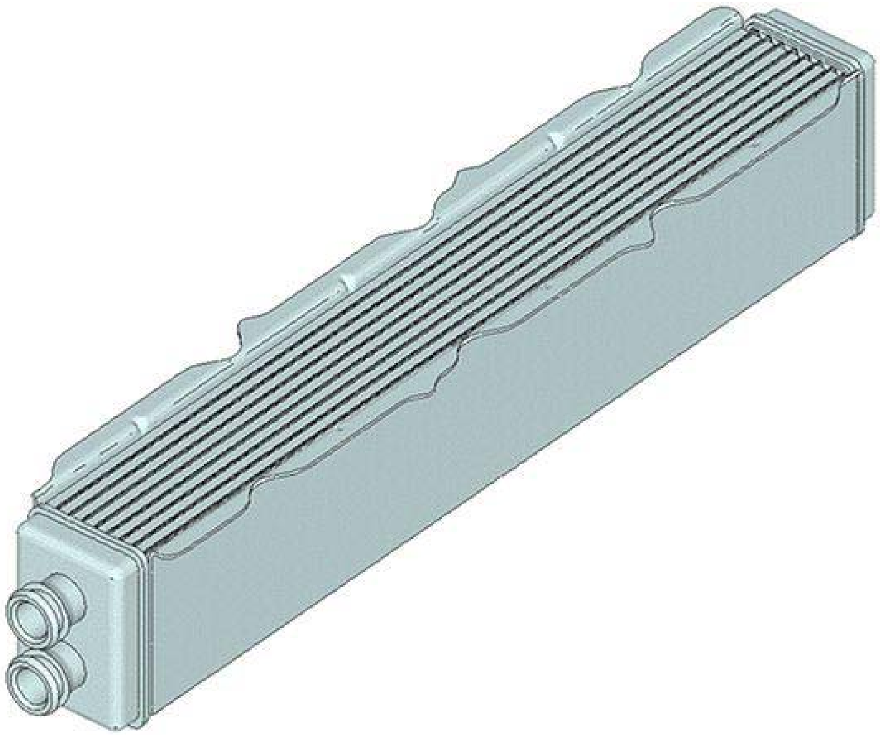

Fig. 142: Charge Air Cooler
Courtesy of CHRYSLER GROUP, LLC

The charge air coolers are located within the supercharger assembly, retained using elastomeric pieces. Both coolers are common parts, connected by the rear crossover tube. The coolers are sealed to the crossover tube using O-ring seals.

RADIATOR, LOW TEMPERATURE

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Drain the low temperature cooling system. Refer to **STANDARD PROCEDURE**.
3. Remove the A/C condenser. Refer to **CONDENSER, A/C, REMOVAL** .

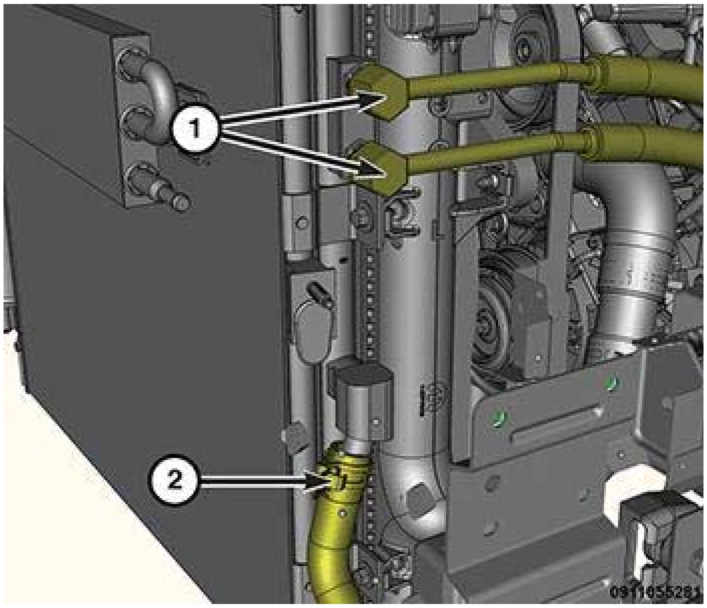

Fig. 143: Transmission Cooler Lines & Inlet Hose
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the transmission cooler lines (1) from the Low Temperature Radiator (LTR).
5. Remove the inlet hose (2) from the LTR.

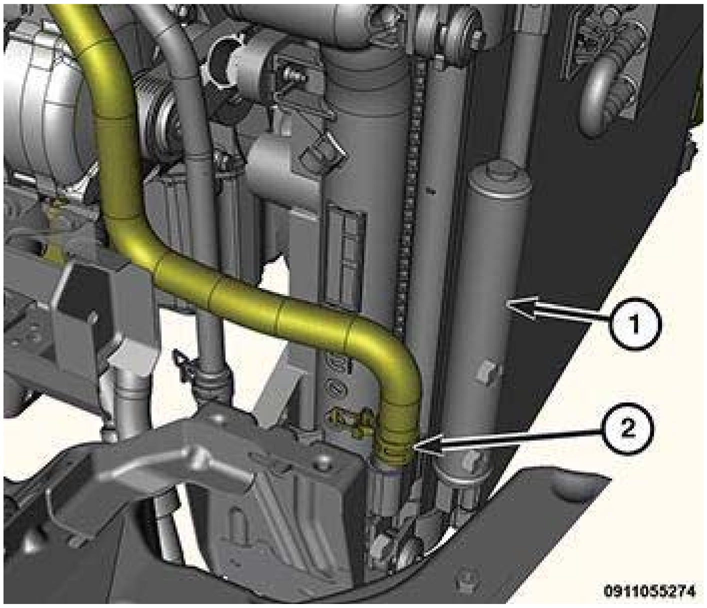

Fig. 144: Outlet Hose & Clamp
Courtesy of CHRYSLER GROUP, LLC

6. Remove the outlet hose (2) from the LTR.
7. Tilt the LTR toward the front of the vehicle and remove the LTR from vehicle.

INSTALLATION

INSTALLATION

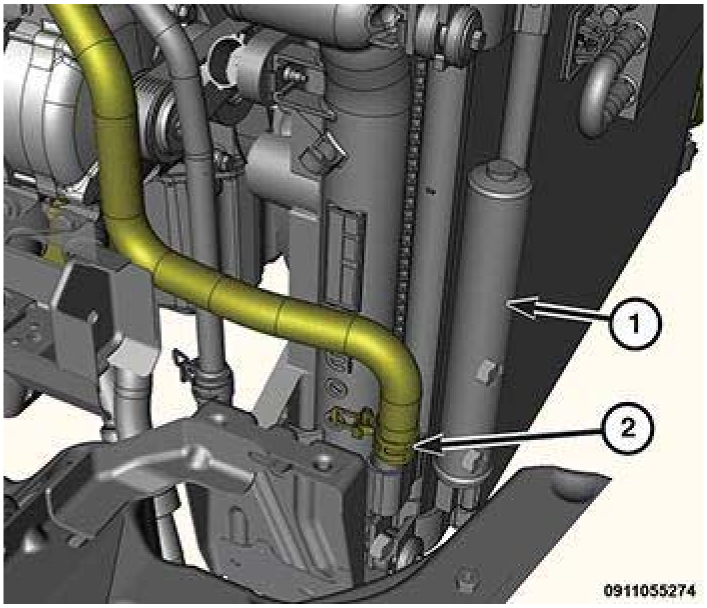

Fig. 145: Outlet Hose & Clamp
Courtesy of CHRYSLER GROUP, LLC

1. Install the Low Temperature Radiator (LTR) into engine compartment and align to the engine radiator assembly.
2. Install the outlet hose onto the LTR and secure the clamp (2). Ensure that the hose is fully seated on the port and that the clamp is not resting on the bead.

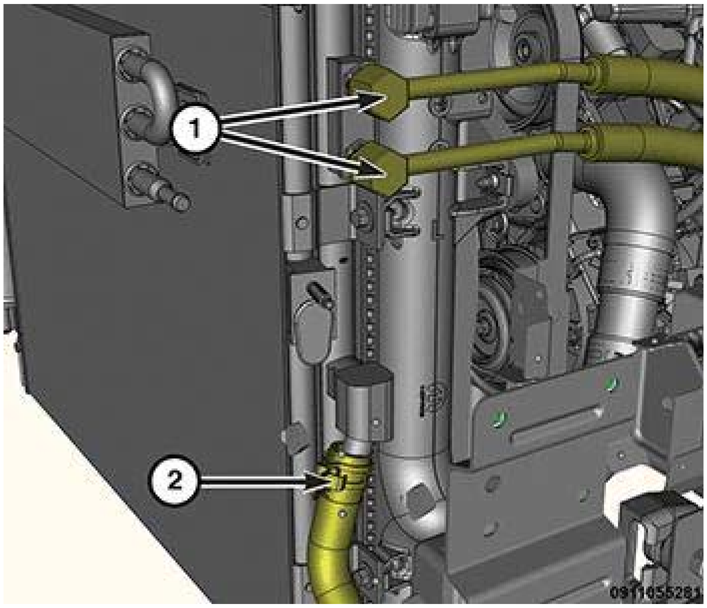

Fig. 146: Transmission Cooler Lines & Inlet Hose
Courtesy of CHRYSLER GROUP, LLC

3. Install the inlet hose onto the LTR and secure the clamp (2). Ensure that the hose is fully seated on the port and that the clamp is not resting on the bead.
4. Install the transmission oil cooler lines (1).
5. Install the A/C condenser. Refer to **CONDENSER, A/C, INSTALLATION** .
6. Fill the cooling system with coolant. Refer to **STANDARD PROCEDURE**.

7. Check and fill the automatic transmission with the appropriate fluid. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
8. Connect the negative battery cable.
9. Operate the engine until it reaches normal operating temperature. Check the cooling system and automatic transmission for the correct fluid levels.

RADIATOR, AUXILIARY LOW TEMPERATURE

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Drain the cooling system. Refer to **STANDARD PROCEDURE**.
3. Remove the charge air cooler coolant pump. Refer to **PUMP, COOLANT, CHARGE AIR COOLER, REMOVAL**.

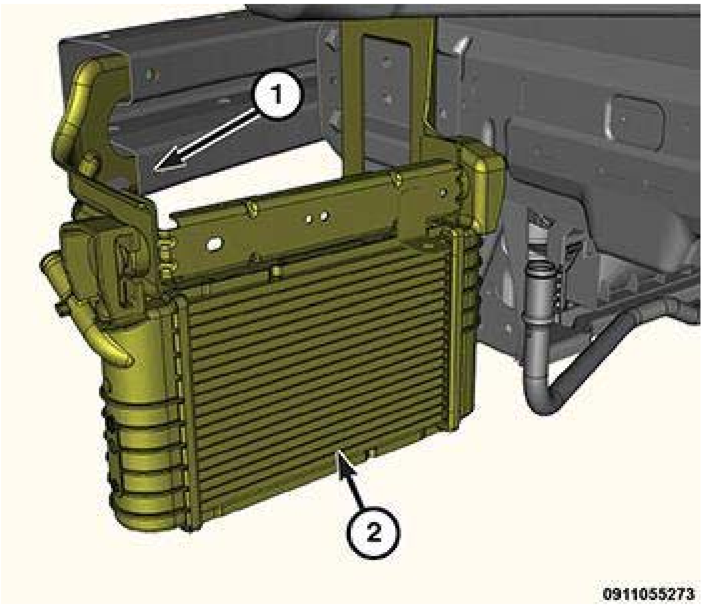

Fig. 147: Auxiliary Low Temperature Radiator & Bracket Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the auxiliary low temperature radiator bracket retaining bolts (1).
5. Remove auxiliary low temperature radiator (1).

INSTALLATION

INSTALLATION

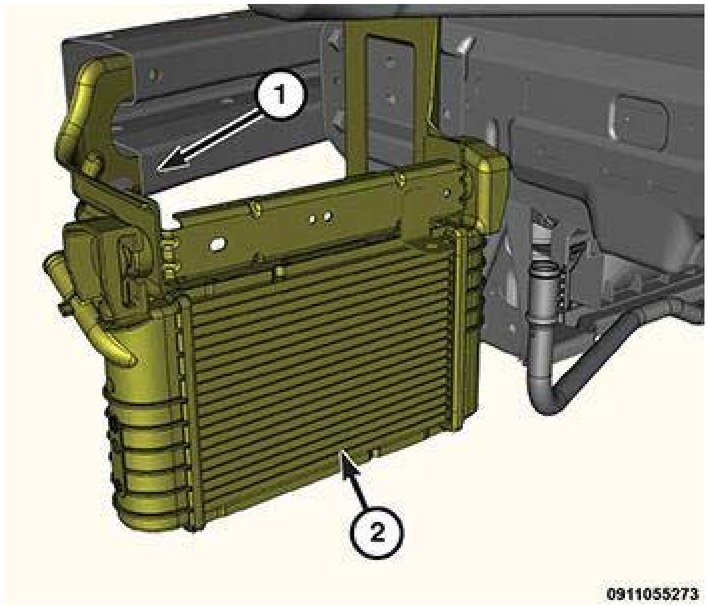

Fig. 148: Auxiliary Low Temperature Radiator & Bracket Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the auxiliary low temperature radiator and bracket assembly (2) to the vehicle.
2. Install the bracket to bumper mounting bolts (1) and tighten the bolts to the proper torque specification. Refer to **SPECIFICATIONS** .
3. Install the charge air cooler coolant pump. Refer to **PUMP, COOLANT, CHARGE AIR COOLER, INSTALLATION**.
4. Fill the cooling system with coolant. Refer to **STANDARD PROCEDURE**.
5. Connect the negative battle cable.
6. Operate the engine until it reaches normal operating temperature. Check the cooling system and automatic transmission for the correct fluid levels.

PUMP, COOLANT, CHARGE AIR COOLER

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Drain the cooling system. Refer to **STANDARD PROCEDURE**.
3. Remove the front fascia. Refer to **FASCIA, FRONT, REMOVAL** .

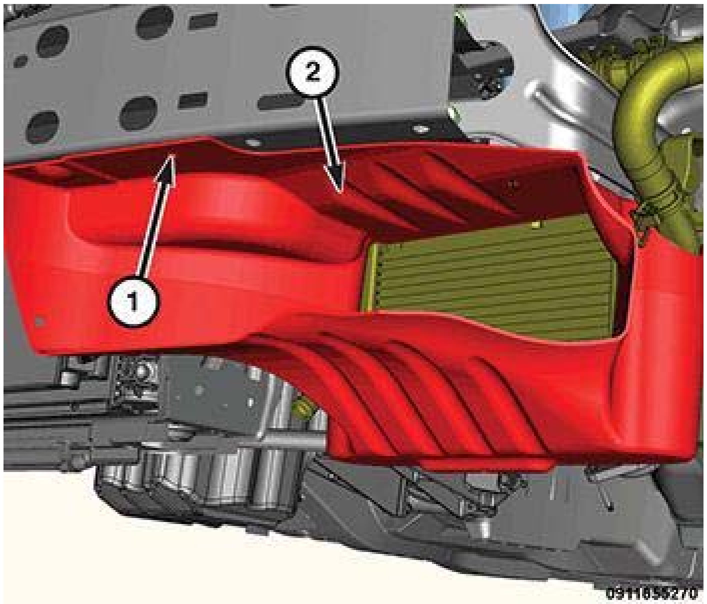

Fig. 149: Low Temperature Radiator Shroud & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Remove the auxiliary low temperature radiator shroud fasteners (1) and remove the shroud (2).
5. Disconnect the coolant pump wire harness connector.

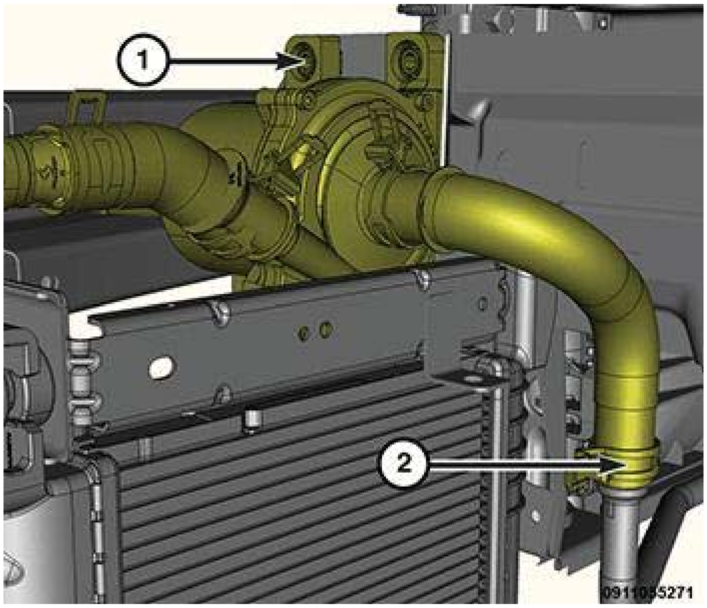

Fig. 150: Coolant Pump To Mounting Bracket Nuts & Clamp
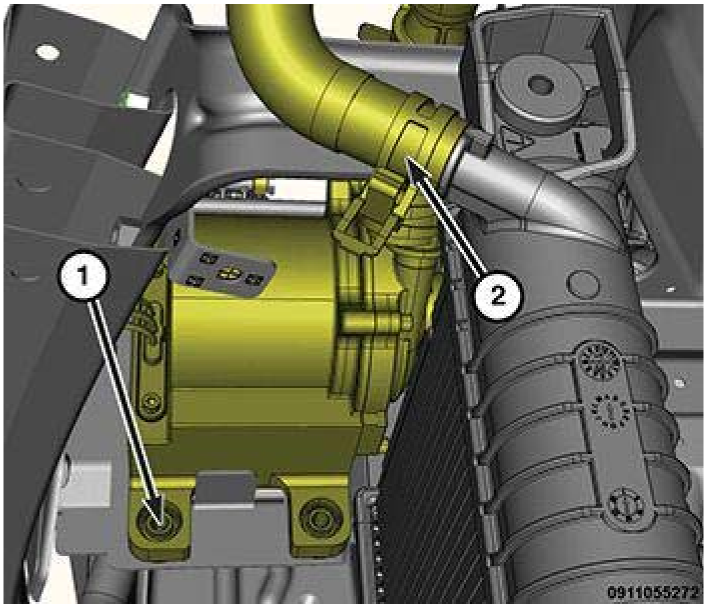
Courtesy of CHRYSLER GROUP, LLC

6. Remove the two upper mounting nuts (1) securing the coolant pump to the mounting bracket.
7. Release the clamp (2) and remove the coolant hose from the pipe.

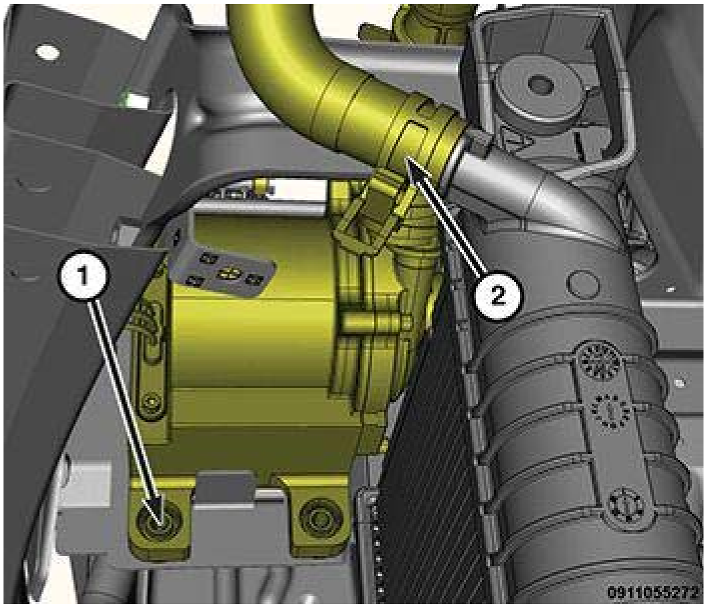


[Fig. 151: Lower Coolant Pump Mounting Nuts & Clamp]
Courtesy of CHRYSLER GROUP, LLC

8. Release the clamp (2) and remove the coolant hose from the auxiliary low temperature radiator.
9. Remove the two lower coolant pump mounting nuts (1).
10. Remove the coolant pump from the vehicle.
11. Remove the coolant hoses from the pump.

INSTALLATION

INSTALLATION



[Fig. 152: Lower Coolant Pump Mounting Nuts & Clamp]
Courtesy of CHRYSLER GROUP, LLC

1. Install the coolant hoses onto the coolant pump.

2. Position the coolant pump onto the lower mounting bracket studs.
3. Install the two lower mounting nuts and tighten the nuts (1) to the proper torque specification. Refer to **SPECIFICATIONS**.
4. Install the coolant hose onto the auxiliary low temperature radiator and secure the clamp (2).

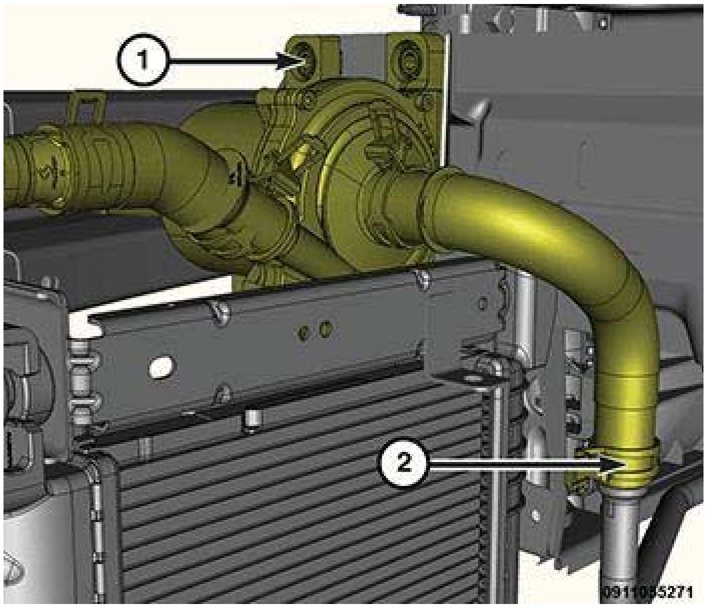


Fig. 153: Coolant Pump To Mounting Bracket Nuts & Clamp
Courtesy of CHRYSLER GROUP, LLC

5. Install the upper mounting nuts (1) and tighten to the proper torque specification. Refer to **SPECIFICATIONS**.
6. Install the coolant hose onto the coolant tube and secure the clamp (2).

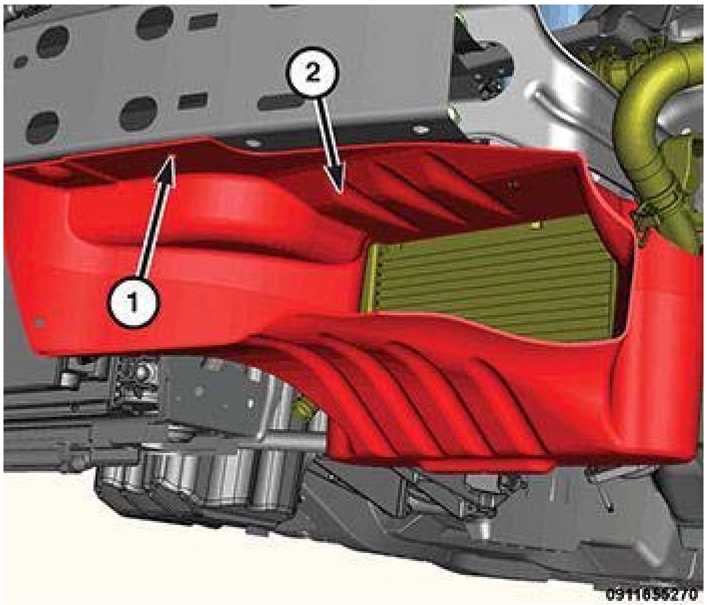

Fig. 154: Low Temperature Radiator Shroud & Fasteners
Courtesy of CHRYSLER GROUP, LLC

7. Position the auxiliary low temperature radiator shroud (2) to the vehicle and install the fasteners (1).

8. Connect the wire harness connector to the coolant pump.
9. Install the front fascia. Refer to **FASCIA, FRONT, INSTALLATION** .
10. Connect the negative battery cable.
11. Evacuate air and refill cooling system. Refer to **STANDARD PROCEDURE**.
12. Check cooling system for leaks. Refer to **DIAGNOSIS AND TESTING**.

RESERVOIR, COOLANT

REMOVAL

REMOVAL

1. Drain the low temperature cooling system below level of the coolant reservoir. Refer to **STANDARD PROCEDURE**.

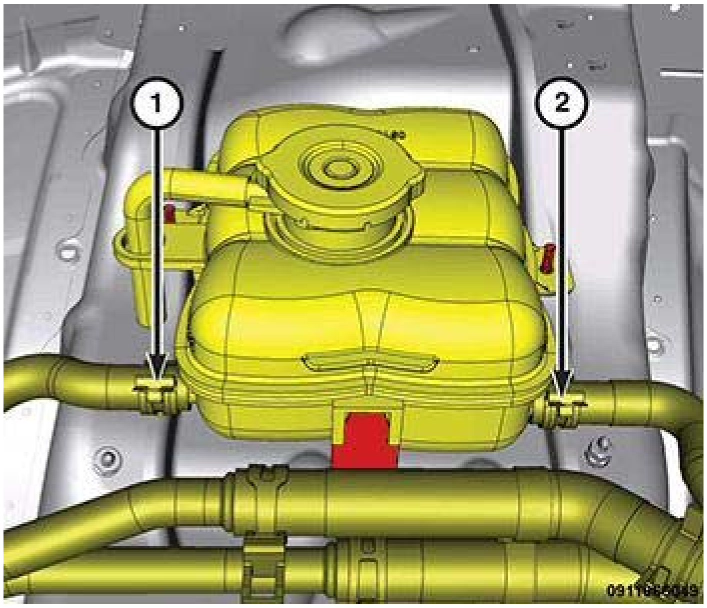

Fig. 155: Inlet & Outlet Hose Clamps
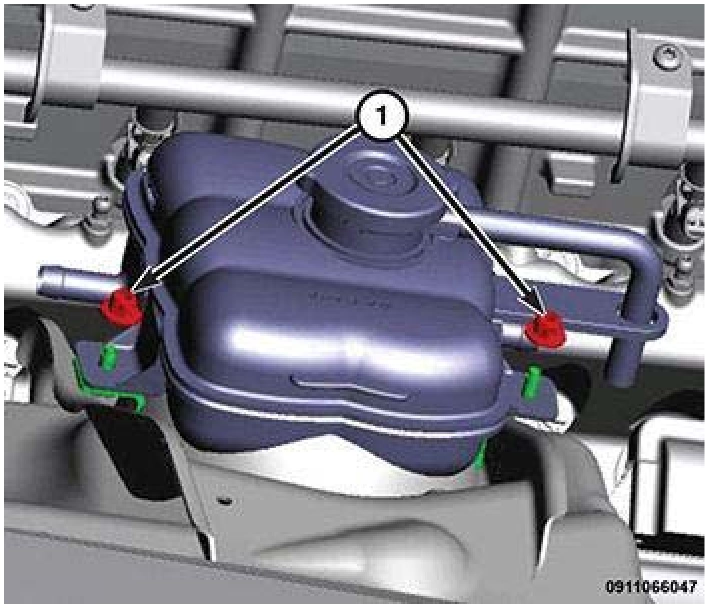
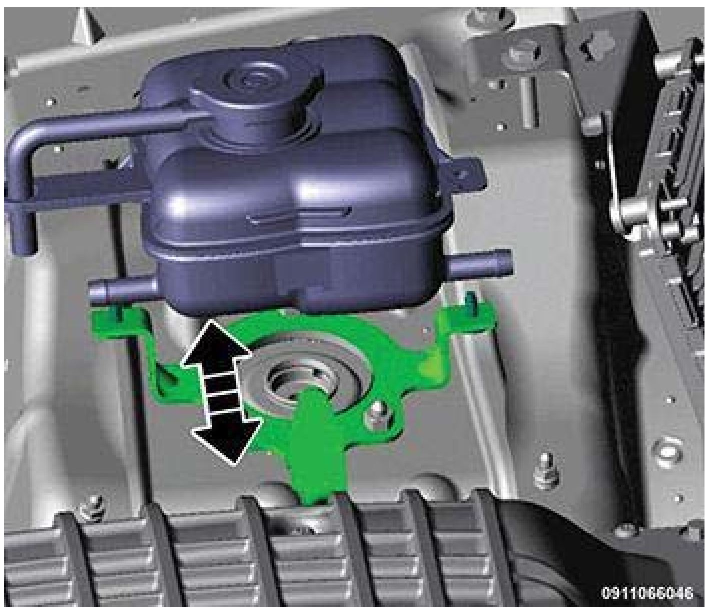
Courtesy of CHRYSLER GROUP, LLC

2. Remove coolant reservoir pressure cap.
3. Remove the inlet hose (2) from the coolant reservoir.
4. Remove the outlet hose (1) from the coolant reservoir.



[Fig. 156: Coolant Reservoir To Bracket Retaining Nuts](#)
Courtesy of CHRYSLER GROUP, LLC

5. Remove the two coolant reservoir to bracket retaining nuts (1).



[Fig. 157: Disengaging/Engaging Coolant Reservoir](#)
Courtesy of CHRYSLER GROUP, LLC

6. Lift the coolant reservoir upward, disengaging it from the mounting bracket.

INSTALLATION

INSTALLATION

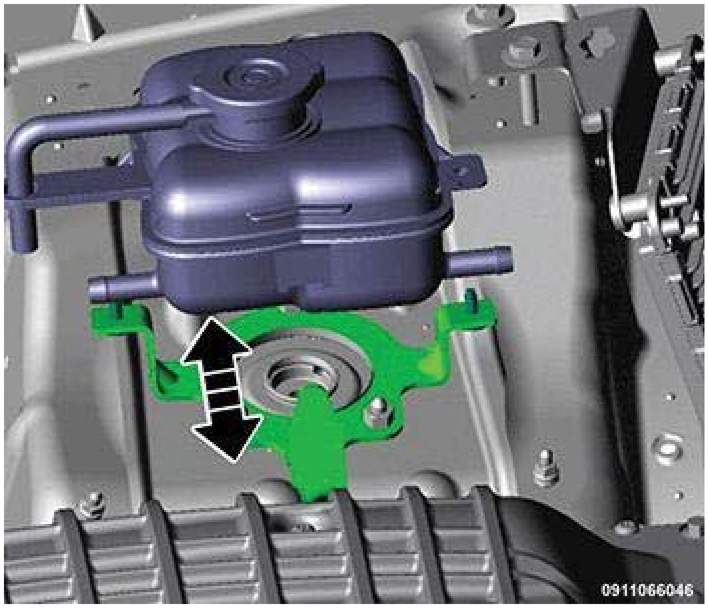


Fig. 158: Disengaging/Engaging Coolant Reservoir
Courtesy of CHRYSLER GROUP, LLC

1. Position the coolant reservoir onto the mounting bracket.

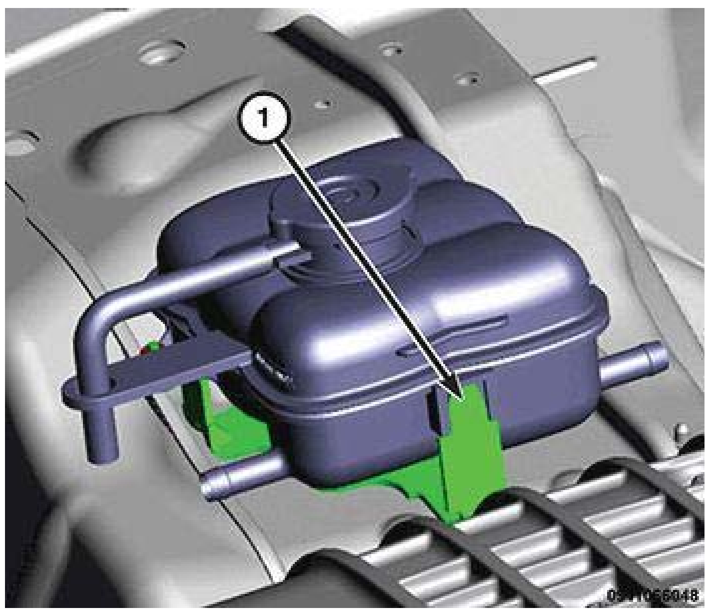

Fig. 159: Coolant Reservoir Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

2. Insert the mounting bracket (1) into the slot on the coolant reservoir.

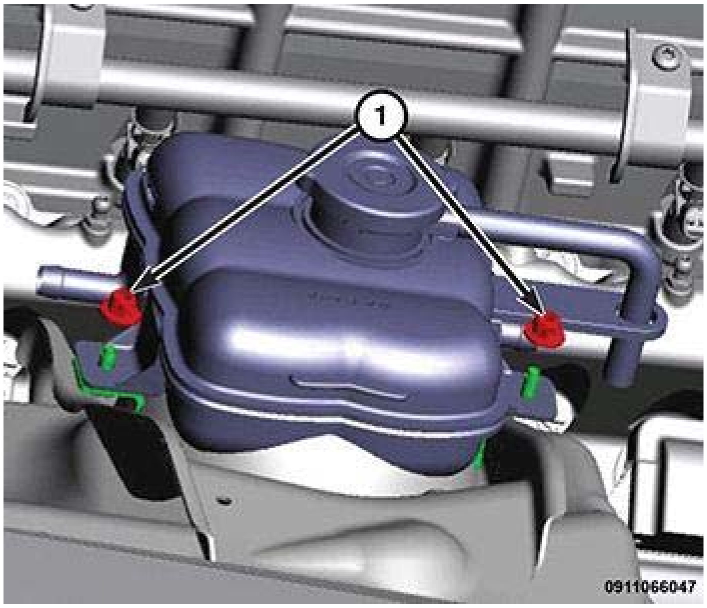

Fig. 160: Coolant Reservoir To Bracket Retaining Nuts
Courtesy of CHRYSLER GROUP, LLC

3. Install the coolant reservoir to bracket retaining nuts (1) and tighten to the proper torque specification. Refer to **SPECIFICATIONS**.

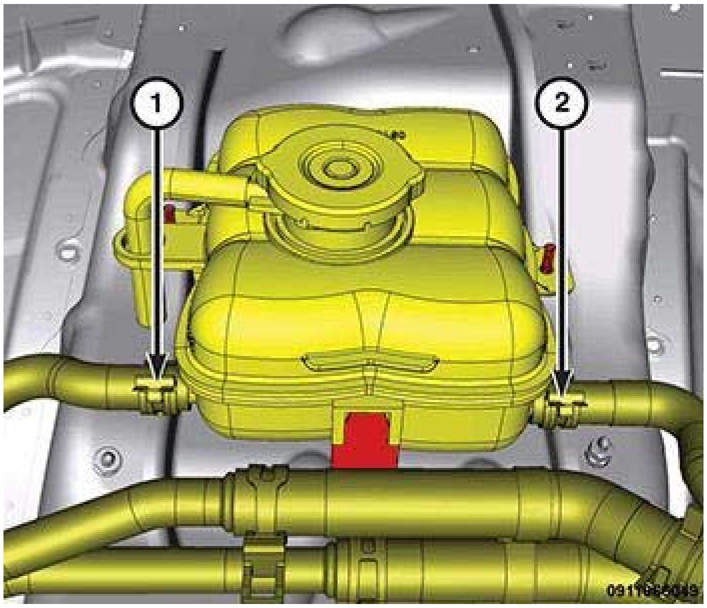

Fig. 161: Inlet & Outlet Hose Clamps
Courtesy of CHRYSLER GROUP, LLC

4. Install the outlet hose (1) onto the coolant reservoir and secure the clamp.
5. Install the inlet hose (2) onto the coolant reservoir and secure the clamp.
6. Fill the cooling system. Refer to **STANDARD PROCEDURE**.

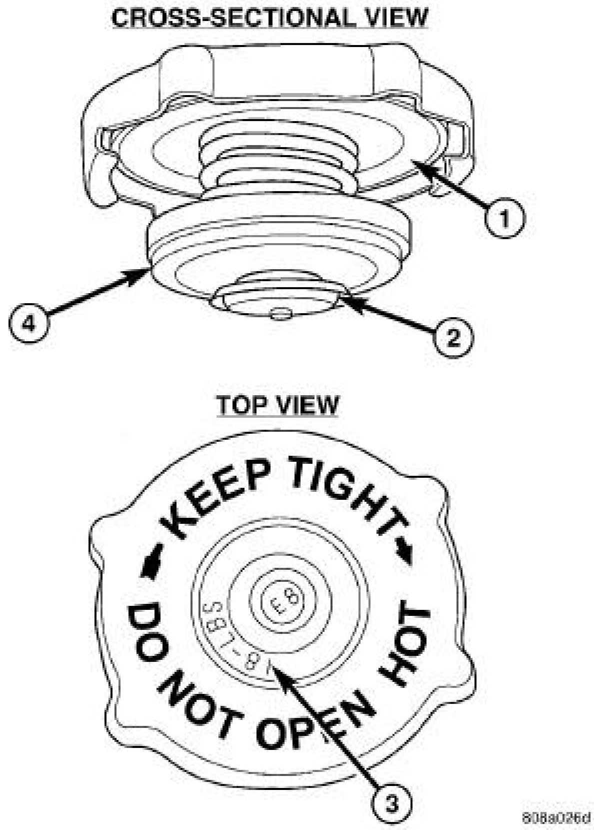
NOTE: **The low temperature cooling system must be vacuum filled.**

7. Install the coolant reservoir pressure cap.

CAP, RESERVOIR

DESCRIPTION

DESCRIPTION



[Fig. 162: Radiator Pressure Cap Components]
Courtesy of CHRYSLER GROUP, LLC

1 - FILLER NECK SEAL
2 - VACUUM VENT VALVE
3 - PRESSURE RATING
4 - PRESSURE VALVE

The Low Temperature Radiator (LTR) cooling system is equipped with an 18 PSI pressure cap. This cap releases pressure at some point within a range of 110 - 138 kPa (16 - 20 psi). The pressure relief point is engraved on top of the cap.

NOTE: **The primary cooling system uses a 21 PSI cap, these caps must not be interchanged.**

The cooling system will operate at pressures slightly above atmospheric pressure. This results in a higher coolant boiling point allowing increased radiator cooling capacity. The cap contains a spring-loaded pressure relief valve. This valve opens when system pressure reaches the release range of 110 - 138 kPa (16 - 20 psi).

A rubber gasket seals to the reservoir filler neck. This is done to maintain vacuum during coolant cool-down

and to prevent leakage when system is under pressure.

MANIFOLD, COOLANT CROSSOVER

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Drain the cooling system. Refer to **STANDARD PROCEDURE**.
3. Remove the cowl cover panel. Refer to **COVER, COWL PANEL, REMOVAL** .

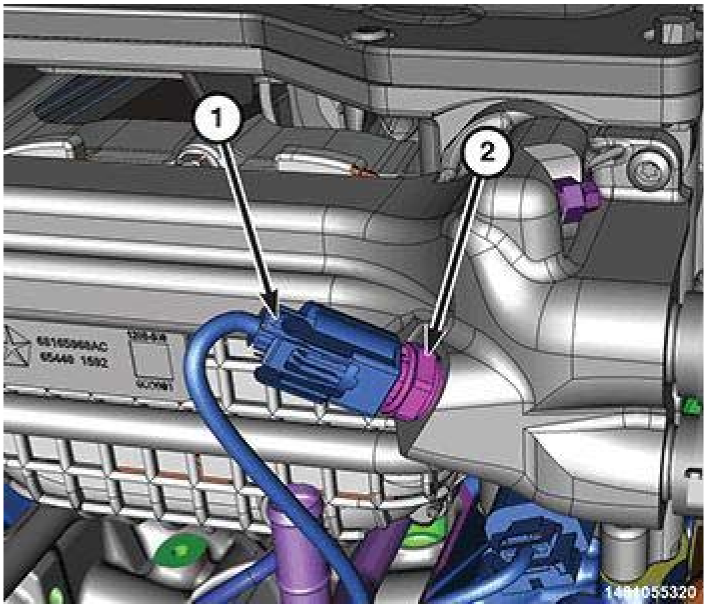


Fig. 163: Charger Air Cooler Temperature Sensor & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the charger air cooler temperature sensor (2) wire harness connector (1).

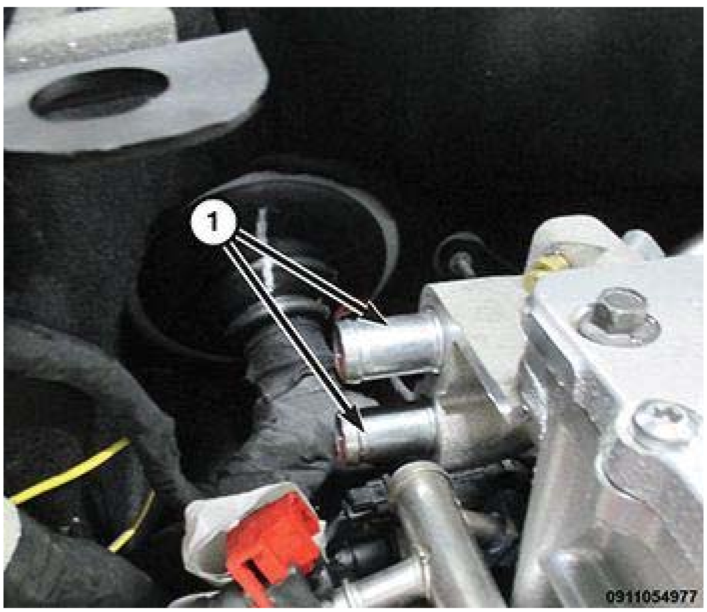

Fig. 164: Coolant Crossover

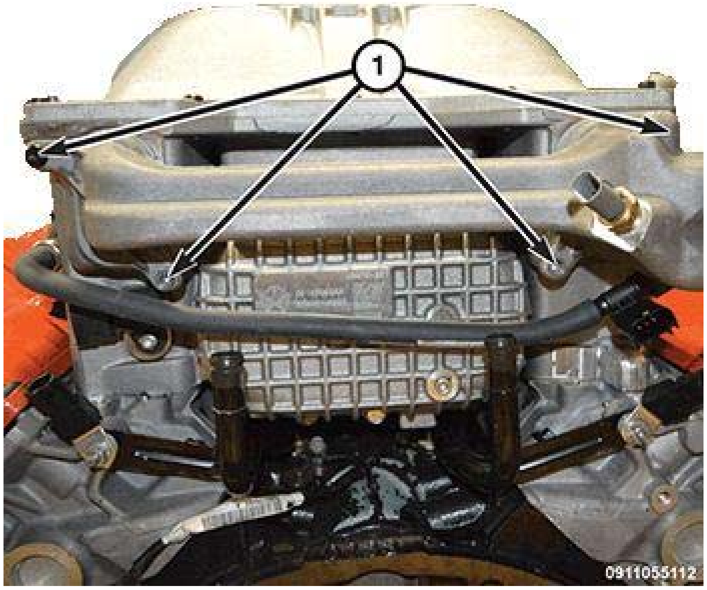
Courtesy of CHRYSLER GROUP, LLC

5. Remove the Low Temperature Radiator (LTR) circuit hoses from the coolant crossover (1).



[**Fig. 165: Coolant Crossover Manifold Mounting Bolts**]
Courtesy of CHRYSLER GROUP, LLC

6. Remove the coolant crossover manifold mounting bolts (1).
7. Remove the coolant crossover manifold from the vehicle.

INSTALLATION

INSTALLATION

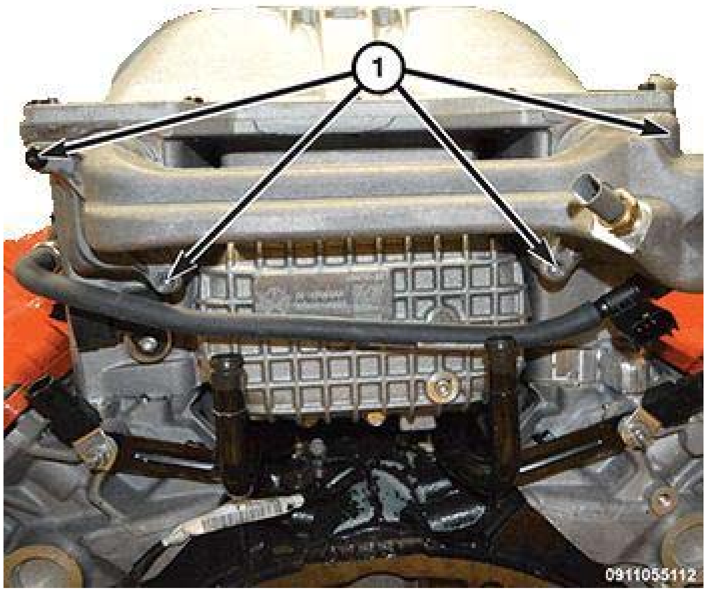


Fig. 166: Coolant Crossover Manifold Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Using **NEW** O-ring seals, install the coolant crossover manifold and tighten the bolts (1) to the proper

torque specification. Refer to **SPECIFICATIONS**.

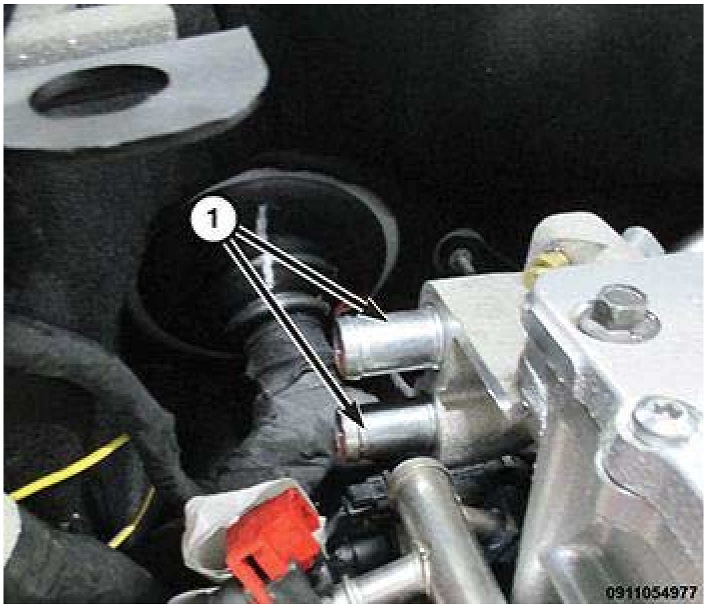

Fig. 167: Coolant Crossover
Courtesy of CHRYSLER GROUP, LLC

2. Install the Low Temperature Radiator (LTR) circuit hoses (1) onto the coolant crossover tube.

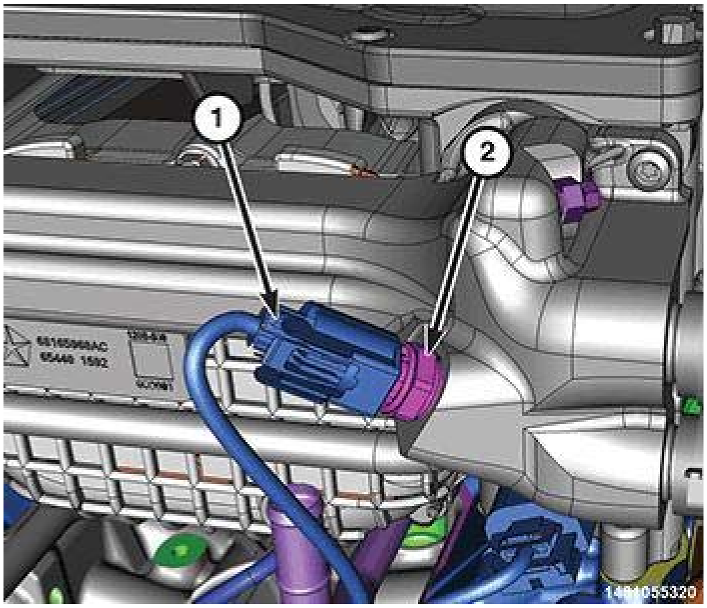

Fig. 168: Charger Air Cooler Temperature Sensor & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

3. Connect the charger air cooler temperature sensor (2) wire harness connector (1).
4. Install the cowl cover panel. Refer to **COVER, COWL PANEL, INSTALLATION** .
5. Fill the cooling system. Refer to **STANDARD PROCEDURE**.
6. Connect the negative battery cable.
7. Start vehicle and check for cooling system leaks.

SENSOR, CHARGE AIR COOLER TEMPERATURE

REMOVAL

REMOVAL

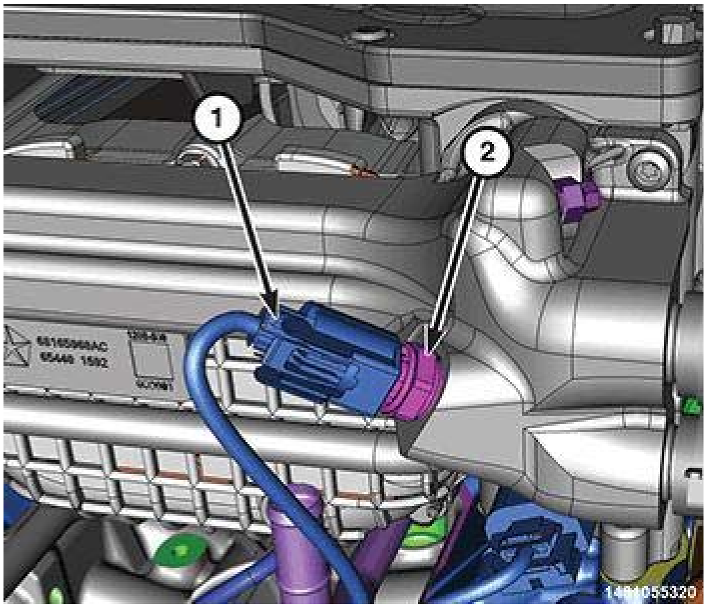

Fig. 169: Charger Air Cooler Temperature Sensor & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

The charge air cooler temperature sensor on the 6.2L engine is located on the right side of the coolant crossover manifold on the supercharger.

WARNING: Hot, pressurized coolant can cause injury by scalding. Cooling system must be partially drained before removing the coolant temperature sensor.

1. Disconnect and isolate the negative battery cable.
2. Partially drain the cooling system. Refer to **STANDARD PROCEDURE**.
3. Remove the cowl panel cover. Refer to **COVER, COWL PANEL, REMOVAL** .
4. Disconnect the charge air cooler temperature sensor wire harness connector (1).
5. Remove the charge air cooler temperature sensor (2) from the supercharger.

INSTALLATION

INSTALLATION

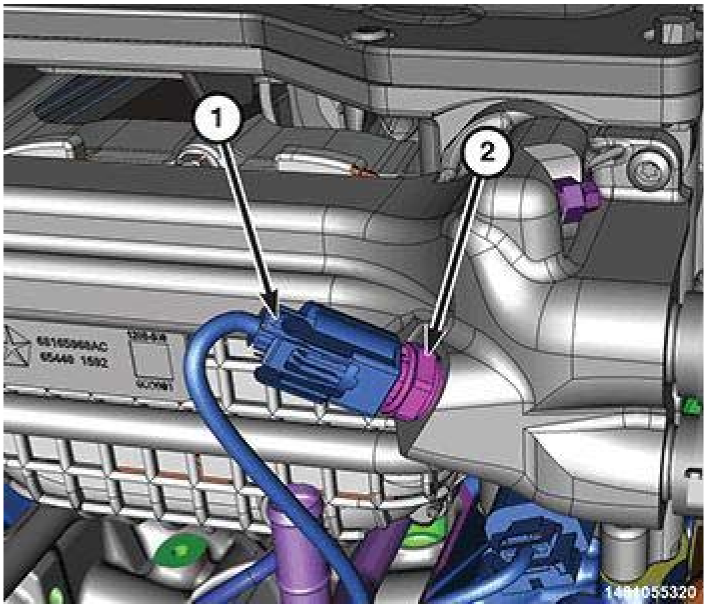

Fig. 170: Charger Air Cooler Temperature Sensor & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

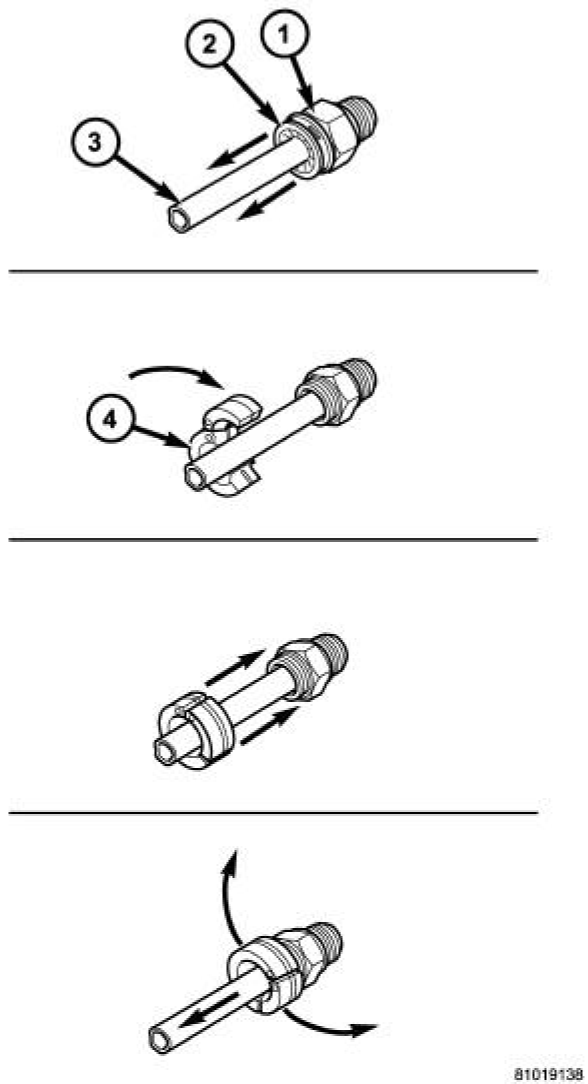
1. Apply MOPAR™ thread sealant with PFTE to sensor threads.
2. Install the charge air cooler temperature sensor (2) into the coolant crossover manifold and tighten to the proper torque specification. Refer to **SPECIFICATIONS**.
3. Connect the charge air cooler temperature sensor wire harness connector (1).
4. Install the cowl panel cover. Refer to **COVER, COWL PANEL, INSTALLATION** .
5. Fill the cooling system. Refer to **STANDARD PROCEDURE**.
6. Connect the negative battery cable.

TRANSMISSION

STANDARD PROCEDURE

STANDARD PROCEDURE - TRANSMISSION COOLER LINE QUICK CONNECT FITTING DISASSEMBLY/ASSEMBLY

DISCONNECT



[Fig. 171: Oil Cooler Line Quick Connect Fitting - Disassembly](#)
Courtesy of CHRYSLER GROUP, LLC

1 - QUICK CONNECT FITTING
2 - DUST CAP
3 - OIL COOLER LINE
4 - SPECIAL TOOL 8875A (FOR 3/8 LINE) OR 9546 (FOR 1/2 LINE)

1. Remove dust cap by pulling it straight back off of quick connect fitting
2. Place disconnect (special tool #8875A, Disconnect, Transmission Cooler Line) onto a 3/8 inch transmission cooler lines or (special tool #9546, Disconnect Tool) onto a 1/2 inch transmission cooler lines with the fingers of the tool facing the quick connect fitting.
3. Slide disconnect tool down the transmission line and engage the fingers of the tool into the retaining clip. When properly engaged in the clip, the tool will fit flush against the quick connect fitting.
4. Rotate the disconnect tool 60Â° to expand the retaining clip.
5. While holding the disconnect tool against the quick connect fitting, pull back on the transmission cooler

line to remove.

CONNECT

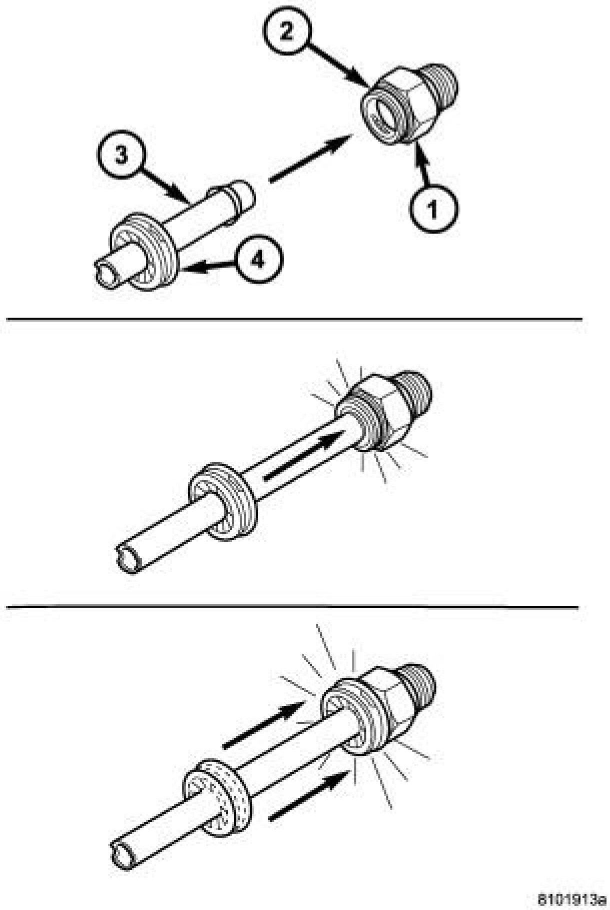


Fig. 172: Oil Cooler Line Quick Connect Fitting - Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - QUICK CONNECT FITTING
2 - CLIP
3 - OIL COOLER LINE
4 - DUST CAP

1. Align transmission cooler line with quick connect fitting while pushing straight into the fitting.
2. Push in on transmission cooler line until a "click" is heard or felt.
3. Slide dust cap down the transmission cooler line and snap it over the quick connect fitting until it is fully seated and rotates freely. Dust cap will only snap over quick connect fitting when the transmission cooler line is properly installed.

NOTE: **If dust cap will not snap into place, repeat assembly step #2.**

COOLER, TRANSMISSION OIL

DESCRIPTION

3.6L/5.7L/6.4L

The automatic transmission cooler is located in the front of the radiator and behind the front fascia and is combined with the A/C condenser. The transmission cooler is a heat exchanger that allows heat in the transmission fluid to be transferred to the air passing over the cooler fins.

The Transmission oil cooler/A/C condenser assembly is equipped with quick connect fitting for the transmission oil cooler lines, a tapping block for the receiver/drier and mounting provisions for the power steering cooler.

The transmission oil cooler/AC condenser is service as an assembly. For removal and installation, refer to **CONDENSER, A/C, REMOVAL** or **CONDENSER, A/C, INSTALLATION** .

6.2L

The automatic transmission cooler is located in the Low Temperature Radiator (LTR). The transmission cooler is a heat exchanger that allows heat in the transmission fluid to be transferred to the air passing over the cooler fins.

The Transmission oil cooler/LTR assembly is equipped with quick connect fittings for the transmission oil cooler lines.

The transmission oil cooler/LTR is serviced as an assembly. For removal and installation, refer to **RADIATOR, LOW TEMPERATURE, REMOVAL** or **RADIATOR, LOW TEMPERATURE, INSTALLATION**.

TUBES AND HOSES, TRANSMISSION OIL COOLER

REMOVAL

8HP45/845RE REMOVAL

1. Remove upper radiator closure panels.

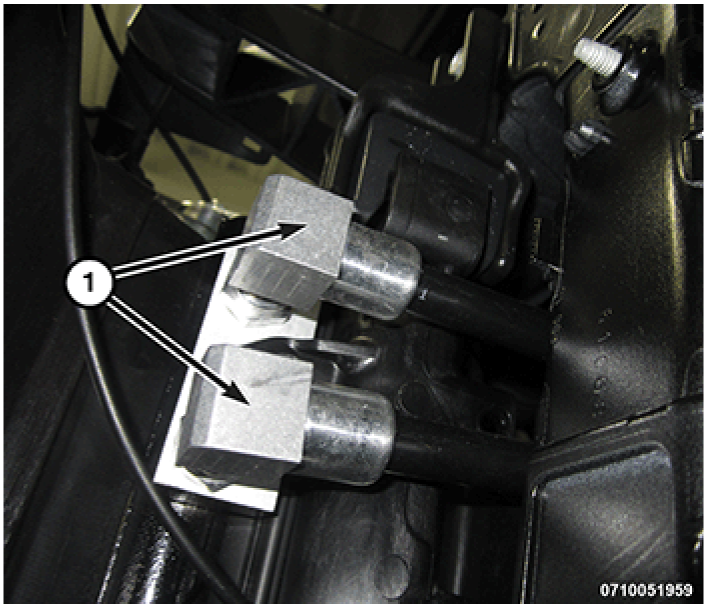

Fig. 173: Transmission Cooler Lines From Transmission Cooler

Courtesy of CHRYSLER GROUP, LLC

2. Using the Transmission Cooler Line Disconnect tool (special tool #8875A, Disconnect, Transmission Cooler Line), remove the transmission cooler lines (1) from transmission cooler. Refer to **STANDARD PROCEDURE**.
3. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

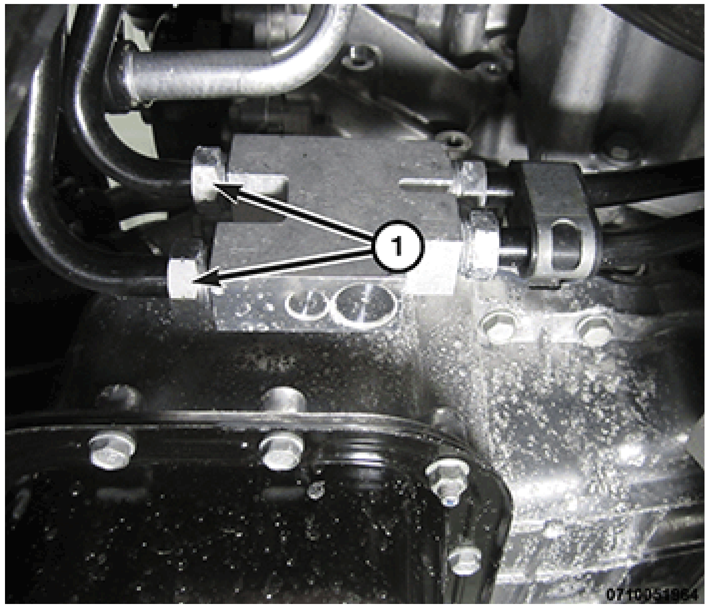

Fig. 174: Front Transmission Cooler Lines
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the front transmission cooler lines (1) from the thermal bypass valve block.

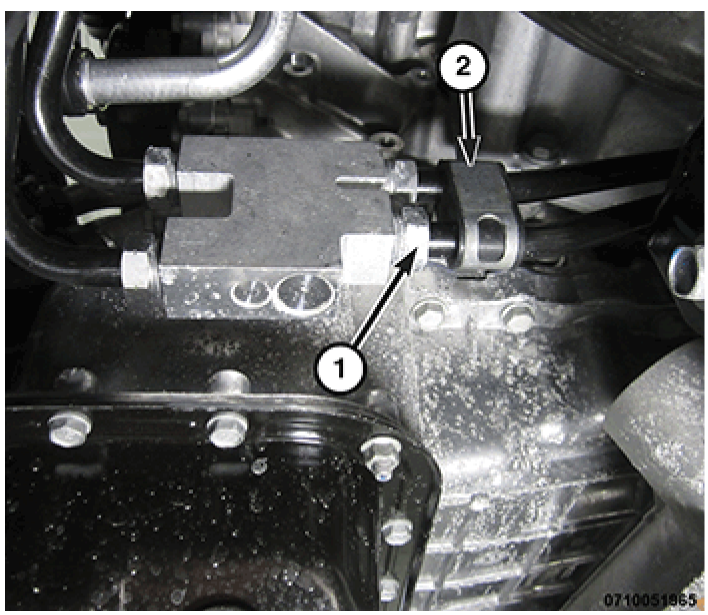

Fig. 175: Rear Transmission Cooler Lines & Bracket
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the rear transmission cooler lines (1) from the thermal bypass valve block.

6. Remove the transmission cooler line bracket bolt and bracket (2).

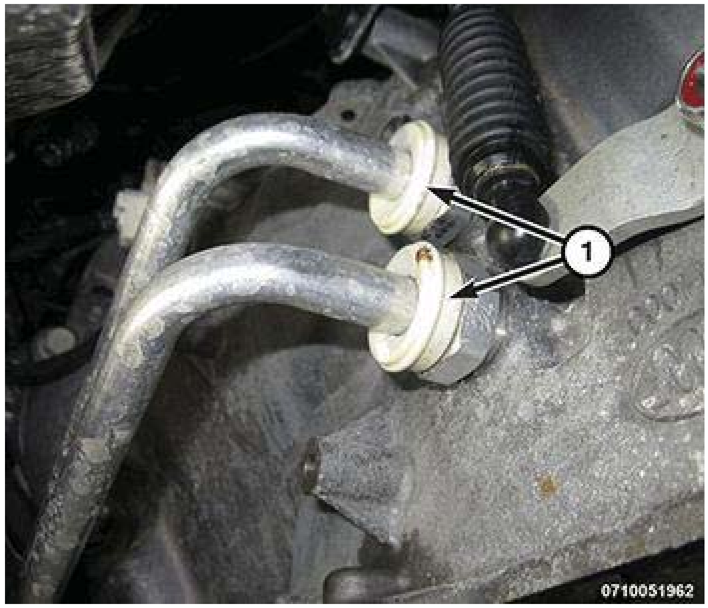

Fig. 176: Transmission Fluid Cooler Lines
Courtesy of CHRYSLER GROUP, LLC

7. Using the Transmission Cooler Line Disconnect tool (special tool #8875A, Disconnect, Transmission Cooler Line), remove the transmission cooler lines (1) from the transmission. Refer to **STANDARD PROCEDURE**.
8. Remove the transmission cooler lines from the vehicle.

8HP70 REMOVAL

1. Remove upper radiator closure panels

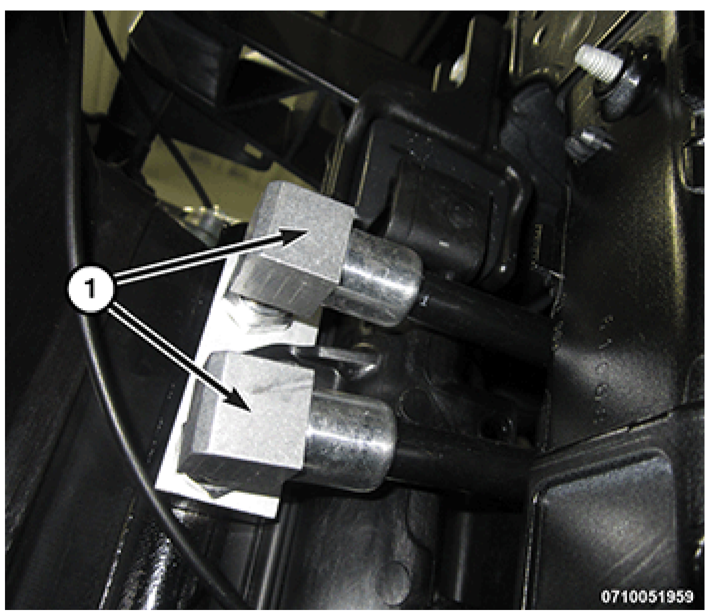

Fig. 177: Transmission Cooler Lines From Transmission Cooler
Courtesy of CHRYSLER GROUP, LLC

2. Using the Transmission Cooler Line Disconnect tool (special tool #8875A, Disconnect, Transmission Cooler Line), remove the transmission cooler lines (1) from transmission cooler. Refer to **STANDARD PROCEDURE**.
3. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

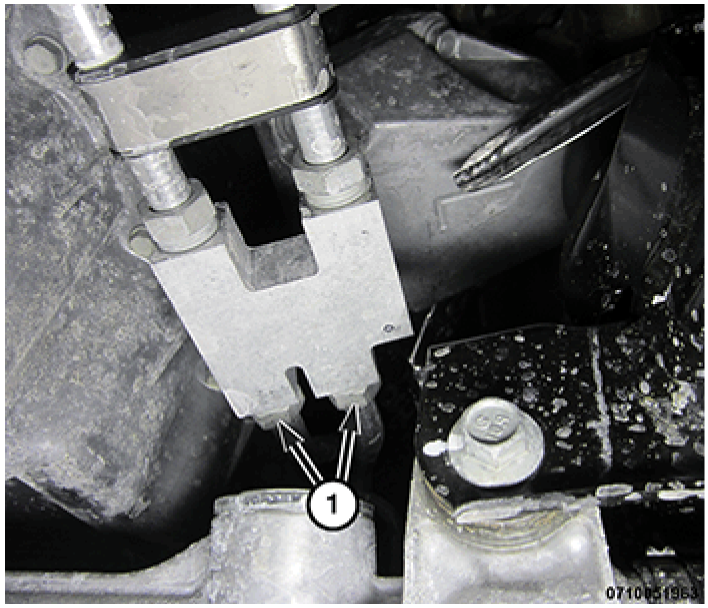

Fig. 178: Front Transmission Cooler Lines From The Thermal Bypass Valve Block

4. Disconnect the front transmission cooler lines (1) from the thermal bypass valve block.

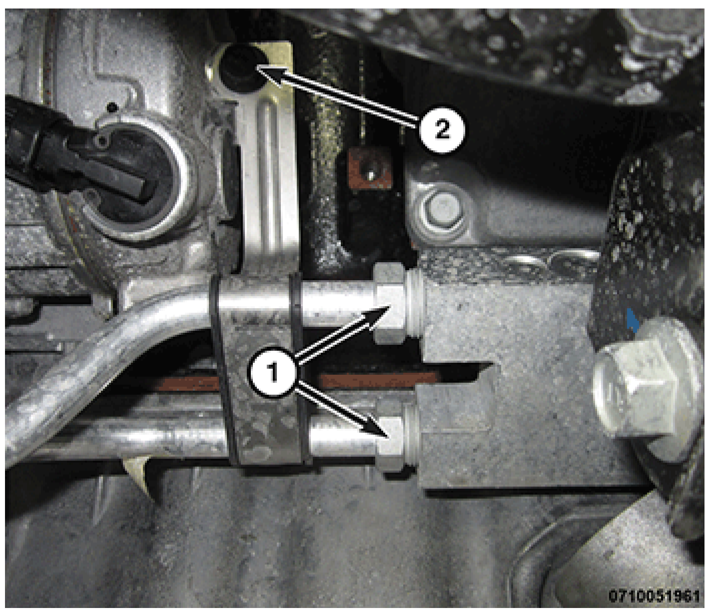

Fig. 183: Rear Transmission Cooler Lines, Bracket & Bolt
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the rear transmission cooler lines (1) from the thermal bypass valve block.
6. Remove the transmission cooler line bracket bolt and bracket (2).

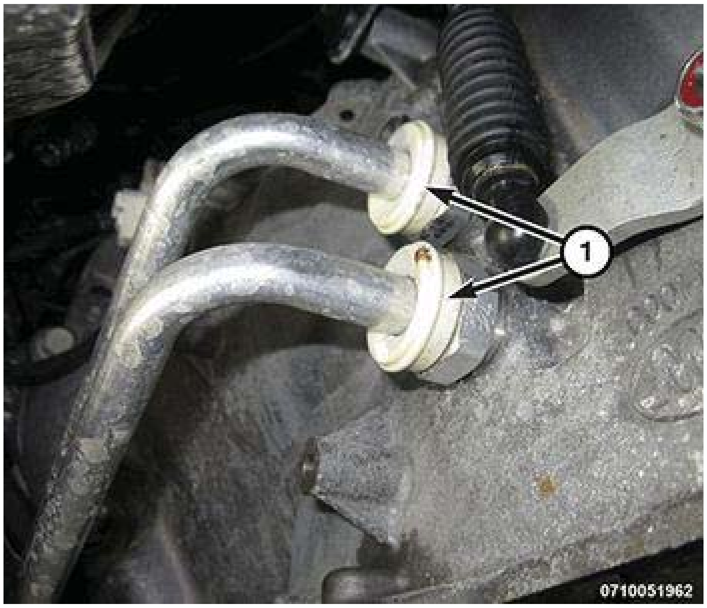

Fig. 184: Transmission Fluid Cooler Lines
Courtesy of CHRYSLER GROUP, LLC

7. Using the Transmission Cooler Line Disconnect tool (special tool #8875A, Disconnect, Transmission Cooler Line), remove the transmission cooler lines (1) from the transmission. Refer to **STANDARD PROCEDURE**.
8. Remove the transmission cooler lines from the vehicle.

TR6060 REMOVAL

1. Remove upper radiator closure panels.

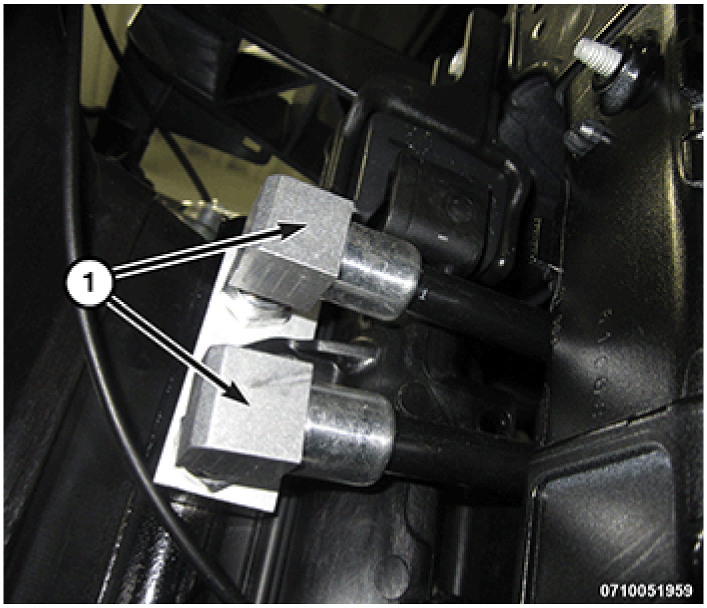

Fig. 185: Transmission Cooler Lines From Transmission Cooler
Courtesy of CHRYSLER GROUP, LLC

2. Using the Transmission Cooler Line Disconnect tool (special tool #8875A, Disconnect, Transmission Cooler Line), remove the transmission cooler lines (1) from transmission cooler. Refer to **STANDARD**

PROCEDURE.

3. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

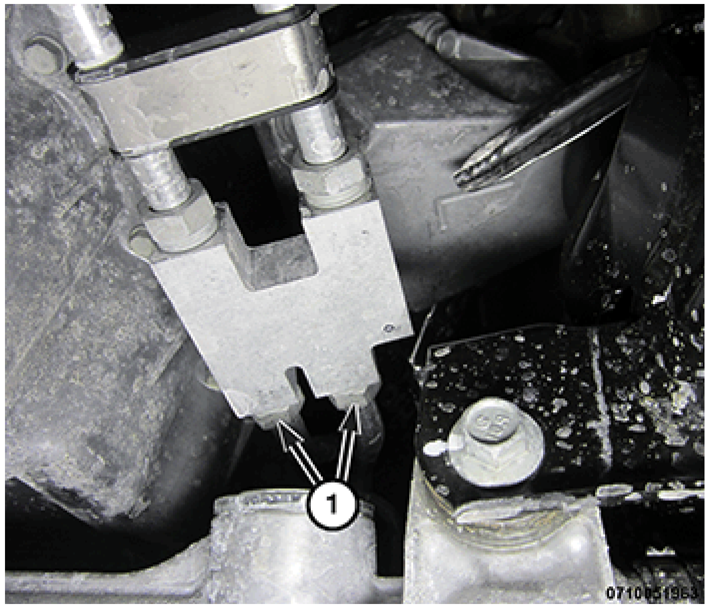

Fig. 186: Front Transmission Cooler Lines From The Thermal Bypass Valve Block
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the front transmission cooler lines (1) from the thermal bypass valve block.

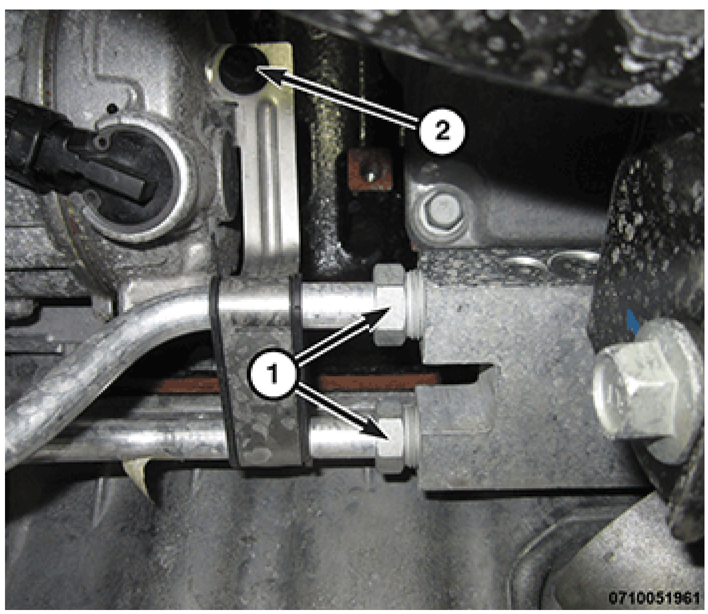

Fig. 187: Rear Transmission Cooler Lines, Bracket & Bolt
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the rear transmission cooler lines (1) from the thermal bypass valve block.
6. Remove the transmission cooler line bracket bolt (2) and position aside the and bracket.

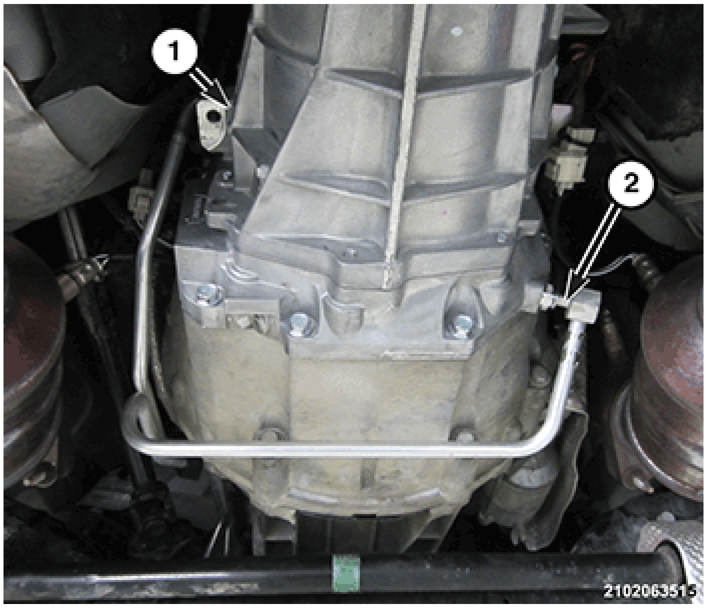

Fig. 188: Transmission Cooler Lines
Courtesy of CHRYSLER GROUP, LLC

7. Using the Transmission Cooler Line Disconnect tool (special tool #8875A, Disconnect, Transmission Cooler Line), remove the transmission cooler lines (1, 2) from the transmission. Refer to **STANDARD PROCEDURE**.
8. Remove the transmission cooler lines from the vehicle.

INSTALLATION

8HP45/854RE INSTALLATION

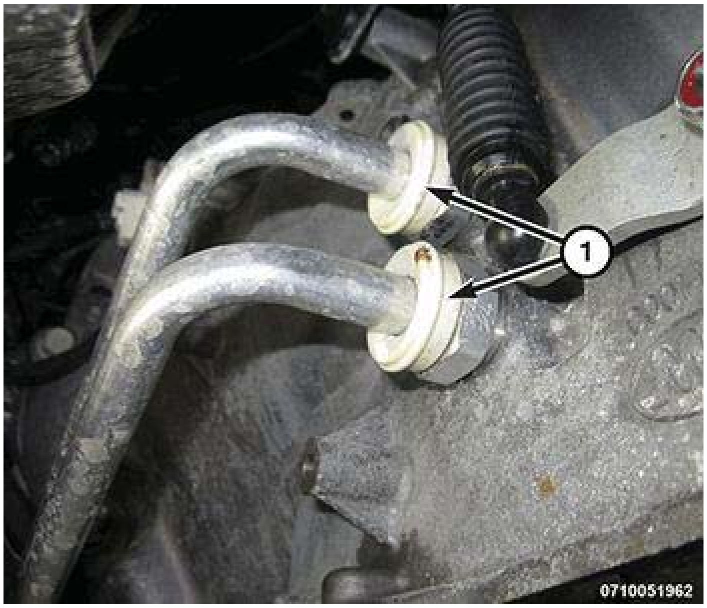

Fig. 189: Transmission Fluid Cooler Lines
Courtesy of CHRYSLER GROUP, LLC

1. Install rear transmission cooler lines (1) at the transmission.

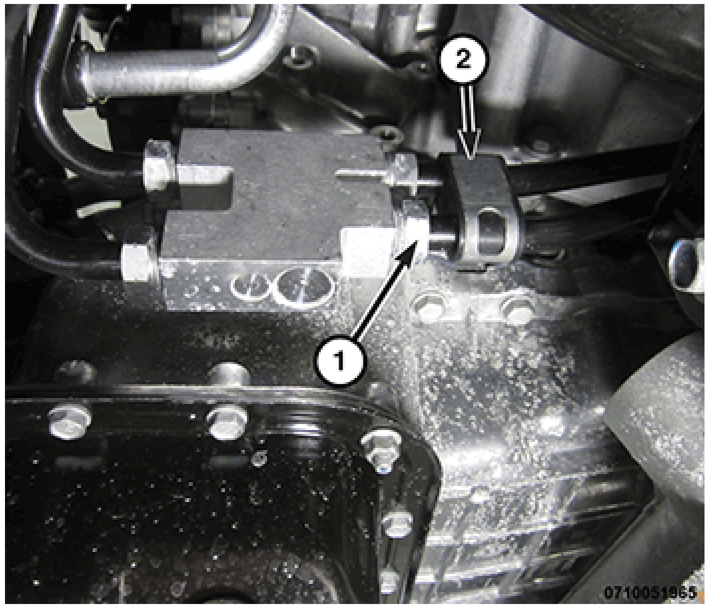

Fig. 190: Rear Transmission Cooler Lines & Bracket
Courtesy of CHRYSLER GROUP, LLC

2. Install the rear transmission cooler lines (1) to the thermal bypass valve. Tighten to the proper torque specification. Refer to **SPECIFICATIONS**.
3. Install the transmission cooler line bracket bolt (2) and tighten bolt to the proper torque specification. Refer to **SPECIFICATIONS**.

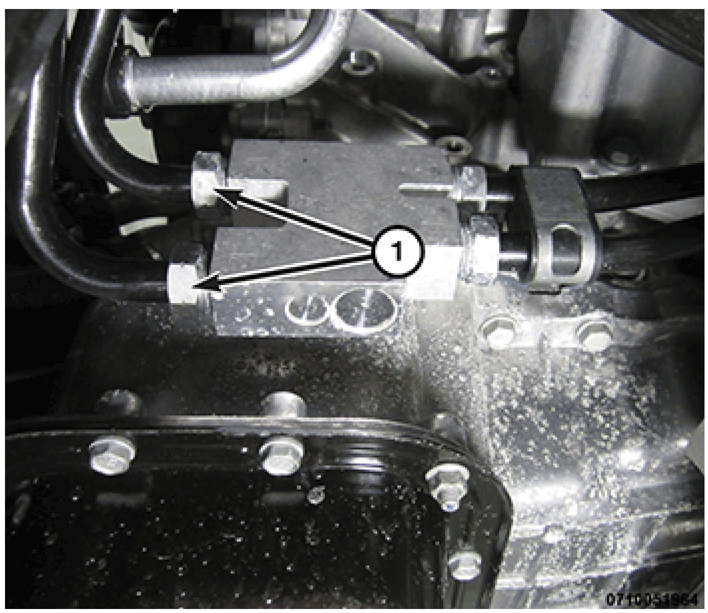

Fig. 191: Front Transmission Cooler Lines
Courtesy of CHRYSLER GROUP, LLC

4. Install the front transmission cooler lines (1) to the thermal bypass valve. Tighten to the proper torque specification. Refer to **SPECIFICATIONS**.

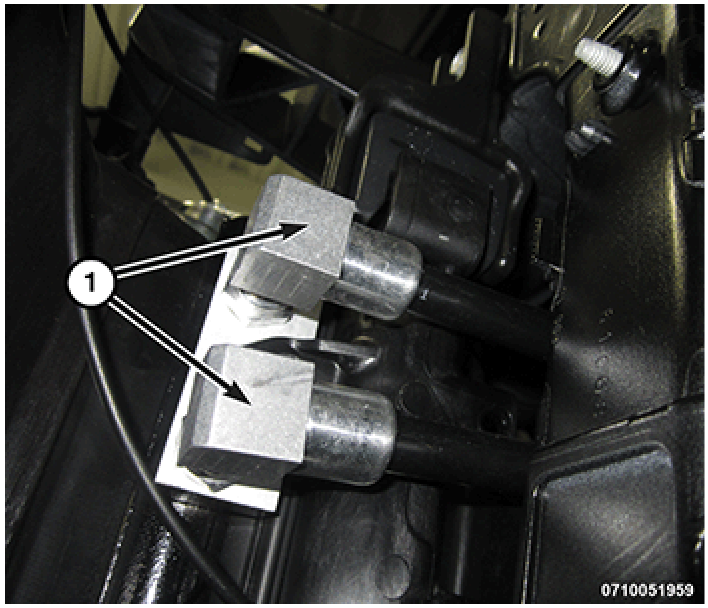

Fig. 192: Transmission Cooler Lines From Transmission Cooler
Courtesy of CHRYSLER GROUP, LLC

5. Install the front transmission cooler lines (1) into the transmission cooler. Refer to **STANDARD PROCEDURE**.
6. Remove the support and lower the vehicle.
7. Install the upper radiator closure panels.
8. Check the transmission fluid level. Refer to **FLUID AND FILTER, STANDARD PROCEDURE** .

8HP70 INSTALLATION

Courtesy of CHRYSLER GROUP, LLC

5. Install the front transmission cooler lines (1) into the transmission cooler. Refer to **STANDARD PROCEDURE**.
6. Remove the support and lower the vehicle.
7. Install the upper radiator closure panels.
8. Check the transmission fluid level. Refer to **STANDARD PROCEDURE** for 6.2L or **STANDARD PROCEDURE** for 5.7L/6.4L .

VALVE, THERMO BYPASS

DESCRIPTION

DESCRIPTION

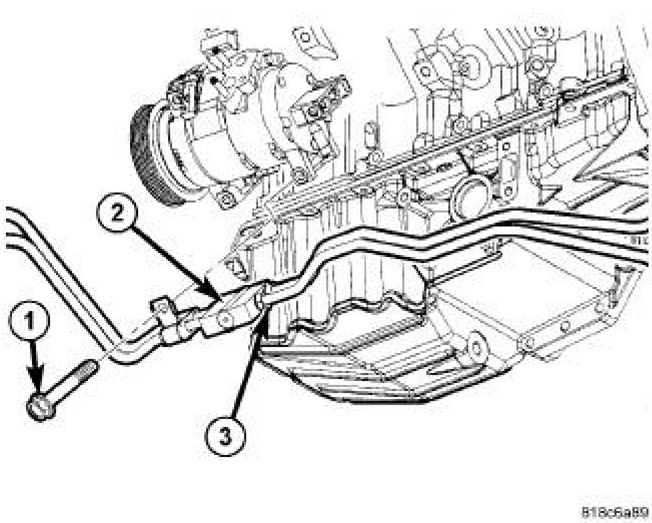

Fig. 205: Thermal Bypass Valve

Courtesy of CHRYSLER GROUP, LLC

The transmission thermal bypass valve is mounted on LH side of the engine at the A/C compressor.

OPERATION

OPERATION

The air-to-oil transmission cooler system has a thermal bypass valve assembly that controls fluid flow through the cooler. When the transmission fluid is cold (less then operating temperature), the fluid is routed through the cooler bypass valve without flowing through the transmission cooler. When the transmission fluid reaches operating temperatures 71Â°C (160Â°F) and above, the thermostat closes off the bypass and allowing fluid to flow through the transmission cooler. The thermal bypass valve is serviced as an assembly.

REMOVAL

REMOVAL

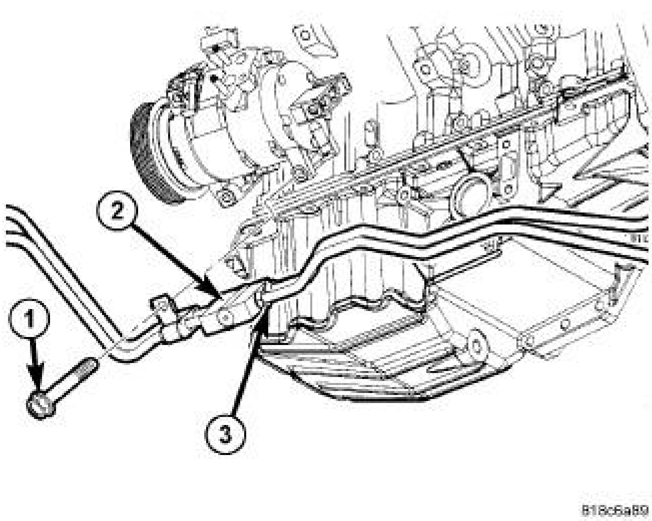

Fig. 206: Thermal Bypass Valve
Courtesy of CHRYSLER GROUP, LLC

1 - BRACKET BOLT
2 - THERMAL BYPASS VALVE
3 - COOLER LINE

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the front transmission cooler lines from the thermal bypass valve (2).
3. Remove the rear transmission cooler lines from the thermal bypass valve (3).
4. Remove the thermal bypass valve bracket bolt (1).
5. Remove the thermal bypass valve (2).

INSTALLATION

INSTALLATION

Article GUID: A00735857

DESCRIPTION

BLIND SPOT MONITOR SYSTEM

The Blind Spot Monitor (BSM) system is an available factory-installed electronic driving aid. This system provides both blind spot and Rear Cross Path (RCP) monitoring features. While the vehicle is being driven, this system alerts the vehicle operator when it detects other highway licensable vehicles that enter the targeted blind spot and cross path alert zones. These zones lie immediately to the right and behind as well as immediately to the left and behind the vehicle. Due to the surrounding rear vehicle structure or other adjacent stationary obstacles outside of the vehicle, these zones might be more difficult for the vehicle operator to easily monitor.

When the BSM system detects another vehicle within one of the target zones, the system is capable of illuminating an amber triangle icon located in each outside rear view mirror glass, as well as reducing audio system volume and sounding chime tones through the audio system speakers to provide the vehicle operator with both visual and audible alerts. However, it should be noted that this BSM system is intended to supplement and not to replace safe vehicle operating habits, including proper adjustment and use of the standard equipment inside and outside rear view mirrors.

The BSM system includes the following major components, which are described in further detail elsewhere in this service information:

- **Blind Spot Displays** - Vehicles equipped with the BSM system have an amber Light Emitting Diode (LED) unit mounted on the back of each outside rear view mirror glass case behind the translucent outline of a triangle in the mirror glass. The BSM system illuminates the appropriate triangle icon in amber each time a vehicle is detected in one of the blind spot or rear cross path alert zones.
- **Blind Spot Sensors** - Vehicles equipped with the BSM system have both a Left Blind Spot Sensor (LBSS) and a Right Blind Spot Sensor (RBSS). The LBSS and the RBSS each include a RAdio Detection And Ranging (RADAR) sensor and an integral electronic control unit. Each of the two control units is independent, communicates on the Controller Area Network (CAN) data bus with its respective Driver Door Module (DDM) or Passenger Door Module (PDM), which is hard wired to its respective right or left blind spot display. The LBSS and the RBSS are concealed behind their respective right or left outboard end of the rear bumper fascia, just behind each rear wheel opening.
- **Door Modules** - An electronic Driver Door Module (DDM) and Passenger Door Module (PDM) receives electronic messages over the Controller Area Network (CAN) data bus from its respective Left Blind Spot Sensor (LBSS) or Right Blind Spot Sensor (RBSS) to control a hard wired output to the BSM display in its respective outside rear view mirror. The door modules are concealed behind the door trim panels on each door inside panel.
- **Electronic Vehicle Information Center** - In vehicles equipped with the optional BSM system, the Electronic Vehicle Information Center (EVIC) within the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) may display textual warnings and error messages related to the current operating status of the BSM system.
- **Radio Receiver Module** - The virtual buttons in the touch screen of the optional premium Radio Receiver Module (RRM) (also known as the radio or the head unit) provide an interface that allows the

vehicle operator to enable, disable and modify certain BSM system settings using the customer programmable features option.

Hard wired circuitry connects the BSM system components to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other and to the vehicle electrical system through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin out and location views for the various wire harness connectors, splices and grounds.

The BSM system components cannot be adjusted or repaired. If any of the BSM system components becomes damaged or ineffective, that component must be replaced.

CHIME WARNING SYSTEM

A chime warning system is standard factory-installed equipment. The chime warning system uses an electromechanical transducer that is soldered onto the electronic circuit board inside of the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) to provide audible indications of various vehicle conditions that may require the attention of the vehicle operator or occupants.

The electromechanical transducer generates beep tones, chime tones and click tones to emulate the sounds associated with conventional turn signal and hazard warning flasher operation. The microcontroller-based IC utilizes electronic **chime request** messages received from other modules in the vehicle over the Controller Area Network (CAN) data bus to monitor many sensors and switches throughout the vehicle. In response to those inputs, the circuitry and programming of the IC allow it to control the audible outputs that are produced through its on-board transducer.

The IC is capable of producing the following audible outputs:

- **Slow Rate Repetitive Click** - Repeated **click** tones that are issued at a slow rate of about 90 clicks per minute.
- **Fast Rate Repetitive Click** - Repeated **click** tones that are issued at a fast rate of more than about 180 clicks per minute.
- **Single Chime Tone** - A single **chime** tone.
- **Slow Rate Repetitive Chime** - Repeated **chime** tones that are issued at a slow rate of about 50 chimes per minute.
- **Fast Rate Repetitive Chime** - Repeated **chime** tones that are issued at a fast rate of about 180 chimes per minute.

Hard wired circuitry connects the IC and the various chime warning system switch and sensor inputs to their modules and to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the IC through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire

harness routing and retention, as well as pin out and location views for the various wire harness connectors, splices and grounds.

The IC chime warning system circuits and components cannot be adjusted or repaired. If the IC circuitry, the on-board transducer or the relay are damaged or ineffective, the IC unit must be replaced.

FORWARD COLLISION WARNING

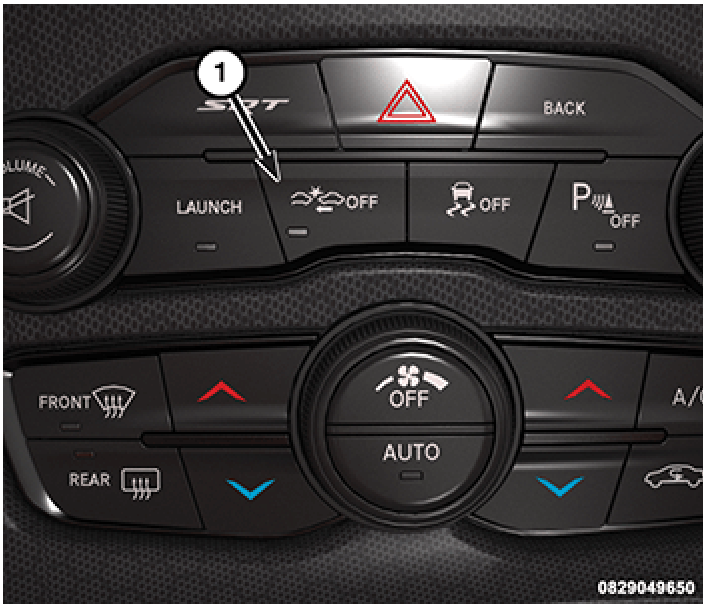

Fig. 1: Forward Collision Warning (FCW) Button
Courtesy of CHRYSLER GROUP, LLC

The Forward Collision Warning (FCW) system is an enhancement to the current vehicles equipped with Adaptive Cruise Control (ACC). The system utilizes radar and video input to detect whether the vehicle is approaching another vehicle or large obstacle in its path too rapidly and warn/assist the driver in avoiding the collision. The system communicates with other components on the vehicle to apply the brakes and/or to alert the driver through visual and audible warnings. The FCW function operates regardless of whether ACC with stop and go is active or not. The system operates down to 0 mph and provides audible closing in proximity warnings as well as brake pedal vibration.

Forward Collision Warning options and Active Braking settings can be changed. When the vehicle is equipped with a UconnectÃ® 8.4/8.4A system screen, the Safety and Driving Assistance soft key needs to be selected to access the options menu. When the vehicle is equipped with the UconnectÃ® 5.0 system, pressing the "+ MORE" hard-key located on the lower right side of the UconnectÃ® system will bring you to the "Settings" soft key.

The following is a list of FCW operations:

- Utilizes Radar sensors to detect whether the vehicle is approaching another vehicle or large obstacle in its path too rapidly and warn / assist the driver in avoiding / mitigating the collision.
- The driver has the ability to adjust the sensitivity and turn brake support on or off in the radio.
- Prefill prepares the brakes for emergency braking.
- Audible & Visual Warnings.

- Brake Jerk: Short deceleration to alert driver.
- CMS (Collision Mitigation System) Up to 1.5 sec of braking to give driver additional reaction time.
- ABA (Advanced Brake Assist) If the driver is not braking enough, ABA will increase the braking to avoid / mitigate the accident. **NOTE: it is important to note the system will use "mitigated" braking to avoid accidents, but will not completely stop the vehicle in all scenarios if an impact is imminent - its purpose is to "warn and assist".**

PARK ASSIST SYSTEM

A park assist system is an optional factory-installed electronic parking aid. During parking and other similar vehicle maneuvers, this system alerts the vehicle operator to obstacles located in the path immediately behind the vehicle which, due to the surrounding vehicle structures, might be otherwise difficult to perceive. When an object is detected, the system uses the cluster display and the audio system in the vehicle to provide the vehicle operator with visual, and audible indications of the presence, and proximity of such objects.

The park assist system includes the following major components, which are described in further detail elsewhere in this service information:

- **Electronic Vehicle Information Center -** In vehicles equipped with the optional park assist system, the optional EVIC in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) displays textual warnings and error messages, and emits audible warnings related to the current operating status of the park assist system.
- **Park Assist Switch** - The optional park assist system can be manually disabled or enabled using a park assist switch that is integral to the switch pod in the instrument panel center stack. The operator can select from one of three options under the settings tab to enable or disable the system, the tone alerts, or the visual alerts.
- **Park Assist Module** - Vehicles equipped with the park assist system include a park assist module which is concealed within the molded plastic park assist module housing. There are two mounting tabs integral to the module housing that secure the module to the vehicle body. Three connector receptacles (only two are used on this model) are integral to one side of the housing and contain terminal pins that connect the module to the vehicle electrical system.
- **Park Assist Sensors** - Vehicles equipped with the rear park assist system have four ultrasonic park assist sensors that are concealed behind the rear bumper fascia. Each sensor is snapped into an individual molded plastic mounting bracket located at horizontal intervals along the back side of the rear bumper fascia.

Hard wired circuitry connects the various park assist system components to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other and to the vehicle electrical system through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin out and location views for the various wire harness connectors, splices and grounds.

The park assist system components cannot be adjusted or repaired. If any of the park assist system components are damaged or ineffective, that component must be replaced.

OPERATION

BLIND SPOT MONITOR SYSTEM

The primary components of the Blind Spot Monitor (BSM) system are the microcontroller based Electronic Control Units (ECU) integral to each of the two RAdio Detection And Ranging (RADAR) sensors, one behind each outboard side of the rear bumper fascia. The two sensors are known as the Right Blind Spot Sensor (RBSS) and the Left Blind Spot Sensor (LBSS). Each ECU operates on battery current received from a fuse in the Power Distribution Center (PDC) whenever the status of the ignition switch is On. Each ECU has a path to ground at all times through a take out and eyelet terminal of the body wire harness that is secured to the body sheet metal. These ECU communicate with each other, with other electronic modules in the vehicle or with a diagnostic scan tool over the Controller Area Network (CAN) - Interior High Speed (IHS) data bus network.

Each BSM system ECU continually monitors its own BSM system circuits and components for readiness, and will store a Diagnostic Trouble Code (DTC) for any fault that is detected. When a BSM system ECU stores a DTC, it sends an electronic request message to the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC). The IC will then display a **SERVICE BLIND SPOT SYSTEM** or **BLIND SPOT SYSTEM TEMPORARILY UNAVAILABLE** textual message in the Electronic Vehicle Information Center (EVIC) to alert the vehicle operator.

The Powernet network architecture used in this vehicle includes the Body Control Module (BCM) (also known as the Common Body Controller), which is also a CAN bus gateway and will relay messages received on the CAN-IHS data bus to the IC over the CAN-C data bus. The BSM system ECU sends request messages via the CAN-IHS bus to the BCM. Each BSM system ECU also monitors electronic messages received over the CAN-IHS data bus from the Radio Receiver Module (RRM) (also known as the radio or the head unit) through the CAN-C bus via the BCM gateway indicating the customer programmable features settings for the BSM system.

Each BSM system ECU receives and analyzes data inputs directly from its own radar sensor, calculates and provides the proper electronic messages over the CAN-IHS bus to the BCM as well as to the Driver Door Module (DDM) or Passenger Door Module (PDM). The DDM and PDM use hard wired outputs to illuminate the visual alert displays in their respective right or left outside rear view mirrors, as well as calculates and communicates the proper audible alert output requests to the RRM over the CAN bus network.

The BSM radar sensors allow the BSM system ECU to locate and identify nearby objects of interest meeting the criteria established by algorithms within the system software. The BSM displays provide the vehicle operator with a visual alert indicating that an object of interest has been detected within one of the vehicle detection zones. The BSM audible alerts are then issued by the RRM through the appropriate audio system speakers based upon electronic **audible alert request** messages received from the BSM system ECU. Each BSM system ECU also sends electronic **radio mute request** messages over the CAN data bus to the RRM whenever an audible alert is requested. This message activates the radio mute function while the audible alert is being sounded, then resumes normal radio function when the alert is completed.

The hard wired circuits between components related to the BSM system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the BSM system or the

electronic controls and communication between ECU and other devices that provide some features of this system. The most reliable, efficient and accurate means to diagnose the BSM system or the ECU and communication related to BSM system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

BLIND SPOT MONITOR MODE

Unless disabled in the customer programmable features settings received through the Radio Receiver Module (RRM) (also known as the radio or the head unit), the Blind Spot Monitor (BSM) mode is active only when the transmission gear selector is in a position other than Reverse (**R**) or Park (**P**). The BSM mode is intended to provide a visual alert to the driver when a target vehicle (object of interest) is located in the lane adjacent to and just behind either outside rear view mirror (the detection zone), in the blind spot area where vision of target vehicles may be inhibited by the rear structure of the host vehicle. If a turn signal is activated in the host vehicle in the same direction as that in which the target vehicle is located, a single audible alert tone will also be generated. The audible alerts of the BSM mode are not active unless the turn signal is activated.

The width of the BSM mode detection zone covers one traffic lane over on each side of the host vehicle, approximately 4.0 meters (13 feet). The length of the BSM mode detection zone starts at the outside rear view mirror and extends approximately 4.5 meters (15 feet) rearward from the rear edge of the rear fascia. The BSM mode visual alerts are activated immediately if an object of interest is within the detection zone and meets the warning criteria. However, the BSM system will not activate these alerts if:

- The object of interest (target vehicle) comes from the rear of the detection zone and passes the host vehicle at a speed greater that 50 kilometers-per-hour (31 miles-per-hour).
- The object of interest (target vehicle) enters the detection zone from the front and remains in the zone for less than 1.5 seconds.
- The object of interest (target vehicle) passes through the detection zone with a relative speed greater than 20 kilometers-per-hour (12 miles-per-hour).
- The object of interest (target vehicle) passes the host vehicle from the opposite direction.

The BSM mode audible alert may be deactivated if the operator prefers using the customer programmable features settings within the RRM. The BSM mode can be configured for visual and audible alerts, visual alerts only or for the entire BSM system (including Rear Cross Path/RCP mode) to be turned Off.

REAR CROSS PATH MODE

Unless disabled in the customer programmable features settings received through the Radio Receiver Module (RRM) (also known as the radio or the head unit), the Blind Spot Monitor (BSM) system provides a feature called Rear Cross Path (RCP) mode. The RCP mode is active only when the transmission gear selector is in the Reverse (**R**) position. The RCP mode is intended to aid the driver when backing out of parking spaces where vision of vehicles crossing laterally through the rear path of the host vehicle may be blocked. The host vehicle must proceed slowly and cautiously out of the parking space until the rear end of the vehicle is exposed. The BSM radar sensors will then have a clear view of the crossing traffic and, if an oncoming vehicle (object of interest) is detected, will generate visual and audible alerts to the operator of the host vehicle.

The BSM system monitors the rear detection zones on both sides of the vehicle for objects that are moving toward the side of the vehicle with speeds of from 1 to 3 kilometers-per-hour (1 to 2 miles-per-hour) up to 35 kilometers-per-hour (22 miles-per-hour), such as typically encountered in parking lot situations. In vehicles equipped with the BSM option, the RCP mode is enabled from the factory as a default. The RCP mode can be

manually disabled and enabled by the vehicle operator using the customer programmable features option of the RRM.

The RCP mode normally uses the same BSM system customer programmable features settings. However, the RCP mode will always include the audible alert feature, even if it was disabled for the BSM mode using the RRM customer programmable features settings. The audible alert can not be deactivated for the RCP mode. The RCP mode visual alert is illuminated only in the display located on the same side of the vehicle where the object of interest is detected. Likewise, the RCP mode repeating short audible alert is issued only through the audio system speakers located on the same side of the vehicle where the object of interest is detected.

STANDBY MODE

The Blind Spot Monitor (BSM) system remains in standby mode as long as the automatic transmission gear selector is in the Park (**P**) position. In the standby mode the system receives vehicle information, responds to changes in customer programmable features settings received through the Radio Receiver Module (RRM) (also known as the radio or the head unit) and can perform limited self-diagnostics indicating hard system fault conditions.

CHIME WARNING SYSTEM

The chime warning system operates on battery voltage received on a non-switched fused B(+) circuit so that the system may operate regardless of the status of the ignition switch. The chime warning system also monitors the ignition switch status so that some chime features are functional only when the status of the ignition switch is On, while others are functional regardless of the ignition switch status.

The chime warning system provides an audible indication to the vehicle operator or occupants under the following conditions:

- **ABS Indicator Warning** - On vehicles equipped with an optional Antilock Brake System (ABS), the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) will generate one short chime each time the ABS indicator is illuminated. This warning indicates a failure condition has been monitored affecting the operation of the ABS related components or circuits. This warning will only occur following completion of the ABS indicator bulb test, and will only occur once during any ignition cycle.
- **Adjustable Pedal System Warning** - On vehicles equipped with the optional adjustable pedal system, the IC will generate one short chime each time a pedal adjustment request is received and a **PEDAL ADJUST. DISABLED - CRUISE CONTROL SET** or a **PEDAL ADJUST. DISABLED - SHIFTER IN REVERSE** textual message is displayed in the Electronic Vehicle Information Center (EVIC) display of the IC. A single short chime will also be sounded each time a pedal adjustment request is received while a failure condition has been monitored affecting the operation of the adjustable pedal system related components or circuits.
- **Airbag Indicator Warning** - The IC will generate one short chime when the status of the ignition switch transitions to On and the airbag indicator is illuminated. This warning indicates a failure condition has been monitored affecting the operation of the Supplemental Restraint System (SRS) related components or circuits. This warning will only occur following completion of the airbag indicator bulb test.
- **Automatic Oil Change Indicator** - The IC will generate one short chime each time an **OIL CHANGE REQUIRED** or **OIL CHANGE RESET** textual message is displayed in the EVIC display of the IC. This warning indicates that a duty-cycle algorithm contained within the software of the Powertrain

Control Module (PCM) has determined that a recommended oil change interval has been attained, or that a reset of the interval has been requested following performance of the recommended service.

- **Charging System Indicator Warning** - The IC will generate one short chime each time the status of the ignition switch is On and the charging system indicator is illuminated. This warning indicates that a failure condition has been monitored affecting the operation of the charging system related components or circuits.
- **Check Engine Indicator Warning** - The IC will generate one short chime when the status of the ignition switch is On and the check engine (Malfunction Indicator Lamp/MIL) indicator is illuminated. This warning indicates that a failure condition has been monitored affecting the operation of a critical fuel or emissions related component or circuit.
- **Door Ajar Warning** - The IC will generate one short chime when a **DOOR(S) OPEN** textual message and icon are displayed in the EVIC display of the IC. This warning indicates that a door is, or multiple doors are not closed or completely latched while the vehicle is moving.
- **Electronic Stability Control (ESC) System Warning** - On vehicles equipped with the optional ESC, the IC will generate one short chime when the **ESC OFF** textual message is displayed in the EVIC display of the IC. This warning indicates that the ESC system has been manually disabled using the ESC switch.
- **Electronic Stability System Fault Warning** - On vehicles equipped with the optional ESC, the IC will generate one short chime each time the ESC indicator is illuminated in the instrument cluster. This warning indicates a failure condition has been monitored affecting the operation of the ESC related components or circuits. This warning will only occur following completion of the ESC indicator bulb test, and will only occur once during any ignition cycle.
- **Fasten Seat Belt Indicator Warning** - The IC will generate repetitive chimes at a slow rate to announce that an input from the seat belt switch and the ignition switch indicate that the driver side front seat belt is not fastened while the status of the ignition switch is On. The chime warning system also supports the enhanced seat belt reminder (beltminder) when this feature is enabled. Refer to **INDICATORS, INSTRUMENT CLUSTER, OPERATION** .
- **Head/Park Lamps-ON Warning** - The IC will generate repetitive chimes at a fast rate to indicate that hard-wired inputs from the headlamp switch and the ignition switch indicate that the exterior lamps are turned On while the status of the ignition switch is Off, and either a hard-wired input or an electronic message is received over the CAN data bus indicating that the driver side front door is open. The chimes will continue to sound until the exterior lamps are turned Off, the driver side front door is closed or the status of the ignition switch transitions to On, whichever occurs first.
- **Low Brake Fluid Warning** - The IC will generate one short chime when a **LOW BRAKE FLUID LEVEL** textual message is displayed in the EVIC display of the IC. This warning indicates that the monitored fluid level in the brake master cylinder is low.
- **Low Coolant Warning** - The IC will generate one short chime when the **COOLANT LOW** textual message and icon are displayed in the EVIC display of the IC. This warning indicates that the monitored engine coolant level in the coolant reserve bottle is low. This chime will only occur once during any ignition cycle.
- **Low Fuel Warning** - The IC will generate one short chime when the **FUEL LOW** textual message and icon are displayed in the EVIC display of the IC. This warning indicates that the monitored fuel level in the fuel tank is low. This chime will only occur once during any ignition cycle.
- **Low Oil Pressure Indicator Warning** - The IC will generate one short chime when the low oil pressure indicator is illuminated and the engine speed is greater than 300 revolutions per minute. This warning indicates that the monitored engine oil pressure is low.

- **Low Wash Warning** - The IC will generate one short chime when the **WASHER FLUID LOW** textual message and icon are displayed in the EVIC display of the IC. This warning indicates that the monitored washer fluid level in the washer reservoir is low.
- **Memory System Warning** - On vehicles equipped with the optional memory system, the IC will generate one short chime each time a memory recall request is received and a **MEMORY SYSTEM DISABLED - SEATBELT FASTENED** textual message and icon, or a **MEMORY SYSTEM DISABLED - VEHICLE NOT IN PARK** textual message is displayed in the EVIC display of the IC. A single short chime will also be sounded each time a memory recall request is received while the memory system is inhibited due to a vehicle speed input that is greater than zero.
- **Overspeed Warning** - The IC will generate repetitive chimes at a slow rate when the **WARNING! LIMIT SPEED** textual message is displayed in the EVIC display of the IC. This warning indicates that the vehicle speed is over a pre-programmed speed value. This feature is only enabled on vehicles that have been configured for sale in a Middle East Gulf Coast Country (GCC).
- **Park Assist System Warning** - On vehicles equipped with the optional park assist system, the IC will generate one short chime when the **PARK ASSIST OFF** textual message is displayed in the EVIC display of the IC. This warning indicates that the park assist system has been manually disabled using the park assist switch. The same chime and **PARK ASSIST OFF** textual message is displayed at the beginning of each ignition cycle and each time the gear selector is moved into Reverse **R** while the system has been manually disabled.
- **Park Brake Reminder** - The IC will generate one short chime when the brake/park brake indicator is illuminated to announce that the park brake is applied or not fully released and the vehicle is moving. This chime will only occur once during any ignition cycle.
- **Remote Keyless Entry System Warning** - The IC will generate one short chime when a **SERVICE KEYLESS SYS., KEY FOB NOT DETECTED, VEHICLE NOT IN PARK,** or **VEHICLE NOT IN REVERSE** textual error message is displayed in the reconfigurable display of the IC. This message indicates that a Passive Entry and Keyless Go (PEKG) system feature is inoperable due to the displayed error condition.
- **FOBIK PROGRAMMING. Refer to STANDARD PROCEDURE .**
- **Service Park Assist System Warning** - On vehicles equipped with the optional park assist system, the IC will generate one short chime each time the **SERVICE PARK ASSIST SYSTEM** textual message is displayed in the EVIC display of the IC. This warning indicates a failure condition has been monitored affecting the operation of the park assist system related components or circuits.
- **Service Tire Pressure Monitor System Warning** - On vehicles equipped with a base or optional premium Tire Pressure Monitor (TPM) system, the IC will generate one short chime each time a **SERVICE TIRE PRESS. SYSTEM** textual message is displayed in the EVIC display of the IC. This warning indicates a failure condition has been monitored affecting the operation of the tire pressure monitor system related components or circuits.
- **Tire Pressure Monitor Warning** - On vehicles equipped with a base or optional premium Tire Pressure Monitor (TPM) system, the IC will generate one short chime each time a **LOW PRESSURE** textual message is displayed in the EVIC display of the IC. This warning indicates that a low pressure condition has been monitored in one of the tires on or in the vehicle.
- **Trans Overtemp Warning** - The IC will generate one short chime each time the **TRANSMISSION OVER TEMP** textual message is displayed in the EVIC display of the IC. This warning indicates that the fluid temperature in the automatic transmission is excessive. This chime will repeat each time the trans overtemp message is cycled from Off to On.

- **Turn Signal/Hazard Warning Flasher Emulation** - The IC will generate repetitive clicks at a slow rate to emulate an electromechanical flasher when the turn signal or hazard warning system are operating. The IC will generate repetitive clicks at a fast rate to indicate that the right or left turn signal are operating with one or more bulbs or circuits ineffective. In either case, the clicks will continue until the turn signal and hazard warning systems are turned Off.
- **Turn Signal On Warning** - The IC will generate one short chime and a **TURN SIGNAL ON** textual message with a blinking right or left turn signal icon are displayed in the EVIC display of the IC. This warning indicates that a turn signal has been active continuously for 1.6 kilometers (1 mile) with the vehicle speed greater than 22 kilometers-per-hour (15 miles-per hour). The hazard warning flashers will not activate this chime feature.
